These paths, so simple in the constructions of the Creator, become labyrinths for us as soon as we wish to tread there.

-- Maupertuis

To my Master,
Monsieur André de **Bélizal**,
who introduced me to the passionate universe
of shape-caused waves and,
with remarkable patience,
guided my first step.

I also thank
Monsieur **Bardet**
for the precious help he gave me by sharing some of his research, thus
allowing me to discover the possibilities of Hebrew.

INTRODUCTION

Many of my contemporaries regard the radiesthesis as a slightly weird individual, who, with a ball at the end of a string, finds or does not find lots of things otherwise invisible to common mortals. This belief is the origin of the pejorative that often blemishes radiesthesia for the otherwise sensible person.

We are going to risk, however, coming out to such an individual . . . The ways of radiesthesia are indeed the only ones, now, that allow us to penetrate the mysterious vibratory world where the roots of life burrow, the world of shape-caused waves.

Our uncomplicated strategy will be that of looking for only what is supported by facts. No prejudgment! It is stupid to make conclusions *a priori* using theories or systems that deaden the imagination with artificial limitations that are only, maybe, the truth of the day.

The pendulum is simply a tool of perception, just like the eye or the ear. It permits detection and analysis of phenomena that still escape classical instrumentation, yet which are quite real in their influence on health, for example, or in their potential for analysis. In addition, the pendulum bestows a strong right direction or consistent reasoning.

Straightaway, this eliminates the divining-pendulum of the purely mental (no criticism intended) and whatever radiesthesic or pararadiesthesic activities that have depreciated this art. The pendulum cannot do everything nor resolve everything, and, beyond rather rare and exceptional faculties, it is of little use to employ it outside of its proper professional activity where it can be checked.

This does not prevent delving into certain areas, notably those of the weak vibrations that interest us here, and that are but one of the subjects ignored by Physics.

Our work will be based upon the concept of the “Vital Force”, which is invisibly woven into the living tapestry of which we earthlings are an integral part. As soon as this field is understood, it will be easy to understand the idea held by Pasteur, modified in our time by Popper, that it does not matter what has engendered life over the course of evolution (one wonders by what “motor”). On the contrary, Life was fashioned over the thread of time by action of the Creator, through the conditions of its successive manifestations from mineral to vegetable, from vegetable to animal . . . We will not go further: we eliminate on principle the domain of

Spirit that masterfully escapes all experiments, although the whole depends on it. We will not cross the uncrossable threshold of the mystery.

And yet, we had to go further on certain subjects that will perhaps offend certain readers.

Put yourself in our place: we had to resolve practical problems that appear in the agricultural milieu, and it was necessary to go back, bit by bit, to its origins in a pragmatic way. We hit, as they say, a snag,

On foot, by horse or auto, what is essential is to arrive with clean hands.

CHAPTER ONE

VIBRATIONS OF WEAK ENERGY: “SHAPE-CAUSED WAVES”

In order to easily enter into the life of this subject, here is a little history.

Several years ago during the month of July, while carrying out research with vibrations from plants, M. de Bélizal tied a specially-shaped 30-centimeter wooden form along the trunk of a young, vigorous apple tree. He hoped to reverse the natural polarities of the tree through the use of this shape.

Three weeks later, the apple tree lost its leaves.

This simple and reproducible experiment shows the power and efficacy of shapes when used with knowledge.

“From pieces of wood!” you say.

Yes, from pieces of wood. Depending on the circumstance, pieces of wood that can kill or heal.

The entire exposé that follows delves into the why and the how of such phenomena that are of the domain of shape-caused waves.

The expression “SHAPE-CAUSED WAVE” [*onde de forme*] was created by radiesthesists, MM. Chaumery and de Bélizal, following their research, which we will tackle later on. This notion will be made clearer as we continue in our exploration, but, first, we will familiarize ourselves with the importance of shape-caused waves in everyday life.

Invisibly, they surround us and they soak into us, penetrating the smallest fibers of our bodies. All of matter gives off energy – the subsoil, buildings, the family furniture, objects worn on the body, electrical appliances, food -- I could go on and on. Everything emits shape-caused waves that influence our health, behavior, and well-being.

Some waves are beneficial, others toxic.

How do we preserve the former, and eliminate the latter?

Herein we will learn together how to know them, how to manage them, and how to protect ourselves as necessary. The subject is vast and sometimes difficult, but it is worth the effort, especially at the beginning, in order to acquire the proper perspective.

Are we more stupid than earlier peoples? Other people made this same effort thousands of years before us; people who constructed dolmens and erected menhirs understood shape-caused waves. The builders of the Egyptian pyramids mastered them.

When we analyze the sculptural arts of early civilizations, so far apart from each other in time and space, we cannot avoid evoking traces in every quarter of a sure science of what we call shape-caused waves, a science in which the degree of mastery is of the highest level. The study of shape-caused waves requires no complex or sophisticated materials of modern sciences. All that is required is a certain sensitivity, aided or not by radiesthetic practices, a curious and organized mind given to observation, and a knowledge of simple geometry.

But this science – because it amounts to a true, verifiable experimental science having reproducible phenomena as its object – was certainly once the prerogative of a small select group of people. It was not in the hands of everyone to select and direct shape-caused-waves that act powerfully and at nearly unlimited distances.

This knowledge is probably as old as humanity. It has become split into bits and pieces, corrupted with additions and deletions at the hand of some civilizations, and a part of what is now convenient to call, the Tradition (capital T), behind which esotericism badly hides its enormous ignorance.

It has taken the brilliant intuition of MM. Chaumery and de Bélizal to recover the lost entrance to the Enchanted Palace. Under the strong light of rigorous experimentation, they restored the solidity it had lost in intellectual fantasies.

Before conveying our own research, we will give a brief introduction to our tool of exploration, the modified and specialized radiesthesists' pendulum, and a history of the research of MM. Chaumery and de Bélizal.

We arm ourselves with a bit of courage, because we will often be obliged to follow a route sparingly supplied with technique. The approach to the theory of shape-caused-waves is not without its limitations... Then, with the assimilated knowledge, our journey will go much better.

THE PENDULUM

An object of suspicion on the part of many scientists, the pendulum is here the required tool because shape-caused waves are weak vibrations, and it is not likely that a detector will be found that can act independently of the

human body. It is necessary then that we accommodate the pendulum and try to learn the better part of its use.

What is a pendulum?

It is mainly a weight, varying from several grams to several dozens of grams, suspended on a flexible cord. This cord is held between thumb and index finger, palm of the hand facing down, the wrist staying pliant.

To familiarize ourselves with this object, we suspend an ordinary pebble of 20 to 50 grams from a string cut to 20 or 30 centimeters of length. Hold the string between the thumb and index finger as stated above, without tension, and walk in the country while swinging the pendulum back and forth in the direction of the walking, not excessively large swings, nor such that they will bump into anything.

In certain places, if we are sensitive, the pendulum will stop its swinging, and, if we do not oppose it, will to begin to circle, the string describing a cone. This happens in spite of ourselves if we are sensitive, because other persons can walk indefinitely without the pendulum ceasing its swing. As with the violin, so with the pendulum: there are degrees of virtuosity.

And now, we stop. We raise the free arm to the horizontal, the hand's fingers together and held vertically. We turn around on the spot very slowly, swinging the pendulum. At certain orientations of the free hand, called the "Antenna", the circling of the pendulum is activated, like it was just now when we crossed certain zones.

We have described by these movements, without interpreting them, the principal processes of the dowser looking for currents of subterranean water in the first operation, the special crossings in the second.

Water research is, in every way, an excellent school for all beginning radiesthesists; they put themselves into contact with a physical reality that can be checked.

To further perfect our operations, we take in the hand a spherical pendulum of a specific color. We swing this pendulum over fabrics or papers of different colors, one of which is the *exact* color of the pendulum. The pendulum will swing over all the colors except one, the one that is identical and which entrains circling. Why? Apparently, there is resonance. We do not listen to hypotheses advanced to explain the physiologic reasons that cause the movements of the pendulum. We will content ourselves by saying: everything happens because the pendulum acts as an amplifier of the reflexes of the hand. By its shape, its material, its color, etc., it enters into resonance with an exterior phenomenon and this resonance acts on the nervous system which initiates the reflex to put it into motion.

In place of a colored pendulum, we can use a “neutral” pendulum, which is sensitive to nothing in particular. In the free hand we hold a piece of colored fabric. The pendulum swing will circle only on the original fabric from which the held piece was torn. This fabric piece is utilized as a “witness”, a resonating relay between the subject-fabric and the pendulum.

A good number of radiesthesists operate with a neutral pendulum and obtain resonance with the most diverse phenomena using mental connection only. Without denying their genuine performances, we will not follow them into this terrain; we leave them to their growing of cries of horror. We look, instead, to eliminate as much mental influence as possible by being present with what we are doing. We look for a physical resonance by passing from the swing to the circling without being worried about the direction of gyration. This direction is thought to give the polarity (+) or (–) by mental convention according to a muscular entrainment. For us, the pendulum turns or doesn’t turn, that’s it. In what concerns the polarities that we define by *a direction of rotation around an oriented axis*, special pendulums are more reliable and less subject to a confusion of causes. These pendulums are quite simply *solenoids*, (a continuous line in the form of a helix around a cylinder of circular section), in the inverse direction of a corkscrew for the + polarity, and in the direction of the corkscrew for the – polarity. We will see these pendulums in Chapter III.

Until now we have swung a colored pendulum over colored things, but we have also a detector for trajectories of vibrations or for an ambient state. There will be small technical problems that do not affect the principle of resonance and that will be seen in their time and place.

That said, a brief history is necessary, for next we will follow the work begun by the remarkable pioneers, MM. Chaumery and de Bélizal.

THE COLORS ON THE SPHERE

How did these men discover “shape-caused waves”?

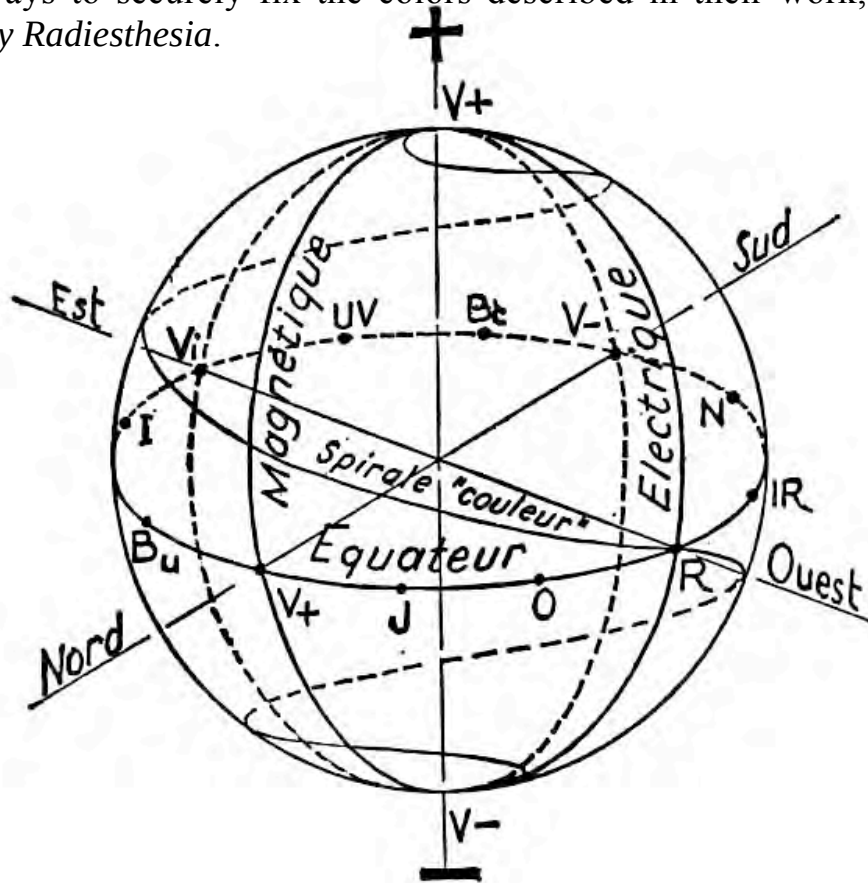

Placing a natural wooden sphere on an independent support, they examined it, employing colored spherical pendulums and what they called a “search pointer”, or simply, a small rod of copper filed at one end to a point.

Swinging a blue spherical pendulum from one hand, for example, they “walked” the pointer as an “antenna” on the wooden sphere with the other hand, seeking the places on the sphere that initiated the circling of the blue pendulum.

They proceeded in the same fashion with other variously-colored pendulums, and they found what follows:

Each color localized as a spiral leading from one pole (+) to the other pole (—) of the sphere. Each spiral cut the equator at two diametrically opposite points, red and violet.

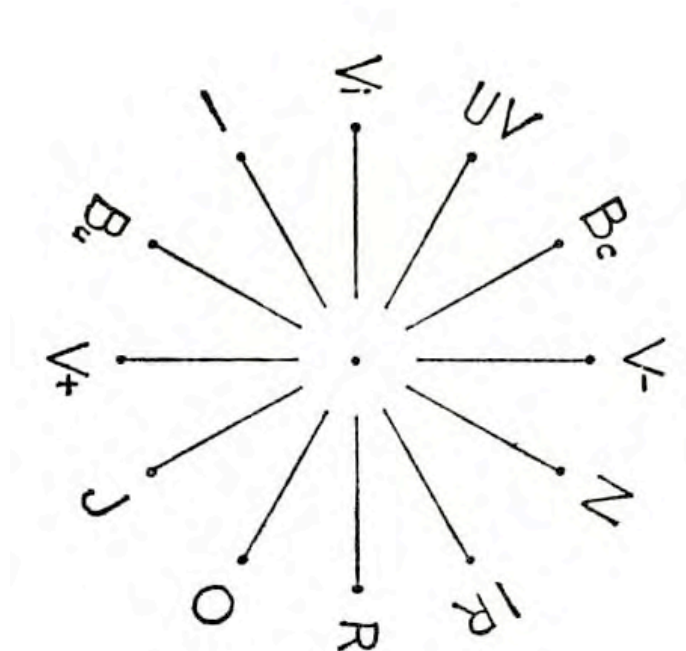

Curiously, the spirals moved around the sphere according to the position of the sun in relation to the fixed axis of the poles, describing a complete circle in the course of a 24-hour day. This movement hindered the work of MM. Chaumery and de Bélizal as they tried to learn from instruments based on the colors detected on the sphere. They had to find clever ways to securely fix the colors described in their work, *Trials in Vibratory Radiesthesia*.

The + pole that makes a neutral pendulum turn clockwise corresponds to a green normal “color” and was called Positive Green (V+). The – pole that gives a counterclockwise spin to the neutral pendulum was named Negative Green (V–) because of its simple opposition to the first, for it does not correspond to any known color.

Another study differentiated two perpendicular meridians on the sphere and resulted in two identical “spectra” with regard to color (and

invisible colors that “fill in the holes”). The two meridians indicated two “phases”, one called “Magnetic” giving the neutral pendulum a positive turning, and the other named “Electric”, giving the neutral pendulum a negative turning.

The “Spectrum” of Shape-caused Waves

Beginning at 12:00 and continuing clockwise: Violet, Ultra-violet, White, Negative Green, Black, Infra-red, Red, Orange, Yellow, Positive Green, Blue, Indigo.

On these two meridians and on the equator, the fundamental colors are situated at equal intervals of thirty degrees from each other: “Magnetic” or “Electric” on their respective meridians, and “Electromagnetic” on the equator.

Here is the spectrum and the abbreviations of the names of the colors in the two phases, Magnetic and Electric. We must remember them because they reappear throughout this book.

Negative Green	–G	[V–]	Positive Green	+G	[V+]
Black	Bk	[N]	Blue	Bl	[Bu]
Infra-Red	IR		Indigo	I	
Red	R		Violet	V	
Orange	O		Ultra-Violet	UV	
Yellow	Y	[J]	White	W	[Bc]

“Symmetrical” colors are those that are symmetrical with respect to the axis +G/–G. For example: Black and White, Indigo and Orange.

Opposite colors are diametrically opposite: White and Yellow, UV and Orange, etc.

THE “UNIVERSAL” PENDULUM OF CHAUMERY AND DE BELIZAL

The preceding study of the sphere gave birth to a spherical wooden pendulum marked with the fixed locations of the colors. It has been named the Universal Pendulum, because it is sensitive for detection of all the vibrations of shape-caused waves possible on any point of the sphere. It is equipped to this end with a half-circle of rigid copper wire aligned on the polar axis in such a way that the point of attachment of the sliding suspension cord on the half-circle can be located right above the chosen color marked on the sphere. A belt of copper wire with an index slides in the equatorial groove, such that at the chosen indication, the index will be under the copper half-circle.

When calibrated, this pendulum reacts to the colors and can replace the colored spherical pendulums. But it enters into resonance with many other phenomena, and in particular, with emissions of geometric shapes, which is why the name “shape-caused waves” was given to the emissions detected on these forms. This diversity of quality in the phenomena detected has led to discussion about the choice of color-names to describe these shape-caused phenomena. Ultimately, their use is not terribly awkward, and color-names actually make ordinary practice easier. They carry the meaning of a quality even though the corresponding quality is not a color most of the time, but, rather, a very different emission.

EMITTERS

After studying the sphere, MM. Chaumery and de Bélizal created instruments that emit shape-caused waves. Their books describe construction and usage of these emitters.

For brevity, we mention the “Bombe C 30”, a hollow wooden sphere 30 centimeters in diameter in which the emission from shape is localized in the center of the sphere. This emitter gives “shock waves”, rectilinear emissions of a shape-caused wave into space from a cylindrical rod called a “cannon”. There are more research instruments for biological usage, etc. All these instruments link to natural conditions on our planet, that is to say, to the cardinal directions and lunar phases. This in no way hinders their

efficacy, but it does require attention to precise orientation and periodic corrections. We will attempt later to free ourselves of these nuisances.

RESULTS

What results have the authors gotten from these instruments?

They have obtained information; they have written books.

It is time to cite the definition that M. Bélizal gives to the shape-caused wave: “It is the product generated by geometric shapes that capture weak ambient energy, resulting in shape-specific combinations. Supersaturated with captured energy, these shapes radiate it as vibrations.” This definition appears to be easy to understand, but we want more. We will have occasion to discuss it.

Shape-caused waves are then vibrations of an electromagnetic nature and of weak energy.

Their wavelengths will be close to those of light, but shorter. We will truly be able to verify that recognition only when the pendulum takes its place with the independent instruments of human physiology. This is not yet the case.

One thing is certain: shape-caused waves have an influence on health. It is as if they enter into resonance with the living cell, it being like a little resonator. This influence is generally unrecognized, but he who has deep enough knowledge of these phenomena notices toxic or beneficial effects every day. Later on we dedicate a chapter to toxic waves, and how we cancel their unhealthy effects with shape-caused wave emitters called re-equilibrators.

We humans are indeed fighting for life in a certain electromagnetic equilibrium, and for harmony with an orderly nature. Everything that destroys this equilibrium and this harmony is fatal, and requires the organism to fight back. When the aggression does not surpass the capacity of resistance, it is not serious, but there may arrive a day when, for whatever reason, we find ourselves too weak. Then we have illness.

If we rebalance ourselves, by submitting the illness or just its sickly organ to a shape-caused wave that is precisely calculated for “color” and duration of treatment that reestablishes the equilibrium to its normal form, we will favor healing by permitting a reaction, but no more. It is already a lot. And that recalls the word of Ambroise Paré: “I will treat it, God will heal it.”

Suppose you are at the foot of a stairs with tied ankles. You cannot climb the stairs. A kind soul unties your ankles: you can climb the stairs, but you must do it yourself.

Shape-caused waves serve only to make you untie your ankles. It is for you, with your own resources and proper medical help, to arrive, eventually, at the top of the stairs.

But you *must* untie your ankles.

Medical intervention stumbles, however, if the equilibrium “of shape” is not *first* sufficiently reestablished. Numerous failures are due to ignorance of very simple phenomena that we find repeatedly in the agricultural milieu. For example, in certain stables, the veterinarian injects and re-injects calves yet they continue to die. If we re-establish an ambiance using the correct shape, the calves react favorably to the injections . . . or may even not get sick at all. In most cases, rather than attacking the microbe with bulldozers as remedies, the simple solution consists of creating a milieu unpleasant to the microbe. Shape-caused waves are not always sufficient, but they help.

M. de Bélizal, with his powerful emitters, was able to treat patients using their witnesses at a distance from the living subjects without any loss of potency. A relay for resonance, the witness can be a lock of hair, a drop of blood on clean paper, etc., taken from the living subject being treated. The witness is placed in the “Bombe C 30” or in front of the cannon of a properly adjusted emitter.

This type of activity is not available to everyone. First, difficulties with regulating the instrument require serious experimentation. There are also risks, because the operation of the powerful instruments related to those of M. de Bélizal is not without a certain danger for the operator. If unaware, the operator absorbs radiations and then notices skin cancers. Shape-caused waves, viewed from this perspective, are not a curiosity for the dilettante.

One is able to ameliorate, sometimes heal, unmetastasized cancers by submitting the witness to vibrations found between Negative Green and Black Magnetic. A big step would be made in research on cancer if the established medical community would admit the primordial influence over the anarchical multiplication of cells of the “electric” emissions found between Negative Green and Black. We find nearly always a correspondence between the currents of subterranean waters associated with East-West faults and the occurrence of cancers in certain localized situations. These subterranean East-West faults emit Negative Green Electric and Black Electric at the surface of the soil.

One can hope that one day, in the case of advanced cancers, proper application of shape-caused waves will be mastered to the degree that cellular multiplication can be controlled by the simple play of electromagnetic equilibriums. Early trials by M. de Bélizal are encouraging. It seems that, like Archimedes, they hold the lever, but to raise the world, the point of contact is still lacking.

We are not discouraged. Even if complete healing is not yet available, a patient can experience relief and a clear attenuation of the symptoms in any case. When the patient is truly desperate, one treats him straightaway with Negative Green Magnetic to calm him.

NEGATIVE GREEN

Following are some details describing the famous Negative Green.

According to its authors, it is the shortest vibratory wavelength in the universe.

It has, nonetheless and without contest, extraordinary desiccating and mummifying properties on living matter, rendering it nearly indestructible. It has become classic to mummify meat at one third of the height of a cardboard reproduction of the Pyramid of Cheops and recently in a book appearing in Editions Laffont (*Fantastiques recherches parapsychiques in U.R.S.S.*, [*Fantastic Parapsychic Research in the USSR*] by Sheila Ostrander and Lynn Schroeder) the authors attribute the sharpening of a razor's edge at this same point in the maquette of a pyramid to a re-ordering the crystals of steel; the same edge has been used for 200 shavings. The point at one-third of the height of the pyramid is a point of Negative Green emission.

Negative Green had been briefly used in 1936 in various applications (cold, etc.) that have never been continued. Now we have arrived at the time of production of Negative Green Electric from electrical energy infinitely more powerful than the forms using simple natural local energy.

We have seen the use of Negative Green Magnetic at the latter extreme of cancer. The Electric Negative Green, however, is very dangerous and leads to a slow death. To show this, M. de Bélizal amused himself by submitting a healthy vine to alternating periods of Electric Negative Green and Magnetic Negative Green. In four years this young, unblemished vine attained 30 centimeters of height above others planted at the same time and in the same terrain, covering the laboratory walls. Curiously, during the emissions of Electric Negative Green, leaves on nearby plants became wrinkled.

M. de Bélizal published other experiments and photographs from negatives of emulsion sensitive to X-ray placed in front of the Bombe canon. These photos have the appearance of a starry sky or bombardment of particles. It also shows the strong delay by an electric pendulum “bombarded” by Electric Negative Green, and many other phenomena.

THE BOOKS

The information given above and much other material can be found in the following works:

Experimental Trials in Physical Radiesthesia, by L. Chaumery and A. de Bélizal. Appeared in 1939 in Editions Dangles.

Trials in Vibratory Radiesthesia by the same authors, appearing in 1956, Editions Dangles (new edition 1975, Librairie Desforges).

After the death in 1957 of M. Chaumery, victim of his research on shape-caused waves, M. de Bélizal published a third work in collaboration with M. Morel: *Microvibratory Physics and Invisible Forces*, in 1965 with Librairie Desforges. Here one finds a complete discussion of discoveries acquired in this epoch on shape-caused waves. It is a mine of information. You will find here one of the earliest study of shapes from ancient Egypt, the origin of “radiesthetic batteries” of hemispheres. The ancient Egyptians used shape-caused waves in a remarkable way. Pendulums of sandstone found in the sarcophaguses add to our understanding of the Nile civilization. Unfortunately, this knowledge was considered magical making it difficult to venture without risk. Many shapes reproduced during Napoleon’s expedition to Egypt are definitely toxic, yet appearing to be safe.

Here follows a quick review of what was pioneering, fruitful, patient, and long-lasting research. It is our own work, which, in small measure, has increased the knowledge in this domain that others continue in the meantime. Such is the ungrateful law that makes research a link in a chain with an unknown end. At the end of our chain, we await nothing sensational. We aim simply to clarify, to put into the service of future researchers simple perfected instruments, and some results.

THE TREE TRUNK -- THE POLARIZED BODY AND THE AURA

In the work of MM. Chaumery and de Bélizal something was not clear.

The equator of the sphere carries twelve fundamental, non-differentiated colors.

If we make a straight magnet pivot in the horizontal plane, we detect at the South, twenty-four different colors: twelve Magnetic and twelve Electric produced by the orientation of the magnet in the terrestrial magnetic field. Why?

We have taken data from the trunk of a respectable walnut tree kept in isolation in the middle of a city garden, without too much advance knowledge of where we would end up, and without mercy from the eventual opinion of ever-curious neighbors.

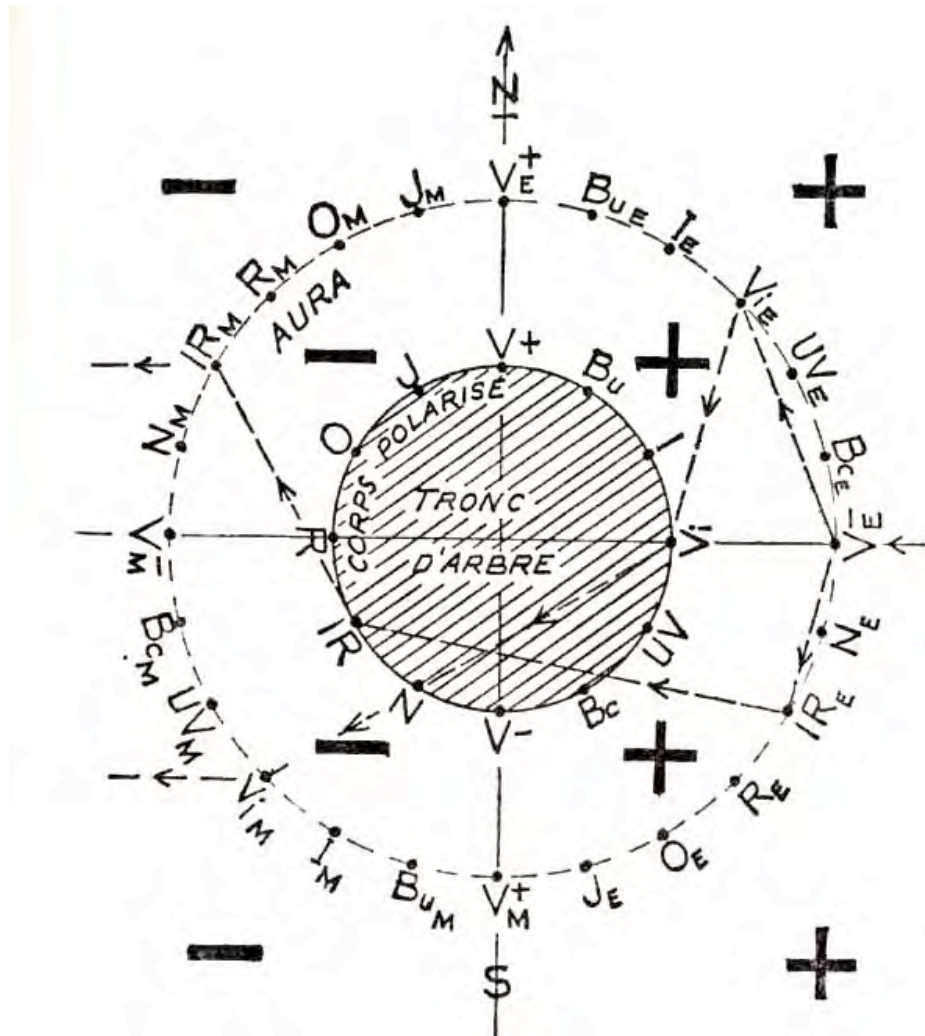

The Universal Pendulum of de Bélizal in hand, we point the index finger of the other hand to the tree trunk, actually touching it.

We detect around the trunk the equator of the sphere: Negative Green to the South, Positive Green to the North, Violet to the East, Red to the West and the intermediaries of the non-differentiated spectrum.

We walk around the trunk while holding the point of a leaf of any plant [see page 41] between the thumb and index finger of the free hand. This tool is going to capture locally some vibrations that would be undetectable while the tree is in harmony with the vibratory rhythms of its environment. We are dealing with an “honest” walnut tree in an environment no longer “honest”.

Outside the trunk, on a larger circle of radius double that of the trunk, we find twenty-four differentiated colors: Electric to the East of the straight North-South line passing through the center of the trunk, Magnetic to the West of this same line: Positive Green Magnetic to the South, Positive Green Electric to the North, Negative Green Electric to the East, Negative Green Magnetic to the West and all the intermediaries.

This virtual circle shows the potentially detectable vibrations, the AURA, while the center section corresponding to the trunk of the tree [*tronc d'arbre*], generalized, becomes the POLARIZED BODY [*corps polarisé*]. (Note: this division of the circle from the center into twelve, then twenty-four rays, approximates some rose windows at the gothic cathedrals, for example, the grand rose of the West façade at Notre Dame de Paris.)

Beyond the Aura, we find only + polarities to the East and – polarities to the West, at a distance most likely a function of the radiation of the tree trunk, but it was not evaluated.

What do we get from this quest around the tree?

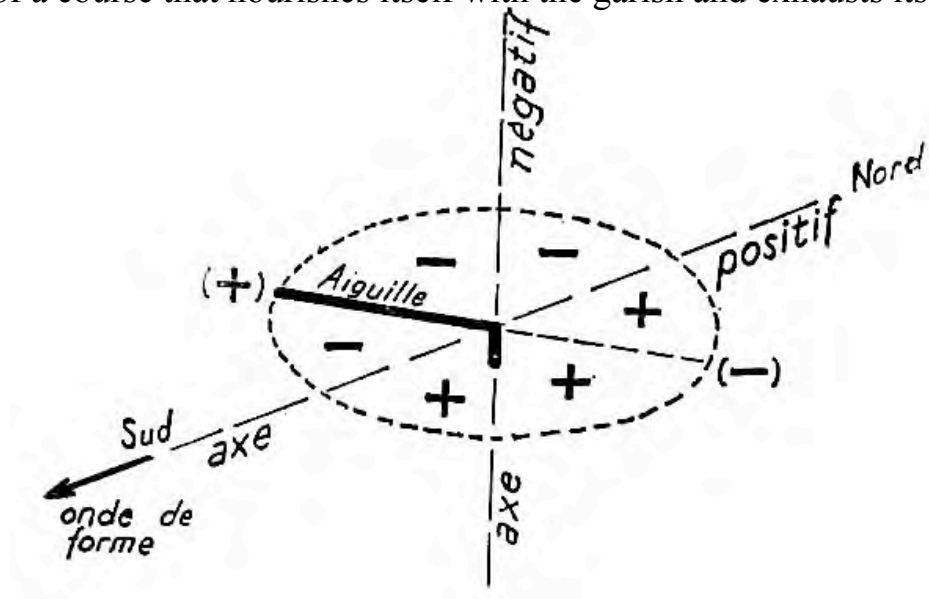

The material Polarized Body, *in equilibrium with its environment*, seems to be a level between the + and – polarities that is activated at the same time as the Aura in a horizontal plane, since, in this plane, its own colors are undifferentiated as to Electric or Magnetic, and *all detections require a device*.

But if there had been a rupture of the equilibrium similar to what can happen with a geometric form, a vibration of shape would appear detectable without a device. It is truly an actual emission and no longer only in potential. Without being able to explain it well nor to figure what is really happening, the geometric shape seems to select, to channel one or more “colors” of a potentially available Aura into all points of space at the same

time that the + appears to the East and the – to the West, manifesting a tributary flux (?) [sic] of terrestrial rotation.

This is how we will produce or analyze the emitting forms of such-and-such a “color” under the conditions of strict orientation in space.

These ruptures of equilibrium with the environment are rarely favorable, at least in the final analysis. Thus we emphasize the importance in architecture, as in all areas where shapes come into play, of avoiding brutal and powerful rupture. Unfortunately, we live in complete ignorance in an epoch rather inclined to provoke these ruptures. By searching for novelty for novelty’s sake and for ways to attract attention, we submit our nervous systems to a rude test. This is the sign, alas, of a civilization at the end of a course that nourishes itself with the garish and exhausts its reserves.

A rotating magnet gives 24 differentiated colors apparently caught up on an Aura by its + pole and diverted to its South. In the case where the magnetism of the magnet would have caused trouble, we repeated the experiment with a straight copper wire with one end bent at a right angle to serve as a vertical axis of rotation when inserted into the hole drilled straight through a wooden cylinder placed on a table. This way the horizontal part of the wire pivots around this axis.

We notice that:

1. The axis of rotation engenders a vertical negative.
2. The horizontal North-South axis, in the plane of the copper needle and passing through the axis of rotation, is positive.

3. The horizontal plane of rotation of the copper needle is delimited by a virtual circumference of which the radiation is equal to the length of the horizontal part of the copper wire. This circumference encloses two semicircular areas, one positive to the East, the other negative to the West, on either side of the North-South diameter.

4. The horizontal extremity of the copper wire is *positive* while the virtual point, symmetrical to this end with relation to the center of rotation, is *negative*.

5. The shape-caused waves are emitted to the South of the axis of rotation outside the virtual circle and *correspond to the differentiated colors of the Aura captured by the + end of the needle*.

6. Finally, there is an angle of 40° to the west of North from the North-South axis of Positive Green that cancels all the polarities. This is an angle of remarkable equilibrium that we found.

The preceding experiment refines our hypotheses: there is no longer a Polarized Body, and the generation of the shape-caused waves seems to be here through a division of the polarities only. This could explain the presence of shape-caused waves, detected by the Universal Pendulum, on multiple manifestations of chimera, heat, acoustic, electric energies, etc., outside of geometric forms in our physical universe. We will return to this. Everything is polarity: the poles of an electric battery, hot and cold, high and low, etc.

We continue our experiments.

We light a candle. The flame will become the center of a virtual polarized body and of its double aura radiation that can be detected in the space with a Universal Pendulum. Around the unlit candle nothing can be detected.

We set up a reaction of acid on a piece of limestone, for example, in an open cylindrical receptacle. Consequently, in the surrounding space we find the Polarized Body and Aura.

And one more trial: above a heated cast-iron frying pan, we find Negative Green Electric that does not exist above the same pan when it is cool. This explains, parenthetically, the danger of the heat of the sun in the presence of Electric Negative Green, the most harmful there is.

A host of experiments will confirm that shape-caused waves are phenomena accompanying all shapes that occur in nature, forming an envelope of energy, some sort of grammar of organization, to see the grammar of the hidden organization of the universe. From a philosophical point of view, this can lead us far.

These shape-caused waves cause us to suspect the existence of a natural simple order, simultaneously flowing and immutable, the principal director of evolution since the geological ages, governing us at all times. Man's prideful ignorance of this natural order results from abstracting a reality that he cannot use because it is outside of him. Thus it is the origin of most tragedies, as much in physical order as in the organization of societies. (Note: One finds an analogous idea in the work of the physicist and Nobel Prize winner, Werner Heisenberg, *The Part and the Whole*, where he wrote that all that we see and sense has to be directed by a Central Order.)

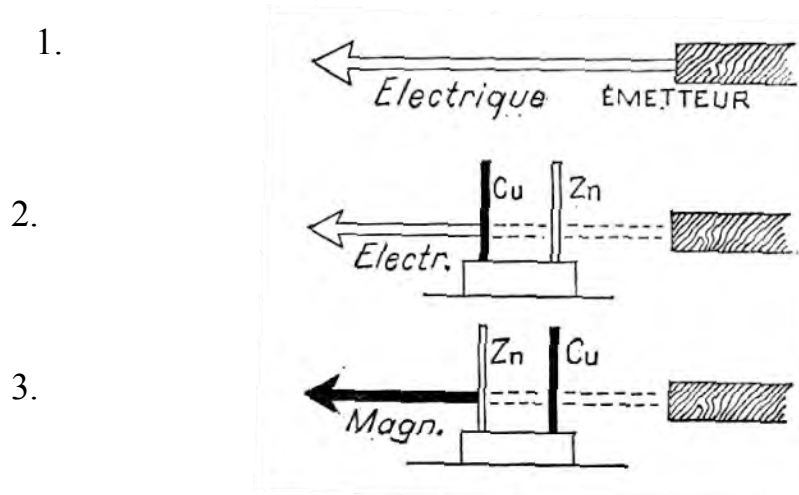

Let us end these cogitations and continue our study, because there is yet a small nod to give before we blow out the lights . . .

THE NATURE OF SHAPE-CAUSED WAVES

Here again is an aspect of shape-caused waves that we have a need to understand, because the preceding experiments have already given us a hint that the words "Magnetic" and "Electric" were probably maladapted to their subjects. It is difficult to understand that the same "color" vibration in moving from the East to the West changes in nature. Imagine how a white horse attached by the head to a post would cease to be a white horse if it were attached by a tail.

This terminology question bothered us because we owe M. de Bélizal, so much. So to clarify and specify, we print the words with an initial capital in order to distinguish them from the ordinary meanings of "electric" and "magnetic".

MM. Chaumery and De Bélizal chose these terms because the "Magnetic" emission was blocked by a magnetic substance, like iron or steel, and the "Electric" emission was blocked by an insulator like rubber or bakelite. We have repeated these experiments. They have not confirmed those precedents in the conditions where we have tried them. If there is an interference effect, it can only be extremely short because we have found the vibrations continuing beyond these interceptor planes that are placed perpendicular to the direction of the emission.

Into the North-South emission [1.], we inserted a bimetal couple formed of two parallel plates, one copper, and the other zinc.

With zinc placed to the North and copper to the South [2.], the emission is not changed.

Place copper to the North and zinc to the South [3.], the “Magnetic” emission becomes “Electric”, and inversely, remaining in the same color.

In the Voltaic battery, we know zinc is the – pole and copper the + pole. So an inversion of direction changes the phase of the emission.

In another experiment, we made an emission from a rectilinear form in the core of a solenoid. A + solenoid maintains the phase of the emission, a – solenoid inverts it. This is confirmation.

The emissions called “Magnetic” or “Electric” seem then to be *of the same nature*, but differentiated by their direction in relation to a point, line or a geometric shape, according to the case.

Why not go further and say that all entities can be positive by relation to a second and negative by relation to a third, finding thus the relative polarities of the Chinese Yin-Yang and the foundations for acupuncture. This is verified experimentally with pairs of forms that, in one orientation, will maintain the phase, and in the other direction will invert, just as we saw with the copper-zinc couple.

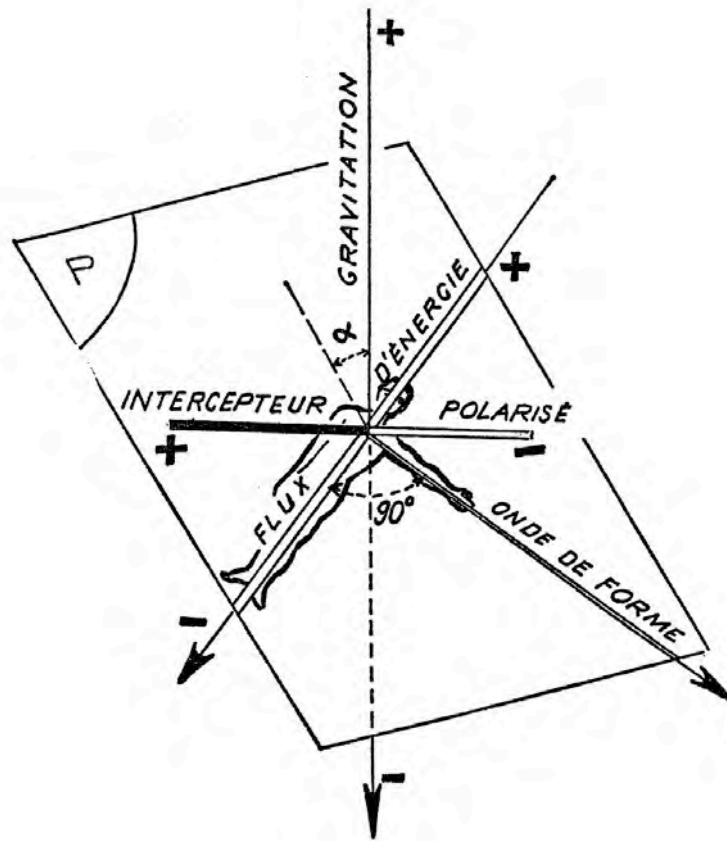

Similarly, with other experiments that vary the orientation of an emitter of shape-caused waves *in space*, we can arrive at a certain generalization of the origin of the shape-caused waves, rather than a precise definition.

It seems that we require three polarized factors in order to produce a shape-caused wave:

1. *Gravity*. One could object, since mass weakens the power of the instruments, but gravity acts also on the Electric or Magnetic phase of a shape-caused wave.

2. A “flux” or oriented energy.

3. A *polarized interference* of the flux, an interference [*intercepteur*] that we will, in this case, designate as a line polarized from its poles, although the interceptor could be of any shape.

We consider the plane (P) to contain the direction of the flux and the polarized interceptor. This plane makes a specific angle α with the vertical at their intersection.

In the drawing above, a likeness of Ampère is lying so that the flux of energy enters him via his head and leaves him by his feet, flat on the plane (P). As shown, when this fellow faces in the + direction of gravity, the shape-caused wave is emitted in the direction of the left arm extended in the plane (P), perpendicularly to the direction of the flow.

The likely necessity of gravity for production of shape-caused waves may give an explanation for the ailments suffered by astronauts in states of prolonged weightlessness. The absence of shape-caused waves would play

an analogous role to that of the action of depolarizing shapes, like the statues on Easter Island. The effect is not as brutal as meeting a bullet head-on, but it makes its mark by disorganizing vital functions.

It would be important to study the production of shape-caused waves in a state of weightlessness. Where would that lead us?

SOME PROPERTIES OF SHAPE-CAUSED WAVES

Can you begin more or less to form a little idea of what shape-caused waves actually *are*? We warned you about the difficulties in understanding them, and that we are still far from perfect familiarity with them. But, fortunately, we have no need to know everything about them in order to use them.

So, shape-caused waves exist. They behave in certain ways, and they are not simply an invention of radiesthesists. They exist independently of the devices with which one uses to understand these experiments and to reproduce the effects. They are studied scientifically, even if certain of their characteristics are fraught with symbolism and esotericism of shapes. Many of their properties remain to be discovered.

Pure shape-caused waves propagate in space like aimed rays and are then able to penetrate matter so easily that it seems there is no existing inert shielding material that can stop them. On the other hand, like light rays through a crystal prism, shape-caused waves decompose and refract when passed through a wood prism. A convex lens of wood concentrates them, and an inclined mirror reflects them. To a certain degree, they seem to obey the laws of optics rather like light rays without photons.

Shape-caused waves can be captured by resonance without appreciable loss at any distance, as we will see regarding message-sending. So we can pose the question: Could we use shape-caused waves like vectors of energy? What would be the losses incurred in restoring or reproducing them? In actuality, we are dealing with science-fiction.

We have been able to make a copper wire follow shape-caused waves and also detect them with a pendulum on the end of a string. By induction, these waves can pass from one conductor into another parallel to the first so well that one can place between them two insulated conductors without interrupting the passage of the shape-caused wave from one to the other.

Certain trials have been done that introduced one shape-caused wave to another that carried 12 volts from a transformer and found them to be amplified by the pendulum to a voltage of 220 volts.

All these experiments and as well as others yet to come will give perhaps a more precise notion of the nature and behavior of shape-caused waves, permitting us higher degrees of mastery. There is no doubt that scientific verification will put this mastery seriously in hand, and then these waves will enter a domain acceptable to everyone; but this, and with more acuity than now, will pose a moral problem, because, we repeat, shape-caused waves can kill or heal and are not always as easily manipulated as we think.

Next we plumb the milieu of the shape-caused waves with a study of places in space where these phenomena are produced.

CHAPTER II

THE FIELD OF SHAPE

Shape-caused waves, we have seen, can be emitted by solid bodies of geometric shapes having a different density from that of the ambient milieu.

These shapes provide evidence of the existence of fields without which there would be no shape-caused waves.

What is a field?

We have already said that the field must be understood as the section of space where shape-caused waves are produced. This is a bit abstract; let us examine some examples.

Air through which the birds fly is a field for frolic for winged beings.

No matter where it is, the needle of a compass orients itself in a particular direction. This can be said to be an effect of the magnetic field.

Likewise, wherever a geometric shape emits shape-caused waves, it could be called a shape-field.

Ask yourself why would we be interested in investigating shape-caused waves?

Biologists do experiments *in vivo* on living subjects, laboratory animals, and others. But in order to precisely determine certain details, experiments are made *in vitro*, that is to say, in an artificial milieu. We maintain, for example, living tissue in a nutritive solution in order to study the conditions under which it can live, apart from its natural setting. This sometimes leads to clarification of the constituents of the normal natural milieu and how to correct it, if necessary.

We will do the same for shape-caused waves.

Since we walk around engulfed in our natural milieu, we are going to try to understand and reproduce the modalities of the natural field. This will aid us in the correcting of a disequilibrated natural field, and we will learn how to avoid injury to the natural harmony. This research is important to our health.

How can we do this?

First, reason requires that we preserve natural local conditions on our planet by creating only mini-fields of shape.

We want to understand shape-caused waves anywhere in space, even among the stars, because emissions of shape result in properties common to the entire universe, including gravity, because only + and – polarities exist.

There is the ticket: hypothesize using some artificial polarities that are going to free us, in a limited enclosure, from those due to the rotation of the earth, in the same way that a powerful magnet reduces the local effects of terrestrial magnetism.

But our artificial fields are themselves emitted by shapes, so well that one might think he is seeing a spirit. You will judge once you have read the chapter.

It is going to be necessary to clarify several enigmas and create some order where radiesthesists have introduced each their own particular notions based on personal reactions. For each category of perception by the pendulum corresponds a field.

We will try not to deceive you.

VARIETIES OF SHAPE-CAUSED WAVES

There are various kinds of shape-caused waves.

We had a glimpse of this one day when we tested the emissions of a new emitter (An emitter is an instrument that produces shape-caused waves, as we will see in Chapter III.) and then made them pass through a wooden prism.

The Universal Pendulum calibrated for the “color” of the emission found *two* locations of that color exiting from the prism. The first was normally deviated by the prism, the other continued on a straight line as if the prism didn’t even exist! We thought then, “This is it! Here is a laser-wave emission from a shape that nothing can stop or deviate!”

Just at that moment, M. Bardet arrived to request our “technical” collaboration on his new work, *Mystique and Magies (Mysticism and Magic)*. This was our first contact with Hebrew text and it is this, with the words furnished by M. Bardet, that has resolved our “laser” problem, by showing us that shape-caused waves do not exist only on the physical plane.

There are also detectable emissions on the vital or spiritual plane and it is important to make distinctions; otherwise, one risks, as many have done, of mixing everything up.

It is especially important to insert a bit of clarification here.

To this end we have chosen an emitter based on the circle that can work at all levels. Armed with Hebrew pendulums, we began.

1		hA	10		Y	19		Q
2		B	11		K	20		R
3		G	12		L	21		Sh
4		D	13		M	22		Th

6		W	15		S	24		M
7		Z	16		chA	25		N
8		cH	17		Ph	26		Ph
9		T	18		Ts	27		Ts

FINALES

As it was for us in the beginning, this will be an occasion for you to make the acquaintance of surprising properties of the Hebrew language. The shapes and combinations of its characters emit shape-caused waves that mean something.

Hebrew, which is read from right to left, has 22 characters in its alphabet; above, the number of each is its order in the alphabet.

Five of these characters have two numbers, their order number when they appear in the body of a word, and the other for a terminal form when it appears at the end of a word.

So, in total: 27 numbers, 27 graphics, for 22 names of characters.

The Hebrew characters chart gives you the Number, the graphic, and the corresponding Roman letter. You will notice that the graphics are basically few, and relatively easy to draw when one understands the mechanics. We will learn a little more in the chapter on shapes.

In our transcription of Roman letters, the order of the letters follows the western practice of reading from left to right.

HEBREW PENDULUMS

Hebrew pendulums are cylindrical tubular pieces of sleeves pierced perpendicular to the axis through the center for suspension cord attachment. A Hebrew word is written on paper and attached to the cylindrical part of the pendulum with an ordinary rubber band.

The words used are:

1. H hA R Ts -- pronounced: Haaretz.

Meaning: Earth

for the physical emissions

2. L N Ph Sh cH Y H – pronounced La Nayphesh Raiah.

Meaning: The Breath of Life

for vital plane emissions

3. R W cH – pronounced Rouach.

Meaning: Spirit

for Spiritual emissions (This is the equivalent of the Greek *pneuma* or the Latin *anima* in contrast to *Psyche* or *Animus*, although the words are not exact substitutes. Hebrew is often closer to deep reality than are approximations in other languages.)

And now, to get on with it!

EXPERIMENTATION

We use a horizontal wave emitter set for a color that activates the three Hebrew pendulums.

We intercept the emission with a wooden prism.

1. We notice that the emissions in R W cH (spiritual) and in L N Ph Sh cH Y H (vital) cross the prism without deviation while the H hA R Ts (physical) is deviated as if it were a light ray through a crystal. We have here, without a doubt, a unique vibration.

2. The non-deviated emission is passed through a witness of living plant or animal. The L N Pb Sh cH Y H part is stopped and only R W cH continues in a straight line.

3. The last emission is passed through a human witness, living or *dead*, and we no longer find R W cH anymore. Man has something more than a mere animal . . . we knew this already. Man is, parenthetically, the negation of pure materialism.

<i>L'Hebreu se lit de droite à gauche (de l'Est à l'Ouest)</i>	דְּרִשׁ לַהֲמַתִּים	M Y Th M H L hA Sh R D	Nécromancie
	 כֶּשֶׁף	Ph Sh K	Magie
	רוּחַ	cH W R	(la) Esprit
	נֶפֶשׁ יְהִי	H Y cH Sh Ph N L	le Soufle de Vie
	אֶרֶץ	Ts R hA H	la Terre
	מַיִם יִצְאוּ	M Y M W hA Ts Y	Il jaillira de l'eau
	דָּבַר	R B D	Parler-Parole
	שָׁמַע	chA M Sh	Ecouter
	לַיְלָה	H L Y L	la Nuit
	אוֹר	R W hA	(le) Lumière
	יְהוָה	H W H Y	YHWH

HEBREW WORDS useful for research according to M. J. G. Bardet.

From the top: Necromancy, Magic, (the) Spirit, the Breath of Life, the Earth, the water fountain, Spoken Word, to Listen, the Night, (the) Light, YHWH.

Hebrew is read from right to left (East to West).

The outlined "horned" symbol in the upper left is "Easter Island".

These last two emissions that do not behave like normal physical vibrations throw a huge question mark in our field of vision. What are they, really?

They exist, and they have physical implications since the specialized pendulum circles for them, but with the means at our disposal, it is not possible to go much further.

We need, however, to weight our investigation on the R W cH (spiritual) side more than we would like, because that side poses us the most difficult problems and leaves the largest number of answers blank . . . Also, in these cases we do not expect a dazzling enlightenment.

The emission in R W cH is awkward simply because of the behavior of shape-caused waves. First, we risk saturation of our instruments. That is to say, they become charged and rendered inappropriate for use, blurring precision and increasing margins of error. Then, auto-suggestion, that plague of radiesthesia, does distract us by overlaying exterior mental influences so abundant in R W cH.

The influence of the R W cH has another inconvenience: it diminishes the precision of the emissions; it paints with a brush, when we want the accuracy of a single hair. For example, the exact graduation of +Green Magnetic in R W cH does not give +Green Magnetic, but that of the Hebrew word Y H W H with the Vau *not* dotted [see paragraph below]. The needle of the instrument shows +Green Magnetic near the axis, on both sides, but this is never a pure vibration.

N.B. “Vau”, the sixth character of the Hebrew alphabet, and so, the number six, can either have a dot or not. According to J.G. Bardet, in the beginning, the Vau was dotted. Our findings have demonstrated the necessity of this dot for a good balance when analyzing Vau for shape-caused waves.

We try to see this more clearly with R W cH.

This Hebrew word covers the whole of “spiritual”, but we ask the question: what is the real, exact level of this R W cH from the point of view that we discuss here, that we detect by pendulum?

We are without a doubt higher than the animals and than L N Ph Sh cH Y H, but without exceeding the highest creation.

Perhaps it is a matter of *one* of the forces they collectively call “psi” phenomena, where the frontier between normal and abnormal is not always evident, and where the Beings of the Inferno, always lying in wait, easily intrude. Did not Papus [occultist Doctor Encausse, 1865-1916] in his magic operations use the Flaming Star (five-pointed star) as an emitter of R W cH over his altar of evocations?

This is why we must eliminate everything “spiritual” from the shapes and instruments if we want to do scientific work. The R W cH encloses us in a domain where we risk, at the minimum, to be no longer in control of the phenomena nor of the detections.

The shapes that simultaneously emit on all three levels are depolarized. We describe these shapes as “magic” because they make the Hebrew pendulums react toward “Magic” (K Sh Ph), or inversely, toward “Necromancy”, etc.

The danger of these depolarized forms comes from their receptivity to the spiritual under the influence of forces of will, conscious or unconscious, direct or indirect, that can modify the properties of the other two levels. Depolarized forms are incomplete forms with a “void” to fill.

One can be poisoned by using shapes that appear to be beneficial for health. Sooner or later they lose their effect or become charged with toxicities without one’s knowing how or why.

We are outside of the scientific domain limited to the reproducible. This sector of shape-caused waves has dark fringes where occultism lurks. It is best to avoid them. Anything outside where Violet passes to the West and Red passes to the East attracts, like anything tainted with mystery, contradictions and inversions. You get caught in a spider’s web, called Sh T N (the Hebrew Shatan).

Shin	Sh	21	3	
Tèt	T	9	9	
Noun	N	25	7	
		55	19	1

The diagram shows three Hebrew characters: נ (N), ט (T), and ש (Sh).

It’s the “Monkey” of the Universe.

A famous example of non-polarized forms is the Easter Island statues that we will see in the chapter on shapes. That experiment taught us to beware. We recall in particular a shape burned into wood on a small, neutral piece of plywood that showed suppression over an area with a radius of 40 meters. Even broken, this form still emitted. It had to be burned.

Is an honest spirit satisfied with these explanations?

We add, in order to be complete, that the Creator, Pure Spirit, has no need of shapes because man attracts his interest. The Creator's immense Love for his creature suffices, and man has been created free to respond to that love, or to refuse it, in return for which he is granted the *post mortem* verdict of eternal happiness or of suffering without end.

Signs such as "crossing oneself", as in the catholic church, are sacraments which, conjointly with prayer and penitence, establish the spiritual bond with God. But this bond is not comparable to that of the R W cH detectable by the pendulum.

We apologize for dotting all the *i*'s, but things must be clear, whatever they are. In addition, we do not want to injure the convictions of the reader in any way.

This is a matter for reflection for an open-minded spirit.

THE FIELDS

The levels above correspond to fields.

THE SPIRITUAL FIELD

This field in R W cH clearly demonstrates the concerns of this study, and we feel already sufficiently heard on the subject.

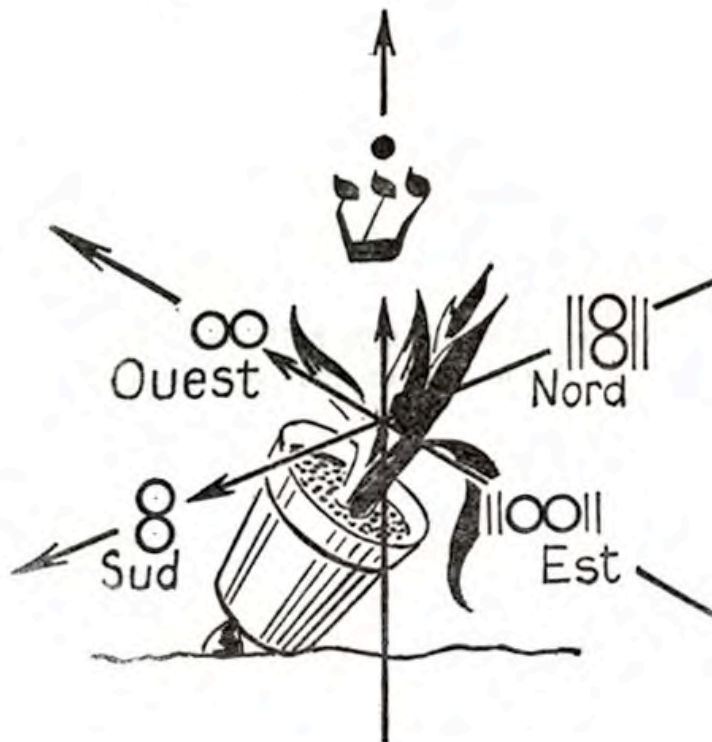

THE VITAL FIELD

The vital field is L N Ph Sh cH Y H. It interests us to the degree that it interferes with the physical field, because we are limiting our inquiries, as much as possible, to the physical field. To dismiss it without any attention would be a mistake, because it is easy to highlight issues specific to the vital plane on the vital plane.

The balanced being does not emit in a way that registers on the Vital Plane, only in the potential state. In order to detect in such cases, it is necessary to use tricks: either press the thumb of the free hand against the bent little finger, or hold a “cannon” (a prism or elongated cylinder emitting shape-caused waves along its axis), 8 + 10 + 5 or 8 + 10 + 10 + 24, or, simply, hold a point of some plant leaf between the thumb and index finger.

We avoid using these tricks by inclining a potted plant to destabilize it. We detect some conspicuous vibrations around it in the three dimensions of space.

1. Above, on the vertical, the Hebrew shin, the 21st character of the alphabet.

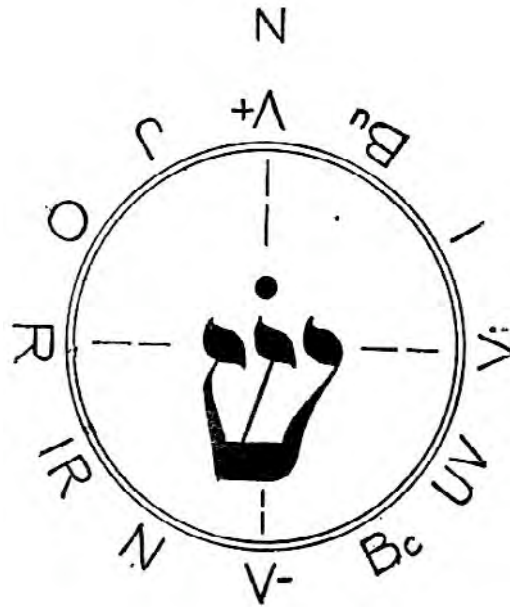

In the domain of the shape-caused waves that interest us, Shin oriented top to North in the interior of a circle develops the spectrum of the non-differentiated colors on the circle of the Chaumery/de Bélizal equator: we find our tree-trunk.

This is important, because the direction of Shin, the orientation in space of the non-differentiated spectrum, informs us about the “magic” of these shapes . . . and even about “magic”, itself!

A rotation of the non-differentiated spectrum by 180° in relation to normal on a living witness gives us greatest caution.

To the West, the vibration of the *Knot of Life* [two tangent circles] in “Magnetic” phase, to the East in “Electric” phase [shown with double parallel isolating boundaries]. The Knot of Life, materialized by two equal tangent circles, their centers in line with the horizontal East-West, is a *fundamental* form that we find in relation to Vital Magnetism. It indicates a transfer.

3. To the South, the vibration of the two equal tangent circles, their centers in line with North-South, or vertical. To the North, the same vibration in Electric phase. We have named this form Eq. It indicates a cessation.

On a plant of a certain size, such as the trunk of a tree, these two latter vibrations lie tangent to the trunk or the polarized body at the intersections of the horizontal and vertical diameters with the circumference [see diagram below]: to the South and to the East in Magnetic phase, to the North and to the West in Electric phase.

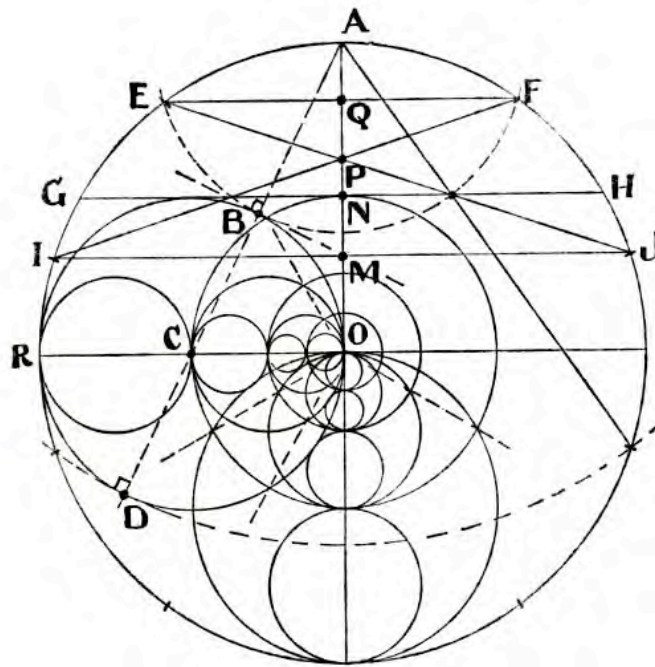

These three components are always present and the living being, participating in the Vital Field, is only the indicator. An inert material like a shard of natural rock does not emit the Vital Field except under certain conditions of movement that are extremely precise – this we have done – because movement is an expression of life.

In our introduction we said that the basis of our study is the Vital Field. Its geometric expression applies to polygons that can define the physical field and its structure. It also relates to Hebrew through the Numbers, by confirming at which point the latter adhere to the experimental results.

A needle of the same shape of which the usable length is placed between the radius of the Polarized Body and that of the Aura sends the colors of the Aura in the same direction.

If one places on the support where the form is drawn or engraved a figure regarded as “magic” or some hairs of a sacred cow, for example, the shortest needle set on non-differentiated Violet sends Red to the artificial South. The Polarized Body has pivoted 180° while the Aura has not changed. The first observation of this phenomenon stupefied us, but it was necessary to accept the facts. In this instance, the Shin inverts to upside-down above the center.

This figure gives us only a limited part of the field. To extend it, increase the number of the circles as permitted by the support.

Here we see that the successive circles have diameters double that of the immediately preceding circles. In other words, the growth obeys a law of shape:

$$y = A \times 2^x$$

Or, if you prefer, a geometric progression to the second power.

This equation says that y is equal to A multiplied x times by 2.

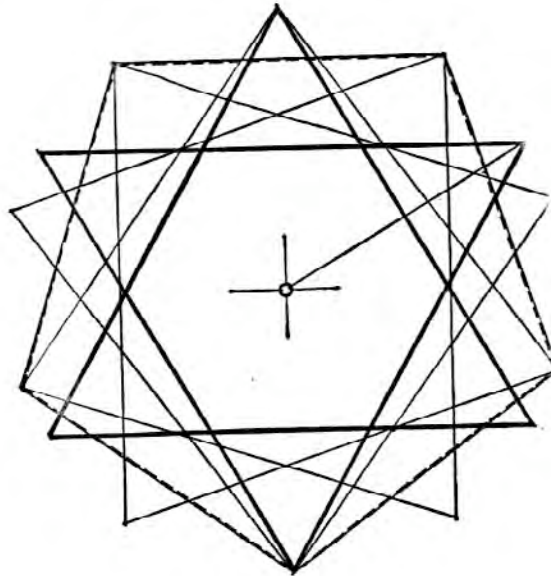

This exponential law to base 2 gives the primary structure of the Vital Field and *frames all that is going to come to be inside.*

Cellular multiplication, by division into two by each mother cell, obeys this law (mitosis).

In certain places, they say, life moves along . . . Close your eyes and imagine this fantastic ballet of immaterial bubbles expanding from each of the infinite number of points of space, and you have only a small and quite inadequate idea of what the permanent explosion of the Vital Field would be if it were to materialize to our sight . . .

THE FIELD OF PHYSICAL FORM

The physical field bathes in the Vital Field. It is often very difficult to make a distinction between the two. And often you will get the impression of dealing with the two at the same time.

In multiplying the circles of the Vital Field, we see that the equal circles are centered on the same axis, of which the center of one is found on the circumference of the other. The intersections situated on the axes form radii of hexagons or hexagrams, which establish the symmetry of space and lead us to the physics of crystals and of beehives.

On the other hand, we notice that the geometric conditions are combined to allow very simply the classic construction of the decagon, and consequently, pentagons. [See below.]

If we express a limited field by one single hexagram, a starred decagon, a convex pentagon and a starred pentagon, have we a valid portion of the field?

Here it is necessary to first state our conditions for establishing some tests.

Without stretching this book too far, for it is not meant to be a treatise on shape-caused waves, we could say that *we must find on a shape from the field the conditions observed in the natural field.*

For example, a disk of cardboard placed on a physical support that shows the structure of the field must show on its circumference the spectrum of the Polarized Body, lead to its Aura, and effect the separation of the polarities, the whole with an orientation *by relation to the support* and not by relation to the natural field.

By the same reasoning, a simple pencil standing on point must emit to artificial South one of the vibrations of the Aura corresponding to its orientation *by relation to the support*, etc.

These checks, and others, are verified if one draws in the same circumscribing circle (non materialized) the hexagram, the star decagon, and the convex pentagon, without forgetting the ray of the UV Electric leaving the center of the drawing where it is pierced straight through, and ending up at the North-east summit of the hexagram. [See drawing above.] This ray makes a 60° angle with the North-South axis and by necessity orients the field.

The pentagram, or star pentagon, is easily inserted into the drawing, but adds nothing to the equilibrium. It is good to add a few words here. This drawing is known under the name, Flamboyant Star, dear to lovers of the dark and sulfurous vapors, that one finds on the Sumerian potteries as a decorative motif, is depolarized like all the odd-numbered polygons, which, isolated, emit in R W cH and “Magic”.

You object, “Five is a characteristic of the living, like the five fingers of the hand, the number of petals of many flowers, starfish, etc.”

Yes. But look attentively. These “five” are only appearances [visible]. They are boiled down to ten, and at parity by doubling, or even by radii of concurrent axes. The petals of flowers have a radial axis or veining, and are also doubled in the sepals. The starfish has a radial body, etc.

The odd number is like live leavening in dough. Once cannot “materialize” without making a pair in harmony with the bipolarism of the physical. The odd number has to dress itself in evenness, but the even number cannot contain life, only serve it as an envelope, so that it under-lies the odd. Do we understand this?

This is why the pentagon is necessary to the expression of the field, which, still physical, bathes in the Vital Field without which it would not exist.

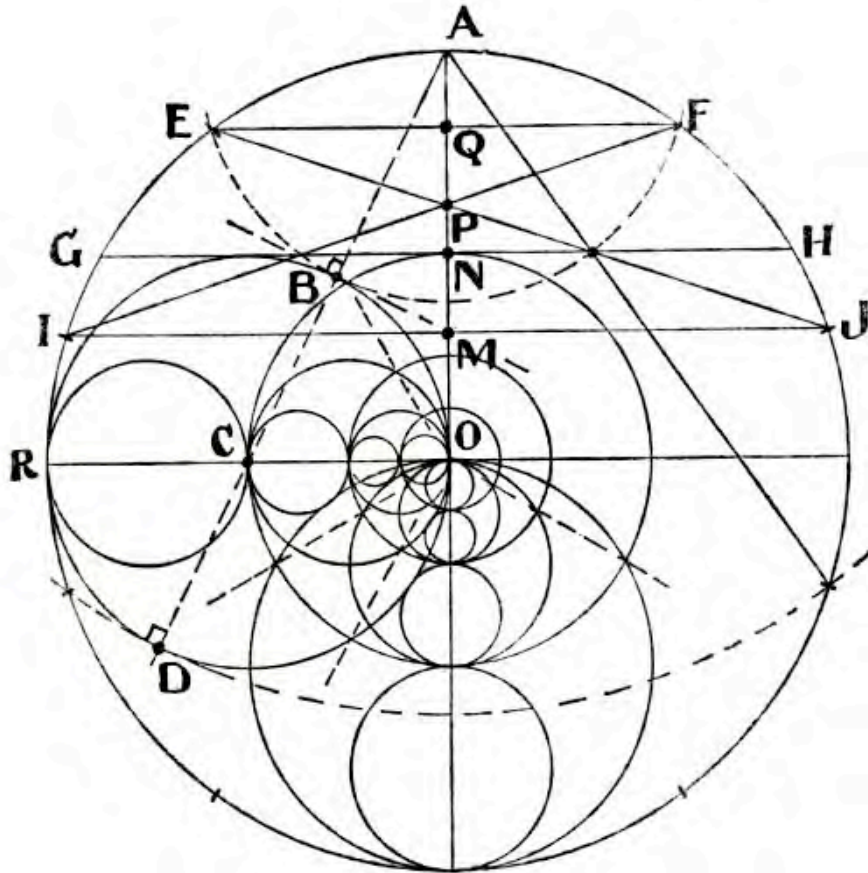

This long parenthetical discussion closed, we are going to be able to deliver several elementary geometric calculations that were formerly taught in a flash in “Humanities” courses, in the days when Euclid still merited consideration. *These calculations will directly give the proportions that we use in architecture and that one finds in Nature* if one but had some patience. It is here that we notice the simple order on which physical nature, inert (apparently) or animate, is constructed.

We will not impose the details of the calculations that use the fact that the hypotenuse of a right triangle of sides 2 and 1 is equal to $\sqrt{5}$.

[Translator is not afraid of imposing the details:

$$\begin{aligned} 2^2 + 1^2 &= c^2 = 5; && \text{by Pythagorean Theorem} \\ c^2 &= 5; \\ c &= \sqrt{5} && \text{take square root on both sides} \end{aligned}$$

Construct a circle of which the diameter is OR.

OR is also a radius of a circle circumscribing our future decagon. Draw a circle C using OR as its diameter. Draw the diameter of the large circumscribing circle perpendicular to this radius OR. With upper end A of this diameter as center, draw two circles tangent to Circle C, partially outside the original circle, one is tangent at B, the other tangent at D [the relevant arcs of these two circles are shown in dashed line]. Their radii are respectively the sides of the star decagon [or decagram; AD] and the convex decagon [AB].

The side of the star decagon [decagram] is AD:

$$\text{Radius} \times (\sqrt{5} + 1)/2 = \text{Radius} \times \phi$$

ϕ , the “Golden Number” = 1.61803 . . .

The side of the convex decagon is AB:

$$R \times \phi - R = R(\phi - 1)$$

From these givens we conclude:

The apothem OQ of the pentagon of side EF is equal to

$$R/2 \times \phi$$

The intersection of two sides of the decagram is at a distance from the center OP equal to:

$$R \times (\phi - 1)$$

The apothem of the pentagram is equal to OM:

$$R/2(\phi - 1) \text{ (for reference)}$$

The apothem of the hexagram is ON = R/2

N.B. The successive circumscribed and inscribed hexagrams fit together exactly inside each other, which, geometrically, fulfills the exponential structure with base 2. Pentagons and decagons, themselves, exactly inscribe in the structure imposed by the hexagrams.

As an aid to these constructions and calculations, the field can express itself in multiple ways by deduced figures. But we can reach another expression of the field from the Hebrew word Y H W H (I AM) with Vau dotted.

The Hebrew TETRAGRAM Y H W H, on which J. G. Bardet has copiously written in his *Secret Treasure of Israel*, is one of the expressions of God in Hebrew, the other being Elohim (hA L H Y M) a plural word matching the singular explaining the creative action of the Three Persons in one God – and who has nothing to do with extraterrestrials.

Y H W H and Numbers 26-17-8 explain the Trinity in four characters:

Yod	Y	10	1	
He	H	5	5	
Vau	W	6	6	
He	H	<u>5</u>	<u>5</u>	
		26	17	both sums add to 8

Yod is number 10, indicating Father.

Vau is Number 6, indicating Son.

He is Number 5, indicating Holy Spirit that intensifies its yearning
of Father to Son and
from Son to Father.

We will go, however, no further in this direction, where we find ourselves ill at ease. We will content ourselves with only shape-caused waves.

The *qualitative* Numbers 10, 6, and 5 give the decagon, the hexagon and the pentagon just above, since a qualitative Number is a division of Unity, or of the circle. But we are going to proceed otherwise.

Yod emits a vibration of Magnetic Positive Green at 180°.

The dotted Vau emits a vibration situated on the Aura at 40° from North towards West, at 320°.

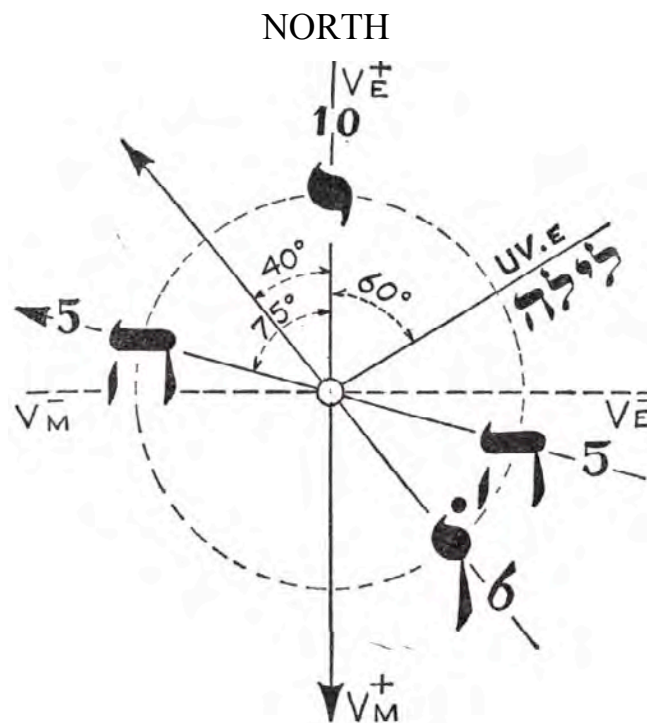

The He emits an Electric Black at 105°.

We draw each character on its respective axis of emission, with respect to the doubling of He, on a non-materialized circle. We can see clearly that the *Hebrew characters are sufficient to define a field that responds to the tests.*

Their axes of vibration constitute what we could call the Director Axes of the field of shape.

If we materialize these by their straight-line currents, it is necessary, as before, to impose the orientation of the Electric Ultra-Violet ray at 60° from NE, in order to satisfy our tests. The field will only be complete if we pierce the support straight through at the intersection of the axes. We add these axes:

1. The artificial N-S line, Yod, 0° – 180° .
2. The line of Vau, 140° – 320° .
3. The line of He, 105° – 285° .
4. The Ray of Electric Ultra-Violet, at 60° .

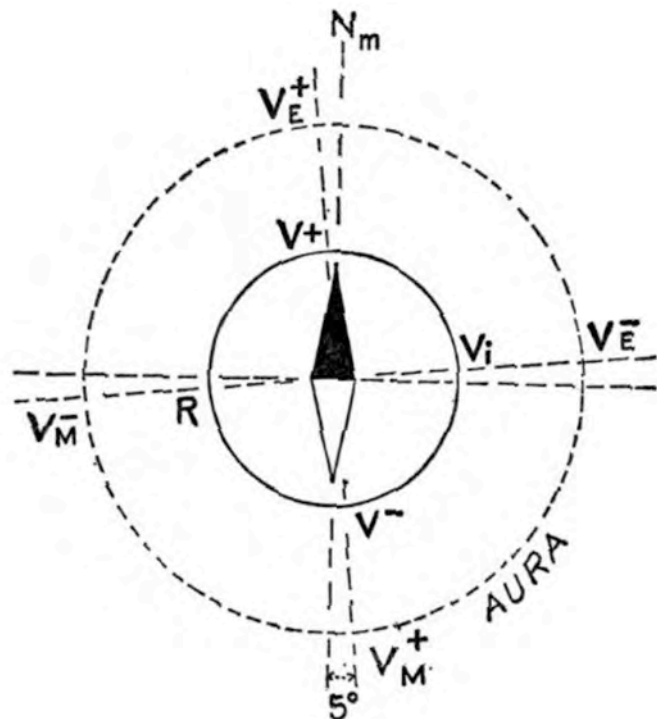

As for the eventual axis of the Negative Green, 90° – 270° , if it were to be omitted, the vertical over the intersection of the axes is positive. If one draws this axis, the vertical over the intersection of the axes is negative and the axis 0° – 180° is positive.

Everything depends on what we want to make, it being understood that a witness must be drawn on a positive axis.

ORIENTATION OF SHAPE FIELDS

We place a compass needle in a certain orientation at the interior of a drawn circle or by a centered copper wire. We activate on the circle a spectrum of the Polarized Body *in relation to the needle*, a double Aura from the circle and + and – polarities a bit separated from the axis of the magnetized needle.

V = vert (French) for
green

So, we can produce the shape-caused waves from magnetic polarities, but we must always account for the mysterious 5° variation. If, on the shape-caused wave emitting instruments, we replace the usual copper-wire needle with a magnetized needle, it will always be at 5° from the copper in a clockwise direction in order to obtain the same shape-caused wave.

The same precaution must always be taken with regard to the orientation of shapes by relation to the terrestrial magnetic field. North of the shape will be at 5° to the West of Magnetic North, or 355° magnetic.

This is an enigma to resolve: why these 5 degrees?

REMARKS

The calculations above show the Golden Number with decagons and pentagons, polygons insufficient to the balancing of the field. The Golden Number, an irrational number, unfinished and inadequate is only a partial given.

All constructions, all systems based *uniquely* on the Golden Number (Golden Section), such as the Egyptian Proportion that we will see later, make us think by analogy of the “idealist” philosophies, of systems that take the real but particular facts and generalize them in intellectual constructions that pretend to contain and explain the entire universe and with which they blow their minds.

The real world explodes with idealism. How close to global reality is a saint Thomas Aquinas with his *Ars Traditur Naturam* in his Preface on Politics (Wisdom draws its inspiration from Nature).

Further, the Golden Number, a geometric fact, or rather, an algebraic limit that is never found in Nature, has a major inconvenience that makes us reject its *exclusive* use: it reverses Red and Violet of the Polarized Body: we stop observing the trunk of a tree to enter completely into magic!

We must, besides, Golden Number or not, trust a so-called Esoteric Tradition. A few facts mixed with quantities of Gnostic, Kabbalistic and other slag appearing in mathematical dress, with some *a priori* distractions. There is much to prune, to clarify in this jumble. Shape-caused waves and experimentation help to sort it all out.

Until now we have used detectors inherited from MM. Chaumery and de Bélizal. We have also invented our own, more simple in construction and more selective of the levels of shape-caused emissions. This is what we will address in the following chapter along with several simple emitters based on the Field of Shape, which will serve us later.

CHAPTER III

INSTRUMENTS

You can skip this chapter if you are not specifically interested in emissions and detections. The survey, however, can add several notions that are useful in understanding the rest of this work.

We present a few, particular instruments, to stoke the woodstove just at the right moment, without overloading it, and including the simplest instruments in our line of research lest we distract or confuse the reader.

We pay particular attention to the simple emitter called the Equatorial Disk. We will give instructions for its use and especially for work with shape-caused waves.

THE DETECTORS

As silly as it may seem, it is not easy to find a detector for shape-caused waves that does not become saturated. That is to say, which does not charge itself in such a way so as to render it unsuitable for research, and which does give satisfaction to a majority of operators.

A good detector of shape-caused waves must be capable of reacting to a chosen vibration without mental participation dominating the detection . . . All attention must be placed on what the detector is doing. Especially, one must not confuse the “Electric” and “Magnetic” phases on one hand, with the polarities, on the other hand.

Never forget that, without exception, we are in a physical domain where the reflexes of the operator, are only, to our senses, a phenomenon of resonance with the nerve cells.

CLARIFYING THE THREE LEVELS

In order to facilitate the general selection of levels of emission with a neutral pendulum (or a detector of shape-caused waves such as the Chaumery-De Bélizal Virtual Cone Pendulum) one can use three neutral radiesthetic knots on the suspension cord.

Knot levels of the neutral pendulum:
Physical, Vital, Spiritual

Knot

The lowest knot corresponds to the “spiritual”, the middle knot to the “vital”, and the highest knot to the “physical”.

Use the knot called “the carter’s knot” by mariners, or “figure of eight” knot. This knot is also recommended under the pendulum to attach it to the cord. This done, the following pendulums work only in the physical, and, normally, do not entrain excessive nervous fatigue, even through prolonged usage in extended analyses.

EQUATORIAL PENDULUM

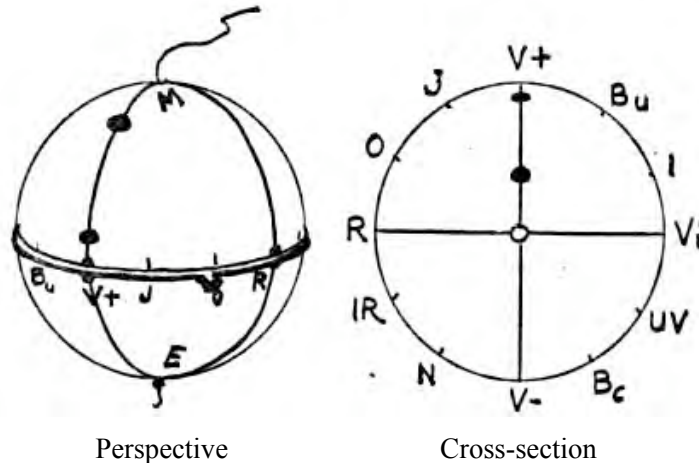

The equatorial pendulum is a sphere of about six centimeters in diameter. Outside of the hole for the cord between the two poles, other holes are pierced in the plane of the equator according to the rays corresponding to the axes determining the field of shape.

A copper wire closed by twisting its ends forms a sliding index on an equatorial groove. This index stops on a gradation permitting the pendulum to respond to its resonant vibration. The equator is calibrated to the 24 colors of the differentiated spectrum of the Aura. That is to say, that half the equator circle is Magnetic and the other half is Electric.

This sensitive and precise pendulum requires a fair amount of skill in execution in order to be a useful tool. So we have sought another pendulum that operates with respect to the twelve equatorial colors in place of the twenty-four: the Equatorial Pendulum “Unity”.

This pendulum functions on the basis of $1 + 8 + 4 = 13$ of the Hebrew word: hA cH D (Ehad) signifying “one”.

The equator is grooved into the wood, as are the two perpendicular meridians. On one quadrant of the grooved meridian, between the equator and a pole, two holes are drilled into the center along radii: one at 1/13 of the quarter-circle from the equator, the other at 9/13 arc length.

The Equatorial Pendulum, "Unity"

The four intersections of the two meridians with the equator are linked by channels along their diameters on each side, in addition to, of course, the hole for the cord between the poles.

The equator is then the seat of the twelve non-differentiated colors of the Chaumery-deBélizal equator. The Magnetic phase is accessed by suspending the pendulum by the end of the cord above the hemisphere with radial holes, the Electric phase by holding the cord at its opposite end.

Like the preceding pendulum, this one features a belt of copper wire with a sliding index around the equator for designating the appropriate color. The equator is divided into 12 colors in place of the 24, allowing for great precision in the adjustment of the index, without which the sensitivity can be affected. There is a corresponding time-saving when passing from one phase to another in the same color, since one merely changes to the other end of the cord.

Supposing that one eliminates the equatorial copper wire belt, this pendulum could serve as a detector on either phase according to which end of the cord is used.

On an undifferentiated color, one obtains resonance with the two ends of the suspending cord, equally. If a vibration makes the suspended pendulum react by one end of the cord or the other we know we are dealing with an undifferentiated color.

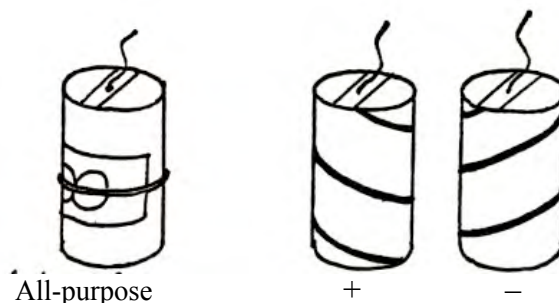

CYLINDRICAL PENDULUMS

Research on shapes has led us to a pendulum made by putting a sleeve on a cylindrical dowel of three or four centimeters in diameter and five to six centimeters of length, and drilled through the middle for the passage of the suspension cord. This pendulum is of little importance to the amateur. To depolarize the wood we score two parallel lines on one section, symmetrically either side of the center of the section. Two cuts with a file will suffice.

A PENDULUM TO DO EVERYTHING

Any drawing on a piece of paper can be attached to the plain cylinder above with a simple elastic band.

To find out the vibration of the shape of a drawing, for example, one has only to swing the pendulum before the exit of an emitter and observe the color of the latter that makes the pendulum turn. Handle the needle of the emitter gently, in small increments, in order to avoid ignition.

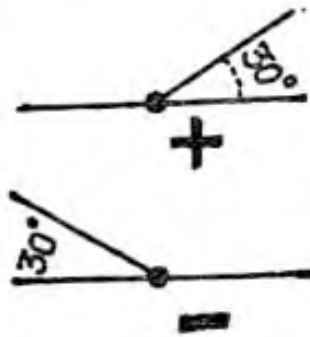

Cylindrical Pendulums

POLARITY PENDULUMS

One can cut a helicoidal groove on a cylindrical pendulum, in the inverse direction of a corkscrew for the positive pendulum (+), or in the direction of a corkscrew for the negative pendulum (-). There is no need to cut the groove in order to have a reaction: drawing a simple line with grease pencil or ink is a good temporary solution.

If one wants a unique pendulum, one can, in a little sphere, such as the small wooden ball used in *Pétanque*, pierce the equatorial plane with perpendicular diametrical holes, and drill a radius at 60° from one of the diameters (UV Electric). One end of the cord gives +, the other end, -.

In every way, these witness shapes are extremely useful in many projects and often more precise than the setting of an index on the Equatorial Pendulum. One can also put a photo on the pendulum.

EMITTERS:

EQUATORIAL DISK

This is a reproduction of the equator of the Equatorial Pendulum. A plywood disk of around 30 cm in diameter and about 2 cm thick is grooved with rays related to certain directional axes of the field of form.

A hole in the center of the disk holds the axis of rotation of the calibrating needle.

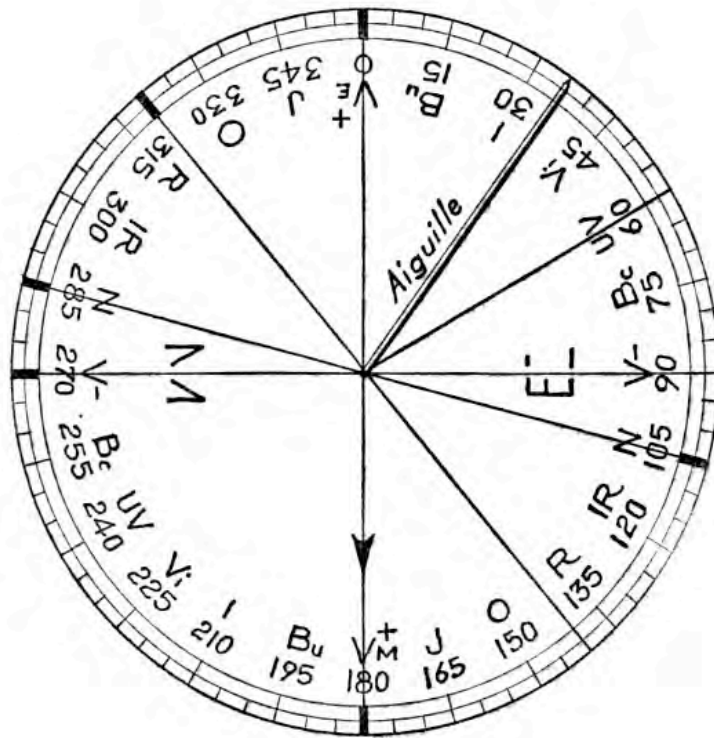

This needle [*aiguille*] is made of sufficiently rigid, straight copper wire. At one end a right-angle bend serves as its axis for rotation.

The graduations on this disk are those of the Aura, the 24 colors of the differentiated Magnetic and Electric spectrum.

We have adopted degrees as the exact graduations for most of the interesting vibrations, and integrated then into the structure of the field based on the hexagon and decagon. The sexagesimal degrees have nothing artificial and are conventional. They are related to experimental reality.

Zero is at Positive Green Electric, and going clockwise: 90° at Negative Green Electric, 180° at Positive Green Magnetic, and 270° at Negative Green Magnetic, to keep the usual norms of the compass.

The horizontal emission in the plane of the disk, is located in the place opposite Positive Green Magnetic (180°). If, for the ease of detection, one cares to turn it to the vertical, one places on the table in front of the Positive Green Magnetic a neutral cylinder, a goblet, etc. The emission propagates then above the body of *revolution* in a normal ambiance.

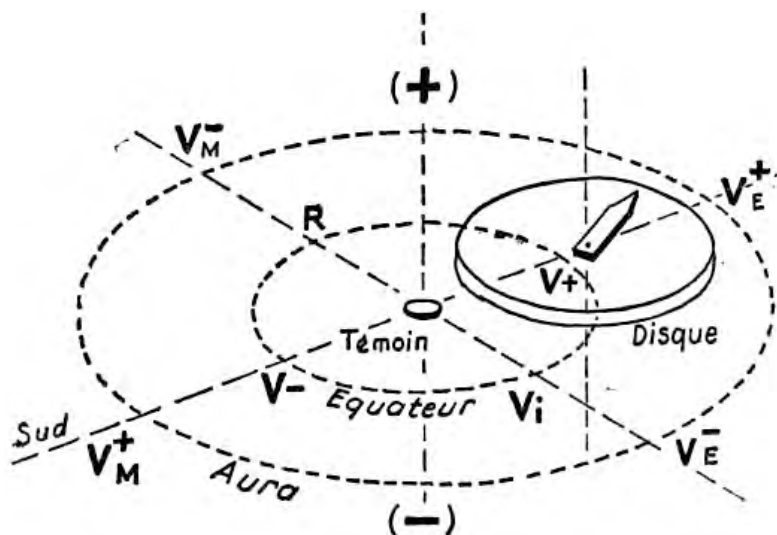

Notice above the center of the disk a – polarity, and at the exit a + polarity, as with the needle by itself in the natural field.

The graduation of the equilibrium that annuls the polarities is 320°, which annuls, it seems, because one finds them by the usual procedure of placing the free hand's thumb on the little finger. The 320° corresponds to the collective equilibrium of all the shape-caused waves, It agrees with the equilibrated structure of the material fields by the proportions 8-13-16-21-26 that we will approach in architecture.

USE OF THE DISK

The disk is a research tool for use when one wants to know the vibration of a shape or the curative or sickness wave of a patient whose witness is placed in front of the Positive Green Magnetic (180°). It is an instrument of *treatment* when one submits a witness of a living person to his healing wave.

Identification of shape or research for the normal healing wave (Witness in center; orientation: Positive Green Magnetic to the South. V indicates Green.)

The people who do mental dowsing pose a question to their preferred pendulum, and make the needle of the research instrument turn and obtain a response – true or false.

We could content ourselves with a probability, however strong it may be, but we must reach certitude through various methods of checking.

These are possible with the different vibratory manifestations that accompany a resonance.

Put the shape whose color you wish to evaluate opposite the 180° of the equatorial disk by orienting this shape *with relation to the disk*.

At whatever marking the needle shows, we observe a – polarity above the center and a + polarity along the extension of the 0° - 180° axis.

When the needle arrives at the vibration corresponding to the shape, the + original horizontal passes to the vertical above the shape, the – appears under the shape. There is no ambiguity with the helicoidal pendulums.

At this calibration of resonance between disk and shape, the latter acts like a polarized body, becomes the center of a Chaumery-de Bélizal equator with its Aura of double radiation, both oriented in relation to the artificial North-South of the disk.

The rays of the equator and of the Aura are functions of the power of the disk. If the disk is of light cardboard, the rays are of several centimeters. When the 30-cm disk of plywood is sufficiently amplified, the rays reach several meters.

This factor of power generation over distance at first confused us about exact shape-caused waves accompanying resonance with the various instruments. In the beginning, we could not find the same vibrations, a source of difficulties when the instrument was not perfectly understood.

Polarities, independent of power, offer a good way to begin, and only then can one test with the equatorial pendulums or with De Bélizal's pendulums.

The same phenomenon is observed when one wants to determine the healing wave of a witness of a living person in the obligatory *Magnetic* phase. The equator and the Aura manifest around the witness in identical conditions to those a moment ago. Why? Is it possible that here the healing wave equilibrating the subject at a distance enters into resonance with the witness and transforms it into an emitter of vibrations equivalent to the trunk of a living tree? In addition to the equatorial and Aural spectra, the horizontal components of the Vital Field tangent to the equator are detected, and Shin appears vertically above the witness.

If one looks for the illness wave in the Electric phase, by resonance, the spectra of the equator *and of the Aura* have pivoted 180°, that is to say, at the same orientation one detects the colors diametrically opposite to those a moment ago. As far as polarities vertically above the witness, they are also inverted: – above, + below.

When dealing with a shape deemed magical, the identification of resonance actually gives the + above the shape in the same way as any other, but some colors have also pivoted 180° like the sickness wave. There is an inversion of colors, but *only of the equator. The Aura remains normal.*

When not knowing in advance what one is dealing with, and the healing wave of a living subject leads to this anomaly of the equator, one can suspect the intervention of magic or sorcery, either subtle or active. Take the fact for a probability, because, in this domain, the art of camouflage is king.

The conception of the disk avoids errors in treating a subject with shape-caused waves because it produces an automatic disconnecting from any noxious vibration. This is important when using the disk for healing illness. Indeed, generally, all vibration sooner or later becomes harmful through the effects of saturation. There is no worry when using this disk. One can easily see, besides, the periods of action or of disconnection, as soon as saturation is approached, by the presence or absence of the ray of union between subject and witness -- radiation that is none other than the Knot of Life in its two phases, going and returning. This security offers an opportunity to amplify the power with regard to an energetic act in ways that we will soon see.

The healing vibrations are many and must be adapted to the subject and his case, but *always* in Magnetic phase. We recall that pulmonary issues are generally righted by a vibration between White and Negative Green, while cancers are treated between Negative Green and Black. The works of

M. de Bélizal, notably *Microvibratory Physics and Invisible Force*, give many more details and the reader can see for himself.

THE EQUATORIAL “BOMB”

Inspired by the *Bombe C 30* of M. de Bélizal, the Equatorial Bomb was conceived to obtain a focused emission at the center of a sphere. It emits at the exterior, but one can follow the progress of a subject only on another witness outside the Bomb, either with the equatorial disk, or on a calibrated ruler.

The Bomb is a carved wooden sphere, made of two hemispheres fastened to each other at the equator. Its diameter ranges from 20 to 30 centimeters, according to needs and desired power, and can be bigger. M. de Bélizal had one of 60 centimeters in diameter; that is the limit as far as ease in handling or operation.

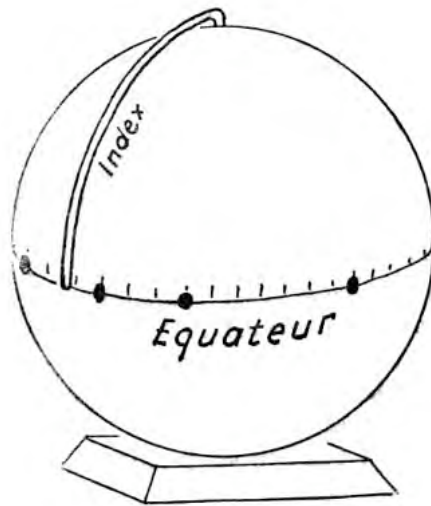

The hollow interior of the sphere, concentric with the outer sphere, is large enough for the witness to be placed inside it, to receive liquid, etc., so that with proper preparation the object to be treated can be located in the exact center.

At the two poles holes are drilled into the center. In the equatorial plane, the holes from either side are drilled along radii lying in the directions of the axes directed along the field of shape.

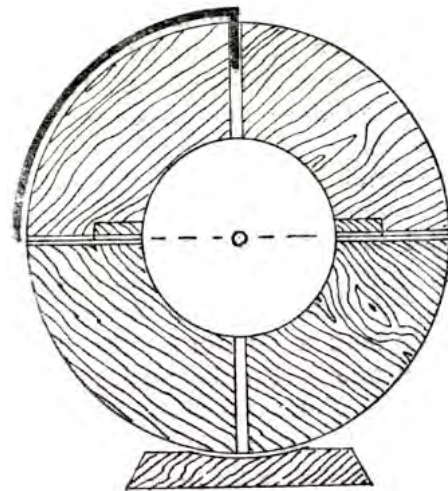

The graduations are those of the equatorial pendulum with the divisions in differentiated colors. A rigid copper wire running from the higher pole along a meridian of the sphere and cut off at the equator provokes the interior vibration. The lower end of the copper wire shows the color vibration on the calibrated equator.

Like the Disk, the Bomb is not dangerous and disconnects the same way as well, upon reaching saturation of the living subject. At the end of the day, its healing is no more powerful than the amplified Disk when one puts a witness before it in an open jar. Its principal advantage is to hold the witness protected from dust.

Like the Disk, the Bomb can charge a solid or a liquid with a definite vibration. To drink water charged with Negative Green Magnetic, for example, to ascertain regulation of dosage and timing with the pendulum, or from analysis, often gives spectacular results for people who spend too much time in the presence of Negative Green Electric. But then, pay attention! Negative Green is a desiccating vibration that has made, *through abuse*, several mummified living victims who then died.

Equatorial Bomb

(cutaway view)

AMPLIFIERS

M. de Bélizal utilized stacked hemispheres to amplify the power of his instruments. Their fabrication required specialist turners, and the hemispheres being unfinished figures, emit by R W cH, that vibration which we want most of all to avoid. One can, however, correct this problem physically, and completely restore safety, by engraving two perpendicular diameters on the flat side of the lower hemisphere. This detail makes it better.

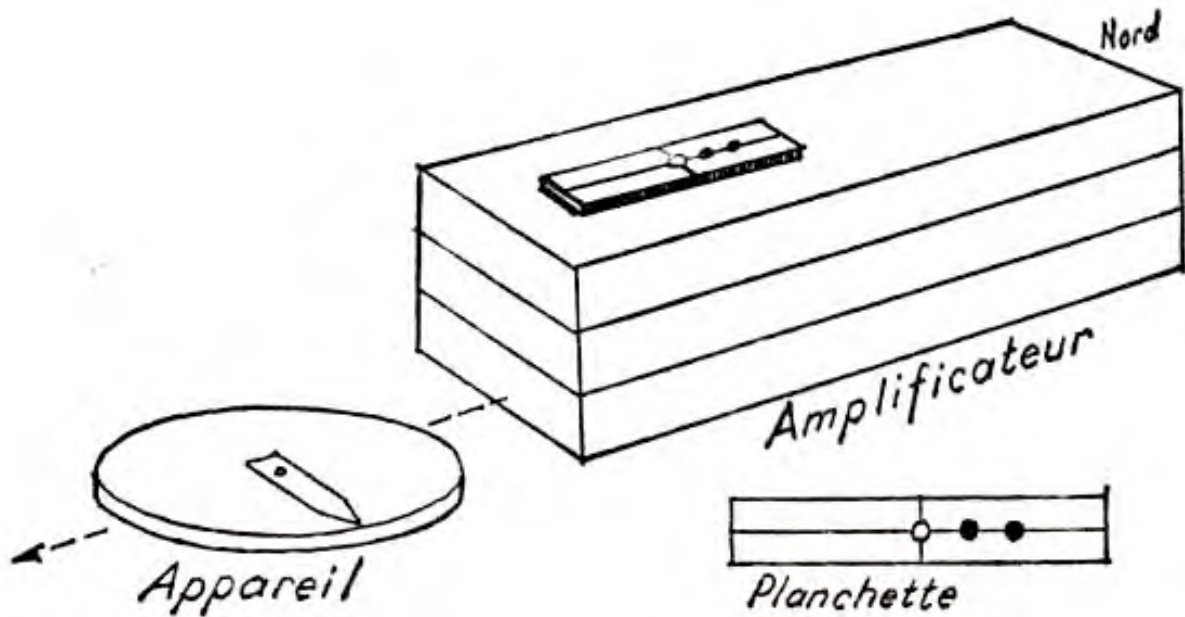

We look for a more simple fabrication for an amplifier.

Two ways, among others, are presented here.

FIRST WAY, FOR ALL INSTRUMENTS

Stack boards, approximately 10 or 20 centimeters wide and a meter or more in length, oriented at 355° magnetic.

On the upper board, place a slat that communicates its powers of collection and of transmission to the entire pile, worked as follows:

Apparatus on the left; the amplifier with its fabricated control piece on the right, oriented toward the south.

On the top of the control slat are engraved two perpendicular grooves that correspond to the axes of symmetry, and at their intersection a hole is drilled. Midway from the central hole to the North end of the piece, another hole is made along the longitudinal axis groove. Another hole is drilled halfway between this hole and the central hole. This is simple to do. We have thus materialized the harmony of the major triad so well known in acoustics:

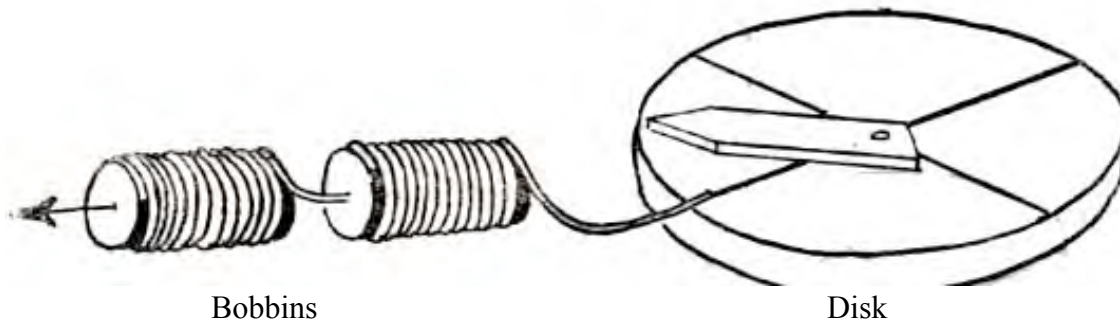

$$0 - 1 - 5/4 - 3/2 - 2$$

Newcomers at this stage, we had to pay attention when we amplified with other emitters such as the Disk or the Bomb discussed above. We risk radiation damage to the skin. After all, we are just a fellow playing with a ball hanging from a cord . . . as noted the beginning of the introduction to this book.

The amplifying apparatus, Disk, or Bomb, must be placed to the south of the pile of boards and, if necessary, the pile must be oriented as well.

USE OF THE DISK BY ITSELF

At 180° (Positive Green Magnetic) one can use adhesive tape to attach the bare end of an insulated flexible copper wire. The rest of the wire is wound in opposite direction to a corkscrew on a cardboard tube or iron rod, forming a solenoid. One can multiply the bobbins in stages, and the shape-caused wave goes out along the axis of the final bobbin.

In front of the solenoid emitting the shape-caused wave, the dowsing rods acted definitely in uncorrected ambience, which leaves one to suppose the introduction by the bobbin of a supplementary factor.

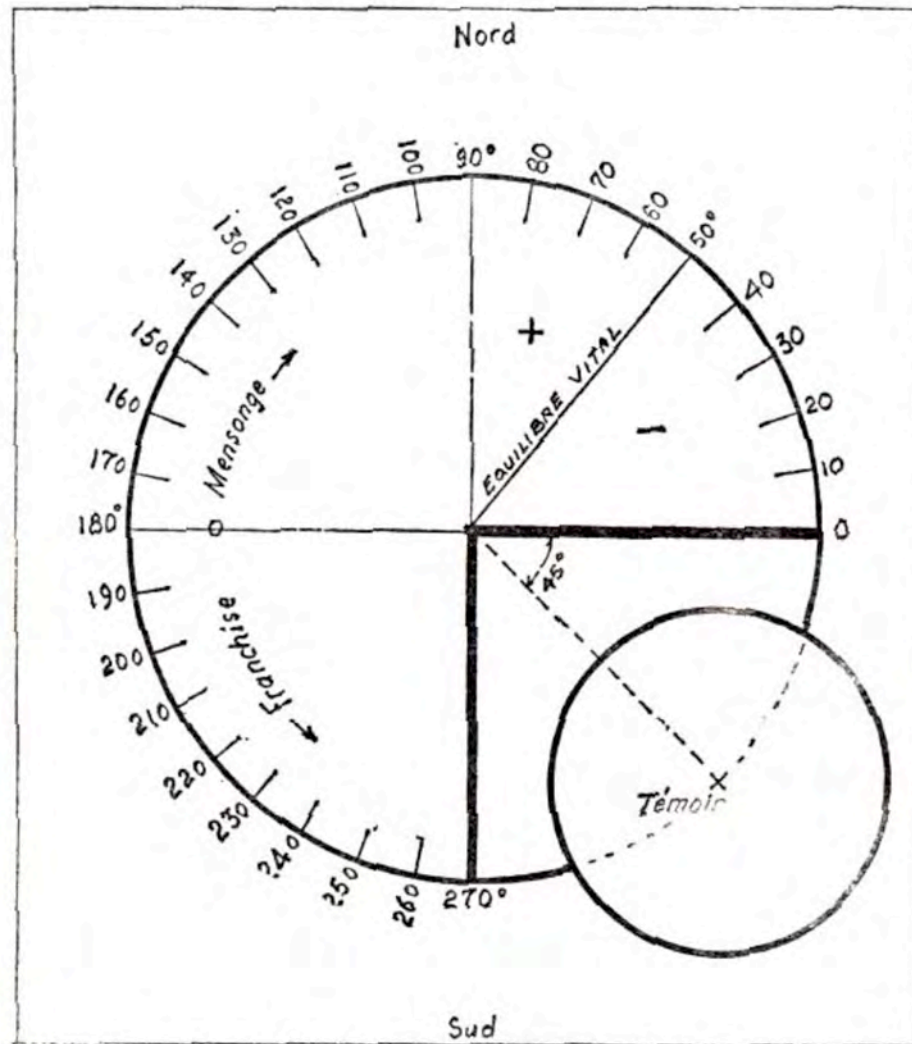

One can, in any case, combine the two methods of amplification.

PSYCHOMETRIC CHART

While this kind of sport doesn't enter our work, it interests some readers. The instrument or the design, inspired by an instrument of M. de Bélizal, renders analogous services with some emissions of a rather different kind.

Here, we have deliberately kept the emission in R W cH with all its risk. A correct result depends essentially on the moral honesty of the operator and his conviction that delves into the depths and the hearts that only belong to God. He has to know how to limit his curiosity.

The principle of the chart is to test the vitality of a subject and his honesty, to know unquestionably with whom one is dealing with in order to orient our behavior with respect to him. With the help of shapes or words *ad hoc* one can, in addition, test certain intellectual faculties. It is not necessary to search further; there is risk of giant blunder.

“Psychometric” chart, north to the top.

The witness is placed on the x in the circle lower right.

At 180°, truth is measured in frankness in counterclockwise direction, falsity in the clockwise direction.

The basic design is realized either impressed into plywood or with China ink on paper. It consists of:

1. A large circle interrupted by a smaller one whose center is located on the large circle.
2. The smaller circle is squared off by two perpendicular radii of the large circle, such that the bisector of their angle passes through the center of the small circle. The witness and the shapes or formulas are placed in the small circle.

The large circle is graduated from 0° to 270° on the three empty quadrants in counterclockwise direction. The vital equilibrium is found at 50°.

From 0° to 90° one finds L N Ph Sh cH Y H, in vital. An individual in good health is found below 50°, but as close as possible to 50°. Step by step, as one approaches 0°, vitality is diminishing.

From 90° to 270°, one is in the R W cH, the spiritual. This half-circle is divided into two quadrants. From 180° towards 90°, things worsen into prevarication and lying, and one must be quite wary of the individuals who are found here.

From 180° towards 270° truth and honesty increase all the more as one moves closer to 270°. Moderately honest people who can be dealt with exclusive of excessive risk of making oneself dishonest (human nature is fallible) are situated toward the middle of the quadrant.

To test intelligence, one can use the Hebrew word hA W R (Haour), Light, for example, suitably oriented with relation to the disk. The Hebrew word in “accepted” characters emits Ultra-Violet Magnetic and can be readily replaced by an equivalent form, among others, with a diamond shape using diagonals 6 and 2. hA W R is opposite on the Aura to the word L Y L H (Lailah), Night, which is Ultra-Violet Electric.

Average intelligence goes from 80° to 90°. It is useless to encourage such a one to aspire to educational degrees above his capacity. . . Above 120°, intelligence is alive.

If one analyzes the vibrations of the shape of the chart, one finds the Hebrew Shin above the center of the large circle, the Knot of Life [infinity sign] emission to the West, etc. The figure emits the Vital Field.

Above the small empty circle, one detects the Electric phase of the Knot of Life, in the space between the small circle and the two perpendicular radii the two vibrations of L Y L H and of H hA R Ts. On the perimeter of the large circle and on the two radii, we find the Knot of Life. All these vibrations, we see them in their time, making it possible then to return backwards, but that doesn't matter, immediately, for you to be able to use the chart.

Here is how:

Swing a neutral pendulum over the center of the large circle; it will finally orient itself toward the requested graduation. Be sure to separate the levels with the knots on the suspension cord.

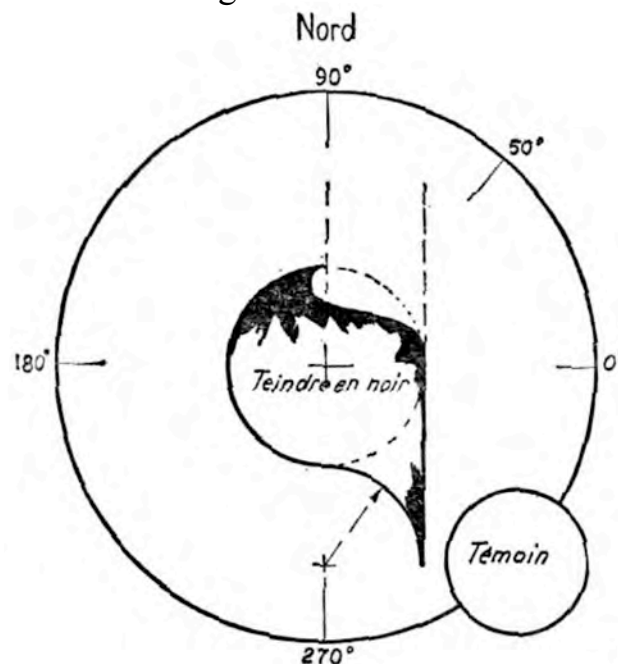

For better precision, one traverses the large circle with a pointer. When the pointer reaches the desired graduation, the pendulum turns. To each his own preferred method . . .

At any rate, one more time, we cannot insist enough that the feelings of the operator must be genuinely honest. A false spirit will fall, besides, most of the time, when reality proves him incorrect.

An absolute rule: Never use a chart as an emitter under pain of dangerous results to the operator – the “boomerang” effect.

Frankly, the chart interested us more in its theoretical aspects than by its use for which we have only a lukewarm curiosity. Indeed, the two radii short-circuit the passage from Negative Green Electric to Positive Green Magnetic; the Positive Green Magnetic range on the circumference has already been discussed while on the subject of emissions by R W cH with the word Y H W H on the radius itself between its two Positive Green Magnetics, here at 270°.

To our knowledge, this chart is the best method of separating the three levels of emission on the same figure.

“Psychometric” Chart: The Hebrew Yod (to be filled in with black ink) and the Witness circle below.

The quadrant between the two radii symbolizes the created material H hA R Ts that returns, by completing the circle, in the Unity Creator-Created. But we fall there in the speculations to avoid. It suffices us to know that one cannot materialize the number Three without inverting the Shin of the vertical of the Vital Field, that one makes it by the triangle or the three quadrants of the circle not finished by the fourth.

The chart is nothing but the development of the Hebrew yod. One can draw any Yod or the chart with circles and radii, and the interpretations of the witness will be the same.

We leave here our proposal, and do not embark in esotericism.

CHAPTER IV

SHAPES AND EMISSIONS

Shapes!

Jungle in the jungle . . .

Shapes are only aspects of the emissions of shape-caused waves, since all emit, but we see them and, here and there, they hit us harder.

When we begin the study of shape-caused waves, confusion reigns, for we lack a sufficient basis for making correct analyses. We encounter what M. de Bélizal called “Kaleidoscopy”, a malady experienced by the neophyte who is dazzled by the perspectives offered by shape-caused waves.

It is tempting to offer analyses of numerous shapes and their compositions, and to ask questions about their function. Still, is it necessary to discover them and classify the properties like plants in a herbal?

We have not gone there; we are occupied by more immediate concerns. The particular vibrations that you find in the course of this chapter have been found regularly, by chance, and when seeking a particular solution. We have no taste for erudition, bookkeeping, or classifying, so do not wait much longer to get information so that you can find them in the jumble of vibrations emitted from an infinity of shapes.

If you only knew how to use a pendulum! It would be so simple.

As for the eye, preference or sentiment are poor detectors – and it is wise to believe oneself divested of intuition *a priori* in this particular domain. We are practically useless next to our ancient ancestors with their fundamental sensitivity, which can still be found among certain primitive people.

How can our senses, dulled by the drug of continual vibrations of all kinds (neon lights, cars, television, household appliances, etc.), how could they detect, without analysis, the subtle vibration of shape that spirals from a plug at the head of our bed or from a statuette on our bureau?

ORIENTATIONS

To begin our attempts, we must attribute a fundamental importance to orientation in space. The vibration of a shape, its “color”, even, can be changed by orienting its points toward the North, the South, or the Zenith, and often with great precision. The properties of a shape in the plane or in

three dimensions, and its influence on the environment and on those who move within that environment, can be influenced to coincide with the placement of household articles or with furniture.

Man can judge with his pendulum that the disposition of his closet, in relation to another furnishing, interrupts his sleep, and Madame from a completely different point of view can oppose him . . . unless feeling prevails over his personal sense of the aesthetic. . .

To study shapes, most of the time, orientation is made with relation to North, occasionally in relation to the East.

The exact orientation is to 355° magnetic for the North and at 85° magnetic for the East. Magnetic zero, we remember, is the position of the North point of the needle of a compass when there are no perturbations deflecting it. We find a 5° offset between the magnetic field and the field of shape.

But one can avoid the subjection of the terrestrial magnetic field:

1. Position the shape on the interior of a circle either drawn or made of copper wire interrupted by a small space and bent towards the center in two straight parallel lines shorter than the radius. Then orient the shape in relation to the circle, the North of the shape towards the point of the circle opposite the two parallels. This is done for purposes of global study of the vibration emitted by the shape ascending vertically from the center of the circle, with a pendulum or a device. The circle permits analysis on three levels, which is not the case of the two following methods.

2. Square the shape on its North-South axis with two small circles, one to the North painted black over its entire surface; leave the other to the South white. This is how the mini-field is created which suffices to isolate the shape from the ambient field.

3. Place the shape on a replica of the field of shape by orienting with relation to it. This is the simplest method.

Once the shape is properly oriented to the terrestrial magnetic field or using one of the three ways above, we examine the global vibration, either with the pendulum, or before the Positive Green Magnetic axis (180°) with an emitter of the Equatorial Disk type. If using the latter, simply orient the shape by relation to the disk without other complication.

If one wishes to deepen the research and analyze the parts of the shape with a pendulum, one places on these parts a bar of ferrite sharpened to a dull point on one end, and held loosely in the free hand vertically. Swing the pendulum above. As a substitute, the index finger will suffice as a pointer.

There are enough shapes described so that one can build up skill and exercise it while waiting to master the art.

STANDARDS OF ASSESSMENT

Shapes can be beneficial or inoffensive; many are dangerous, at least in the end. An organism does not produce a uniform vibration indefinitely.

Certain criteria can be useful. In principle:

Magnetic shapes are not dangerous, and all the Electric ones are. The first charge, the second drain. This is the general rule, and equilibrium can be found in a certain compensation between the two.

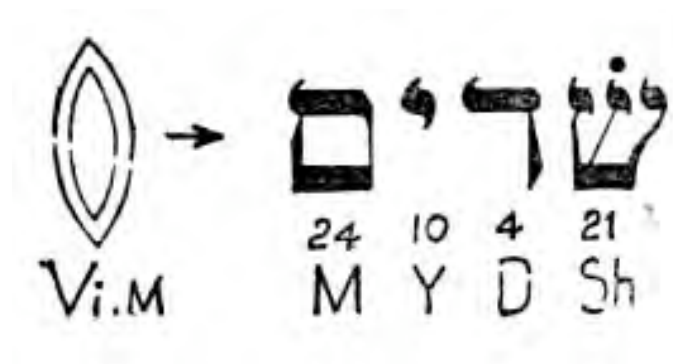

We repeat: it is necessary especially to be wary of shapes emitting in “Magic”, that is to say, making the Hebrew pendulum K Sh Ph react. On Easter Island, “Necromancy” or “Shin” pendulums turn counter-clockwise. These shapes without their own polarities are eliminating the other ones.

One can however eliminate toxicity in the R W cH level by eliminating this R W cH. In order to do this, we draw two lines at right angles intersecting at a center in order to not alter their emission in the “Physical” which remains. The center emits, in general, the Knot of Life. Better yet, to be complete add the directed axes of the field of shape. What is important is to restore the shape to the normal bipolarism of the physical world.

Let’s take an example:

Among the ideograms of Easter Island is one emitting Violet Magnetic in “Physical” and the Sh D Y M (Shadaim), the Demoniac Powers, in R W cH.

This ideogram is made of two almond-shapes, one inside the other, with North and South points.

In general, a closed shape inside another closed shape is a subtraction. In this case, the shape of the base is the “Almond of Glory”, which surrounds the Christ in cathedral tympanums. One can interpret the subtraction here as a zero; the symbol of the fallen angels, removed from divine Glory.

The simple form of this almond, which, North-South, emits the Hebrew Ts R W R (Tsoror) of Positive Green Magnetic, is not magic, nor of Hebrew origin. One finds this shape on the tablets from Easter Island.

Horizontal or East-West, the single almond is the Egyptian hieroglyph for “mouth”, which emits in magic the wave of charge Z^+ of vital magnetism that we will see later on.

To return to Violet, with two rectangular right angles incorporated according to the axes of symmetry, “the magic” disappears and the “earthy” 4 brings back the emission at the “Physical” level.

You will find or already know the traditional symbolic shapes, of which many (not all) emit in R W cH, and, by their shapes themselves, have *receptive preferences* for certain charges that made them active symbols, but not necessarily beneficial symbols.

If you must render them harmless, use the same way as above: the two perpendicular lines can be employed to drain the R W cH, completed lines must pass through the direction axes of the field of shape. Often it is enough to place these shapes on a shape reproducing the directing axes.

In the case of open shapes, it is necessary to extend the rectangular lines or the director axes to the edges of the foundation paper, or to make them diameters of a circle.

Outside of finding bipolarity, a well-oriented, complete shape emits, in principle, Ultraviolet Electric over its drawing, and Ultra-Violet Magnetic in the spaces when one points with a wand of carved ferrite.

You can also ask how one can make a shape change from Magnetic to Electric, or the reverse.

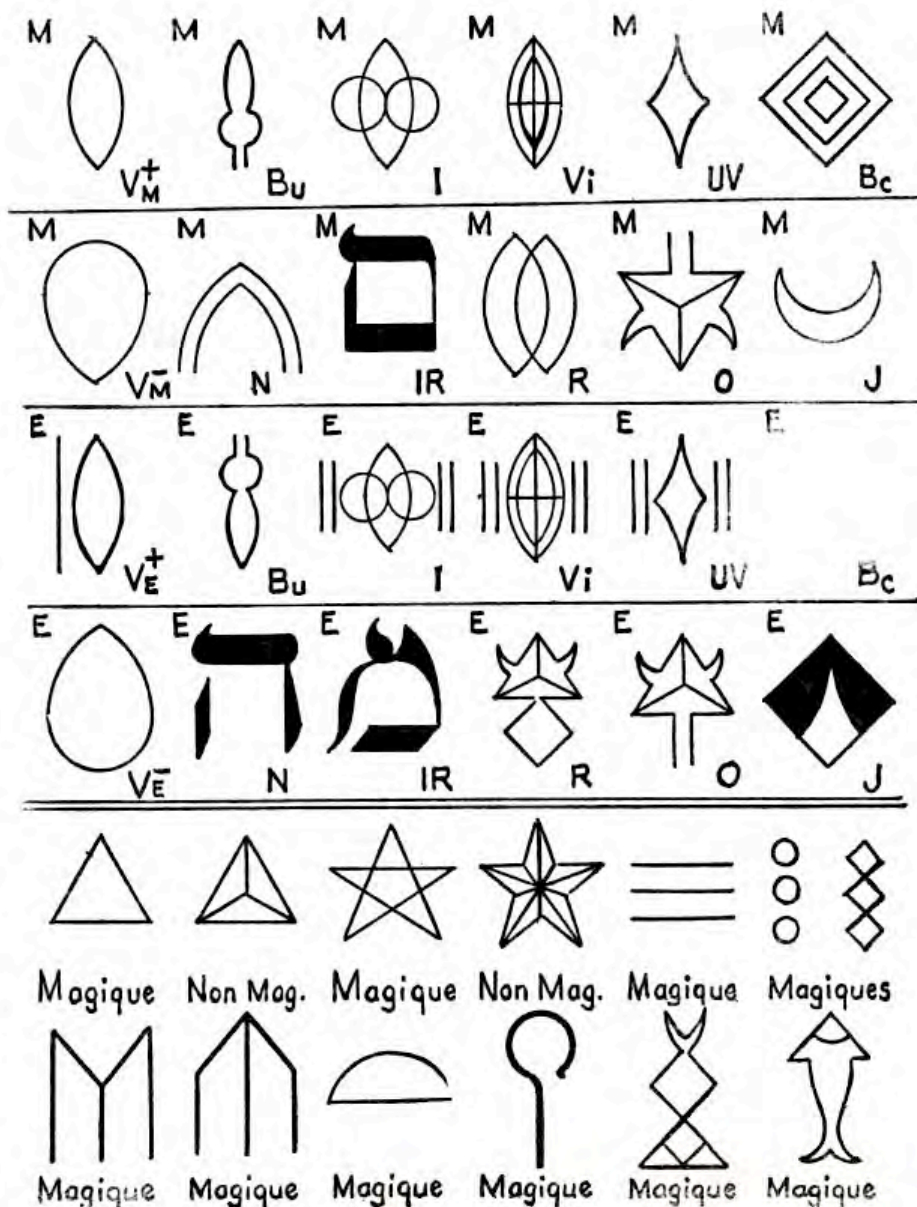

If the shape is not symmetrical in the North-South direction, it can be reversed in the North-South direction in order to change its “phase”.

This makes us understand the importance of orientation. A more or less “abstract” piece of furniture or object can be inoffensive or truly noxious according to the azimuth.

In a more general manner, in order to transmute Electric to Magnetic shape, one can frame the shape between two pairs of North and South-running parallel lines on the East-West sides of the symbol.

These parallel lines are condensers.

In each particular case it is necessary to find the best solution.

SOURCES FOR SHAPES

Even more fascinating than the innumerable number of shapes that can be imagined or pulled from geometry, for example, are some highly interesting families of shapes, such as the ideograms of the Easter Islanders, the Hebrew “square”, the Egyptian hieroglyphs, the “traditional” figures, Chinese I-Ching hexagrams, etc.

Some comparisons between these families could facilitate research for determining the identity of emission, from known to unknown, at least in certain cases.

Among the ideograms from Easter Island, many are “magic”, which should not be surprising. It is the same with hieroglyphs and many other figures. For a proper study, it is necessary to make distinctions between levels, but this is inevitably no easy task.

We have the opportunity to posit a language known to the senses, and its extraordinary properties allow it to serve as a basis of comparison. It is the Hebrew Biblical “square” without massoretic punctuation. A Hebrew word emits its meaning in shape-caused vibration, from where comes its use as a witness for pendulums or research. What is also interesting, one can calculate its numeric value by giving to each character the number of its order in the alphabet, considering the five finals. We thank M. Bardet for having found the Number total of the word by using the “theosophical” reduction, proof by nine.

Thus, R W cH, $20 + 6 + 8 = 34$ gives:

$$\begin{array}{rcl} \text{R} & 20 & \rightarrow 2 \\ \text{W} & 6 & \rightarrow 6 \\ \text{CH} & \underline{8} & \rightarrow \underline{8} \\ & 34 & 16 \end{array}$$

We give a chart of Hebrew characters, only the ones rationally used. It is necessary to eliminate the rabbinical Hebrew or that, more or less deformed, found in the Kabbalah, on the pentacles and magical formulae.

Each Hebrew character is *the expression of a number*, so it can be geometrically represented, for example, by a length. We take a cylindrical rod, divide it with circles engraved all around, making the distances between circles proportional to the Number values of the characters in the word: the end of the rod emits the vibration of the word. That excludes, it should be said in passing, the kabbalistic numeration for tens and hundreds that give nothing of experimental value and lead to gratuitous speculation. The

Kabbalah is a mixture where intellectual, idealistic and philosophical constructions, mix up bits and pieces of the truth.

We return to our subject and give an example. The word cH Y H (Raiah), Life, is an equivalent to the Knot of Life in the two phases, Electric and Magnetic.

The rod is 23 units long, divided by engraved circles at $8 + 10 + 5$, and emits the Knot of Life in Magnetic phase through the 5-end, in Electric phase at the 8 end. This rod has become what they call a “canon” which, held like an antenna by the 5-end, allows detection of a myriad of things from far and near.

One could nearly write Hebrew with lengths only. The properties of this language are then of capital interest for the study of Numbers, but pay attention, and use extreme prudence. Do this for your well-being, because the Numbers are employed in magic. If you feel that you have gotten lost, then destroy and burn, without remorse or pity. We know by experience how certain atmospheric situations are painful if the disturbance is not discharged or if one is not in possession of a strong equilibrium.

SOME REMARKABLE SHAPES AND WAVES

HEPTAGONS

Place three identical bottles on a board, in any sort of triangular arrangement. Magic or not, their shape-caused emission will depend on the orientation of the triangle with relation to magnetic North. Place a ceramic square, for example, among the bottles. We notice above this arrangement a shape-caused emission of which the “color” is a function of the orientation of the square with relation to the triangle of bottles. Magnetic North seems not to intervene.

One can generalize: a quadrilateral and a triangle superimposed [makes a heptagon] emit a constant vibration perpendicular to their plane and independent of the orientation in space.

A quadrilateral can be replaced by diagonals, a triangle by a base and the corresponding height.

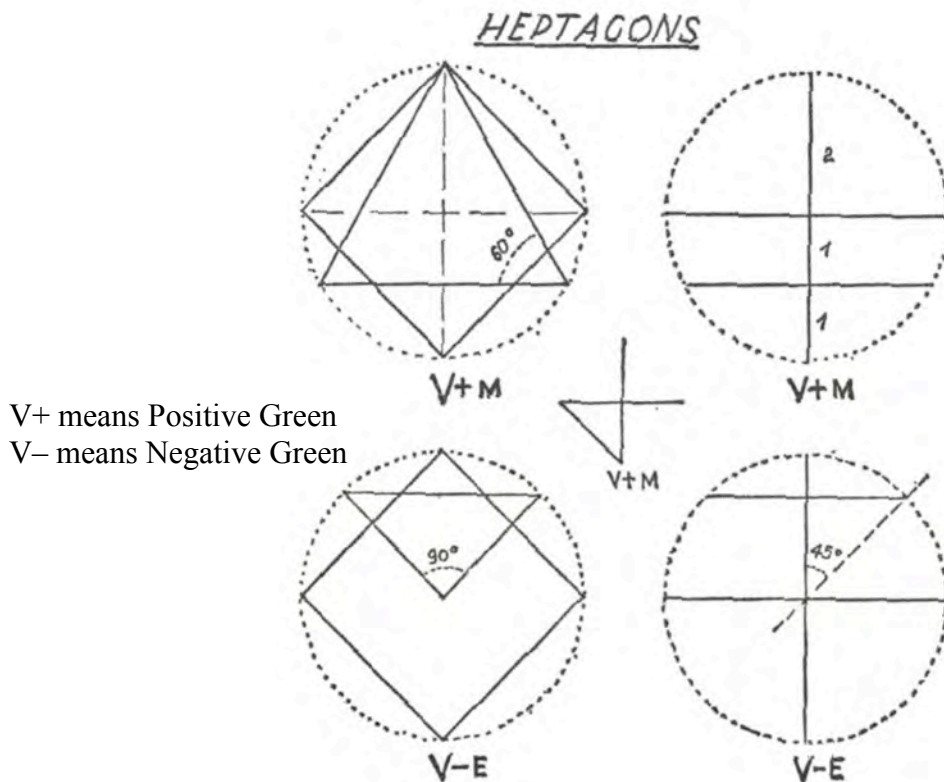

These trials with the concurrent lines, quadrilaterals, triangles and other combinations, support the following general conclusion: every system boils down to seven angles organized in three and four in the same plane or in parallel planes, emitting a vibration perpendicular to these planes and of a constant color whatever be the orientation of the system in space.

One can call this family of figures heptagons.

This family of heptagons can lead to a huge number of combinations where spirit is liberated. Many decorative designs can be created that give the shape-caused emission that can be recognized by those who have examined the question in depth. It is a matter for research.

The orientation plays no part in the color of the emission, but there are some very special cases where the *influence* of this color can vary according to the orientation.

Several heptagons are convenient in witness figures.

For example, a square and an equilateral triangle inscribed in the same circle give a Positive Green Magnetic emission if the altitude of the triangle coincides with one diagonal of the square (upper left).

One gets another heptagon giving Positive Green Magnetic by joining the neighboring ends of two diagonals of the square by a straight line (center).

As for Negative Green Electric, it is produced by a right isosceles triangle of which the vertex of the right angle is at the center of the circle circumscribing a square and of which the hypotenuse is perpendicular to a diagonal of the square (lower left).

The latter heptagons are easily placed on cylindrical pendulums by engraving or drawing the simplest shapes on the cross-section, without which it would be necessary to depolarize the wood.

THE CHÂRTRES WAVE

In October 1966, we published an article which we called, “The Chartres Wave”, in the review, *La Radiesthésia pour Tous (Radiesthesia for All)* from the Servranx Brothers. At the time this article appealed to some readers, and we give herein a summary. Since 1966, we have found and used this vibration many times.

The work of Louis Charpentier: *The Mysteries of the Chârtres Cathedral* (Laffont Éditeur) relates spirit to shape-caused waves quite naturally.

The geometric basis of the construction, the harmony of the proportions, and the supposed reference to the Great Pyramid, all play a role, despite a mysterious telluric influence in this high place of the Gauls, who seem to have determined the abnormal orientation of the cathedral. Our ancestors have decidedly much superior knowledge than we do in certain domains.

In studying the numerous illustrations of the building, we have found a very special wave that cannot be accidental. We have named it the “Wave of Chârtres”.

This wave’s essential properties are very curious.

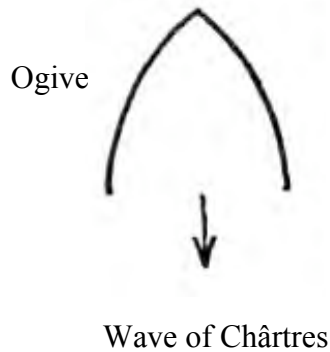

- It is one wave composed of all the colors of the spectrum, because it can be decomposed by a prism to reverse order from normal white (shape-caused wave), like a type of inverted white.

- It reverses all the colors of the undifferentiated spectrum by their symmetry. Red becomes Violet, yellow passes to Blue, etc.

- The Chârtres wave transforms itself to Black by a sort of autodestruction when two figures generating this wave oppose each other. This can be a test that proves one has a genuine Chârtres wave.

- Added to normal white, the Wave of Chârtres gives Red and Violet *at the same time*.

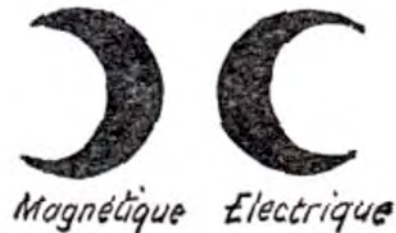

The shape forming the basis of the emission is the ogive, which leads one to think that the gothic style is not just a thoughtless fashion, but it addresses other, deeper, considerations outside of the necessities of the strength of the construction material.

The ogive in copper wire is easy to study, because, no matter what the position of this shape, the emission is axial. One can understand this since the ogive is made of two secant circles. The colors cross the entire length of the axis of symmetry in symmetrical colors, generated by the Wave of Châtres.

One finds the Wave of Châtres from many shapes, but it is necessary to be wary because it is rarely pure. It is very difficult to spot on the screen of an instrument. The Magnetic phase is situated at around 300 Grades on the Universal Pendulum of de Bélizal, between Ultra-Violet and White, and at 251° of my division of the disk.

It is really easier to use cylindrical pendulums with witness shapes. Among these shapes is a crescent moon, painted black, open to the West for Magnetic, and to the East for Electric.

This brings us to the lunar influences on vegetation. For example, purple clover sown by the waning moon lessens the risk of meteors hitting cows than that sown by a waxing moon. A dungpile spread in the pasture returns to the earth more quickly if it is spread during a waning moon. Planting of grains and root crops is better by a waning moon, etc. It is not necessary to scorn under pretext of a rational science the observations of generations of agriculturists.

The Hebrew word corresponding to the Wave of Châtres is hA R Ts, (Haretz = Earth), and better still H hA R Ts means *the* Earth.

What are the properties of the Wave of Châtres? For now, we can only imagine.

When we freely support two beams inclined towards each other to form a roof, we find the Wave of Chârtres at the point of contact. It is nearly the equivalent of the effort of the weight at the summit of the ogive. Would the Wave of Chârtres be the balancing wave of systems under active tension?

VITAL MAGNETISM

What is customarily called “Vital Magnetism” has always been poorly defined. Mesmer was the first to speak of it, and for the healers who are asking for it, we attempt to supply a good definition.

We ask your indulgence: we must begin by finding simple shapes that emit the same vibration as certain parts of living beings. After much trial and error, we were able to isolate three fundamental vibrations: the wave of charge, $Z+$, the wave of discharge, $Z-$, and the Knot of Life.

The Wave of Charge $Z+$

We used $Z+$ first because we believed that its Number was zero. This is incorrect, but the habit was already formed.

This wave is emitted by the palm of the hand and the mouth when the eyes are open, and but from the bottom of the hand if the eyes are closed, and from the undersides of plant parts in the sun, etc.

This curious phenomenon of inversion when the eyes are open or shut explains the fact that magnetizers treating patients with the palm of the hand sometimes feel the need to close their eyes: they go unconsciously from charging to discharging $Z-$ that we are going to see next.

The $Z+$ vibration is emitted by various shapes, many of which we know: two crescents attached at the back, the Seal of Solomon or the Star of David, the *Fleur de Lys* of the Kings of France, the *Hermine de Bretagne*, some ancient forms considered to be sacred, etc.

The Hebrew word corresponding is D B R (Dabar), word, to speak. The Word, of which the number is: 26-8-8, to compare with that of Y H W H: 26-17-8.

In the spectrum, $Z+$ is found at 250° between Ultra-Violet and White in Magnetic phase, at 1° from the Wave of Chârtres.

In Electric phase, $Z+$ is very dangerous.

One obtains $Z+$ by opposition of colors of the undifferentiated spectrum:

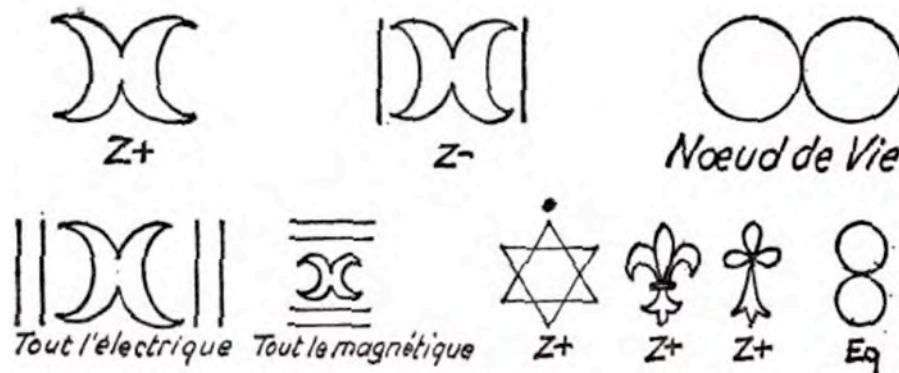

Blue and Black,
Indigo and Infra-Red,
Violet and Red,
Ultra-Violet and Orange,
White and Yellow

and Positive Green Magnetic and Negative Green Electric.

which gives a supplementary form, indifferent to orientation, the heptagon Positive Green Magnetic superimposed on the Negative Green Electric heptagon.

The Discharging Wave Z-

They call it Z- simply because it is opposite to Z+. It is emitted by the top of the hand when the eyes are open, and by the palm of the hand and the mouth when the eyes are shut. One finds Z- in plants under the sunny side, in the roots.

VITAL MAGNETISM:

Row one: two double crescents giving waves of charge and discharge, and Knot-of Life,
Row two: double crescents giving electric and magnetic phases, Star of David, Solomon's Seal,
Fleur-de-Lys, Hermine de Bretagne, Knot of Life

The shapes giving Z- can be obtained from those of Z+ in their addition to the Wave of Chârtres, that is to say, in fact, with a North-South line on each side, to the East and the West.

The corresponding Hebrew word is ShM chA (Sham-ch'ah), to listen, listen. Its number is 50-14-5.

Its position in the spectrum is 290° between Black and Infra-Red in Magnetic phase.

This vibration could, really, be used to facilitate sleep, but it is necessary to stop the emission as soon as the result is obtained, because, prolonged, it drains. It is quite preferable to try sleeping naturally with the given ambiance balanced by the effects of the correct field.

The Knot of Life

This vibration, which makes a trinity with Z^+ and Z^- , is a *fundamental* wave of the Living Field that must never be focused on an organism, artificially. It blocks natural reactions.

We have already seen the shape of its emission, two tangent circles aligned horizontally East-West, eventuating as the mathematical “infinity sign” drawn with a line of uniform thickness.

Earlier we saw an equivalent Hebrew word, cH Y H, but there are three forms:

cH Y, Living (masculine) and cH Y H Living (feminine),
each emitting Magnetic phase by the extremity
10 or 5 from a “cannon” divided into intervals,
the Electric phase at the other end.

cH Y Y M (chaim), Life, emits Magnetic phase at both ends
of the cannon. This is a channel oriented to the Magnetic
phase.

The vibration from the Knot of Life is found on the spectrum at 200° between Blue and Indigo in Magnetic phase, at 20° in Electric phase.

We can detect this wave in Magnetic phase at the level of the soil and vegetation, in the brain, and at the navel of mammals. We also find the Knot of Life on the mouth of *dead* humans and at the respiratory orifices of *living* animals. Also, it appears like an umbilical cord, with the Source of Life at the left temporal of living humans. This was originally the idea of M. Bardet, who deduced a certain number of conclusions we have reported here. So the Knot of Life can serve to detect the state of life or death on a photo, given that it is found at the left temple of the living or on the mouth of the dead.

We are mixing levels here, because they are not always easy to distinguish. “Life” for M. Bardet is an abstraction. He sees in cH Y Y M, or Life, five levels: physiochemical, vegetal, biological, psychic, and pneumatic, from the lowest level, that of the mixing of the smallest micro-components of the physical body, to the most elevated spiritual level.

N. B. There is another way to find the state of life or death of a human being. The Hebrew words Ts R W R H cH Y Y M (Tsoror Hé Chaim), the Almond [Vesica] of Life, the Envelope of Life, the Seed of Life, react to a death. These words emit Magnetic Indigo.

Other vital waves

There are other waves of Vital Magnetism generally composed of three constituent principles. One is for signaling; the one for which the shape of emission is made of two equal tangent circles lined up vertically, North-South. Turning the Infinity sign 90°, we have already pointed out, creates this North-South component of the Vital Field.

This vibration is found at 230° between Violet and Ultra-Violet Magnetic, and at 50° Electric.

We have called it Eq because at one time we believed we had found with it a shape of equilibrium. But once we used it, we found it to be insufficient. Completed, we will find equilibrium in the reciprocal circles.

General Properties

Altogether, the Z+ and Z– waves are compensating sine waves, that is to say that they tend constantly to modify an equilibrium in two opposite directions, with an indefinite pulse. When produced artificially, usage must be limited, and it is necessary to stop the action before saturation of the organism, which is implicit in any serious magnetization.

THE CIRCLE

This simple figure, symbolic of Unity, has a capital importance for shape-caused waves. It acts on all three levels. It is not surprising, then, that it is used for protection in the form of the Magic Circle.

Two fundamental properties are sufficient for our discussion:

1. If one submits the exterior of a horizontal circle to an emission directed towards the center, the vibration becomes vertical from the center.

This property has been utilized with an emitter of horizontal waves in order to render the emission vertical. In a lesser measure, the circle has a

tendency to concentrate an ambient vibration and then to facilitate its analysis above its center.

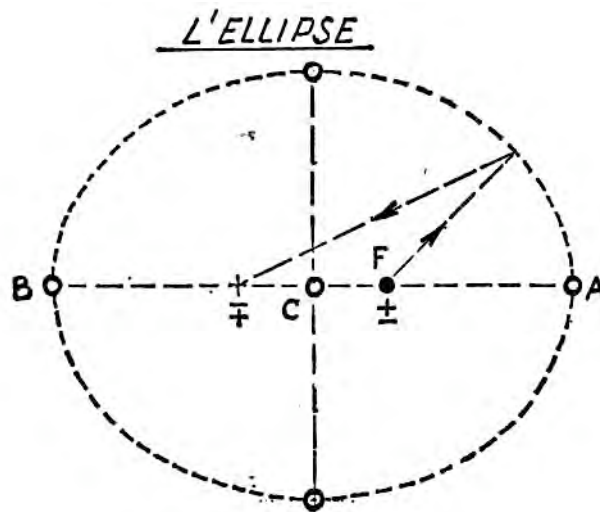

2. Inversely, if one places a shape oriented to pure vibration at the interior of a circle, the emission is found dispersed around the circle. If it is a matter of a composite vibration, then we analyze the circumference of the circle. The case presented itself with Shin, which gives on the circle the non-differentiated vibrations of the Chaumery-deBélizal equator.

A remedy or a plant, for example, put in an open jar, disperses all around its vibration to a distance that will be a function of the influence of the cylindrical jar. One can take that into account by holding a witness plant or remedy in the free hand.

A canon $8 + 10 + 5$ placed horizontally on the open jar transforms the diffuse emission by a directed emission to the end of the last 5, an emission that can be used on the witness or on the subject himself, by limiting the time of exposure. This is only one of the possible combinations using the circle as a point of departure.

THE ELLIPSE

All the conics have interesting properties. We limit our discussion to the ellipse.

This is a physical ellipse, routed in plywood with its two axes of symmetry. Holes are pierced on each side of center and at the ends of the axes. A partial hole is hollowed at the site of a focus.

We know, through optics and acoustics, that the emission leaving a focus reaches the other by reflecting off the curve.

With shape-caused waves, it is exactly the same, and comprises the part L N Ph Sh cH Y H (on Vital level) which, as we have seen, passed straight across the prism and which, here, is reflected by the ellipse. Is it a vibration or a particle that rebounds like a ball on a surface? We don't know the answer.

Whatever it is, we are going to have a supplementary proof that the "Magnetic" and "Electric" correspond to a direction in relation to a particular point of reference, here each focus of the ellipse.

Indeed, if we place a shape of a certain color, for example, Red Magnetic, on the visible focus, we find an emission of Red Electric vertically from the other focus. It is the same for any vibration: the same "color", but opposite phase. Or, in other words, that which goes in to one focus comes out by the other, but there is no reciprocity between the foci. A shape to the non-materialized focus emits only by its vertical, nothing at the other focus.

One can then ask oneself if this property could not be used against a microbial malady. For example, if one placed a microbial strain at the materialized focus, the witness of the patient at the other focus would receive an anti-microbial emission. This is yet to be attempted.

Or better yet, if one places a witness of the same subject at each focus, it seems that one would re-equilibrate the other, acting like a sort of automatic auto-vaccine!!!

In a completely different domain, you certainly know the problem of the "black points" of the planetary orbits. At one of the foci is the sun. But at the other? An anti-sun?

FIBONACCI SPIRAL [Fibonacci Series: 1, 1, 2, 3, 5, 8, 13, 21, 37 . . .]

Among the natural living shapes, certain ones carry spirals in well-defined number patterns. For example, if we observe a pinecone or the center of a daisy, we notice that the scales or the flowers are on spirals of inverse direction. Counting the features in each direction reveals two consecutive terms in the series called "Fibonacci":

5 and 8, 8 and 13, 13 and 21, etc.

These spirals can also be generated by cellular multiplication through bipartition (see *Forms et Forces*, by René Huyghe, Flammarion Editeur).

This presence of a series in which each term is the sum of the two preceding terms has given us the idea of constructing a spiral by points that permit us to verify the validity of the series.

These points are distant from a common center of a length proportional to the numbers of the series and placed on concurrent axes by the common point 120° and 60° apart from each other.

After various trials, we have been led to the following solution:

The Center, the first 1 of the series, is pierced completely through the base material.

The Second 1, placed on the axis at 120° from North-south, is located away from the 1 at the center and is only partially drilled into the base.

The 2 and 3 of the series are omitted, but it is necessary to partially drill the 4 on the axis at 240° (4 is not part of the Fibonacci series.).

5 is excluded.

8 is partially drilled on the axis at 0° or 360°.

From 13, pierced completely through on the 60° axis, the points of the series: 21, 34, 55, . . . are also pierced completely through on axes separated by 60°: 21 is on 120°, 34 on 180°, 55 on 240°, etc., as far as the base permits.

1,4,8, the first numbers of the spiral call to mind the Hebrew word:

hA cH D (1 + 8 + 4) signifying “One”.

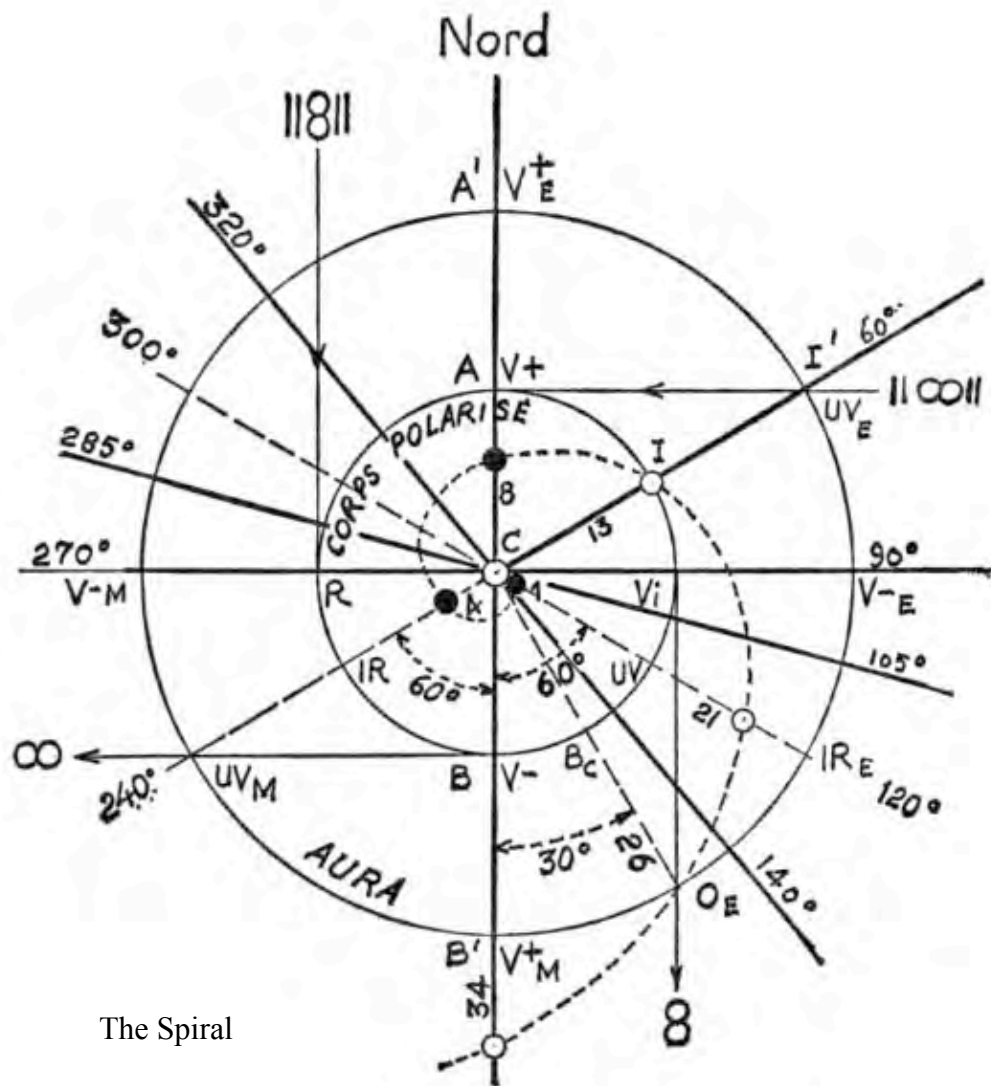

The circle of radius 13, of the Number of Hebrew “One”, reproduces the non-differentiated colors of the trunk of a tree with relation to the 0° – 180° North-south orientation.

This is the solid material gained instantaneously from the unity of life in which future growth is programmed by the structure of the field.

The circle of radius 26 is the seat of the differentiated colors of the Aura. Hereafter polarities are not found.

Completed by the grooved cardinal axes 0° - 180° (N-S) and 90° - 270° (E-W) that fix the physical level and by the directed axes of the field of

shape, the spiral initiates all that we have observed around the trunk of a tree or a polarized body. We have not departed from reality.

This spiral can, with needles conveniently attached to the center, serve as an emitter.

With a needle of usable length shorter than 13, we get the non-differentiated colors. With a needle of usable length between 13 and 26, we have the differentiated colors in Magnetic and Electric of the Aura.

By using needles placed so that they can turn independently of each other, if that interests you, you can construct an instrument of multiple uses: analysis, treatment on a witness, research, etc.

A remark in passing: the differences of the first numbers of the spiral:

$$4 - 1 = 3 \quad 8 - 4 = 4 \quad 13 - 8 = 5$$

are the sides of a right triangle, called the Egyptian, with which a right angle can be drawn when the perimeter is represented with a string of twelve knots (13 intervals).

Finally, we point out that a nail planted in a living tree trunk at the point of vertical generation of the non-differentiated Indigo vibration makes a detectable Wave of Châtres on a *spiral* at the exterior of the trunk. This Indigo generator (55° true Magnetic) is a discernable line of the living plant that one would perhaps be interested in studying *in vivo*. Knowing this line would help when transplanting a tree by orienting it to its original North-south alignment. [One can also mark North on the trunk before digging.]

THE “UNITY” SPIRAL

Quite simply, we have put into a spiral the Hebrew word hA cH D (1 + 8 + 4), as already seen a moment ago, by using common points.

On a disk, on three radii separated by 120° from each other, we partially drill holes at distances of 1 and 9. Then, at 13 and the center, we drilled holes that go all the way through. So that:

Distance to center: 1 on the 180° ray. Partial hole.

Distance to center: 9 on the 300° ray. Partial hole.

Distance to center: 13 on the 60° ray. Hole runs completely through the base.

We have hollowed out the usual grooves at 0° - 180° and 90° - 270° as well as the 60° radius passing by the 13 point, and have completed the picture by showing the axes of the field of shape.

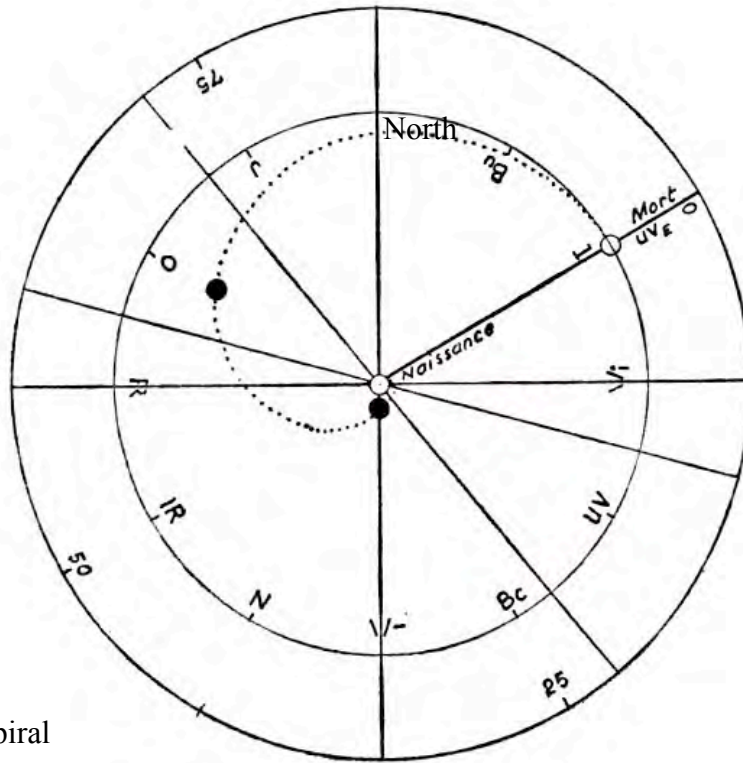

The virtual circle of radius 13 is, as we understood it, the seat of the un-differentiated colors of the Chaumery-de Bélizal equator. New fact: *beyond 13 there is no Aura*.

What length, then, would be better than 13?

The spiral describing the whole circle from its origin to its end contains all of life of the living person, and one can determine the *physiological* age from this.

We are in time: youth, middle age, old age.

It is possible that the spiral relates with cellular activity, because it produces an ideal shape called the “sigmoid” crescent, which is to say, slowly at first, then accelerating, then slowing just before death, expressing the conflict between expansion of life and the slowing of entropy.

We divide a disk into 100 parts starting with the 60° radius in clockwise direction, the direction of the growth of the spiral. We can theoretically have an idea of the probable age of death by putting a witness before the 180° , by turning a needle around the center and swinging a + pendulum, for example, above the witness.

$$\frac{M_x X}{100} = A \quad \text{or} \quad M = \frac{100 \times A}{X}$$

X is the division of the circle

M is the probable age of death

A is actual age

under *real* health conditions. If the malady persists closer to the date of death on the disk, the return to health requires more time.

It is more important to be prudent with humans, to not inconsiderately throw around predictions, nor to calculate prematurely a schedule for coming into an inheritance.

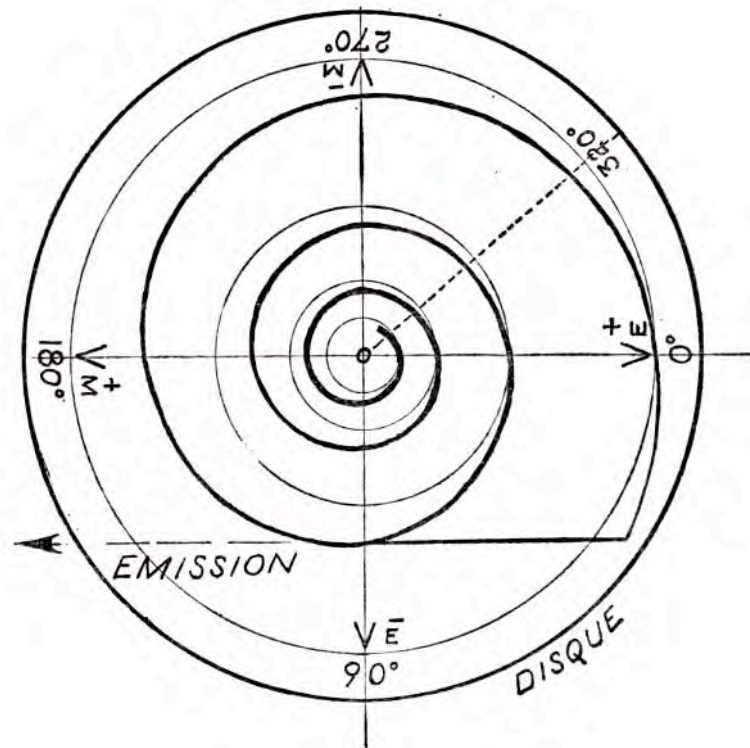

Fewer precautions are necessary with plants and animals. It would be, on the contrary, very interesting to verify the information derived from the disk on annual plants, longevity of seeds, earliness of maturity, etc.

The ESCARGOT (SNAIL)

The Escargot, or Indian Conch, shape derived from the spiral has long been the object of radiesthesic research.

The Engineer, M. Turenne, MM. Chaumery and de Bélizal, among others, have tried it, each with his personal perspective and toward a specific end.

The Escargot of MM. Chaumery and de Bélizal is a curve cut where each virtual radius grows from the center zero at $1/12$ by $1/12$ of the circumference in clockwise direction to the point on radius 1 where the stopped spiral is reunited to the center line of origin by a straight line. To understand the general method of these men, know that their Escargot emits non-differentiated vibrations from the equator of the sphere.

We have other impressions.

We are coming as close as possible to the *escargot* known to gourmets, its emitting properties, and of the shape of its shell known as a *logarithmic spiral*.

It is known that the logarithmic spiral is often found in the living world and many excellent descriptions have been written about it. Mollusk shells, ruminant horns, and others are natural illustrations of the spiral, living expression of whirlwind movement.

It is useless to try to recall the geometric properties of the spiral. The radius issuing from the center lengthens in geometric progression during which it sweeps out an arithmetic progression, at uniform speed, if you prefer.

The equation in polar coordinates of this spiral is of the form

$$R = K^t$$

Where R is the radius, K is a constant, and t is the angle of rotation for the radius around the center.

The lengths of R are then:

$$K, K^2, K^3, \text{ etc.}$$

when t is 1, 2, 3, . . .

t being a whole number and the total circumference is taken for unity.

For some angle t, the lengths of the successive radii cut by the spirals are equal to :

$$K^t, K^{2t}, K^{3t}, \dots K^{nt}, \dots$$

And the relationship of two successive radii:

$$\frac{K^{nt}}{K^{(n-1)t}} = K$$

Although the reasons for K in geometric progressions are variables of one kind or another in nature, we construct a spiral of reason 2 so that we can find a direct relationship with the exponential structure of the field of shape:

$$R = A \times 2^t$$

Contrary to what we think before having looked closely at a snail shell with a loupe, the spiral does not begin at a center, nor from a circle, but starts up from a point close to the center with a non-zero R. On the other hand, the drawing of its end is perpendicular to a radius at the point where it cuts the last turn.

This escargot centered and carved into a plywood base is a remarkable emitter of vibrations of the Aura to two levels “Vital” and “Physical”, without requiring orientation with regard to cardinal points and without addition of axes.

A copper wire needle rotating at the center makes an emission of the vibration of the Aura out the end of the straight line, in the outer margin, on a positive axis.

The Positive Green Electric of the Aura is on the radius parallel to the final line, and the Positive Green Magnetic is on the radius opposite to the Electric. Negative Green Electric is on the radius perpendicular to the final line, the Negative Green Magnetic diametrically opposite to it.

A shape placed on the base and not specifically oriented with relation to the Escargot is captured by the Escargot and emits in the extension of the virtual queue, except if this shape is placed on the 320° radius, which annuls all emission.

A witness of a living person placed on the 320° radius emits (+) above, and around, the spectra of the polarized body and of the Aura. This witness is automatically re-equilibrated, simplifying all these adjustments. . .

If one walks a sharpened pencil oriented with relation to the shape on the base *or in proximity*, the emission of the Aura corresponding to the orientation of the pencil is always located in the outer margin.

This Escargot is, probably, one of the most powerful shapes with relation to its weight that we know.

Amateurs in radionics (emissions over a distance), if they find themselves among our readers, could participate in their hobby without magic, by the simple play of the vibrations of shape, on the condition that they not use formulas written by themselves which they would have re-enter into the circuit with the possible returns. The colors, remedies, or vibrations of the Escargot itself, etc., offer sufficient possibilities.

The general vibration of the Escargot is the 320°, like all balanced forms that self-relate.

Maybe the snail (the animal) has medicinal properties, given the remarkable shape of its shell. We are far from knowing all its properties! But M. de Bélizal was enthusiastic about its use for healing swollen ulcers.

THE EASTER ISLAND STATUES

Many hypotheses have been formulated about these enigmatic statues. These hypotheses, in order to be worthy, must also support the shape-caused

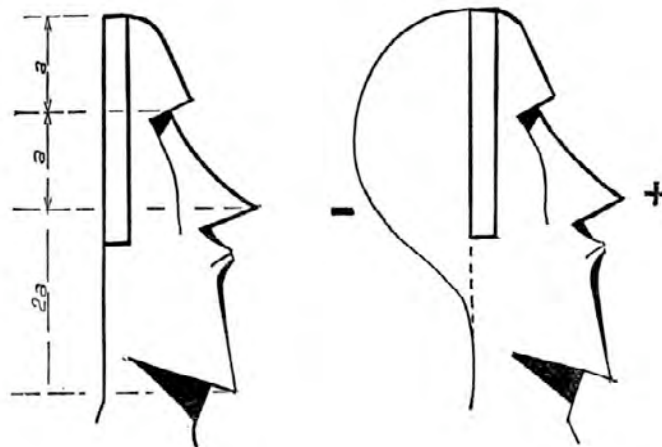

emissions of the statues. We give our observations, but other researchers, using the facts supplied here in our book about shape-caused waves, could still continue the work without exhausting the subject.

We have found:

1. The statues are not only depolarized shapes, but depolarized emitters in “magic” making the K Sh Ph and Shin pendulums spin to the reverse, Necromancy, inverting the equator of the sphere of Chaumery and de Bélizal: they are not shapes of the balanced natural order, because they are un-balanced and un-finished. Like all depolarized shapes, they can be used by the influence of a directed will. They are shapes, you might say, that are available for that purpose.

The depolarization is due to the flat shape of the rear surface of the skull and of the back. The top and the shoulders change nothing and are primarily amplifiers.

We copy, one over the other, two drawings of profiles of the statues. At the first we will give the back the normal rounding of the skull, and on the other the flat silhouette of the actual statues. The drawing with the rounded back is polarized + in front, and – in back. If we approach the other drawing from the previous one, the polarities are erased.

2. We put an emitter shape in front of the statue, in front of its profile at the height of the nose: we find the vibration of the shape at the same height behind the statue and it is amplified. If the shape is put behind the statue, the emission is found in front. There is reciprocity.

If, on the other hand, one draws in the back of the statue the design carved into the statues of the first epoch: the circle, three parallel lines and the third, like an “M”, the circle collects, channeling all the emissions, even those from the front as well as those from the rear. This is, at once, a “microphone” and a “loudspeaker”.

One might suggest that these statues were emitter-receptors. At the time of their erection, they had been for listening to the exterior world, a bit like radio-electric mirrors listen for information from the cosmos.

On this isolated island, we can imagine the people so far from everything, trying to capture around themselves what is emitted by others, themselves emitting thought or other waves towards hypothetical receivers. This supposes it all the more likely that the civilization of the sculptors was not born on the island, and that their knowledge did not stop at the horizon.

This possibility of emission-reception is reinforced by the orientations in fan-shaped range noted by Fr. Mazière in his book, *Fantastique Ile de Pâques* [*Fantastic Easter Island*]. The fanning-out range curiously leaves empty the North-east quadrant, by contrast with the empty quadrant in the field of shape, the South-west.

Whatever other opinion one might formulate, religious, magic, etc., one cannot help noting that the sum of the knowledge demonstrated by the conception of these statues reaches a scientific level, at least, in their time, because the statues from the *ahus* [platforms] are pale imitations, in spite of their powerful emission.

We use pendulums to amplify our reactions, and to select vibrations: we are degenerated by our weakened senses. But in those distant times, man, surrounded by a practically virgin Nature, had to directly sense vibrations, just like a hunted animal detects his hunter, and also like the Australian aborigines, who know what is happening hundreds of kilometers away.

The statues, then, actually “talk”.

We also think about the possibility of transmitting messages in “writing” with the use of ideograms according to a related technique that we will examine in the short chapter on messages at a distance with shape-caused waves. It is quite simple.

The shapes of the depolarized statues can also be charged by willing, as we have already said, and to have an influence at a distance, but there we leave the rational in order to enter into the free arbitrariness of the mental.

Whatever it is, these shapes, isolated, are strongly toxic by their Negative Green at the front on the one hand, by their depolarizing influence on the other.

MM. Chaumery and De Bélizal mummified meat with a 30 cm tall reproduction of the statue, using the Negative Green emission from the mouth.

The depolarizing influence, even in reduced form, is difficult to understand. It requires a perfectly balanced environment in order to not experience the toxic effects physically.

It is possible that judicious placement and orientation of multiple statues annulled the toxicity of the individual statue. Some trials were done and groupings appeared give a preferred point of concentration of emitter/receptor, because together they have the ability to form a system. It is difficult to believe that statues calculated and carved so carefully would be placed by chance.

But the system is not understood.

Given the scale and the weight of the actual statues, a badly-conceived restoration would provoke, without a doubt, a disequilibrium of the environment, placing the restoration promoters in completely good faith into the role of the sorcerer's apprentice.

A limited trial could probably be held with hemispheres on a maquette.

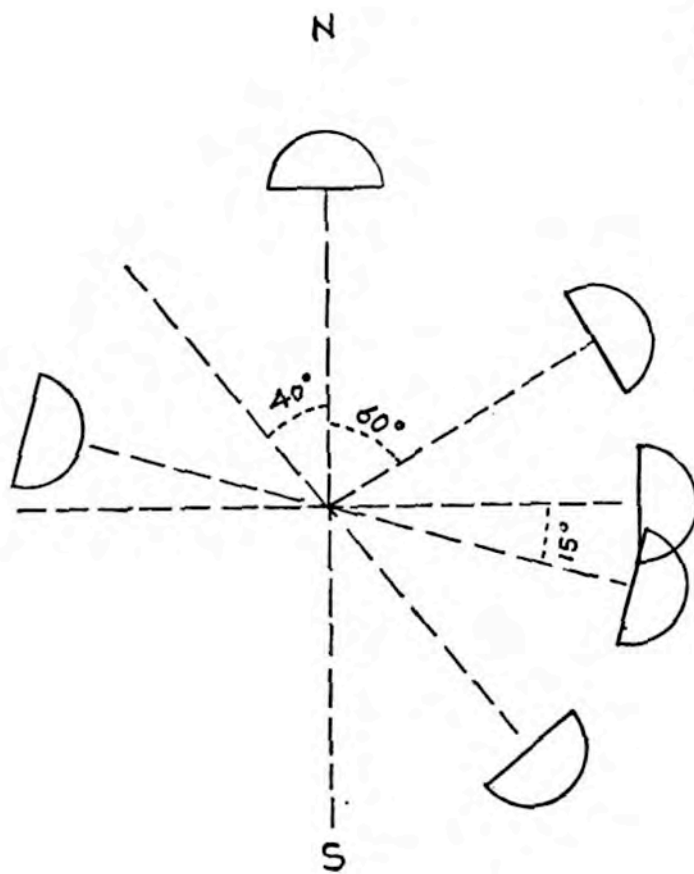

A hemisphere has, indeed, properties of transmission identical to those of a statue: a shape placed next to a bombe emits via the vertical plane; inversely, a shape beside the flat plane emits via the summit of the hemisphere. If one uses a witness of a living person in place of the shape, the "Ray of Union" (Knot of Life) between witness and subject only appears if the straight line connecting the two is perpendicular to the plane of the hemisphere, like what happens with a statue. We have a *strictly directed* antenna.

But with six hemispheres placed in a circle on the directed axes of the Field of Shape as on the figure facing, a shape placed at the interior of the circle emits all around, towards the exterior.

Another possibility lies in combining radiating heptagons around a point in such a way as to obtain a + polarity over the center that would render the Island's environment "livable".

Research and hypotheses are far from being exhausted . . .

Nature has proved the escargot to be a remarkably balanced and protective house; we do not, however, enjoy the same type of protection. This is why an elementary study of architectural proportions is essential, for it seems that doctors found so few health problems among the people that they had the pretentiousness to shelter them. This will be the subject of the next chapter.

CHAPTER V

ARCHITECTURE AND SHAPE-CAUSED WAVES

In accessing this topic, the reader will do well to exercise patience. We are not architects and we have no special knowledge. We feel, therefore, free to state our thoughts, which are unbiased by preconceived notions.

A monument, a building, a shrine, even, must not only be beautiful but must integrate natural rhythms just as a tree does in its forest. This is to say that the imagination of the creative architect must comply with certain laws. Otherwise he risks siting buildings in toxic locations or creating buildings dangerous to the health of people who live in them or to the health of the environment. And God knows such houses exist, not to mention monuments!

We will go further.

The architect's design table is without a doubt more important for health, in the prevention of cancer for instance, than the astronomical sums of money devoted to medical research and healing of ailments. The architect can even address health issues without adding to building costs.

If there are houses where the inhabitants are bursting with health, there are others where, in the memory of man, no one has ever felt comfortable inside. There exist houses of cancer . . .

Placement plays a role, we will see it in relation to toxic terrestrial waves, and it is not the only troublesome element.

One can limit, correct, or even suppress poisonous influences with the shapes and proportions of the building.

An example: when you enter the Chârtres Cathedral, in spite of telluric perturbations along and across it, which ought to disturb you, you feel relaxed. The proportions of the building correct, and beyond, the inconvenient natural properties at its location, and, in fact, they balance you.

This is the way to do architecture, even for the most modest construction.

Architecture is not meant to be done so that the Master Architect may flaunt his superproductions to the sun. It is not done to compensate for lack of novelty, nor to multiply the heart-breaking series of rubbish, called residences, that exhibit their blandness along the roads, nestling behind a discreet veil of green. Architecture is to be done for the well-being of the human being and for the joy of his sight.

It is not a matter only of a simple intellectual creation by an artist, even under constraint of solidity, of static equilibrium, and of apparent comfort.

Architecture must remain a submission to natural principles.

Alas, these principles, which we want to understand clearly, and which the builders of the Middle Ages seemed to have possessed during their short-lived summit of our civilization, were quickly diluted by the practices of the profession, in time to disappear during the era of concrete and tacky-tacky public housing.

Can we recover these principles?

The solution to the problem is facilitated by shape-caused waves, and we already know this field.

Our requirements, at the outset, will be the integration of the Field of Shape with what follows: harmony with natural shapes and their beneficial effect on the living.

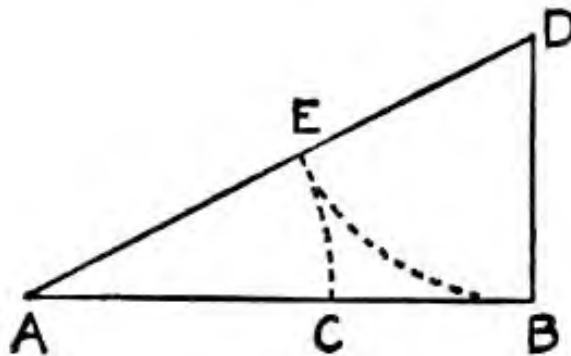

But, first, we will quickly look at several proportions, which, through the ages, have appeared across the board in the plans and layouts that our pendulums are going to analyze.

THE GOLDEN NUMBER

Credit where credit is due.

Already discussed, the famous Golden Number was known to the ancients.

This is, *in principle*, the most harmonious way of dividing a line into two segments.

The Golden Number results from the proportion called “mean and extreme”: $(a+b)/a = a/b$

Geometrically, it is a matter of dividing the segment AB in mean and extreme proportion. Draw a perpendicular at B such that $DB = AB/2$.

Then with center at D and radius DB, cut DA with an arc at E. The arc of the circle centered at A and radius AE cuts AB at C. This gives:

$$AC/CB = AB/AC = (AC + CB)/AC = \phi = 1.61803 \dots$$

Algebraically, one can define the Golden Number as the limit of the ratio of each two consecutive numbers of the Fibonacci series, of which each term is the sum of the two preceding terms.

The Fibonacci series is:

1 1 2 3 5 8 13 21 34 55 ...

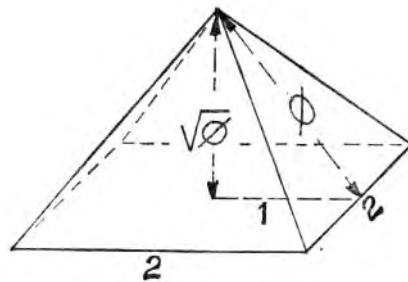

The ratios:

1/1 2/1 3/2 5/3 8/5 13/8 ...

These ratios approach the limit of the Golden Number:

$$\phi = (\sqrt{5} + 1)/2 = 1.61803 \dots$$

A famous example celebrating the application of the Golden Number is the famous pyramid of Cheops:

The length of the side of the square base is 2.

The height of the triangle of the faces (apothem) is ϕ .

The height of the pyramid is $\sqrt{\phi}$.

In drawing conclusions from this study, nearly everyone forgets that the pyramid is anchored in the soil by its foundations. Photos of the pyramid emit in “magic” from above the summit, but no emissions are found around it. On the other hand, an isolated model is clearly magic and can, in certain

cases, poison the environment. This is a limit-shape that does not accept a surcharge. A simple blade of grass nearby can make it emit a powerful Electric Negative Green emanation from the summit; and one day, we were its victim. Having absorbed this Electric Negative Green emission an entire night, when we got up the next morning, we didn't know the way to the window. The window turned like an airplane propeller . . . And all that for a simple blade of grass forgotten near a pyramid of plywood.

The spectrum of equilibrium with regard to the methods for reestablishing a normal ambiance gives Electric Ultra-Violet on top, or at North, and Electric Negative Green at the bottom, or to the South. On the pyramid, this spectrum is inverted: Electric Ultra-Violet is at the base and Negative Green Electric at the summit. In spite of all the published works relating to this monument and the interests of the researchers, be wary like the plague of this device, a model of the pyramid without foundations.

In certain time periods like the Renaissance, builders systematically used the Golden Number ("Divine Proportion", "Golden Section"). Some find it in nature or wherever they look. Everyone forgets that the Golden Number is a limit never reached in Nature by reason of its character as an irrational number, and that it is necessary to incorporate it into an exponential structure in base 2 in order to find the normal bipolarism.

And yet a proportion was skillfully built upon this number, the Egyptian Proportion called "of Divine Harmony"; contemporary mathematical authors find it strongly appealing.

In this regard, by way of a digression, do not think that we have something against mathematics as a tool for research or against its powers of abstraction. We refrain from translating pure mathematical speculations into reality. Mathematical theories have often influenced art and architecture without concern for human frailties. Even some works of art that are calculated according to the most classical norms can result in toxic emanations because of the resistance of the materials. For example, bridge pilings flared at the top like one sees along the roadways, and certain water castles. The technically beautiful structures are not necessarily favorable to health. No more so are the most beautiful calculations.

THE EGYPTIAN PROPORTION (a beauty from the Devil)

This proportion was found by the architect, Fournier des Corats, according to the monumental work, *L'Architecture Naturelle*, of Petrus Talemarianus, from which emanates a certain odor of firewood. Fournier des Corats could verify that this proportion had served at the conception of every Egyptian sculpture with only eight relationships based on ϕ which, incontestably, give a harmonious result to the eye. These relationships have been found by folding the faces of the Cheops pyramid over the base. Unfortunately the Egyptian proportion, an intellectual construction built on a limit, is in reality a super-creation monkeying around with the truth. And, indeed, one notices that all that is constructed from this famous proportion emits Shin at the inverse to the vertical, making the K Sh Ph pendulum react, and inverting Red and Violet of the Chaumery-de Bélizal equator. It is, therefore, to be eliminated without regret.

We made a proof of this several years ago by innocently using a re-balancer of the environment based on the Egyptian proportion. The rupture of the forces was offset at the moment; we had suppressed the diarrhea of calves in the barn, but at the price of a spectacular falling out of patches of hair. This was the magical transference brought to light.

THE 3-4-5 TRIANGLE

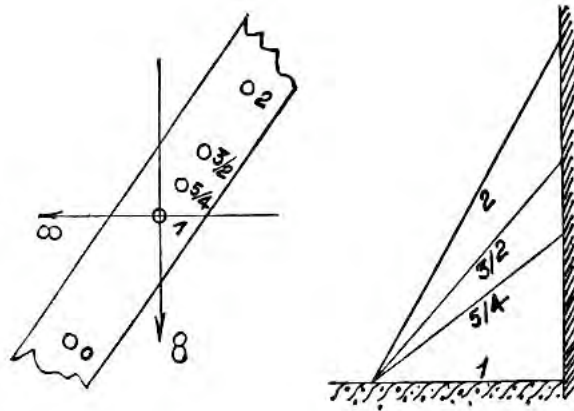

The use of this triangle was lost in the Night of Time: it was known during the Neolithic Era!

The reason for its existence is probably that it permitted easy construction of a right angle with a string having 12 equally-spaced knots. From where, perhaps, a more systematic use extended to proportions themselves. At the outside, it served, in the whole and in the details, in the construction of transportation buildings having an ellipsoidal dome, following a unitary principle, of the portico at the summit of the vault.

As much as this proportion is not dangerous, its systematic use seems really artificial. The unique trump of this triangle is that it is the only one that is not magic, to our knowledge.

MUSICAL PROPORTIONS

If one completely pierces through a plywood plank at locations with respect to the musical intervals of the major third and the fifth, one can see that the plank unpretentiously makes an emission of the vital field to a witness of living person poised above it.

Harmonic Musical Intervals

Louis Charpentier gives this use in the elevation of the Châtres Cathedral.

The harmony of the major triad is, we recall,

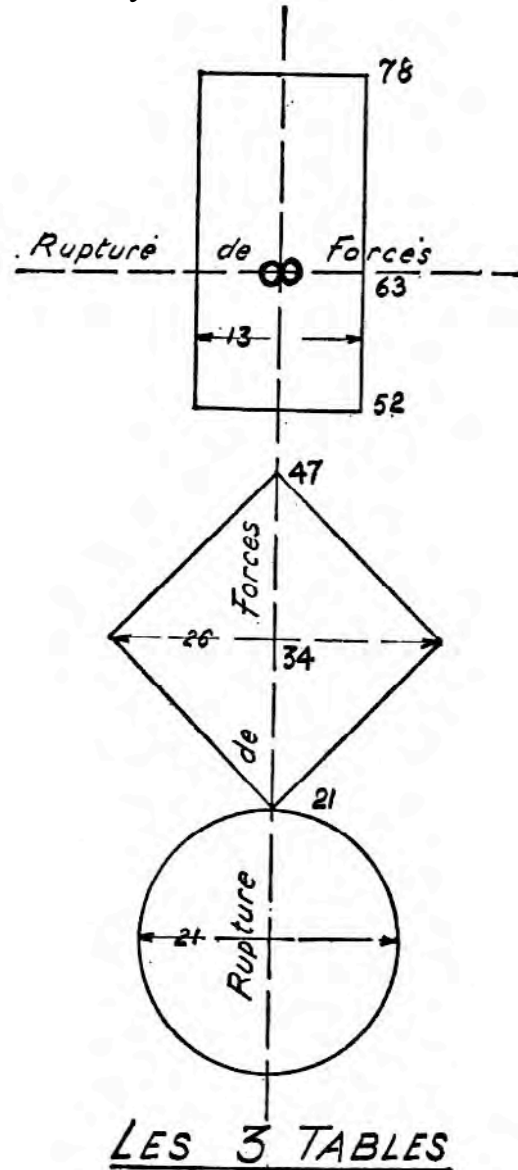

$$0 - 1 - 5/4 - 3/2 - 2$$

We have used this harmonic series to amplify our instruments. One can also, certainly, make a good oriented re-equilibrator for the environment. The results are correct if one does not destroy its efficacy for special shapes.

The harmony of the major triad is a particular and incomplete case of the exponential structure of the Field of Shape.

THE THREE TABLES

These three tables show up in certain works, more or less well-interpreted. We cannot do any better.

The Three Tables seem above all to be a basic secret of knowledge, a relic of the Middle Ages. Louis Charpentier gives a glimpse of it in his previously cited work, *Les Mystères de la Cathédral de Châtres*. From time to time it reappears in the Grail Story as the “Tale” of the Companions:

“The Grail rested on Three Tables of equal surface, one round, one square, one rectangular, and their number is 21.

“A fourth table covers them and its number is 6.

“The Grail is 17 and it is One.”

That's something to fry your brain!

Louis Charpentier gives the Three Tables along a single axis, and we have tried to construct them 1) from the Golden Number, 2) of a total length of 21, and 3) using the Hebrew numbers of Y H W H. It is this last way that we have retained.

Diameter of the round table: 21 (Hebrew *shin* or Y W H)

Diagonal of the square: 26 (Y H W H)

Length of the rectangle: 26 Width: 13

For the correct and proper function, the Rectangular Table must be 5 units above the apex of the Square Table, the 5 being the difference between the diagonal of the Square Table and the diameter of the Circular Table. Additionally, the total length of the three Tables is:

$$21 + 26 + 5 + 26 = 78 = 6 \times 13 \text{ or } 3 \times 26$$

Would the Fourth Table be 6 x the Hebraic unity?

$$hA cH D = 1 + 8 + 4 = 13$$

Besides, we detect the Knot of Life at a distance equal to

$$63 = 3 \times 21$$

from the end of the Round Table opposite the Square.

Whatever the calculations of the tables and the approximate equality of their surfaces, the whole emits with the K Sh pH and "Necromancy". It is necessary, in order to eliminate these emissions, to draw two straight lines passing through the point 63, and going to the edges of the base, one in the axis, the other perpendicular to the axis. These straight lines emit the Knot of Life as do the rupture of forces or telluric perturbation above a subterranean current.

Tables aside, these ruptures of forces by a right angle give at their crossing a powerful emission of Knot of Life. This seems to have been known and used for a long time: the megalithic covered walkways that we have examined carry a rupture of forces along the length and one other similarly across an end.

In the cathedrals and the old churches, we find these traditional ruptures, one on the axis of the nave, the other across the choir, and that sometimes would explain certain abnormal deviations in the construction.

If the proportions of the building eliminate the toxicity of the ruptures, the ruptures just remove the eventual magic of the shapes. A sort of tit-for-tat.

The ancient altar had to be found at the crossing of these ruptures at a preferred point of emission likely to protect the whole environment *and at all levels* of shape-caused waves.

In the sixteenth century the altars were located at the back of the choir. In our decadent era, without there being any moral obligation on the part of the superior authority, they moved the altars to the crossing of the transepts for reasons of visibility, to conference tables as Charpentier emphasized. And the churches became empty. Not that there would be a relation between cause and effect, The Holy Spirit is above these material considerations, but it produces a serious dissonance between the original intelligent conception and present ignorance. Otherwise, one would try to establish full harmony between the material and the spiritual. Today, the rupture of equilibrium between the materialism of some and the angelism of others only brings on confusion, “*circonfusion*” according to the word of Chanoine Roussel (Téqui Éditeur).

AND NOW, WHAT PROPORTION?

We earlier cited Thomas Aquinas: *Ars traditur naturam* [art imitates nature]. This is the golden key for opening the doors to our desired solution. We observe nature, which is certainly alive, but we do not copy it blindly, because it is the reflection of a light between two antagonistic forces: Life, which is expansive, and Entropy, which tends towards rest and death.

We must certainly study, in order to conceive a useful and applicable work, the structure of construction of the living in growth and expansion: not that which slows down and ends by wiping out expansion.

“Growth” applies to the exponential structure of the Field of Shape. Entropy manifests its inertia by the shape called “sigmoid” (from the Greek alphabet, *sigma*, or S-shaped) of the growth of the living: growth, first slowly, then accelerated, and diminishing and canceling itself in death. Sigmoid growth applied to the re-equilibrators of the environment has given very bad results. It spreads and separates things, and is therefore not a cause.

But as the growth accelerates or slows, adding stages to stages, and layers to layers, it acknowledges the structure of the field in its partial proportions, only varying its speed.

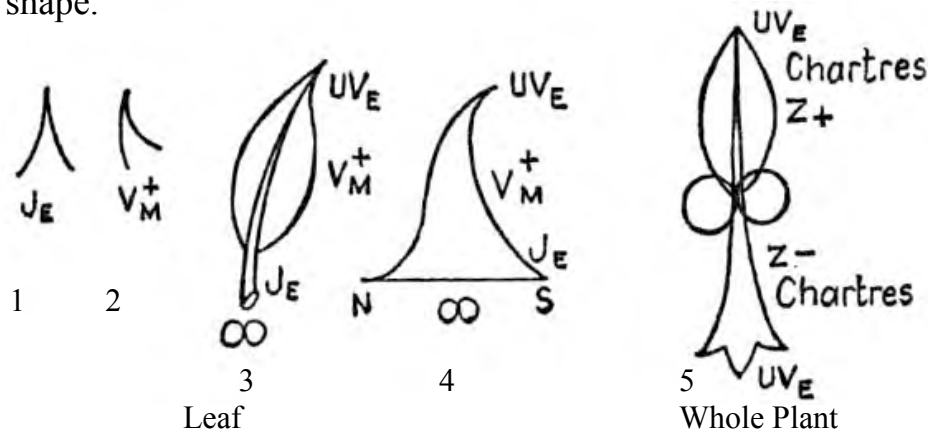

Whatever may be, construction is analogous to the plant, with parts in the atmosphere and roots in the soil. The study of plants, easier than that of animals, can only be useful for it introduces us directly to our subject.

THE LEAF AND THE PLANT

Plants and animals are shapes that capture and transform energy that participate in universal harmony. One's education is never finished, and the shape-caused waves make one appreciate them from another perspective than, say, that of a walker who is as curious about nature as is his suitcase in the trunk of his car.

The Leaf

All leafy branches, as complicated as they are, emit Magnetic Positive Green, and all the leaf-stems emit Electric Yellow. But the most interesting thing is the finding of the Knot of Life at the exit of the stem from the branch. That confirms the leaf's power of capture is determined only by its unique shape.

1) Electric Yellow; 2) Magnetic Positive Green; 3) and 4) Knot of Life at base, Magnetic Positive Green on leaf, Electric Ultra-violet at tip; 5) Electric Ultra-Violet at root tip, -Z and Châtres at roots, Knot of Life at junction of stem and root, Z+ above ground, Electric Ultra-Violet at top.

We can draw or model the equivalent of a leaf shape. We create the shape of a rose thorn (figure 4 above) using a sigmoid shape on its left and the arc of a circle to the right. Use this design to re-establish the equilibrium of the atmosphere by orienting the point of the cut-out shape to the East, like a natural leaf, as we will see in the chapter on dangerous waves.

The Whole Plant

In the whole plant, the root, another capturer of energy, balances the leaf. Both are sites of an Electric Ultra-Violet of cosmo-telluric capturing at the extremities, or, if you prefer, of the Hebraic L Y L H (Lailah), The Night, emission.

With the entire plant growing in the soil, the upper, aerial part carries a Z+ emission (the wave of charged of vital magnetism), the root shows Z– (the wave of discharge of vital magnetism), the collar gives the Knot of Life at the level of the soil surface.

Between Z+ and Electric Ultra-violet, one finds the Wave of Châtres, which can be expressed in Hebrew by a phrase appearing merely to be poetic, but actually effective in partially re-establishing an equilibrium by orienting:

L Y L H hA R D B R Sh M chA
HA R Ts L Y L H
(Lailah Haretz Dabar, Shamc'ha Haretz Lailah)

The Night Earth speaks; listen to the Night Earth.

For an uprooted plant, the Knot of Life disappears, Z+ and Z– go out at a distance just a bit farther than the edges, and the plant dies.

To make Z+ and Z– return into the uprooted plant, lay it down flat and oriented North-South. Place a Knot of Life shape at the precise point of the collar (boundary between above/below the ground). Now the plant emits in L N Ph Sh cH Y H. The same observation can be made with an artificial plant shape made of copper wire, and it can serve as a test of the value of this shape.

If the plant is cut at the level of the soil, Z+ and Z– disappear completely, never to be restored.

The deepest examination of plants from this angle can lead to interesting studies in plant physiology.

A plant in the soil is the condensation of a spectrum:

Electric UV, Châtres, Z+, Knot of Life, Z–. Châtres, Electric UV

This spectrum is bounded by two Electric Ultra-Violet cosmo-telluric waves that we will find over the shapes that are able to compensate a rupture of forces.

Animals can live and move freely on the surface of the soil because they carry their own Knot of Life. The plant, less advanced in evolution, is tied by the Knot of Life to the soil where it grows.

From this we get a lesson. Movable objects, without ties to the surface of the earth, must be constructed with an independent Knot of Life. The construction must maintain the vibration of the Knot of Life with its shapes and proportions at the level of the soil. This can be detected on the plan or elevation. (This is why the Pyramid must have foundations, even artificial ones, that anchor it in the earth and prevent its spectrum from streaming out toward the sky. A pile of sand is made to rest on a solid surface and is not designed with a base in the currents of the air. . .)

THE PROPORTIONS TO REMEMBER

Our study of the Field of Shape led us to construct a circle circumscribing a hexagram, a star decagon, a required convex pentagon, and an optional star pentagon.

To find the organizing axes of the Field, we had begun with the Hebrew word Y H W H and its Number, 26. This Number includes the entirety of Y H W H and we will adopt it for the radius of the circumscribing circle.

The apothem of the convex pentagon becomes:

$$R/2 \times \phi = 13 \times 1.61803 \dots = 21.034$$

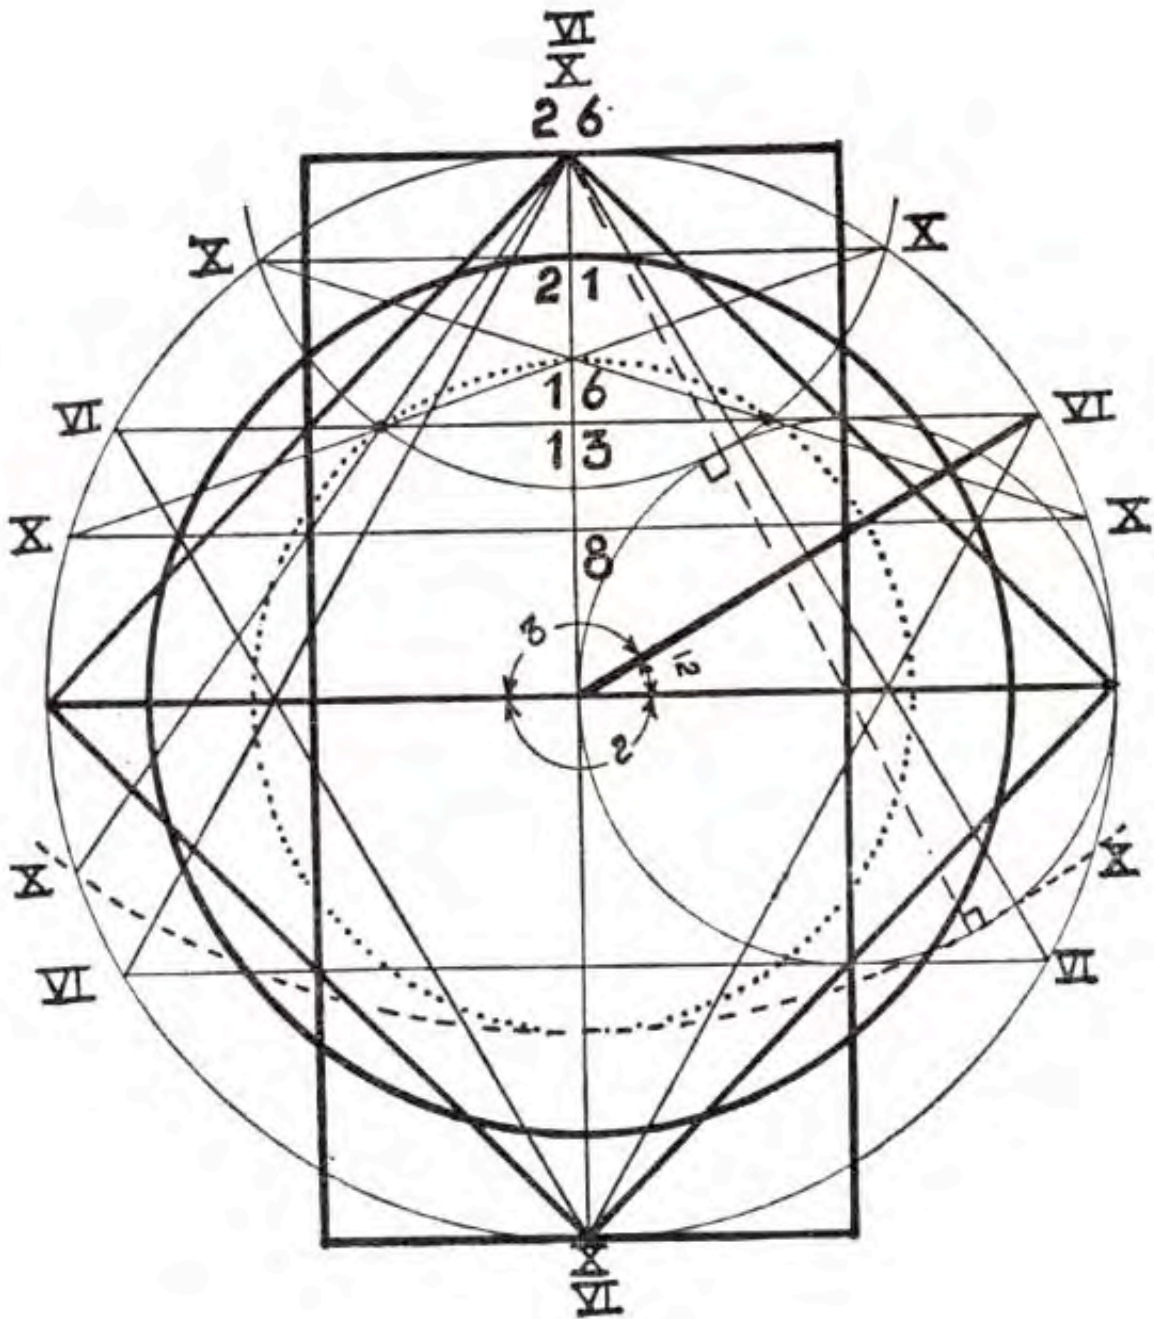

The intersection of the sides of the star decagon is at a distance from the center of:

$$R (\phi - 1) = 26 \times 0.61803 \dots = 16.06878$$

The apothem of the hexagram is :

$$R/2 = 13$$

These are the sufficient and necessary *base Numbers*.

The several hundredths are negligible at the level of shape-caused waves in practical architecture and therefore we adopt these integer numbers:

13 – 16 – 21 – 26

which have the advantage of corresponding to the Hebrew Numbers:

M – chA – Sh – Ph

and give much more ease in the establishing of a geometric plan with numbers easy to work with – at least to have as thorough a knowledge of these geometries as the Master architects of the Middle Ages, who probably were burdened by complicated calculations.

Those among you who enjoy the ruler and compasses may have some fun.

The holders-on-at-any-price to the Golden Number could verify that:

26/16 and 21/13 are close to this number and that

26/21 and 21/16 are close to its root.

Rest in knowing that if a plan constructed on these Numbers is going to be found, the tests of the Field of Shape . . . but we are not there. It is first necessary to look at how these proportions can be applied to a living growth process.

Organized Growth

A growing, living shape keeps its own shape and that is one of the arguments in favor of the Golden Number. We can thus understand that a shape has grown following concurrent axes, from a point, proportionally along the length of each axis from a given moment. This is a simplified view, one that does not take into account successive subdivisions, but can serve as a hypothesis from which to begin.

Growth on one of the axes varies according to a constant law in a rather short time interval.

When time is expressed by: 0, 1, 2, 3, . . . n . . .
growth attains this dimension: a, a x 2, a x 2², a x 2³, a x 2ⁿ
in order to satisfy the exponential law of the field of shape.

And if: a = 26, then

26, 26 x 2, 26 x 2², 26 x 2³ . . . 26 x 2ⁿ . . .

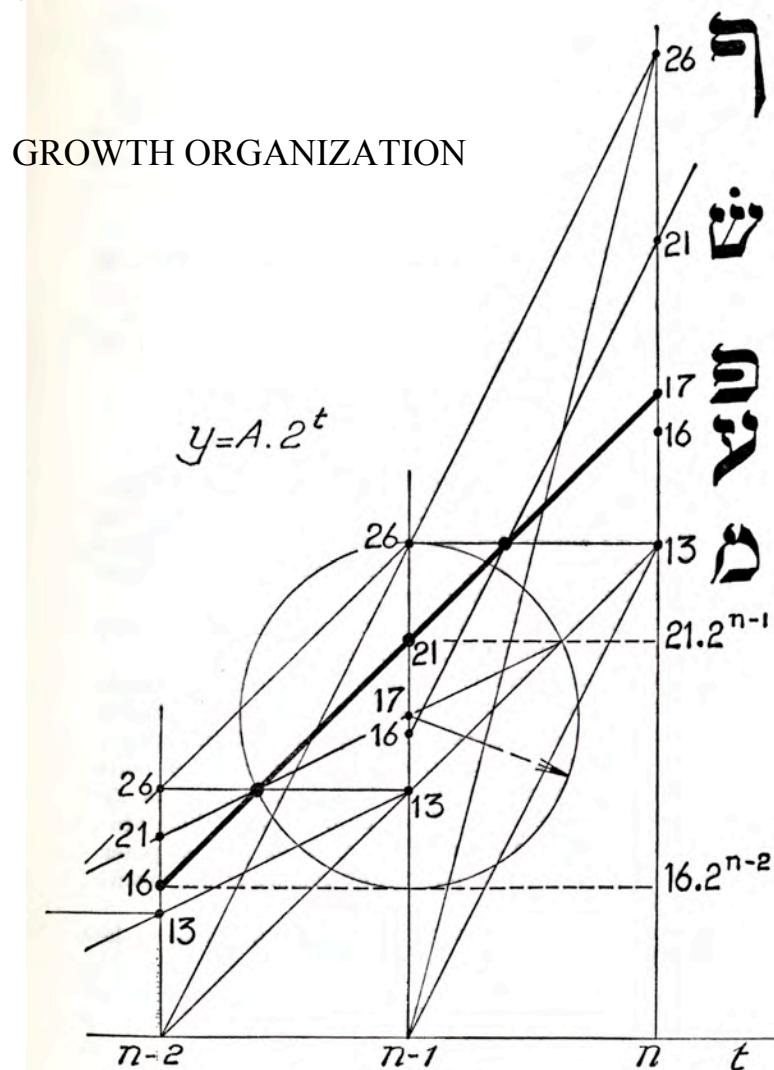

At each stage in time other numbers are inserted for a, 13, 16, 21 which follow the exponential law of their leader, 16.

This can be illustrated in table form:

Time	Growth proportions			
0	13	16	21	26
1	13×2	16×2	21×2	26×2
2	13×2^2	16×2^2	21×2^2	26×2^2
.....				
n	13×2^n	16×2^n	21×2^n	26×2^n

We plot the times 0, 1, 2, 3, . . . n . . . on an x-axis and, from each of the equidistant points, we raise a perpendicular line to the x-axis. On each perpendicular we will mark the corresponding proportions in ordinates.

We show graphically that a new number is introduced, 17, on the extension of the oblique line passing by the 16 and 21 corresponding to the two preceding abscissas.

This simple calculation confirms the drawing:

$$\frac{17 \times 2^n - 16 \times 2^{n-2}}{17 \times 2^n - 21 \times 2^{n-1}} = \frac{17 \times 4 - 16}{17 \times 4 - 21 \times 2} = \frac{68 - 16}{68 - 42} = \frac{52}{26} = 2 = \frac{\text{hA L H Y M}}{\text{Y H W H}}$$

for two similar right triangles.

What is this number 17 outside the middle between 26 and 8?

“The Grail is 17 and it is One”, goes the Tale.

We draw an axis of the Negative Green and the Electric Ultra-Violet ray at 30° from this axis. The Numbers of the angles add to:

$$2 + 3 + 12 = 17$$

which, covering the entire circle, superimposes upon Unity.

For those who will ask how we have numbered the angles, an angle is the value of the number of parts in which it divides the unity of the circle. A semi-circle is value 2, a 60° angle is value 6.

17 is also the normal “Peh” of the Hebrew alphabet (when Peh is a final letter, it is number 26, the Number of Y H W H).

We superimpose the Peh 17 on the drawing of angles, the (+) pendulum reacts. There is a probable identity.

Or, the Electric Ultra-Violet of the Angle Number 12 orients a shape. We have seen this in regard to the field of shape. If we use 17 in our proportions, do we risk seeing the plane of the soil of a building in dissonant orientation with the natural field? The question can be posed although we have not yet noticed this inconvenience.

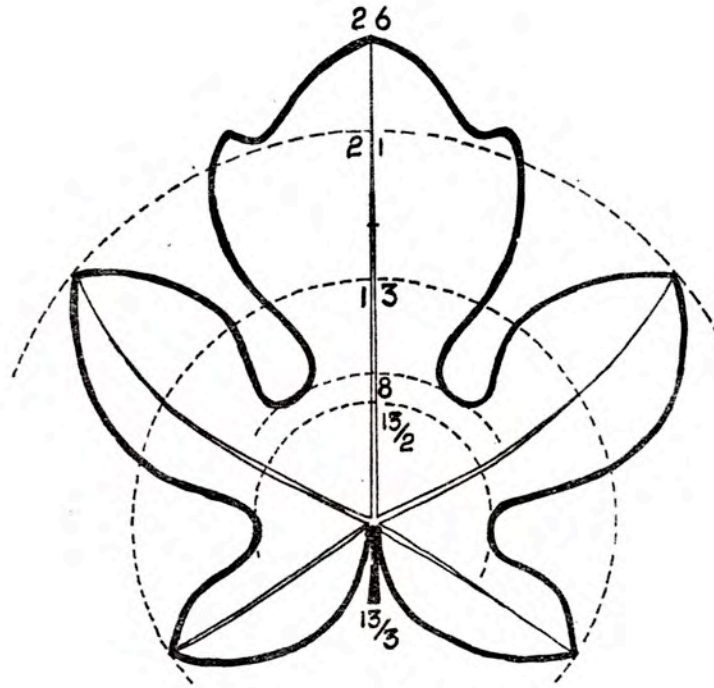

And now, how to actually apply this proportion:

$$13 - 16 - (17) - 21 - 26$$

On the Ground Plan

Growth occurs from a germ, from a point, the Center of Life, seat of the Knot of Life, around which all radiates. The center was probably the Sacred Center from which a religious building was conceived and oriented.

From this center we begin by drawing concentric circles of radii 13, 16, 17, 21, 26 and their multiples by 2ⁿ, n being a positive or negative whole number. From the center, the axes radiate, arbitrarily or not. We stop their growth with certain circles above, without forgetting the 16. We are assured of having a figure of homogeneous proportions.

A particular case is that of two perpendicular axes that cross at the Center of Life. Growth is then calculated on the two axes leading one subsequently from the perpendiculars, passing by the calculated points.

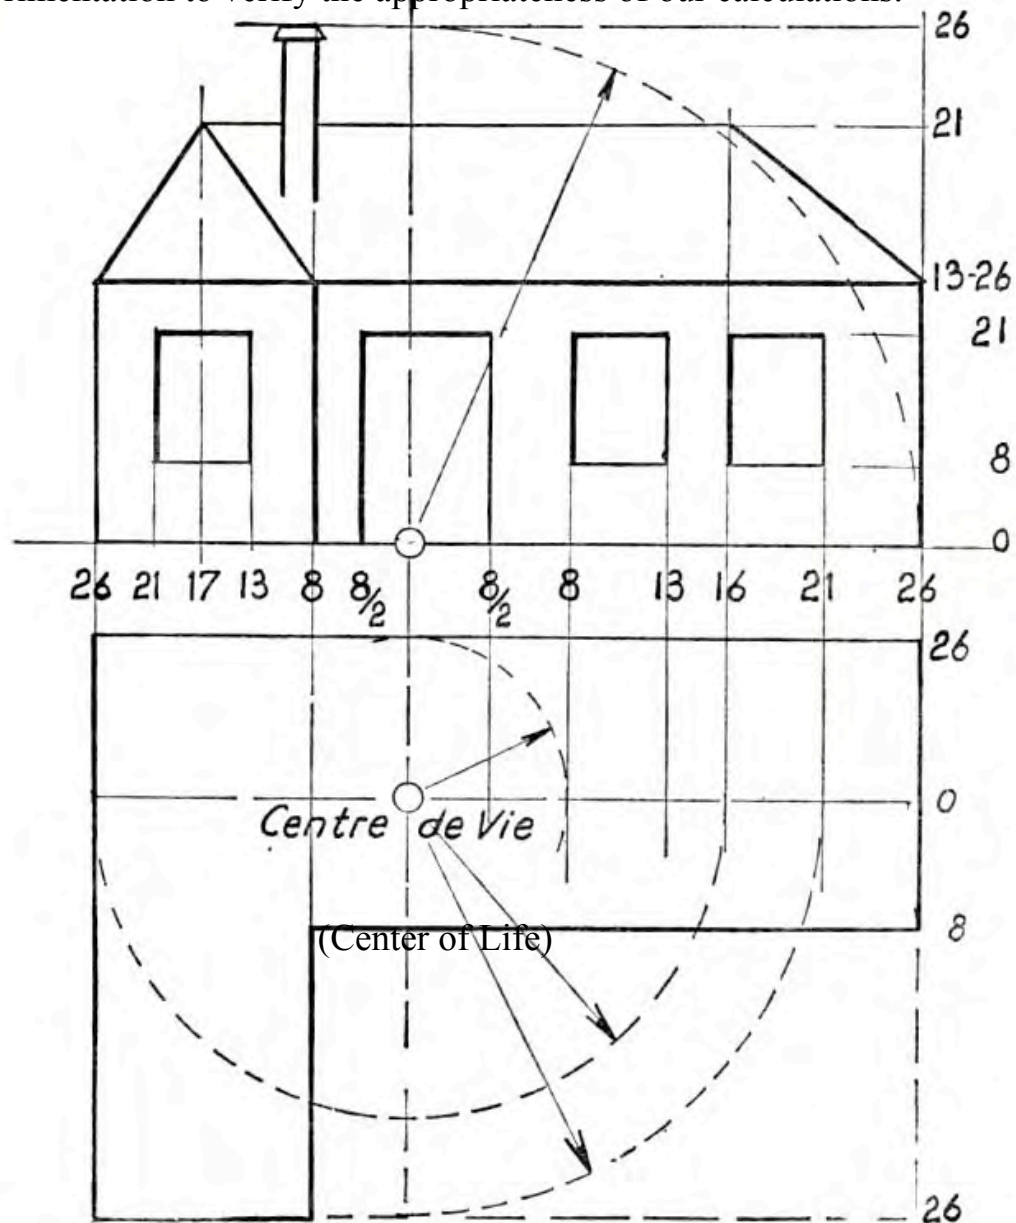

The method works nicely, because each principal interval can be re-divided according to the same proportions.

With regard to ease, M. Bardet in *Mystic and Magic* notices that only the Châtres cathedral shows the incorporation of the three Tables in its floor plan. Its contemporaries adopt various plans, which probably result from a strict rule, but very flexible, or degenerated, in their application. It would be necessary to study each case separately by taking as the point of departure of growth, the crossing of the ruptures of forces in the choir.

In Elevation

The Center of Life is at the ground. Gravity connects it to the horizontal and the vertical despite modern techniques using tension and cantilevers imitating trees and mushrooms. Once the proportions are defined, one can relink the calculated points with oblique lines or curves. When the plan is finished, if emissions appear from the plant above the ground (Z+, Châtres, Electric Ultra-Violet), the construction will be integrated into its natural living surroundings.

Perhaps these considerations appear to be theoretical, rather than scientific, because of their geometric or Hebraic origin, with a good tincture of *a priori* [prior knowledge]. Nothing could be more worthwhile than experimentation to verify the appropriateness of our calculations.

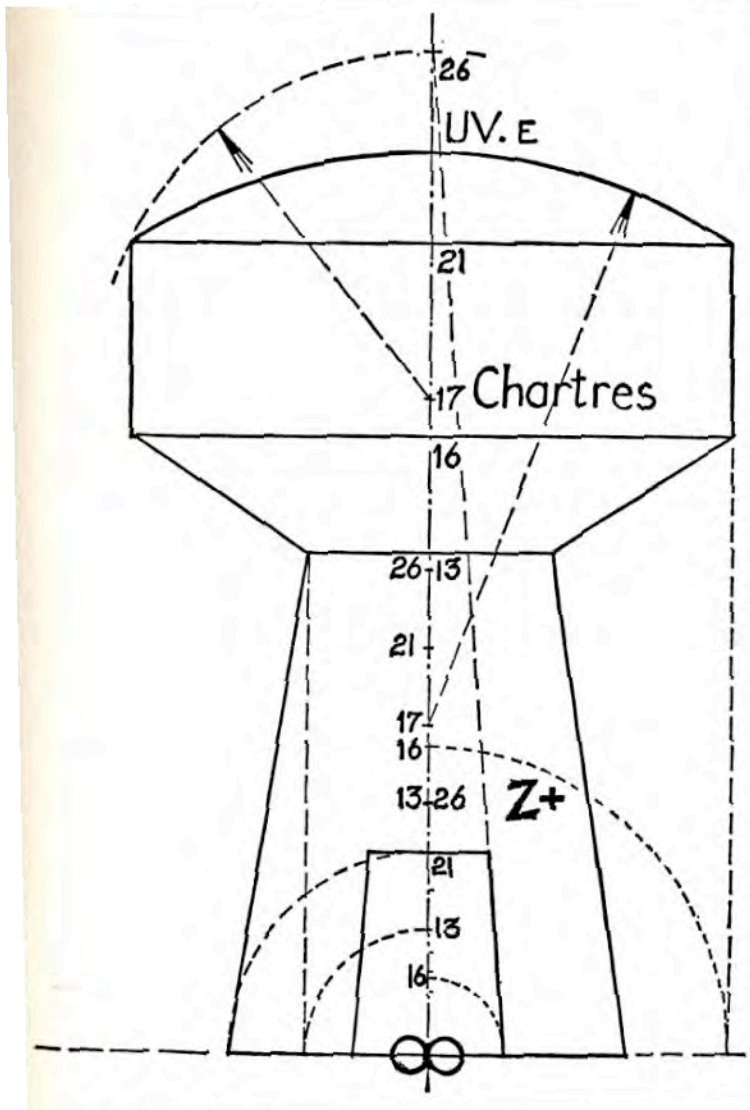

Our preferred way to approach this is with the cylindrical pendulum with the Hebrew characters: M chA Ph Sh Ph representing the numbers: 13 - 16 - 17 - 21 - 26.

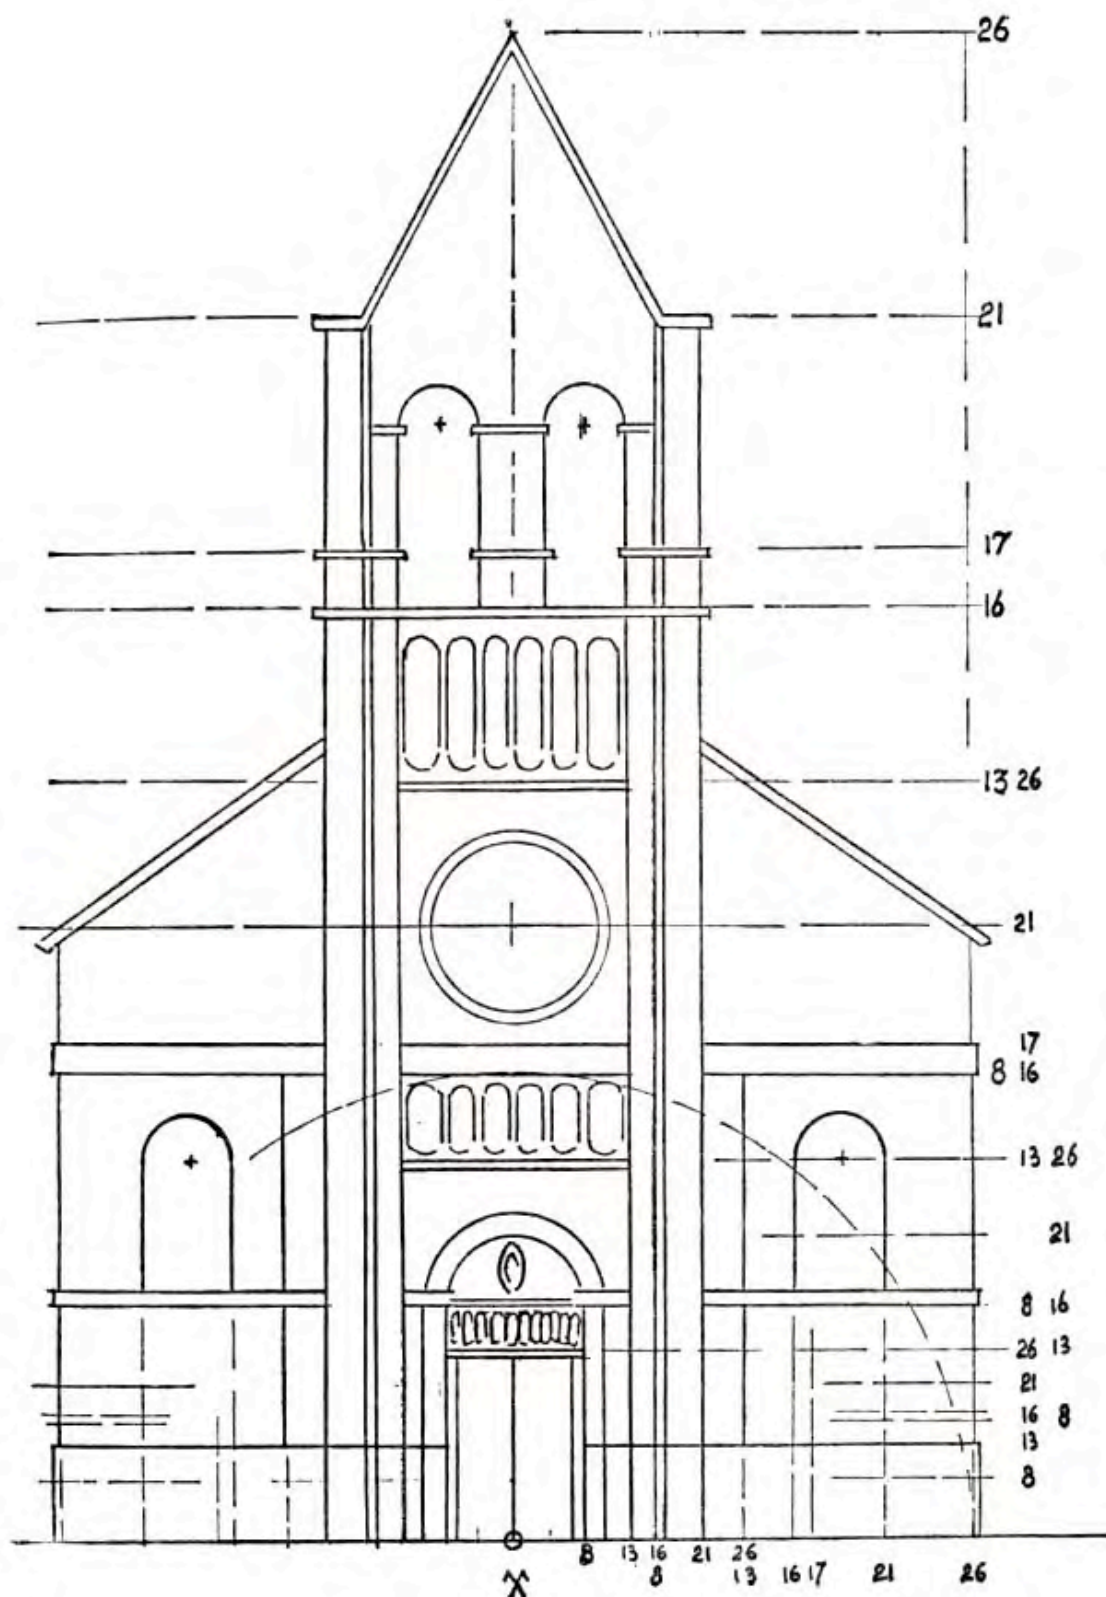

This pendulum turns in a balanced environment, with the usual effects.

We can also experiment directly upon the proportions of the foundation. The rafters and the planks have been pierced completely through between the two faces at the following intervals: $13/26$, $16/26$, and $21/26$, the total length being regarded as 26. They have then been placed with people who have health challenges: sleep is ameliorated, asthma is attenuated, and digestion is normalized.

Then, although the beams placed in such a way may not be ideal and do not reestablish the equilibrium for a rupture of forces, they have procured relief, demonstrating the beneficial effect of the proportion and its harmony with the natural field, a harmony already verified with the (+) pendulum by putting the thumb on the little finger.

On the other hand, we have established ground plans and elevations that are uncomplicated. The valuable tests for the Field of Shape confirm this.

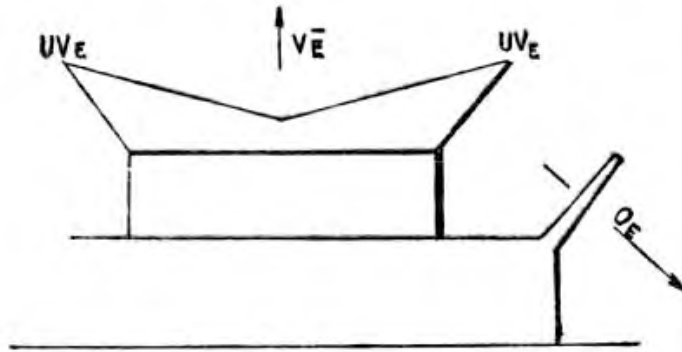

We hope that the facts above, while elementary, will be taken into consideration, deepened, improved, . . . and applied, for the greatest benefit to the health of people and animals.

For it is sorely needed.

The examples that follow are the proof that imagination is not confined to architects studying aberrant vibrations, the fruits of the intellectual perversion of our time.

EXAMPLES OF SERIOUS ERRORS

Most of the “rabbit cages” of our new residential subdivisions are rectangles. Aside from their respective installations, certain decorative motifs, and surely, the concrete frame and the television antennas that disturb normal magnetism, there is not a lot to say further from the vibratory point of view.

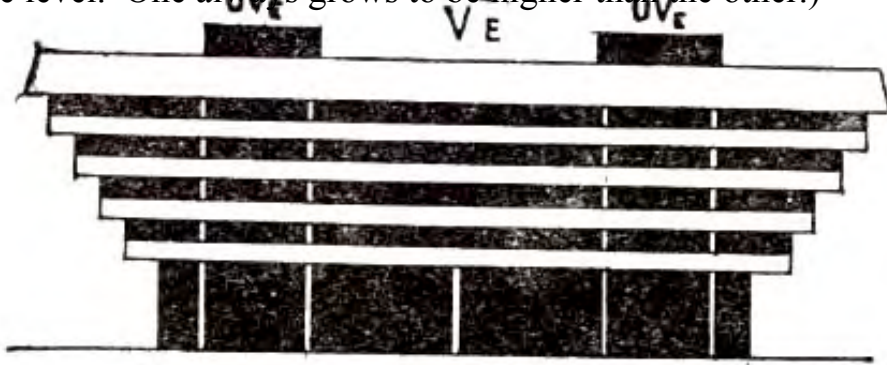

But then again, this isn't paradise . . .

But certain architects suffering from a need for novelty have amassed some truly detrimental factors.

1. In a city to the west of France has been built a large ten-storey building. Its overall pyramidal shape attaches to a roof of inverted slope (the worst kind) from which the emission is multiplied by French-fry basket handle projections on each story. This inversion provokes a powerful Electric Negative Green vertical emission accompanied all around and on important surfaces by various equally Electric and “magic” vibrations. I know nothing about how it is working, on the whole, for the inhabitants of the building, but personally, without any means of protection such as we will see later, I would prefer to live in the jungle despite the discomfort, in order to lengthen my life.

2. In an entirely new city in the Paris region, they have built a prefecture in which the stories get wider as they go up, making an inverted pyramid. Their reasoning goes like this: each story overhung by the one

above will have sunlight in winter when the sun is low in the sky, and shade in the summer, when the sun is high in the sky. The misfortune is that the shapes resting on the ground larger above than below create an extremely powerful emission of Electric Negative Green aided by the double emission of Electric Ultra-Violet above the highest terrace. (Note: Any tree whose “leader” or “head” is cut out never produces two leaders at the same level. One always grows to be higher than the other.)

This Electric Negative Green is accompanied by an impressive series of inversions comprising Red and Violet of the Chaumery-de Bélizal equator.

Further, in examining the photos, we see that the environment is also profoundly perturbed. When one knows the radiating activity of certain shapes of such enormous weight, we can ask how far the toxicity of such a building extends.

Here is what J. G. Bardet in his book *Mystique et Magie* had to say:

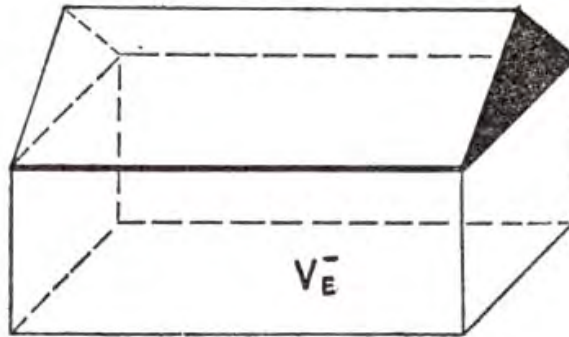

“ . . . The air-conditioned interior engenders claustrophobia, spleen and nervous fatigue. In less than a year, nervous depressions were multiplied, even for the prefect, himself, who was installed in the top of the building. He has left because of . . . vertigo.”

After having experimented in the presence of Electric Negative Green, there is no difficulty understanding such reactions.

M. Bardot adds: “In the Concourse of Beaubourg Centre, in Paris, we find several inverse pyramids. As for the designated project, it signifies lack of culture!”

3. For some time in the new streets and neighborhoods, we have chanced to notice a new style for the gables of the houses.

In lieu of continuing the gable in masonry to the summit of the roof without compromising continuity, the vertical space between the summit and the base of the triangle is made of a framework covered with slates: a triangle surmounting a rectangle.

This differentiation generates Electric Negative Green in the interior of the house that adds its toxicity to the wall-ties of reinforced concrete.

To conclude this chapter, we notice the difficulty that man always has in integrating his conceptions with the rhythms of Nature, more nowadays where misleading information contrasts with the Universal harmony of things, and we see it everywhere.

Architecture, in particular, depends on techniques and materials that it uses at its own will, to avoid the ordinary.

Man, whether he wills it or not, is partly integrated into Nature, and he risks paying very dearly for his lack of submission to the natural order. The moment to abandon this suicidal attitude and to commit acts of humility has arrived . . . *Ars traditur naturam*. [Art relates to and springs from Nature.] If he does not, then . . .

CHAPTER VI

TOXIC WAVES AND THE RUPTURE OF FORCES

Badly created architecture, we have seen, contributes to the creation of a toxic environment that threatens health.

Many other phenomena intervene that are contrary to the natural order in which we were made to live, and the work of R. de Lafforest; *Ces maisons qui Tuent* (Laffont Éditeur) [*Houses that Kill*] gives a good, though incomplete, sampling.

These intervening phenomena generally fall into the category of “TOXIC WAVES”. They have preoccupied radiesthesists for a long time and many theories have been advanced. Many gadgets have been created and used to restore the vibratory environment to a normal balance. How many of these inventions function in a satisfying and permanent way?

In our opinion, the research made until now has been without sufficient theoretical basis, and it falls under a more- or less-sophisticated empiricism. We have tried to go a bit further by taking the opportunity to experiment on non-suggestible living subjects, livestock animals.

Without pretending to have definitively resolved the problem, we are going to review the principle causes of dangerous waves: subterranean currents, faults, electricity, furniture, etc. and we will then give, for each category, our own solutions, no doubt temporary.

UNDERGROUND WATER CURRENTS AND DRY FAULTS

You might ask why reestablish equilibrium over springs and faults? These are natural phenomena that are normally not dangerous. There is perhaps, then, in virgin Nature an auto-compensation, but the hand of man always introduces a dis-equilibrium, and that is not limited to simply clearing a spot in the forest.

We have passed this stage.

For the people in the countryside, it has long been known that sleeping over some underground watercourses compromises health. Many unhealthy conditions follow, of which the least is rheumatism. Cancer, itself (Cancer is the inverse of the East-West constituent of the Vital Field.), practically always coincides with East-West subterranean watercourses and faults. It was M. deBélizal who discovered this relationship between underground springs and cancer, and we have many times verified it since

then. According to M. deBélizal, the true cancer-causing water flow is in the West-East direction, but cancers are also found over East-West and even in other directions. Everything depends on how the natural causes interfere with the conditions that have been artificially created at that place.

How do we know that someone has been sleeping over underground springs? Or more generally, sleeping in an unhealthy environment?

Outside of the pendulum and the dowsing rod, an indication is less frequent: one gets up in the morning more tired than an old person, just from lying down in bed, although his normal awakening is to jump out of bed in full form.

The need to sleep during the day, after meals or any other moment, ought also to alert us. Pains attributed to rheumatism, arthritis and other causes can have the same origin, and I could go on. The dis-equilibrated environment forces the nervous system to re-adjust until that day when the central nervous system weakens and shows fatigue, lowered vitality, and even nervous depression.

One of the most frequent maladies associated with ruptures of forces or perturbations of telluric origin is septicemia of the calves in the stable. Re-establishing the equilibrium of the environment eliminates the septicemia. Corrections of the environment often lead to spectacular ameliorations, sometimes unnoticed. So many examples I could give! You will see later on that it can work for you.

In addition to finding the underground water that surprises us by causing damage to animals and people, it was and is still the special preoccupation of dowsers of all kinds and all times, to find water and dig wells.

Many methods of prospecting rely on experience and personal factors for a scientific approach. We will not address them. If you have the inclination to perfect your general education on this subject, the literature offers you inexhaustible choices.

We will content ourselves that we have a Hebrew phrase, well-understood by M. Bardet, that could be useful: Y Ts hA W M Y M : it will spring up from the water.

This "Squared" Hebrew text on a paper attached by a rubber band to a cylindrical pendulum gives surprising results and reduces testing. Placing the text to the right, one finds only the places where one could dig, where there is a pressure from water, in general over a crossing of subterranean currents. With the free hand as an antenna, one can easily spot these points with precision.

With the text on the other side, holding the cord at the other end, the pendulum only reacts to the currents themselves, not to their crossings.

This pendulum functions whether or not the ruptures are balanced. It would be in vain to use it to regulate a re-equilibrating instrument. But that is not essential for our purposes, which is the correction of the noxious character of the water currents.

First we must try to understand what happens.

What do we see?

The “Knot of Life” pendulum turns when it encounters the vertical from a subterranean current. There is then a right angle deviation from the East-West constituent of the Vital Field. The problem of correction consists of restoring the correct direction, horizontal, of this constituent, and at the same time we will cease detection of Electric Negative Green, which had caught the eye of M. de Bélizal. He saw equilibrium in a compensation between + coming from above and – coming from below. This is whence the name “Rupture of Forces”: the Electric Negative Green makes the + switch off. Apparently, it seems to be so when one remembers what we said in our first chapter on the genesis of the shape-caused waves, but, in our humble opinion, the Electric Negative Green is the consequence of a deviation of the challenged field.

We explain.

We present two “canons” to each other on a horizontal plane, $8 + 10 + 5$ or $8 + 10 + 10 + 24$, emitters of the Knot of Life. On the vertical at the point where the emissions meet, a non-balanced environment, we detect at the same time the Knot of Life and Electric Negative Green.

Electric Negative Green is a consequence of the crossing of the two emissions of the Knot of Life.

Now, subterranean moving water is the carrier of the Knot of Life. It cuts the East-West of the Vital Field. The meeting of the two emissions of the Knot of Life gives the resultant vertical Electric Negative Green.

This is about all we know about the process of the rupture of forces.

Maybe you have another explanation to give, or a more complete one?

How do we reduce the situation to normal? That is to say, how do we make it as if there had never been a rupture of forces, leave the dowsing rods still, and, if possible, to eliminate the health troubles caused by these ruptures?

For years people have tried to do this with more or less complex and mysterious systems. The discovery of shape-caused waves by M. de Bélizal led him to make a giant step with his “Maxi” and “Mini” re-equilibrators based on an Egyptian ring. This was enormous progress.

We confess to wandering for a long time, obsessing about the famous Electric Negative Green, in spite of the infinitely valuable and patient aid of M. de Bélizal.

The discovery of the Vital Field and the emission of the Knot of Life by the stem of a leaf has given a simple solution: orient a plant leaf with its stem intact so that the emission of the stem is East-West. Fasten the leaf on a board with one piece of tape running lengthwise, then with one or two courses of tape around the board to secure it. This serves as a collector; the board supplies power and radiates around 100 meters per kilogram of board. Orient the leaf point to the East and be very precise, for one must observe a meticulous propriety. Another method is to place the pressed leaf *unattached* between two boards if you are able to check it frequently.

This leaf-board, a good first-aid solution, has given excellent results when dealing with natural phenomena on the physical level. Failures have been due to other causes for which we return to the chapter on Magic.

Another solution for local correction consists simply of materializing the three axes comprising the Vital Field: two perpendicular grooves along the axes of symmetry on the upper face of a board or a beam completed with a hole completely through at the crossing of the grooves. Once the board is oriented North-South along its length, the result is nearly correct. One finds neither Electric Negative Green nor the Knot of Life, the condition found in a vibratory ambience of calm. Indeed, the stable equilibrium thus obtained is elastic. The least movement, the least variation, the passing of a car, makes the temporary return of the Knot of Life and Electric Negative Green for a very short instant. While it works in the countryside, this system is not for the busy street. It must be stabilized.

Begin with the holes from the harmony of the major triad on the North part of the board as we did for the amplifiers [see pp 65 and 104]. This shape is oriented to 355° magnetic, and then a dowser will not find more springs unless he holds a plant leaf by the point between thumb and index finger, or closing the circuit by supporting the thumb on the little finger.

If you want to create your own re-equilibrators, these must be absolutely permeable to magic, not only in the physical, to be without influence over the direction of Shin from the vertical of the Vital Field. Otherwise, sooner or later, but certainly, the re-equilibrator will charge up, saturate, and become ineffective.

In addition, it is necessary that the Knot of Life be *really* re-established at the horizontal, that is to say that the usual parameters already mentioned must not find it above a rupture of forces, only the Electric Negative Green.

The problem of the dry faults is exactly the same as that of the springs from the point of view we take. The difference is in detection. You will find plenty of Electric Negative Green and the Knot of Life in the vertical direction, but the Y Ts hA W M Y M pendulum will obstinately refuse to turn to the right or the inverse.

A CORRECT SOLUTION? THE LAW OF SYMMETRIC COMPENSATIONS

This law is usually present in all balanced systems or useful practices for correcting a field that produce automatic, lasting compensation.

This law might even condition the natural defense mechanism of a living being against the various aggressions of which it is the object. This could be clarified by research.

Experiments

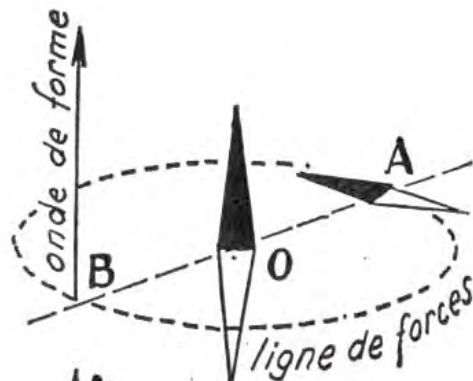

1. Let a magnetized vertical needle be cut at its center O by a horizontal plane.

Around a point A on this plane, a horizontal magnetized needle is turned. We notice an emission of a shape-caused wave to the vertical from a point B on the plane, symmetrical to A in relation to the center O of the vertical needle.

This shape-caused wave depends upon the angle of the horizontal needle with the line AB and shows the usual spectrum of differentiated shape-caused waves (at nearly 5°).

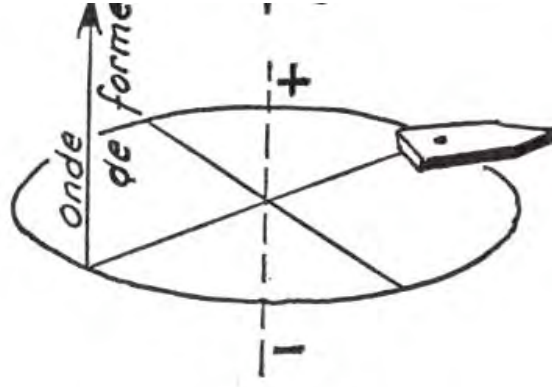

The orientation of AB in relation to North does not behave with detectable or appreciable effects. One can suppose that the shape-caused wave follows the lines of the circular forces of the vertical needle in the horizontal plane. So we search on the circle having O as its center and passing by A and B with the aid of a ferrite rod placed vertically on the plane.

Shape-caused waves moving
Vertically from B; circular line
of forces

2. More generally, draw a circle with its two perpendicular diameters in a horizontal plane such that the + field is above it and the – is below. Around the extremity of one of the diameters, turn a horizontal pointer, and find a vertically shape-caused emission at the other end of the diameter.

Shape-caused waves emitted
vertically at the opposite end of the
diameter

3. Now think of a shape creating its own polarized field, such as the Equatorial Disk, for example. An emitting shape, placed on the artificial North axis (0° or 360°) emits on the artificial South axis (180°), symmetrically with relation to the center.

An emitter placed on the South axis (180°) emits above itself.

An emitter placed on the surface of the artificial East semicircle emits above a point symmetrical with relation to the center.

Any shape placed in the West part of the surface emits above itself.

We can then say:

A shape in a positive sector of a plane or on a straight positive line emits in a sector or on a negative line symmetrically with relation to a polarized axis (Electric Ultra-Violet) perpendicular to the plane. One shape in a negative sector or on a negative straight line emits above itself.

Remarks: We know that in cellular multiplication by mitosis (bipartition), the nucleus in a cell engenders the future nucleus by induction. Why not think that this induction happened with relation to a virtual polarized axis of the cell, thus following the law of symmetrical compensations? One could perhaps discover here the anomaly that causes the anarchical multiplication of cells in cancer cases. One could, in any case, try to see what happens on an Equatorial Disk submitted to a vibration from between Electric Negative green and Electric Black. We have not done this important experiment.

Application of the Law of Symmetrical Compensations: Reciprocal Circles

Given two equal tangent circles, a shape placed at the center of one of the circles emits above the center of the other. There is reciprocity between the two circles and we have adapted this particularity to the Law of Symmetrical Compensation.

On a rectangular base, we draw three equal circles. Two are tangent to the center of the third and the line of the centers is on the rectangle's axis of symmetry.

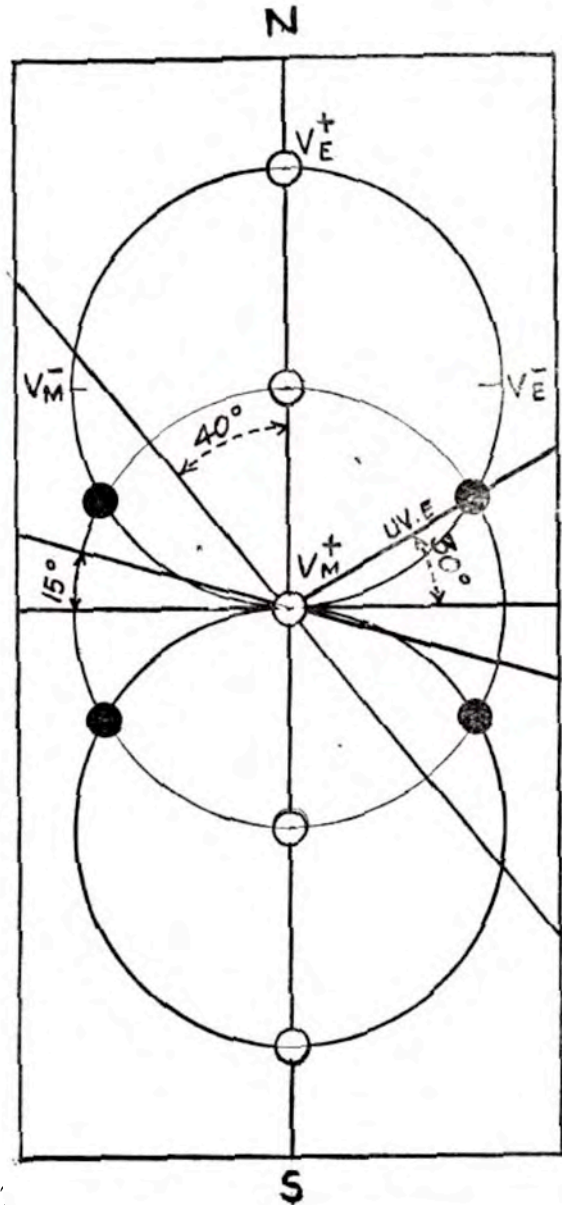

Drill holes completely through on this line of centers at the ends of the diameters and at the centers of the circles, five holes in all.

At the four intersections of the three circles begin, but drill only partially, a hole.

Reciprocal Circles

V = vert for Green

UV is Ultra-Violet

Finish the construction by grooving in the principal rays of the Field of Shape, the point of intersection being the tangence point of the two outer circles and the center of the central circle.

A shape placed on the center of the artificial North circle emits vertically above the center of the South circle. A shape placed at the center of the South circle emits above itself.

When correctly oriented to 355° magnetic, this re-equilibrator functions indefinitely and does not seem to be able to be dislodged by other nearby shapes.

One can also make an instrument for emission and treatment by turning a needle around the center of the North circle. This circle is then divided into graduations according to the usual norms for the Aura, and the shape-caused wave is found above the center of the South circle.

Place a witness directly on the South center, and, in effect, pull a cord from a reel inserted in the hole in the center; the results on a subject treated at a distance are good on the condition, surely, that the correct setting for vibrations is chosen. Like the Equatorial Disk or the Bombe, saturation is not a problem, because it shuts off automatically.

We understand that amplifiers can be attached to this instrument.

This solution for the reciprocal circles is one of many possibilities, but must not limit the imagination of researchers; there are many others. Take, for example, the innumerable vibrations from Nature on the same theme . . . and never forget polarity.

THE SPECTRUM OF EQUILIBRIUM

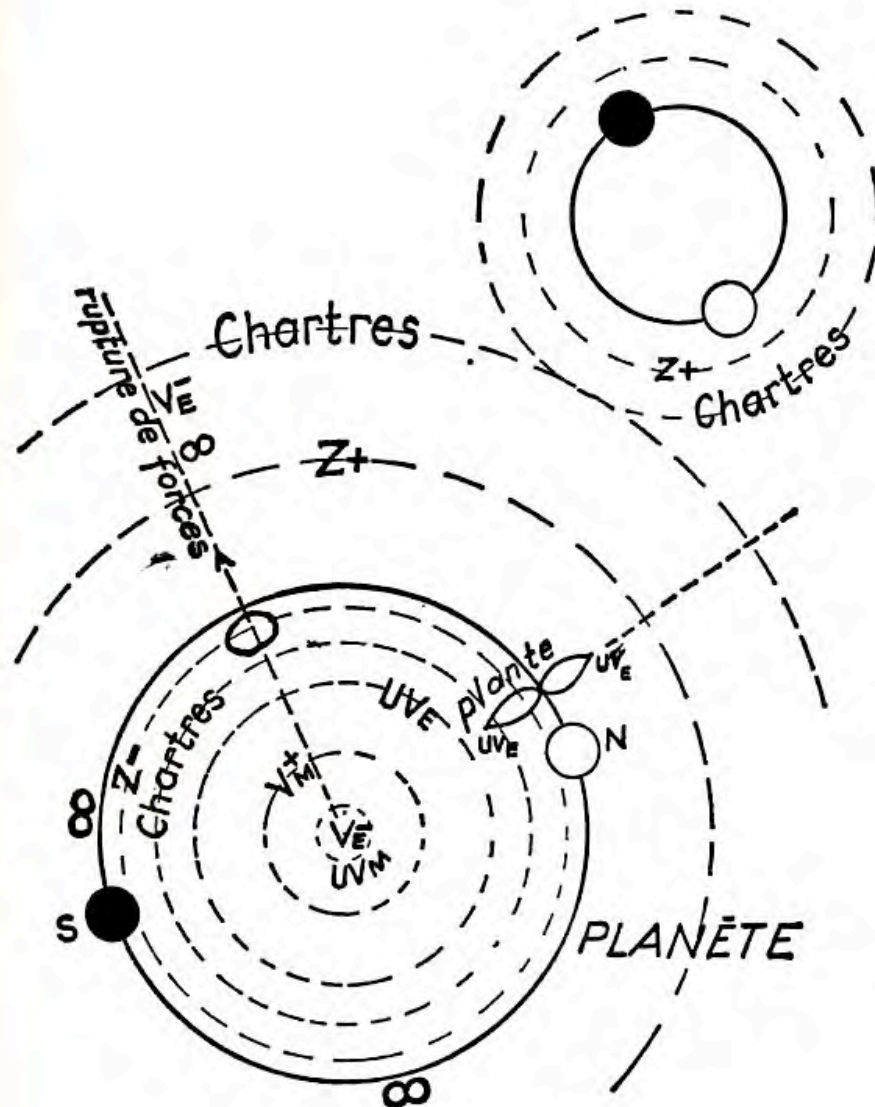

The symmetrical compensations are an approach aimed at producing equilibrium, but as yet they are insufficient.

There is, in fact, an entire group of remarkable vibrations that accompany equilibrium from the origin above our heads to the center of the earth. This collection of vibrations constitutes a spectrum that one could call “The General Spectrum of Equilibrium”, and that is found in its entirety on every shape that is capable of providing equilibrium to its surroundings.

This spectrum is superimposed on other specific vibrations of elementary shape, which do not facilitate research.

We got the idea of this spectrum of equilibrium by examining the interior of the Châtres Cathedral, notably a span from the upper rose and continuing to the ground.

For a clear exposé, perhaps the simplest way is first to locate the spectrum of equilibrium in space, as it is understood to present itself around the centers of the celestial bodies in balance.

We have a planet and a satellite. Between the two celestial bodies, at a distance from each relative to their respective sizes, the Wave of Châtres can be detected. We understand this to be the wave of equilibrium of two forces under active tension at their point of application.

Toward the center of each body and on the concentric circles, we find:

The Z+ vibration.

The Knot of Life on the surface of the celestial body, here
on the circumference of the drawn figure.

Z– under the surface of the soil.

The Wave of Châtres.

Electric Ultra-Violet (or L Y L H, the Night).

Magnetic Positive Green.

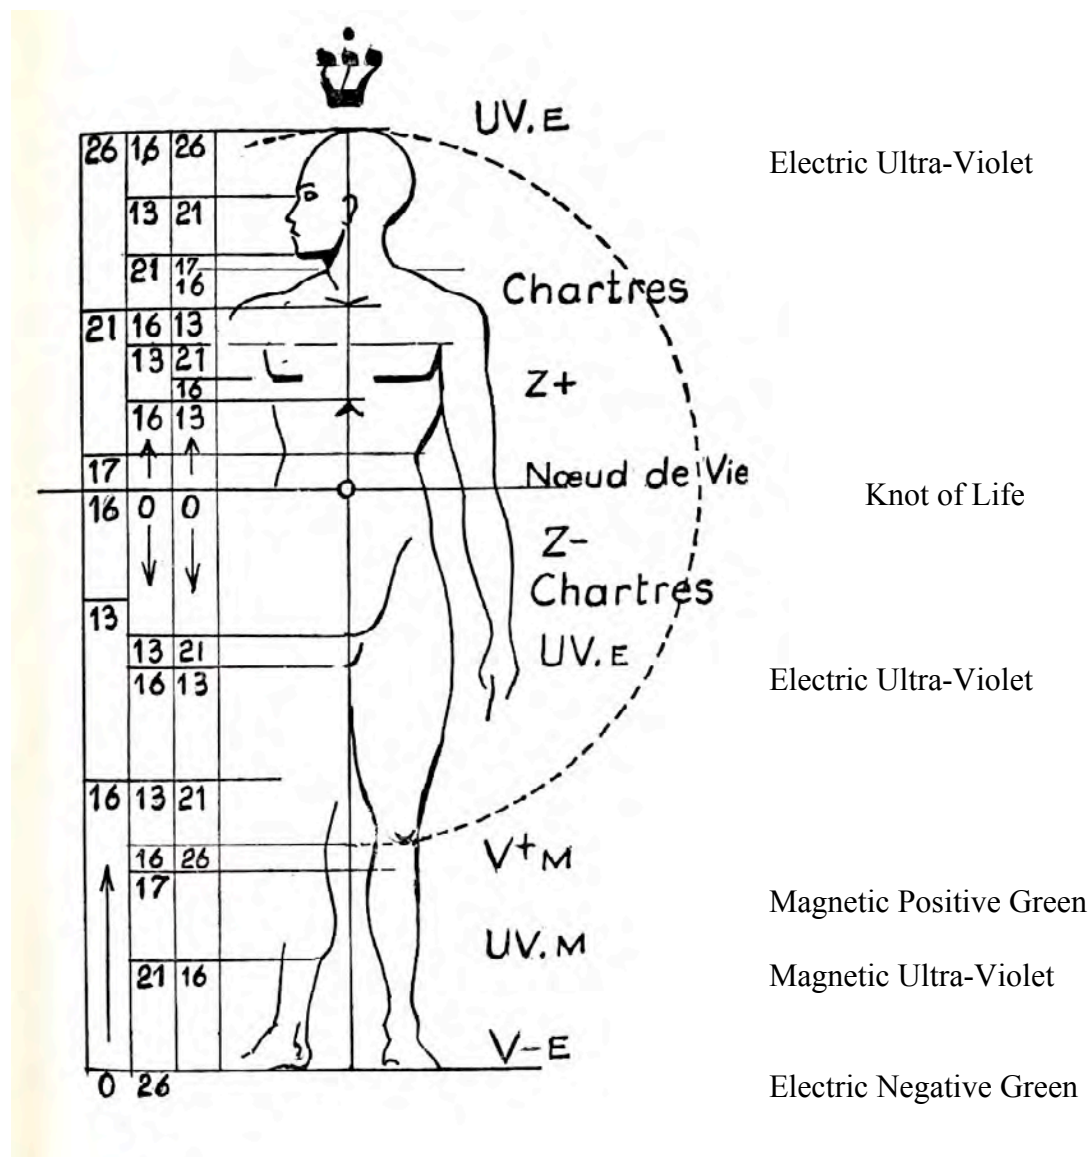

Magnetic Ultra-Violet,

and finally, at the center, an Electric Negative Green.

Toward the exterior, beyond the Wave of Châtres, we have not found Electric Ultra-Violet explicitly. It is, however, present at the potential state because one has merely to put the smallest point on the surface of a celestial body for it to manifest.

The drawing of the polarized celestial bodies permits reproduction of what we observe on the surface of our globe, ruptures of forces and others, that justify our drawing. We see in particular that the plant tied to the soil at its Knot of Life is limited to two Electric Ultra-Violet at the two ends of its shape. So, if we want a complete balancing that would leave us independent like so many little satellites, it is necessary for us to go beyond the Electric Ultra-Violet of the roots, until we reach the Electric Negative Green from the center of the Earth.

This is the spectrum observed on man and the animals who are autonomous and have their own Knot of Life on them. At the physical level that we occupy, this Knot of Life is found at the point of origin of our growth. For mammals, for example, it is at the navel, the point of insertion of the umbilical cord and source of fetal nourishment and growth. The fact is easy to verify by applying the Law of Symmetrical Compensations. A shape placed at the Knot of Life emits its vibration to the Magnetic Positive Green point, and Electric Ultra-Violet from the other side halfway around.

It seems, then, besides that human proportions must be calculated from the navel in the manner of a floor plan of a building taking its origin at the Center of Life. Others who are more familiar with these issues could broaden the question with the natural proportions seen in architecture. It is besides well known that the navel divides the human body according to a proportion approximating the Golden Section. But you know our sentiment on this Section: it is necessary to incorporate it into an exponential (geometric progression) structure.

As for animals, if the Electric Ultra-Violet of the origin is situated near the head, at the highest point, the Electric Negative Green varies in location. It can be between the paws of a mammal on the ground or of a perched bird, or at the end of the tail of a fish or a snake. On the subject of the latter, the symbol of the serpent that is biting its tail and swallowing its Electric Negative Green makes one wonder: an auto-mummification???

The vibrations of the spectrum of equilibrium can very well not be at rigid divisions from each other as were the forms calculated from a proportion. These separations can vary according to shape, and it is no surprise that there are an unlimited number of possible shapes, which, with the right orientation, are capable of neutralization of a rupture of forces, rendering illusory a commercial protection of long duration.

We give an example of the spectrum of equilibrium in Hebrew characters arranged inside an Egyptian cartouche. You can see that it can be used like a reference. The Knot of Life is produced by the positioning of the Hebrew words and their separation distances.

Rather than telling more, it is really necessary that everyone work on it a bit.

(Magnetic Positive Green)

ELECTRIC POLLUTION

As if the natural causes are not enough in causing disequilibriums, our “civilization” exaggerates it with all the electrical phenomena that we produce in one way or another. Our comfort requires electricity.

And not to forget the steel-reinforced concrete which disturbs the normal magnetic field.

Then for electrical conductors and the many machines that ionize the ambient air, those important re-equilibrators for underground springs also give good results, because they seem to act through amelioration of the resistance capacities of the organism.

A solution for simple repair and at little cost sometimes succeeds, on the condition of putting some care into its execution:

Take a copper wire (or non-magnetic metal wire) of 3 or 4 millimeters in diameter, such as wound on electric motors, and at least one meter long, if you want a convenient handle.

Bend the wire at the middle into a circle, diameter 3 to 6 centimeters. Bend the branches back so as to make two *parallel* lines of the same length of which the separation is constant and equal to the diameter of the circle.

This figure, which is perfectly symmetrical with relation to one axis, is suspended vertically on a single pulley turning around an axis.

The ionized air discharges, but, if you take a leaf from a plant by the point between the thumb and index finger, you will find the Knot of Life above a rupture: the system is incomplete.

The Peyré rays, among others, remain, with their disadvantages, but in certain “impossible” and anti-natural ambiances, this copper wire provides actual relief.

A word about Television.

Never lie down at the vertical of an antenna. This is a powerful accumulator that forces back to the vertical from its foot radiating one to two meters of toxic radiations. One day we found a farm woman who got up with stiff legs every morning. The television antenna was affixed to a rafter in the attic exactly above her bed. The antenna was moved to another truss and the discomfort was finished.

When we see the forests of antennas on roofs, one can understand the Social Security deficit. . .

The TV set itself is not without danger, besides the “gamma” rays emitted by the screen. We had a son whose bed upstairs was exactly over the TV. In the morning he experienced fainting fits and vomiting rather frequently. Now every night we unplug the TV and the antenna, and the malaise has disappeared.

We have also known someone whose daughter slept in the plane passing through the antenna and the set, between the two. The parents worried because they noticed that their daughter had a lot of difficulty healing wounds. And then, one fine day, the TV set broke down and was not replaced for several weeks. To their surprise, the parents watched the cuts heal over in a normal manner.

There also exists an insidious and little recognized phenomenon of ground wires that malfunction. It came to us to dig up an old ground from an old milking machine in a cow barn where they had diarrhea: by the next day, the diarrhea had disappeared. The wire was an antenna capturing who-knows-what, the plug itself was full, and it all gave out Electric Negative Green to the cows.

Most of the time, the grounding electrician contents himself with planting a stake in a more or less humid spot and to make the contact with a clip instead of an honest solder with tin. At the moment, as they say, the ohms are correct, but come back one or two months later, the time it takes for oxidation to appear . . . and verify with a neutral pendulum by touching the wire with the index and middle finger of the free hand.

A good ground must be made at the exterior, outdoors, never under cover, in a place and at a depth where one finds good humidity in summer. It requires a sufficient coating of metal conductor (never iron, which rusts) on the order of one square meter per instrument, and that all be soldered with tin from one end to the other. Otherwise the daughter of the house risks electrocution at the handle of the refrigerator . . . That's what happens.

You think about the grounding done by the EDF [French Electricity Board]. They are usually deficient. Like at the home of a brave man who had a transformer at the end of one of his buildings.

Early one morning, after having rendered his tribute to nature, it was impossible for him to get up: his legs were paralyzed. His cries awoke an employee who, obligingly returned his boss to the vertical.

So the EDF remade its ground under the pool and all has been fine ever since.

FURNITURE, etc.

In general, all the emissions from the furniture in one room mix and are not detrimental.

It happens, however, that certain arrangements are toxic, like armoires that make a triangle with the angle of the wall in a corner. This particular situation, frequently in the country, emits a powerful Electric Negative Green at the angles of the piece that reflects off the walls and completely poisons the room.

If a bed is at the corner of the armoire, the head of the sleeper accumulates Electric Negative Green all night, and in the morning: headache.

Tablets and sleeping pills follow, and everyone knows where that goes. It would be simpler to put the armoire along the wall.

It can take a long time to find the origin of certain illnesses.

A shopkeeper selling fabric awoke stiff in the morning as in the case of the TV.

The local dowser had found springs all over the place under the bedroom. Our opinion had been asked, so we found that the origin came from above. Effectively, in the ceiling truss there was a missing vertical member directly over the bed. A board was nailed in to re-establish the symmetry of the shape on both sides of the truss, and the affair was closed.

That understood, many other origins can be found for these so-called toxic waves, but no one can spread out infinitely far nor have everything prepared in advance. It is for the knowledgeable radiesthesist to make his imagination work using his experience.

A SURVIVAL TEST?

This is outside the category of toxicities, but we are discussing methods of re-equilibration, as in making the following experiment with the re-equilibrators that we have on hand.

This is within the ability of any good dowser and the trial has been repeated successfully several times.

Take one of our re-equilibrators placed flat on a table with a carefully-determined orientation. In its radius of action, one finds no springs and no toxic waves.

We place directly under this re-equilibrator (or on the South center of the Reciprocal Circles) a witness of a living plant or animal. The instrument works directly on the subject whose witness it is, and a dowser finds his springs have disappeared. It is the same with a photo of a living person.

Now we use a witness of a *dead* animal. The dowser cannot find his springs. The dead animal returns to matter, and the witness has become something inert. Attention, however, if you use a photo of yourself, because this can represent something living at the moment of the test, a tree or a shrub, for example.

If we make a witness of the *dead person*, this witness reacts like that of the living person: the dowser finds his springs.

So, to conclude:

Not in the direction of spiritism, which, according to the Curé of Ars, is nothing but the toy of Satan. We notice simply that the life of a man does not end with the death of his body. What relationships exist between the human immortal soul and what is left on Earth?

Mystery.

Without a doubt we will know the answer to that when we are dead ourselves . . . We can, nonetheless, think of a place to subsist between the soul and what becomes the Body of Glory or of Damnation at the final Resurrection.

Do not bolt, but reflect.

CHAPTER VII

ANALYSIS

GENERAL

After using classical agricultural analyses and having found a number of these analyses in other radiesthesia books, we would be satisfied if we had resolved the problems on the job. But for every method there are advantages and disadvantages.

Shape-caused waves are not without their troubles or failures, yet all the same, they come with possibilities that do not show up in other analyses, notably from the point of view of reproduction and extension to multiple elements without modifying the way they are made.

The methods that follow have been conceived for agricultural goals and for professionals, although their usage can be universal.

To great advantage, we base them on the unique reference of vital equilibrium, which is important for all living things, and capable of putting an organism into its optimum relationship.

This is superior to chemical, spectrographic, atomic, and other methods of which the absolute numbers cannot be interpreted except in relation to norms calculated as a function of long and much-repeated experiments. Yet one is never sure that unknown factors have not caused a false interpretation of the data.

On the other hand, the numbers that we obtain, directly expressed as a deficiency or an excess, automatically take into account the entirety of the unknown and the known of the sample being analyzed. Without worrying about the rest, we know this or that element is too much or too little in relation to the optimal. The distinction between deficiency and excess clearly limits the experimenting to the control of the importance of a deficiency. With good experience on the job, big mistakes are less likely.

The ruler described below turns out to be a magnificent working tool for research, provided the researcher has acquired a sufficient mastery of the pendulum. Trials are done that eliminate the pendulum, but they are only a first step if that is all you do.

The pendulum only intervenes as a last resort, simply to verify that the measurement is made, without mental effort, a little like the idiot light that illuminates on the dashboard when the engine starts.

THE INSTRUMENT: THE RULER FOR ANALYSIS

This ruler is the result of years of research related to the rulers for equilibrating the environment because the two problems arise from the same principle, that of the law of symmetrical compensations.

Essentially, this method is a comparison between points A and B, which are symmetrical with relation to a center C around which turns a needle that regulates the equilibrium.

The drawing gives the locations of the grooves and accessories. If one places a shape at A, its vibration is found above the B. If one places the shape on B, it emits at its own vertical: a familiar occurrence . . .

A Summary Description of the Ruler

The body of the ruler is a rectangular board of wood or another homogenous, non-magnetic material.

a) Around the center of symmetry C on the upper face are grooves following the axes of direction of the Field of Shape, including:

The rectangular axes of symmetry of the board

The axis of 40° from North-South in the N-W, S-E quadrant

The axis of 75° from North-South in the same quadrants

The radius of the Electric Ultra-Violet at 60° from the North toward the East.

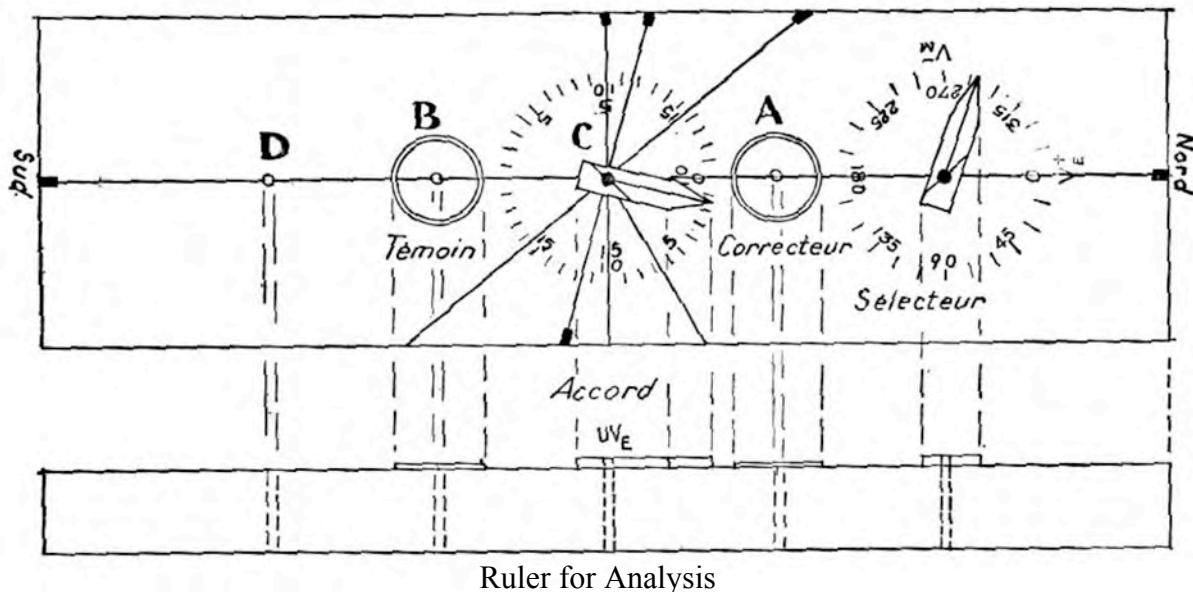

b) Two vertical axes in copper cross the board from side to side on the longitudinal axis of symmetry, one at center C, the other to the North. Around these axes turn wooden pointers with axial grooves and they capture Electric Ultra-Violet at the tip of each pointer from 60° to 120°.

c) Symmetrical by relation to the central axis of rotation and centered on the longitudinal axis of symmetry are attached two circles of copper, A and B, of which the one, A for the witness [Témoign], is found at mid-distance from the two axes of rotation.

d) Around the North axis of rotation is traced a circle graduated in sexagesimal degrees and according to the usual spectrum of differentiated shape-caused waves with Magnetic to the West and Electric to the East. The needle turning around this center of the circle selects the field: Physical at 270° (Magnetic Negative Green), in the Vital at zero (Electric Positive Green). Without the needle, the Vital is given.

e) Around the center C is traced a circle graduated into conventional decimal divisions established in view of an easy-to-use curve. Two graduations: one on the exterior, one on the interior. The exterior graduations go from 0 to 20 on each semi-circle, from South to North, passing by the East. The interior graduations go from 0 to 20 on the whole circle in a clockwise direction. In a moment we will see why these graduations have been chosen.

f) Holes have been drilled completely through the board at the centers of the copper circles A and B as well as at D on the longitudinal axis, symmetrical to the North axis of rotation in relation to center C.

Detection and pendulums

Just like the Equatorial circle, one observes – polarity above the center C and + polarity to the South of the ruler, in a non-equilibrated ambiance.

The North pointer engenders a shape-caused emission to the South of the ruler. This emission makes the H hA R Ts pendulum turn when the pointer is on the Magnetic Negative Green. The L N Ph Sh cH Y H pendulum turns when it is on the Electric Positive Green. These are respectively the selections on Physical and Vital, the latter obtained directly by canceling the North pointer.

With the North pointer set on a certain graduation, there exists a position of the central needle that suppresses the preceding polarities, making the + appear above the circle B and the – below. This is the reaction of equilibrium, with circles A and B empty, obtained when the two pointers are perpendicular in a well-determined direction. On the other hand, the same equilibrium renders the center B the center of a polarized body and with an Aura whose rays are a function of the power of the ruler, permitting supplementary controls of the equilibrium.

If circles A and B are occupied by a witness and corrector, the angle between the two needles that make the + and the – appear in the vertical over B, the spectrum of the Polarized Body and that of the Aura, indicates an equilibrium to interpret that we will summarize next.

CALIBRATION OF THE RULER

If you place identical coins in various denominations on each of the circles, A and B, the relationship of the weight between each circle permits determining the central graduations by the positions of the C pointer corresponding to the equilibriums.

1. North Pointer on Magnetic Negative Green or Electric Positive Green. Interior divisions of the Complete Circle C

The coins are on B, nothing on A:

y = the number of coins:	1	2	3	4	...
10 x = graduation of equilibrium	10	15	16.7	17.5	...

All coins on A, nothing on B:

y = the number of coins	1	2	3	4
10x= graduation of equilibrium	10	5	3.3	2.5

The weight over B multiplies, over A divides.

The curve corresponding to B is an equilateral hyperbola with equation:

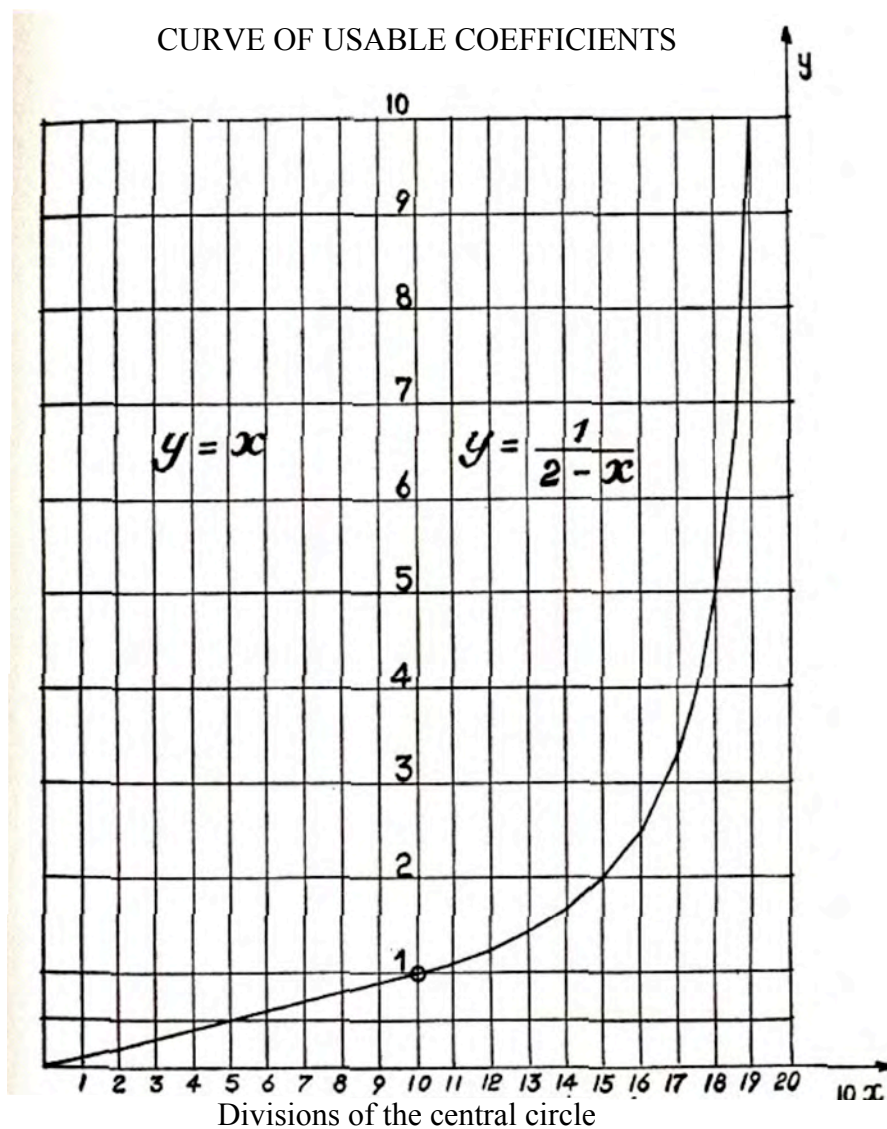

$$y = 1/(2 - x)$$

The curve corresponding to A is a straight line of equation:

$$y = x$$

The two curves have the same angular coefficient: $x = 1$

There is, then, a continuous curve from the 0 mark to the 20 mark of the central circle.

2. Coins on A and B

The North pointer on Magnetic Negative Green. Interior divisions of the whole circle C.

Number of coins		Divisions of Equilibrium	Equation
A	B	10x	
1	1	10	
2	1	5	$y = x$
3	1	3.333	
4	1	2.5	
.....

The North pointer on Electric Positive Green. Exterior divisions of each semi-circle at C.

Using the same operation as above, we notice that the important curve for the whole circle is also correct for each semi-circle, west or east. It is with this intention that the two graduations, interior and exterior, have been created.

This curve is called the Usable Coefficients Curve, or UC because its principle application is for corrections for animals or soils. Nothing prevents expansion to other applications of the ruler.

HOW TO USE THE RULER

1. In the Physical

With the north pointer on Magnetic Negative Green, the weighings occur when one makes comparisons between inert objects of the same chemical composition placed on A and B, one serving as the standard.

Then we apply the curve of the Usable Coefficients to the interior graduation, equilibrium being at 10 (Usable Coefficient = 1).

Precision requires that the weight put into comparison must be of the same order of size. It is also without a doubt possible to make the weights of the simple elements composing them by taking a standard of the pure element form comparison (Cf. G. Noel, *La Radiesthésie au Laboratoire de Chimie [Radiesthesia in the Chemistry Lab]*). Not being chemists by profession, we have held back launching such operations. But according to Noel, who operated by the Neutral Point method on a Lesourd ribbon, in a dilute solution the concentration is in the solution: from a certain concentration it moves suddenly to the dosage from the dry element.

Soils: With nothing at A, if a soil sample is placed on B in a small Plexiglas container, the North pointer set on Magnetic Negative Green, then the pointer at C gives the graduation that corresponds to acidity or alkalinity. One can then calibrate the pH.

This, in any case, can be done with the elements and solutions of known pH, acid or alkaline.

Alkaline under 10. Neutral at 10. Acid below 10. Remember: interior divisions of the whole circle.

Animals: With nothing at A, the optimum is at 10, interior graduation. The scale corresponding in C to a living animal witness placed on B reflects the electromagnetic ambiance. In reality, one can begin to worry when it is under a UC of 0.8 to 0.9. Below 0.7, the environment requires correction. It is rare that it descends lower than 0.6. It is curious to note impregnation of cows who live in the barn only for the time period required by treatment and remain in the pasture night and day. Their equilibrium is close to that of those who would have a prolonged sojourn in the barn.

We note that magic can give the illusion of a toxic electromagnetic ambiance, the same can influence the ambiance of a mineral. This is curious, but normal: people or animals in bad health have disturbed equilibriums no matter what the cause.

2. *In the Vital*

North pointer on Electric Negative Green. Or without the North pointer.

Witness of a living person on B. Nothing on A.

Interior divisions of the whole circle. The UC gives the vitality of the subject. Optimum is 2 (division 15). Most persons and animals have UC varying from 1.3 to 1.4 (divisions 12 to 13). Above 1.4, health is good.

Under 1.0 it is really quite bad. The big illnesses without any hope of cure can descend to 0.3 or 0.4. Below that, it is truly the end.

In the soil, the UC is of course related to microbial activity, but we have not done systematic research. Sterilized soil gives a UC in the neighborhood of 0.

Witness of a living person on B. Chemical corrector or remedy on A.

Exterior divisions of the semi-circles.

The respective weights of the witness and of the corrector do not figure in. Only the qualitative aspect of the elements counts. Through the UC, we obtain figures of the relative importance of a lack or an excess in relation to a single optimum equilibrium.

If the C pointer falls to equilibrium in the west semi-circle (alkaline), a figure from the UC is needed. It then becomes a multiplier for the normal use of the element being tested.

For example: if the usual fertilizing of the soil is with 100 units of phosphoric acid (P_2O_5) and a UC of 0.7 is obtained for Phosphorus, the fertilization is to be reduced to $100 \times 0.7 = 70$ units.

Without looking for too much precision, a UC of less than 1.0 corresponds to a diminution of the usual application. With a UC of more than 1.0, the application is increased within the limits indicated by the test. Sometimes it is necessary to repeat the application. It is not a matter of shooting an illness or temporarily sterilizing a soil with brutal corrective methods.

If the C pointer falls on equilibrium in the east (acid) semi-circle, there is an excess and to be sure, it is necessary to avoid adding the tested element. One would immediately search for an antidote, which normally, with rare exception, is deficient.

Examples of correctors for soil and animal analyses: (in a closed Plexiglas container). Non-limiting.

Nitrogen: NO_3H stabilized by cotton wadding (10 cc)

Phosphorus: PO_4H_3 stabilized by cotton wadding (10 cc)

Potassium: Bicarbonate of Potassium (10 g)

Calcium: $CaCO_3$ precipitated (10 g)

Magnesium: Calcinated Magnesium (10 g)

Sodium: Carbonate or Chloride (10 g)

Sulfur: Flowers (10 g)

Iron: Filings (1 g)

Manganese: Dioxide (10 g)

Copper: Chips
Cobalt: Chloride (1 g + cotton)
Zinc: Chips
Iodine: Tincture on cotton
Boron: Boric Acid (1 g)
Molybdenum: Ammonium molybdenate (1g)
Lithium: Chloride (1 g)
Nickel: Metal (1 g)
Carbon: Retort carbon

EXAMPLES OF ANALYSIS

The pendulum we use is of little importance; what is essential is to have it well in hand. There are certain moments when one pendulum is more sensitive than another, and without reason. One can within the same test use various pendulums and compare them to each other, especially at the beginning. Then, with practice, the breaking-in for series analysis is completed.

Suppose we have a soil to analyze. We put around 5 g or one level coffee-spoon of sifted dry soil (2 mm) in a small Plexiglas container. We place it on B and leave it there.

First operation

We set the North pointer at Magnetic Negative Green (270°). With the Electric Ultra-Violet pendulum in hand, for example, one gets a rotation above C. With the free hand we slowly turn in small discrete increments, the C pointer starting at the interior zero. At a given moment, it seems that the pendulum stops or changes its direction of turning. Would we be at equilibrium? Changing the direction of rotation of the pointer starting again at zero by small discrete increments. At the same graduation as before, the pendulum stops. Pay attention. Return the pendulum to C and it begins to turn. We are without a doubt close to equilibrium, but precision is required to manipulate the pointer with the finger until the pendulum definitively refuses to turn. The stopping is very precise. Then we verify, if we care to, the vibrations of the Polarized Body and the Aura around B, as well as + above.

Suppose that the interior division indicated was 12.5 corresponding to a UC of 1.3. We are in the presence of a very acid soil to which it is necessary to add lime. We must have confirmation for this need of calcium carbonate to determine the correction.

Second operation

Now we set the north pointer on Electric Positive Green where, by choice, we straightaway remove the pointer and the results will be the same. As before we sought the graduation of the cessation of pendulum movement at Electric Ultra-Violet, or better, this time, we directly take the + pendulum.

Our choice made, we swing this + pendulum over B while we manipulate the C pointer with the free hand. When we arrive near equilibrium, the pendulum begins to turn the other direction sometimes, then ceasing when the graduation is passed. The precision is not as perfect as when checking for cessation as before, but it suffices often when making serial analyses to see a possible interpretation. One must keep one's guard up against certain movements that make the pendulum begin again too soon, and that is why we advise the moving of the pointer by small increments.

Suppose we have found the division 11.2 corresponding to a UC of 1.1, interior graduation. We can conclude that the microbial life is slowing down and needs to be increased. Will fertilizer do the job, perhaps?

Third operation

North pointer on Electric Positive Green or without the pointer, we place, for example, the phosphorus corrector on A. Using the same operations as before we find an interior graduation of 14 on the west (alkaline) semi-circle. This is a need and the UC is 1.7. We must seriously augment the serves of the soil with phosphoric acid with 150 to 200 units of P_2O_5 , for example, with a tone of slag or 700-800 kg/hectare of superphosphate 18%.

And now then,

Averages:

UC	Deficiency	Excess
0.1	Quasi normal	Tendency to excess
0.2	A bit weak	Very light excess
0.2 to 1.0	Weak	Light excess
1.0 to 2.0	Rather Poor	Excess
2.0 to 3.0	Poor	—
3.0 to 4.0	Very Poor	—
More than 4.0	Deficient	—

A SIMPLE VARIATION OF THE RULER FOR ANALYSIS

We have seen the Analysis Ruler directly applied to the Field of Shape and of the law of Symmetrical Compensations. It can appear complicated to make and to use. If one is not too demanding, a simplified ruler can render the same services as the one we just examined. The precision is proportional to the length of the ruler.

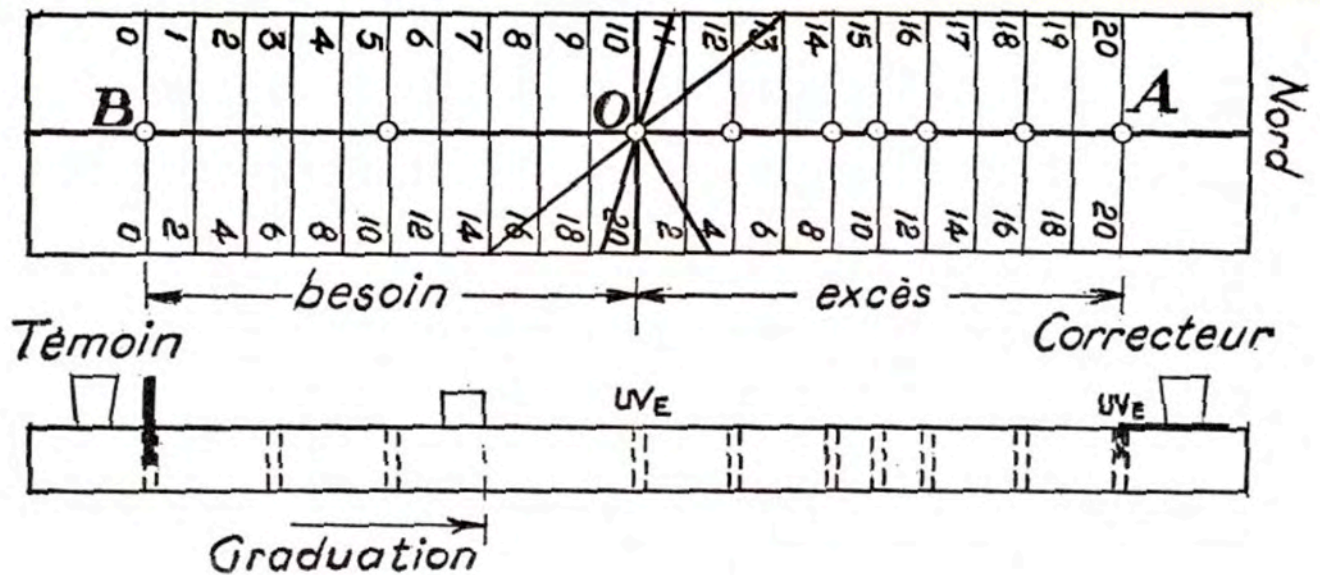

Take a board or plywood piece one meter long, by 12 to 15 centimeters wide and 2 centimeters thick. Make a lengthwise groove from end to end on top; then apply the directive axes of the field through the center.

Drill nine holes completely through this longitudinal groove: one at the center, one on each side at 40 centimeters' distance, at A to the artificial North, at B to the artificial South, and the others according to the drawing.

Divide the 40 centimeters to each side of the center into 20 equal divisions numbered from B to O to A in order to find the equivalent of the exterior graduations of the central circle on the first ruler and to be able to apply the same curve.

Another graduation divides AB into 20, and this corresponds to the interior graduating of the central circle. The witness is placed to the South at B, the corrector to the North at A.

One can use a + pendulum over the witness so that the index finger of the free hand moves across the ruler. At one position of the index finger, the + pendulum turns. One can fix it and use that as a reference point in place of the index, or again, place something that turns on the ruler, such as a little plastic cylinder on which is wound some "Scotch" tape. This is then the division that tangents the cylinder at the North that counts.

SIMPLIFIED RULER: WITNESS to the left, CORRECTOR and North to the right
 B to O shows lack; O to A shows excess.

In place of the + pendulum over the witness, one can also use an Egyptian pendulum or an equivalent over the O, and wait for it to stop.

An advantage to this ruler is that it permits trials for several correctors grouped on the board to the North of A, to test a complex correction. It can get crowded, however.

Like the other ruler, it is possible to select the field with a needle of copper wire, bent at a right angle, with the bent part inserted into A. Point the needle toward the North, Vital, or toward the West for Physical.

We suggest quite humbly that this ruler is more exact than the other for a beginner and less tiring for a trained operator. This ruler can analyze an element in a minute, notes taken, without exaggerated fatigue except for the tester's standing.

To find Vitality

With copper needle pointing toward North, witness to the South at B: the graduation found is between zero in B and the 20 in A which makes the pendulum react.

To Find the Correction

Copper needle at A pointing to North or remove the needle.
Witness to the South at B, corrector to the North.

From B (zero) to O (20) is LACK.
From O (zero) to A (20) is EXCESS.

We do not go any further on this because this size is most useful from the point of view of interpretation. Of course one can use a ruler that is twice as short, but also half as precise, and you can appreciate that it is also twice as tiring because of the increased attention that would require.

Now we are going to move into applications, which are almost exclusively agricultural, but one can use it for testing people and we know that medical questions intrigue radiesthesists. After the classic warnings regarding legal prescriptions of medication, no one can blame a person for taking an interest.

						18,5	6,67
						19,0	10,00

As for doctors and veterinarians, who know at least how to use a pendulum, they can discover in the ruler a useful helper for quickly finding answers to their questions.

CHAPTER VIII

APPLICATIONS OF THE ANALYSIS TO CATTLE

Real mineral disequilibrium in humans is close to that of livestock. Our mineral nourishment comes from vegetables planted into soils submitted to the same chemical fertilizers, N-P-K. Even a city-dweller could profit from certain conclusions made herein.

To state it clearly, I had practiced analysis by pendulum well before knowing shape-caused waves, in simple, valuable, and calibrated ways, based on the displacement of a neutral point between two identical samples of the same witness under the influence of the chemical correctors placed on a metric ribbon. I would notice without comprehending, and this method requires rather complicated experimental curves for interpretation to give a relatively imprecise result. I have now abandoned these methods, in favor of a good entrainment with the pendulum, solid information and often spectacular ameliorations in livestock farming.

From the moment of making contact with M. de Bélizal to the moment of the publication of *Microvibratory Physics and Invisible Forces*, I was captivated by shape-caused waves: at last we had something physical and that stands up!

I had only to adapt these waves to my professional needs, which were, among others, the setting back on its feet the explorations in disequilibrium. It had been necessary to accomplish the research from start to finish, and develop practical applications. You have seen the provisional end, the fruit of experiments on farms for about twenty years. It will perhaps interest specialists, farmers, and several others.

Whatever one thinks or says, the pendulum correctly and scientifically used over time promotes faith in classical methods (that I have practiced) by going straight to the end, provided one does not ask questions of the pendulum. I am not a “mental” dowser and do not like riddles any more than problems without solutions.

ACTUAL STATE OF SOME MINERALS FOR CATTLE

Nitrogen

A nitrogen deficiency reveals itself in malnourished animals for which the fundamental solution, from the energetic point of view, is to complete or enrich. Such cases are rare. Excess, on the other hand, while more frequent, is more difficult to interpret.

Phosphorus-Calcium

These two elements are linked to the detection of their relationship to each other. In checking plants, one normally finds a slight deficiency of phosphorus and a slight excess of calcium. From this data one cannot conclude about the need for lime on the plants because it relies on other data. We find, however, more and more dairy cows where the phosphorus is truly in excess or the calcium is lacking. This is due to the frequent use of mineral additives too rich in phosphorus used by farmers in doses too high based on theoretical tables, and especially in winter. A number of accidents of sterility, cysts, etc., more than likely have their origin in these unfortunate amendments.

From our point of view, in a certain measure, a cow is pushed to a certain disequilibrium. It is necessary to stop this right away but at the same time avoid brutal reversal. Practically, it would be necessary to ascertain the mineral conditions, year-round. The relationship between calcium and phosphorus gets even closer to that of the plants that are correctly analyzed, that is to say around 2, that would be found on acid or calcified terrain, and being given corn silage or other nourishment. We have seen spectacular phosphate deficiencies in the cows in chalky regions with a mineral additive containing 19 for phosphorus to 3 for calcium. On the other hand, a farmer told me he had never had such good results than with an additive featuring calcium to phosphorus equal to 3.

The problem of phosphorus is much more than assimilation of the absolute quantity, on land regularly dusted with manure phosphates. There can be limiting factors. Certain phosphate additives occasionally end up causing anomalous results. We have observed cows, who, after the administration of 16-16, began to gnaw at the bark of the trees and miscarry. To end this activity, things had to return to order. We have nothing against

16-16 used wisely, but it helps to consider other factors, and, in particular, the possible shortfalls of trace elements. In general, free service is preferable to the imposed dose. We have even encountered a farmer who placed in the pasture a trough divided into compartments into which he put various formulas and also simple elements. "When I rotate my herd's pastures, they change the situation," he told us, and it gave him important information for the correction of the pasture.

Potassium

Potassium is most often found in excess, but because of its antagonism with, among others, magnesium and sodium. A cow can have an excess of potassium on ground poor in potassium, but poorer still in magnesium and sodium. It is then necessary to restore the sodium and magnesium reserves of the soil by using a potassium manure of normal count for reserves and availability. To set out on a war against potassium is the origin of many misfortunes, as they say, and is pure fantasy. A plant has no power without potassium. It is all a question of balance, and we must guard against excess as well as its poverty.

There seems to be a certain antagonism between potassium and cobalt.

Magnesium

Magnesium is nearly everywhere deficient, somewhat rarely a serious lack except in certain poor regions where there is also intensive agriculture. Corn silage used in excess can accentuate the deficiency, because this plant is indicative of magnesium deficiency.

Such excesses are due to "force-feeding" magnesium chlorate by the farmer. In everything it is important to stay within reason.

Sodium

Since the abandonment of simple and double sylvinite [mixture of KCl and NaCl rocks], and with the use of fertilizers with high levels of pure potassium, one can say that most cows lack sodium to an increasing degree.

Cows never directly turn stone into milk. But the true problem is not an artificial correction that stresses the organs of elimination of the cow. It is in the creation from the very beginning of balanced pasture, not with a view to forcing a maximum of fodder, but by taking into account the point of view of the animal who is nourished by this fodder. We are often led to eliminate all potassium additions, here comprised of manure and slurry, for a year, and to replace it with ocean salt. There will be as much or more grass and the aspect of the cows has obviously improved: the hair is finer and shinier, and shed in the proper season. It is important to be careful with potassium amendments.

Sulphur

There is a parallel between sulphur and phosphorus. If animals are deficient in phosphorus, even when not sulphured, they are also in excess with sulphur (except in the case of the presence of the bacteria-caused paratuberculosis enteritis called chronic enteritis). This does not mean that it would require rashly giving sulphur to the animals to enrich their phosphorus; there is no reciprocity. This can even be dangerous, for the optimum sulphur ingestion is not far from the toxic dose.

Iron

Iron is usually found in excess of need probably with relation to an insufficiency of manganese and copper. The correction of pastures for these two elements diminishes markedly in the presence of excess of iron. It is well known that iron is not assimilable in the absence of copper.

Manganese

Nearly everywhere, manganese is more or less deficient, especially since the intensive use of nitrogen fertilizers. If, for the time being, nitrogenous manure facilitates the assimilation of copper, in the end the increase of taproot decomposition creates complexity. The highest indicated dosage can end up causing shortages through this copper complexity due to the lack of oxygen for fermentation of organic matter.

We find more and more signs of deficiency of copper: hair discoloration; bone problems, especially in young calves whose back hooves have a tendency to separate at the base; weak milk production, etc.

Cobalt

Cobalt is often lacking. Cobalt weakness is clearly tied to underground springs and the rupture of forces. When the electromagnetic field problem is added to poor soil, it becomes dramatic: nerve damage, parasites, enteritis, etc.

The animal's hair is bristly on their necks, sometimes more or less wooly on the flanks, signifying a deficiency of cobalt. Sometimes merely establishing a good equilibrium for the ambient environment will result in a balance of cobalt within the animal.

When there is bloat *in the barn*, or even in the straw, the veterinarian introduces a tablet of cobalt into the belly of the animal. Now the relationship is noticed often between bloat and rupture of forces. By equilibrating this, one also suppresses the bloat.

Zinc

Very often zinc is found in light excess, perhaps through a certain antagonism with copper (as in the electric battery), because the correction of the pasture with copper sulfate sometimes suppresses the prior excess of zinc. In other cases, the two elements seem to be completely independent.

There are some deficiencies of zinc, more frequent in certain regions, like the Côte-d'Or or the Nièvre. We have noticed deficiencies of zinc in some farms where "wood tongues" are frequent, associated most frequently with an insufficiency of iodine.

Iodine

Iodine is generally in excess in the west of France, except in several pockets touching Orne, Mayenne, and Sarthe. The Swiss cows seem particularly iodine-poor.

Iodine is antagonistic to boron. It is very curious to notice a lack of boron and an excess of iodine on the French cows, and the inversion of the relationship when one moves on to Switzerland.

Molybdenum

Molybdenum has a clear antagonism with copper. It is more often in excess. It is even found in very light excess in soils where the lack of molybdenum manifests in the vegetation, which poses problems for correction if copper is not considered. Insufficiencies of molybdenum in animals are rare.

Boron

Boron is not considered, to my knowledge, as indispensable to cows. However, in France, cows are rather below meeting their needs.

Boron demands to be studied. Indeed, given a weak dose on the order of 0.5 to 1.0 milligrams of sodium borate per cow daily in its feed, boron compensates the equilibrium of the other mineral elements: it diminishes the need for a deficient element and the importance of one in excess.

Unfortunately, when increasing boron dosages, they very quickly achieve toxic levels, and their management is very delicate.

The correction of 2 kg/hectare of sodium borate in the pasture has been necessary in one case to complete a prior application of trace elements and suppress a tenacious sterility of the vegetation.

Lithium

Lithium is constantly needed, but moderately. It would seem that lithium plays an analogous role to boron, that of compensation for equilibrium. It is dangerous to use by itself, and must be associated with other elements.

Nickel

So far, all cows analyzed were poor in nickel. We do not have sufficient perspective to give a useful evaluation on the role of nickel. In human medicine, nickel is a catalyst serving to correct pancreatic deficiencies. Perhaps for cows pushed into intensive production it plays an analogous role in digestion.

Carbon

The carbon test seems to take into account the state of stoutness or thinness of the cows. An elevated need for carbon is found in underweight or fat cows. A weak UC would then indicate the proper treatment.

REVELATIONS FROM SEVERAL COW MALADIES WITH THE BALANCING OF MINERALS AND THE ENVIRONMENT

Sterility

Sterility is due to various imbalances for which only one analysis gives a vague idea at best. The general rule is to “plug the holes” and to avoid above all giving minerals in too high doses. It is necessary to take all the deficient elements, and only those. It is this or nothing. These equilibriums are extremely fragile. This is why one is constantly checking when one gives the minerals that are considered to be useful. Their antagonisms play and disturb the correction.

Many are obscured by the lack of phosphorus and persistent additions to the feed. In that case we must curtail the supplements in order for the cows to “retain” them, finally . . .

Brucellosis

We doubt that a prophylaxis would bring this scourge rapidly to an end if it were not accompanied by a system re-equilibration for the animals and the soils. The corrected cases are now numerous enough that we can affirm that the application of certain grouped mineral elements allow us to save most of the calves in a brucellosis barn, even when aborted and gravely

infected, whether vaccinated or not. In more cases than one would think at first sight, a follow-up correction is required at the end of three or four years, sometimes two, in order to produce a reversal of the brucellosis reaction.

Cases are varied, and one cannot always restore the reserves of a cow with the first correction, but in general at the end of four to six months, the cows arrive at term. It is evident that an intervention correction at the beginning of gestation has more chances of success than when applied later, especially if one carefully removes phosphate additives which adversely affect the assimilation of manganese.

Indeed, the characteristic of brucellosis is manganese deficiency, which seems to be provoked by the introduction of the Bang bacillus. Essentially, the brucellosis-type disequilibrium is poverty of manganese, sodium, and magnesium. By adding copper, cobalt, and a trace of boron to the correction, one raises the chances of success, and retards certain secondary accidents like arthritis. Fertility is also enhanced by Vitamin E.

At this point the complete re-balancing is spectacular if the cow was prepared to abort, falls over, or has a bulging udder. Sometimes a massive re-equilibration over several days has completely restored everything and carried the cow to term. This is not exceptional and one can give it a try.

The direct correction of animals allows the gaining of time, but the definitive solution is to correct the pasture through the soil. It must also be said, to be honest, that perfectly balanced cows, if the Bang bacillus is introduced, must absorb the first shock, and cannot always avoid several abortions in the beginning.

Paratubercular Enteritis (Johne's disease)

Examples are mounting up proving that the re-balancing of pastures can bring about an end to this malady.

A preliminary remark: I have never yet found Para-tubercular enteritis without which there were subterranean currents of water passing under the buildings.

This dis-equilibrium is rather characteristic: deficiencies in sodium, magnesium, sulphur, copper, cobalt, manganese. It seems that it would be the Johne bacillus that follows the poverty of sulphur. Cobalt often borders on being the true deficiency.

The direct correction of animals seems not to be successful so far. Perhaps we need to find adequate shapes, or better yet, the correction of the soil arousing other factors (vitamins, enzymes, amino acids, etc.) in the pasture, which we still ignore.

For soil, we have had positive results with:

- Quicklime with a high inclusion of magnesium before winter.
- 300 to 400 kg/hectare of superphosphate 18% (for the sulphur) in winter.

- Trace elements before February.

Avoid any potassium application, including manure and slurry, for at least one year. The absence of enteritis rests essentially on a fragile equilibrium. A lack of fertilizer can bring back the illness.

Parasites

There are always parasites and microbes. But they fail to thrive when the conditions for their existence are less than they require. The goal is to have animals with sufficient resistance that when they do host the occasional parasites there is little suffering as a result.

From numerous observations we can say that animal parasites and ants are about the only animals that enjoy residing in the ambiance of underground watercourses. The issue is to reestablish equilibrium of the ambiance, meaning that it must always practically be completed with a better mineral balance corresponding to the particular situation. Cobalt is absolutely necessary, among others, at the beginning, but is only rarely used in isolation. An analysis is required.

Septicemia of cows

The term septicemia implies a variety of microbes. A vaccine can sometimes be successful, but it can work one time, and then later be ineffective. It's like chasing a shadow.

One could disinfect the barn, and change out the animals, right? One day or another septicemia returns in the same buildings or in privileged parts of these buildings. The solution can be then to calve outside and to not let the calves return to the barn.

There is a microbe without which it would not be septicemia, but the real problem is almost always a problem of a dis-equilibrated environment, put out of balance by underground springs or something else. If we rectify the environment, the calves will become resistant and respond to veterinary treatments when they are needed.

Mastitis

There are many causes and many treatments for mastitis.

There are barns of mastitis. Even there one finds two intertwined problems: emanations from underground springs and mineral imbalances. When certain places in the barn encourage mastitis in any cow that is put there, you can be almost sure that there is a spring underneath (like when the cows became blind). It seems to me that finding pre-fabricated reinforced cement barns of the same model always to have mastitis proves again that electromagnetism from springs plays a role.

One cause, more frequent than one would think, comes from a formation of static electricity on the isolated milking pipes. This electricity discharges itself at the udders of the cows when milking, and with enough repetitions of this simple trauma, the udder is weakened and susceptible to microbes. The remedy is simple. Discharge the pipes with an induction coil and a condenser with a copper wire of 50-60 centimeters in length twisted in the shape of the pipe, crossing underneath, giving an ogive at the end of the crossing and extending into two straight and parallel legs. It hangs freely from the pipe. The shape must be perfectly symmetrical in relation to the vertical and the two legs at the same level.

If there is blood in the milk, or blood clots, one suspects an electric origin. We have had several nearly identical cases of which the cause was an electrical ground that sent the electricity from the diffuse sector to the birthing area of the stable. The cows lay down, and their udders received the discharges.

It is sometimes difficult to track down the exact origin, for example when an electrician (I have seen this) attaches the ground to the milk pipe washer.

Bloat, Tetany

Although these two accidents are different in their manifestations, through analysis, we see that they are related imbalances.

Bloating is produced by preference for legumes or cruciferous plants, and tetany by grasses, but at the level of the soil, the same imbalance is found: an excess of potassium in relation to nitrogen. The remedy consists of establishing the antagonists. To avoid excessive applications of potassium and nitrogen, apply magnesium, sodium, copper, and cobalt.

In a well-balanced soil, there can be clover “as high as that”, but the cows do not swell up from their favorite causes, bloaty or otherwise. Tetany from the vegetation and bloat are ailments caused by civilization through errors in fertilization.

CHAPTER IX

EXAMPLES OF PRACTICAL PROBLEMS ON THE FARM

When there are animal troubles affecting the entire herd due to mistakes in animal husbandry, it is necessary to find the cause as far as one can. Return to the origin, ask if the conditions of the environment or feeding are making the animals weak and vulnerable, or is it a more general problem of balance?

There can be a disturbance in the ambient field by the rupture of forces. If so, the animal battles against it as long as his nervous reserves can last.

If a mineral imbalance in the basic feeding is found, then the soil from where he forages must be examined.

It often happens that even the farmer of good intent un-balances the animals himself by feeding inappropriate food.

One also finds, alas, victims of sorcery. Against this, one is powerless. Chapter XI is dedicated to these sad phenomena that are fruits of human wickedness. We are obliged to accept them as such *when everything else has been tried*. In these cases, the physical corrections often give temporary amelioration, but never the full desired definitive results. In the face of natural dis-equilibriums, one can count on arriving at an end. In the case of sorcery, it no longer depends on us.

How do we begin?

The first thing to do is hair analysis. For cattle, it is easy to take a sample from the tuft between the horns. As for soils, the young plants give a better reflection of how the milk cows have been supplemented. The comparison of the first and second analyses can still prove interesting. Each is judged according to its conditions. Analysis is a solid base to initiate a correction.

Analysis alerts us to the ruptures of forces that eventually impregnate the animals and to their degree of toxicity, to the probability of brucellosis (manganese), and of the mineral imbalances that must be rectified. In 90% of the cases, one can find the origin of the problems.

Our long experience shows us that:

– If there is a rupture of forces, the best mineral balance in the world can only ameliorate without reaching the hoped-for results.

– Conversely, the suppression of a rupture of forces gives to the animals the possibility of better resistance, it is true, but will not arrive at the goal of mineral balance.

It is necessary always to play on the two tables. And then there may be some salvation, especially when the classical methods have failed, veterinary or otherwise. Veterinarians can succeed when we use our methods. One of them told me one day: “Before you came by, I injected without results, my reputation suffered from it and I do not like seeing the bursting of animals in my hands. Since you have corrected this farm, I come by, to be sure, less often, and when I intervene, the animals respond.”

Rather than flooding you with details and recommendations, we will give examples that worked.

SOME EXAMPLES

1. At a farm in the north of *Mayenne*, there was enteritis for twenty years in a pasture of about thirty hectares. The losses there during the sixties surpassed a million old francs per year, and not to forget several thousands for the veterinarian. Everything was tried.

After hair analysis, taken from young cattle grown in the barn, we applied an amendment of magnesium chalk (40% MgO), superphosphate 18%, and trace elements. There were spectacular results that summer.

In the following spring, however, enteritis returned. Re-analysis: lack of cobalt. A supplementary addition of 1 kg/hectare of sulfate of cobalt brought the problem under control; it was necessary to bottom out to such a point that two years later, this same farmer won a first prize in a competition for beef cattle.

Excessive potassium at the beginning of the summer had been suppressed for three consecutive years, then they adopted a restorative regimen on the order of 100 kg/hectare of double sylvinite at 40%, of K₂O every other year with 100 kg/ha of sea salt. From one year to the other, they varied the form of phosphate fertilizers: scoria, superphosphate, and natural phosphate.

Five years after the first correction, a check-up analysis led them to reduce the magnesium chalk and trace elements. This is where we are and all is well. The farmer bought heifers all those years that he raised “ready to go”, and never the least problem.

2. *Paratubercular Enteritis* A farmer used to raising meat. M. M. was desperate. He had spread a ton of magnesium chalk per hectare without obtaining any result. The next year, with hair analysis, he applied the complement, that is to say, sea salt, trace elements, 18% superphosphate in February. Two weeks later (surprisingly soon, we think) the enteritis was stopped. The father-in-law of this farmer took during the season eleven hectares of pasture that was not corrected: enteritis happily returned. All the land must be treated. Since then it has been more than seven years, there is no return of enteritis.

3. *Enteritis. Malformations of bone. Sterility.* A fertilizer merchant sent me hair from a cow on behalf of one of his terribly troubled clients, because the veterinarian had no idea of what to do. Injections, food additives, everything failed. By analysis, there was a lack of phosphorus and copper.

The farmer was not in agreement about the phosphorus because he had in hand an analysis showing his ground to be extremely rich in this element. He had his analysis done at the laboratory of his choice, and the lack of phosphorus was confirmed. Here's what then happened: the farmer, his father, and his grandfather, had spread the ton of scorie per acre every year. The reserves were enormous, but all of it was blocked.

300kg/ha of superphosphate 18% through sulphur had returned the scorie to the circuit, the copper completed, and the herd returned to its normal state.

We have here a typical case where the artificial ways fail because the basic covering rate of more than 80% of the soil amendments is totally unbalanced.

4. *Brucellosis.* The actual case set-up does not matter so much, but one day I received a letter of thanks worth the trouble of including, because it is not so very frequently that we can give the details of the evolution of the malady. I quote the entire letter:

Monsieur de la Foye,

I enclose hair from the calves for analysis for correction, just to be sure, because everything looks good at this point. It is now just over a year since September 1968, when, having had a cow abort at eight months, I had taken a blood sample to the veterinarian at the time of delivery. From the month of September 1968 until February 1969, I had six cows abort. Each was analyzed, and each showed brucellosis.

At the end of September 1968, blood samples were taken from all the cows. I had ten positives. The veterinarian told me that all the positives would abort, and so would the negatives. And so, indeed, from September to February they all aborted at six months.

My father-in-law and two brothers-in-law had the same troubles, and having followed your treatment with good results, I did not hesitate to send you the hair sample for analysis. I was able to begin the treatment at the beginning of November 1968 and until the end of April 1969, I have given the solution in the feed every morning without interruption.

At the beginning of winter 68-69, I had applied to all pastures *Supermagnédol* chalk (1500 kg/ha) and last spring (1969) everything was treated with *Oligopré* [trace elements] (300 kg/ha). Since February, abortions have ceased, because we kept all our calves and they are healthy. It is the solution that has been the primary and complete remedy for treating the soil.

It has been like pouring money into the soil, but I do not regret it. On the contrary, there were six months during which we never saw the veterinarian, We had the best calves, and they did even better.

When we took blood samples in September of 1968, among the positives, one cow was three months pregnant with a level of 144. When she herself calved at term at the beginning of April, everything had gone very well. I took another blood sample to see if the level had risen, and she had dropped to 80. I know it was the treatment that made that level drop.

I regret only one thing: if I had treated sooner, that is to say, made an analysis sooner, I would probably not have lost any calves.

I can only encourage your treatment and will give this recommendation to anyone who inquires.

My best regards, Monsieur de la Foye, to you and yours, and many thanks for all your good work.

B.

There is nothing to add to this letter apart from several doubts regarding the variability of rates or causes. All cases of brucellosis are not so easily cured, and from time to time a cow will abort here and there from other causes. All the same, it is certain that mineral balancing, and not anything else performed by this farmer, limited the damages by a considerable proportion, facilitating the delivery of calves that otherwise would have been aborted.

5. *Tuberculosis*. In the beginnings of tuberculosis prophylaxis, a farmer from *Ille-et-Vilaine* had been obliged twice in four years to put down his herd for tuberculosis, in spite of disinfecting. When I was called, I had noticed a huge rupture of forces that passed from one end to the other of the stable under the bellies of the cows. Each morning the hair of the cows was soaked with “dew” despite the presence of a roof. At this time and in bits and pieces I arranged systems that required placing an oscillating circuit with a ground whose action was amplified by an exactly vertical cement pipe on each rupture.

Aided by the farmer, a sometime radiesthesist, I had with much trouble calibrated the system. By the next day, the cows were dry. When the “dew” returned, the farmer regulated the oscillator system himself, and all was well. Actually, it was years ago, and tuberculosis has not reappeared in the stable.

6. *Pica*. On an important pig farm in *Sarthe*, the animals in lots of 25 were nervous and aggressive, and each one was energetically devouring its tail. The farmer blamed their food and was ready to abandon his supplier.

Led by a broker to this farm, I had detected an important rupture of forces 200 meters deep. Without knowing *a priori* what was happening, I placed a simple board with an axial groove on the underside, oriented North-South at the height of an armoire. The pigs have become sweet like lambs and the feed merchant has retained his client.

The results have been confirmed in another farm where the same phenomenon of pica was produced. It is not always good to generalize, and the balancing of feed can also play a role.

7. Another pork story: At the middle of a building the litter was always deficient. One champagne bottle on a sheet of copper (one of my innumerable systems) placed in the loft exactly vertically on one of the ruptures of forces, 80 meters from the pigs, fixed the entire affair.

8. The farm of bloody hair. There are always troubles with foals. They get diarrhea easily, especially when they are restricted in buildings. A partial correction of the pasture with magnesium chalk, sodium, manganese, copper, boron, cobalt, completed by the annulling of the ruptures of forces with a champagne bottle nearby re-establishes normality. One beautiful day they called me. All the foals in some stalls situated a hundred meters from the main farm had diarrhea. The local veterinarian had not cured anything: he was nothing but a big specialist with big fees. I observed the ruptures and

the electricity everywhere. And I saw the bottle that had never been touched: the spiders had drowned the champagne bottle and its sheet of copper in a network of webs, as if the bottle was saturated and it poisoned the field. I replaced the bottle with a grooved plank, which was easier to watch. The diarrheas disappeared like magic.

9. Examples like this are legion. I have saved for the last one a typical case where everything found itself rebalanced so that nothing was left hanging. A big case, and a paradise for the researcher.

In June 1968, I was called to a farm on the edge of ruin. Technicians and veterinarians were grinding their teeth.

This farm of 50 to 60 hectares was held by a young family. The soil was a true Sand of the Loire deposit. The modern classical fertilizers, N-P-K, gave only 2500 kilograms of wheat per hectare. But the wheat fared better than the pigs, who survived only by being bottle-fed. There was close to total sterility in the cows. A trial of 800 guinea pigs under contract was terminated at the end of six weeks because of total mortality. It was the same with the rabbits. And even more for the poultry.

The farmer, less than thirty years old, had paid a million old francs for operating expenses and various treatments for a year. The children had perpetual colds. As for the milking machine, it had been necessary to repair the fourth motor, the three previous motors having been replaced according to the conditions of the warranty, fortunately.

At the site, I repaired a powerful rupture of forces running North-South, 60 meters deep, passing along the axis of the stable. Another rupture, this one East-West and cancerous, promenaded through the stalls.

From the analysis of the hair of the cows: deficiency of phosphorus, sodium, sulphur, manganese, lack of magnesium, copper, and cobalt.

We attack the problem on two fronts.

First, we put a champagne bottle on a sheet of copper in the barn to re-equilibrate all the buildings. Then, we rebalanced the cows with an appropriate solution, while waiting on the correction of the pastures.

The results from June 1968 to April 1969:

- The pigs regained complete health without any pica.
- Cow fertility was almost total.
- Not even a single cold for the entire winter, parents and children.

No visits to the doctor.

In April 1969: for an unknown reason, the bottle no longer functioned. The troubles began again for the cows, pigs, and humans. It required several tries to bring back the balance, and not without difficulty.

The first cows had gross articulations in their front feet, with a tendency to separate at the base (lack of copper). Some of them walked on their knees. But there were calves and enough milk for them.

Another spectacular result in the direct correction of the cows has been the recoloration of their coats. A white Normandy took on normal-colored spots, so that the inseminator had to redo the identification tag.

The soils, in the winter of 1968-69, were given magnesium chalk, superphosphate 18%, and trace elements. During the summer of 1969, which was particularly dry, this farm, and only this farm, furnished a quarter of the milk-truck's pickup on that route.

From 18 cows in 1968, they have moved to 70 in 1973 and the goal is 100.

Not everything is resolved, however. And it is perhaps the tightrope, but, from complete ruin, the farmers have regained their equilibrium by their relentless work and now they can see a future that was in no way possible in 1968.

And for humans?

To tell the truth, I am not especially interested in my fellow creatures, having already worked so hard with the animals of the farm. But often the inhabitants of a farm profit by what we do for their animals, notably from the perspective of balanced ambient fields. If one can be permitted the expression, from this latter point of view, animals and people are the same bag.

To end, an anecdote.

A lawyer had spent a fortune on his asthma, for which the crises obliged him to stay in bed. Finding him there to attend to my affairs, we discussed this brave man's condition. I immediately looked to see if there were some ruptures under the floor. Indeed, the bed was sitting on a "water line". I placed a champagne bottle vertically on the floor of the attic exactly at the rupture.

Result?

The asthma attacks have nearly disappeared and (coincidence or not?) the marriage relationship for nine years without offspring had a birth nine months after the placement of the bottle.

CHAPTER X

MESSAGES AT A DISTANCE

It is again, thanks to M. de Bélizal that one can succeed in sending messages at a distance using a scale-reduction of the Pyramid of Cheops and an Egyptian Pendulum. We have taken this problem using other bases and eliminating the R W cH field, which can carry uncontrollable disturbances.

Many instruments can give an emission, even a charged rotating pendulum. We remember in particular a small, very simple board that we used, being at *Rennes*, to charge a stone at M. de Bélizal's home near *Lamballe (Côtes-du-Nord)*. Our only intermediary playing the role of the similar was the same card that visited each of our homes. A blank card in front of our emitter at *Rennes*, with another under the stone, at the same orientation, *chez M. de Bélizal*. This stone charged successively with the Knot of Life and Eq, placed before the cannon of M. de Bélizal's large "shock wave" emitter, inverted the Electric Negative Green to Magnetic Negative Green.

I have gathered from this experiment, which, despite the 100 kilometers that separated us, there was practically no loss of power.

Everyone said: "Messages at a distance in this way? I don't believe it." I don't believe it ... a small phrase that prohibits any discussion. If one had spoken to Archimedes about the transmission of images by television, would he have responded, "I don't believe it."? You know nothing about it or us. But this response is disgraceful coming from one claiming to be a true scientific person with an open attitude: the more one discovers and the more one perceives, the less remains to be discovered.

We do not see, besides, where the idea that messages cannot be sent by shape-caused waves comes from. It is a question of resonance and is the true nature of the field. The violin that makes the string of another violin vibrate through resonance uses the vibrations of the air, but the radio uses the electromagnetic field. As for shape-caused waves, how well do we know the field that surrounds us?

The analytical ruler that we have seen is well-conceived for emitting and receiving in this very simple way.

At the beginning we encounter a difficulty that could appear to be insignificant, but upon which rests our success: the establishment of a

vibration of union between the two instruments, the receptor and the emitter. This unifying ray demands a perfect resonance between them in absolute obedience to the law of similars.

The vibration of a unifying ray, we already know, is that of the Knot of Life that one finds between subject and witness, which permits finding the direction of a missing person, etc.

In the present case, one must find the unifying ray in the direction that joins the two instruments and is not confused by the East-West constituent of the Vital Field, which can be emitted by the ruler under certain conditions.

Now, let's have the facts.

The Emitter

The central needle plays the role of the similar when it is set on a convenient division that has to be adjusted in order to repair the unifying ray with the receptor.

The Equatorial pendulum, or another, calibrated on the shape-caused wave of emission by the North needle is swung over the B disk. When the pendulum turns, which requires several seconds, the stone placed on disk B of the receptor is charged. One then sends another vibration of emission and so on.

The Receiver

A well-charged stone is on the receiver's disk B. The C needle is matched with that of the emitter. The North needle is moved to a waiting mode. When one knows, even several days later, that the stone can be charged, one turns the North needle, replacing it just to where a + pendulum turns over B and then stops. Then another color can be sent with the North needle and so on. It is discharged this way, in the order in which it was charged, of all vibrations successively emitted by the emitter.

When nothing more is found, one instantaneously discharges the stone by putting needle C on the interior division 10.

With 24 principal divisions around the North axis, one has a lot to encode . . .

Using only the central square to establish the unifying ray cannot be done exactly because a third person can, himself also, look for the unifying ray of the receiver or emitter, with the central needle.

In order to make it easier from this point of view, nothing prevents the two correspondents from placing a stone on B, without anything over the area of the emitter; above the area of the receiver, an identical layout, precise and perfectly oriented *in relation to the ruler*. One can remove the central needle or retain it. If the needle is retained it is necessary that it be calibrated on a convenient division.

The instrument built on the reciprocal circles with a needle turning around the center of the North circle is also a good tool for transmitting and receiving. Not having a central needle, it requires the coded drawing on the South circle. It is perhaps preferable to begin the entrainment with this simpler instrument.

One would proceed in the following manner:

Emitter

Layout on the center of the South circle, squared away and oriented properly. When the stone of the receiver is charged, + will be detected over the emitting layout as will the stone is on its receiving layout.

Remove the emitter layout when the message is finished.

If an error has been made, erase with the needle at 320°.

Receiver

With the stone on the layout outside the instrument, a unifying ray is required clearly with the emitter. Some – is emitted over the stone while the charge builds up. It continues and then ceases as soon as the emitter changes to another color.

Before decoding, be sure that the – is definitely absent above the stone. At this moment, place the stone at the center of the South circle without a layout. In a moment the colors will be detectable with the + pendulum.

Once it is finished, discharge the stone at 320°.

CHAPTER XI

MAGIC

Although we left solid ground at the beginning of this study, and the ice is fragile under our feet, it is necessary to quickly address the subject of magic, upon which we have already touched.

The fact of magic exists, and it interests the public. See the high numbers of works treating magic or related subjects in the libraries. Remember the TV shows that feature magic, and films as well. Calculate the figures in business of certain professions that run parallel to it.

As for radiesthesists, by practicing radionics especially, are they sure that their practices are always purely natural? And they not sometimes playing with influences about which they are ignorant? The boundaries are hazy when so many occult phenomena are concealed under innocent appearances. The operators must be assured that their experiments are reproducible and can hold up against the standards of scientific proofs.

This is why we must really listen to the terms and the facts.

Frequently magic is thought to be just simple tricks and it is given other names that do not describe it in the sense that we are meaning here, in other words, limited to events that are not due to natural or unknown causes.

More precisely, magic, minus the smokescreen or camouflage, is essentially the action at a distance of one individual upon another living or inanimate being by using a demon as a carrier, consciously or not, with disproportion between the cause and the effect.

It can range from the worst black magic to the *use* of shapes emitting magic. I say *use*, because the non-polarized shapes that we have called magic, while indifferent by themselves, when acting by the effect of an oriented will, are the preferred backup.

Some will be surprised perhaps, or even shocked by the word “demon” in our world where they live as if God never existed and never pray. But to believe or not to believe has never prevented what exists from existing, no more than does hushing up the facts under the pretext that they do not center on a theory, or they oppose an opinion, proof of scientific honesty lacking moral integrity.

It has been given to us to collaborate on one of the works of M. J.G. Bardet, *Mystique and Magic*. This was the occasion of learning a mass of information on magic shapes, non-magic shapes, anti-magic shapes, etc., particularly with the aid of pendulums carrying Hebrew words, and this knowledge, I do not regret in spite of certain moments which were not at all easy.

We had noticed that magic reversed the vertical component of the Vital Field. The Hebrew Shin turned upside down, and that can also be noticed in an ambient field. Effectively, magic is certainly an inversion of the natural order. This is also a transfer since the demon creates nothing. Inversion and transfer are two characteristics, in the processes and the results, but heard also in a very general sense and not only material. All inversions of the order desired by the Creator are signs of a satanic presence, and influence moral values in a decaying world.

Armed with this completely new knowledge, I had tried to ascertain which farms experienced attacks of sorcery on the animals and people, a strong practice as popular as the success of those many works on the subject, the grimoires, where under their somewhat inoffensive appearances, not even to say pious appearances, hide authentic prayers to the demon.

Truthfully, in the country, it is jealousy and interest, which, for all time, has been at the origin of sorcery. In our time, however, these activities have developed an accelerated rhythm. In the cities where magic is practiced in other forms, the lure of the unhealthy mystery certainly plays a role and adds to the evil.

To return to anti-magic shapes, with hindsight: they are disappointing. An anti-magic *shape* re-establishes a Shin inverted by a magic *shape*, but when one is dealing with real deeds, these shapes give only temporary amelioration or no amelioration at all, posing a mysterious problem of interaction between the material world and that of evil spirits. In the first case, at the end of a certain time, the magic recommences more forcefully, and there has been absolutely no amelioration of the moral behavior of the people who have benefited from it. One runs after its shadow, and this is not without danger, for having contact can make you attack yourself. Chase a demon, he will return seven times stronger than at first. This is written in black and white in the Book of John, and it is true.

Experience is helpful, I have better understood, especially from the day when, in order to have a clean heart, I had wanted to bless one of my suspended re-equilibrators that was swinging all by itself for no reason. The re-equilibrator was immediately stabilized, but I had quite a time recovering my spirits . . . The demon does not like to be opposed.

It is all about being good for demons. One can tell a pile of stories and not believe any. Magic in its strict reality, they repeat, is the mobilization of the demon who only demands that, very content to harm or impress the audience. And the demon, in fact, madly mocks the sticks of wood, rings, and talismans and protectors. He appears temporarily to account for them in making a better deception. We are always at a totally different level.

The only effective weapons are spiritual and at the disposition of the one Catholic Church: exorcism, salt blessing, water blessing, novena to Saint Michael, prayer, penitence, love of God, confidence in God, a real and sincere Christian life, in a word, transparent to the Will of the Father. If it pleases him to send a remedy, one is better armed to support it.

It is necessary to be submissive to the facts, to the enchantment of the causes and the effects.

Here is an example among many others. In a farm near *Mainz*, despite corrections of the soil and the environment, nothing was improving in the barn or the house. The calves burst without reason, the cows had no more milk or cream, and the farmer was at the edge of a catastrophic depression that the problems alone did not justify. At my counsel, these brave farmers succeeded, not without difficulty, to get their priest to come to their home. He conscientiously exorcised buildings, animals, and individuals without making detail. Since? That was more than a year and a half ago, they have not encountered a single loss of animal, and the farmer carries himself like the *Pont-Neuf* [long arched bridge in Paris]. Most spectacular has been the rapid rise of the milk and the grass (13 points).

How to recognize such as a magic action? Mostly by its irrational character.

In the farms, suspicion can arise at the sight of the bloated bellies of every calf. If, further, one notices the non justifiable, sometimes important variations and over 50% less daily of milk or cream, the suspicion is confirmed. If, further, one finds unusual objects in the fields, on a slope, at the foot of a tree, etc. or arranged abnormally, in general by threes, certitude is introduced.

A marked variation in milking without natural explanation, for example, is the phenomenon type of transfer magic: the sorcerer, call him by his name, makes the milk pass from one herd to another. What one has lost, the other regains. Another transfer is spectacular. A calf cured of diarrhea by magic, even involuntarily, lost a part of its hair in sheets, leaving part of its skin naked. I have had the experience with my own eyes, and not only just one time.

But it is not only minor manifestations. We also see true stories of madness, as in the case of the banknotes that disappeared instantaneously from locked drawers. In other circumstances, we see infinitely sad cases going to death from illnesses that the doctor cannot understand. Sometimes the people are pushed to suicide. If one knows what happens and keeps silent . . .

In order to detect magic, we also use the Hebrew pendulums (As always, thanks to M. Bardet.) K Sh Ph (Magic), inverted Shin, and especially D R Sh hA L H M Th M (Necromancy), the latter turning also on the anti-magic shapes. But before using these pendulums with *extreme prudence*, it is necessary to recite a *sincere* and well-chosen prayer, for example a *Pater* and an *Ave*, because the pendulum responds correctly without misplaced occult intervention and for protection, which is necessary, believe me, if you do not wish to harvest multiple inconveniences and take on a serious accident. You have business with these invisible but terribly real beings that will not take it as a gift.

In the case of positive response, and that remains, in spite of everything, a probability, it is necessary to take measures that are appropriate: uniquely spiritual and with a goal of spiritual amelioration of the targeted people. The result is not always immediate or lasting. Nonetheless, one must never lose hope and especially, the victims, an *essential condition*, must pardon the person or persons who have done them wrong from the bottom of their hearts. This is sometimes very difficult, but without it, one will never arrive at a positive result. Hundreds of “Our Fathers” are useless if one is not sincere. Do we not say: Forgive us as we forgive . . .

We salute in this connection a father and mother, who, invited, are going to dinner as if nothing had happened with a person who had wanted to kill their little 5-year-old boy with the feathers from a pillow. Success was at this price.

To shed some light: feathers constitute one of the innumerable supports used in sorcery. In this case, it was done by an act at a distance; the shape of a chicken was made of feathers stuck together tightly. When the animal is entirely shaped, he who sleeps on the pillow dies. Merciful God, the parents had been providentially alerted in time. I saw the beginning of the formation, the head and the front of the body that had then been sprinkled with blessed and burned salt. Because it is always burning that one finds to be abnormal, passing incombustible materials through the flame like “charged” stones (another important support) and putting them in

blessed salt finally to chase away the bad spirits. If possible, avoid directly touching the charged objects, this could be dangerous, often disagreeable.

I have no wish that anyone be bewitched or enchanted, whatever the term used and its weight, but it is much more important to be alert and warned that nothing can shelter a person from an attack if one lays oneself open to it, in these times where the demons are manifestly able. Do not make this an obsession. The demon does not act without divine permission, and it is not necessary to attribute a sprained ankle on the curb of a sidewalk to fate. There are many people who believe they are victims of sorcery and who are absolutely not. It is necessary to use spiritual discernment. Be prudent, because one can create favorable conditions for what one would hope to avoid.

Good advice: do not seek out spellbreakers, maguses, and such, who, for a fee, promise to help you out. Despite sometimes spectacular-appearing successes, always temporary, the biggest troubles can return, and one can no longer leave them. A battle of sorcerers is in reality a battle of demons where the strongest wins. Magic and anti-magic are the same.

Making requests of healers in order to get rid of warts, scurf patches, burn marks, etc. is to banish. There is no real healing, just a transfer to others. That facilitates the ultimate attacks of magic and it is then so much more difficult to get rid of it. All the same, the descendents are sometimes submitted to the consequences of the practices of the “donations” by their ancestors (even in good faith and with honest intention). This is a fact verified many times over. “The fathers have eaten a sour grape and the children’s teeth are set on edge”, it is written in the Bible. [Jeremiah 30:29]

Other causes favor bewitchment, materials themselves, like city women wearing trousers, scarlet rouge, raw greens, bright yellow dyed uniforms. These colors so dear to the demons can spark crises in the homes under spells that take them when they approach blessed objects, for example.

By way of ending, a word about radionics or action at a distance. The term has a scientific allure, and one can do radionics in resonance with a shape-caused wave by the law of similars, without which there would only be sorcery or magic. One simply uses the fields of physical form. There exist, unfortunately, many emitting shapes that make the Necromancy pendulum react. It is more important to trust, especially if one uses formulas written in the right hand. It is so easy to take them otherwise and put outside the circuit. For this activity has its risks, and I know at least three practitioners who died of cerebral congestion.

There we leave this dangerous subject . . .

SENOFF

Here we are, you and I, at the end of our study. Is there more? I hope so ... while tackling these various and curious subjects, without embellishments or concessions, perhaps not exposed with all the possible or desired clarity. But here I have always seen myself clearly through a little-explored domain, in a fairly solitary search full of pitfalls.

For those who would only add some flower to their garden of general culture, I regret having put some dryness on the technical allure of several chapters. For others, have I sufficiently furnished details that they would like to know? Can I actually do that, in this technical part? If the “some” and “others” have gleaned according to their pleasure, that would be good.

My goal, truly, was especially to bring out from the shadows in a minimum of pages, the fruits of long fertile research into dead-ends, to reconnect these results to the discoveries of MM. Chaumery and de Bélizal. If this research had sometimes played hooky in the quasi-scientific regions, please pardon me.

I hope to have attained a higher level in shape-caused waves, and made this book a tool for working, because, if the simple instruments are created, many experiments remain to be made in multiple areas: medicine, physics, biology, etc. The areas of shadow still await opening.

The vital field that I have discovered in being led astray by magic, – nothing is useless, after all, on the condition that one comes back safe and sound, – dissipates certain fogs around the study of shapes, but not everything is resolved.

“The greatest glory is man”, said Professor Enrico Medi, “It is the carrying of nature in my trembling hand, so that this nature, through man, returns to God”.

In its unity is its simplicity.

Everything must fit into a harmonious whole. That is the goal of our research.

If it is not attained herein, it will be reached by others.

ADDENDUM

NEW PATENTED COMPENSATOR AGAINST TOXIC WAVES

This book in its first edition, had for a goal – and it has it still today – to give an idea of shape-caused waves found in the research, and to inform the public about the phenomena that waves inflict or provoke without our even knowing it or being accountable for it.

But research is a tenacious illness. Always possessed by such a virus, the author and his friend, Andre Phillippe, electrical engineer, have searched for a compensator against noxious waves that could function without complications or orientation, and be put at the disposition of anyone with assurance of efficacy. This new edition gives an outline of it.

The reader will find without trouble the simple ideas that are the common thread of the whole work, those which, dedicated to the conviction of an order in the pre-established things in the universe without which no experimental science is possible, leading to verifiable and reproducible facts.

The point of departure is the following:

If one draws the extension of a ray through the circumference to the exterior of a circle, automatically at the interior of the circle sparks a + semi-circle and another – semi-circle separated by the virtual diameter aligned with the exterior extension of above-mentioned ray.

This circle shape with a “tail”, we have long called “Tadpole Shape”. It has the property of emission in the extended tail, of a shape-caused wave placed at the interior of the circle and oriented by relation to the direction of the tail. This can even be a possible emitter of shape-caused waves by making a needle turn around the center of the circle. One more emitter among a plethora of emitters.

If one draws a diameter perpendicular to the direction of the tail, if one carefully draws at each end of this diameter a little empty circle centering on the circumference of the large circle, and, finally, one traces a small empty circle centered on the middle of the diameter, one notices that the polarities at the interior of the small circles. Further, the balanced polarities at the center are transmitted to the end of the tail.

We were not at the end of our troubles.

The reciprocal circles (p 129) have been an indispensable aid to replacing the tail by a second circle tangent to the first. But it still has to be oriented if one wants an acceptable result.

We then directed our view towards a shape that could function in all orientations. This shape was obtained from isosceles triangles of equal base to height and tangents to circles (these triangles are tied to the construction of the decagon, cf. p 44, triangle AOC, which forms half of one of the triangles of equal base and height. [root 5 triangles?])

Completed by holes and a general axis of symmetry, the shape has definition that permits the compensation of polarities.

It remains to be used and to notice the effects.

We have ended up with two types of compensators.

1. A small compensator that needs no outside power, is entirely autonomous, and destined particularly for installation in apartments or homes. It suppressed toxic waves from the Electric spectrum, including, of course, the famous radiation Electric Negative Green, which can originate from subterranean water currents, geologic faults, TV's, heating through the soil, special shapes, etc.

This little compensator can also be used for the suppression of Electric Negative Green in the radiology treatment rooms or automobiles.

2. A large compensator destined for industrial use, which is fed partly by a continuous voltage of 170 volts produced with the aid of a supply branch on the 220 monophasic sector. This form is also connected to a special antenna made of a pole of ferrite with coils on the joined spires.

The range of this large compensator is around 8 kilometers. That allows suppression of the Electric Negative Green over this distance, and avoids by consequence electrical atmospheric discharges in a bolt estimated at 4 kilometers.

It is then a very interesting application and useful for protection of central electrical and telephone stations, electric lines, rooms of computers, etc.

As for central nuclear plants, the interest of the compensator is double. Not only does it prevent lightning at installations properly armed, but also it suppresses the horizontal radiation of Electric Negative Green produced in a ray of several kilometers' range by atomic reactors.

These several lines, we hope, could satisfy the curiosity of the majority of our readers.
