GRATITUDES

Works of nonfiction, like the fruits of any exploration, are cooperative efforts and this one is no exception.

In the late summer of 1967 at the recommendation of a friend living in Mexico I was about to call Peter Tompkins at his dairy barn home in Virginia when my telephone rang. "This is Peter Tompkins," gruffed a voice with an overtone of studied chilliness. "I understand we have a mutual friend in Cuernavaca who suggests we should get together. Why don't you come out now and get it over with?"

That invitation led to a series of adventures during which Peter introduced me to overlooked corners of the cosmos and to unsuspected crannies of English style. After a two-year stint as a correspondent in Yugoslavia, I entered into a collaboration with Peter that eventually led to our writing a book together.

In 1970, while pursuing research quarries, I was introduced on a Rockport, Maine, porch by another friend to Reaford Daniels who had spent a quarter century pioneering the study of what has come to be called "electromagnetic interference." Rex's huge Etes included investigations into undefined energies apparently unconnected to electromagnetism such as the "orgone" of the late Dr. Wilhelm Reich and an "X-force" which, hovering somewhere between the physical world and the realm of the psyche and with apparent roots in both, seemed to play a role in inexplicable actions by which living creatures, man included, relate to their fellows and to their environment.

In the fall of the same year, in the midst of tracking down more clues subtly dangled in front of me by Rex, I found myself talking with Dr. Bernard Grad of McGill University's Allan Memorial Institute of Psychiatry in Montreal, who suddenly asked: "What do you know about *dowsing*?"

The answer being "nothing whatsoever," Grad urged that on my drive down through New England I stop off at the convention of the American Society of Dowsters (ASD), held annually in the tiny village of Danville in Vermont's "Northeast Kingdom." To the ASD Board of Trustees, which I was subsequently invited to join, and to ASD members hailing from every state of the American Union and many foreign countries, *The Dowsing Hand* owes its principal inspiration, matched only by the constant encouragement and cooperation of all of this book's protagonists.

The way into a virtual Minotaur's lair of references to dowsing was provided by two compendious bibliographies. The first appeared in Arthur Jackson Ellis's *The Dowsing Rod: A History of Water Witching*, printed in 1917 as U.S. Geological Survey Water Supply Paper 416; the second appeared in a series of publications by Sir William Fletcher Barrett, physics professor at Dublin's Royal College of Science and a past president of London's famed Society for Psychical Research, and later collected in the volume *The Dowsing Rod: An Experimental and Psychological Investigation* (London, 1926). That classic would never have seen the light after Barrett's death without the perseverance of his younger collaborator, Theodore Besterman, who wrote in the preface: "Whether the results justify this [Barrett's] labor is for the reader to decide, but should it be agreed that the ability to find objects by other than normal means

has been established, the question can hardly be answered otherwise than in the affirmative. For what scientific discovery could be of greater importance than that of a hitherto unknown human faculty?"

Taken together the two sources run to well over 1,500 titles, a large portion of which were examined at the Library of Congress in Washington, D.C., the Widener Library at Harvard, the Sterling Library at Yale, the Engineering Societies Library in New York City and the library of the Museum for Electricity in Life in Minneapolis, Minnesota. To the staffs of these five magnificent repositories of knowledge, and particularly to the heads of the Stack and Reader, and Loan, Divisions of the Library of Congress and to their courteous and helpful assistants, heartfelt thanks are expressed.

For dogged and detailed research I am indebted to George "Bud" Brumard whose diligence I hope I partly repayed by assisting him, in turn, with the production of his master's, and masterly, thesis on the pineal gland written for Goddard College and to Oliver Niehebo, Harvard divinity student turned budding inventor.

Translation from German sources by Reza Eghbal and Trudy (Mrs. John H.) Fisher were equalled in their expertise by English renderings from Latin by Gaby Christov; from Russian by George Petrov, Vadim Medish, Cyril Muroncew and David Chavchavadze; from Chinese by Jing Nuan Wu, and from Italian by Lisa Sergis. It was also Lisa's apt contribution that finally won the day among a plethora of titles suggested for this book.

In the Union of Soviet Socialist Republics, I am beholden to Dr. Alexander P. Dubrov, author of the recently published *The Geomagnetic Field and Life*, for his coordinating a review by himself and several colleagues of that portion of the text devoted to Soviet dowsing. In France, Maurice Plateau, Jerome Dumoulin, reporter at *L'Express*, and Jacques Richardson, editor of UNESCO's *Impact of Science on Society*, provided many courtesies. In Germany, Louis Bélanger, now writing and teaching in his native Quebec, was a more than able interpreter and a cordial host.

Enduring thanks to Thomas Heston, for his skillful illustrations turned out with great joy and dispatch under the trying circumstances of deadlines and to Dr. Andrija Puharich for opening my eyes to many marvels.

Finally, without the persistence of my wife, Lois Pengelly, and Rose McClark, the manuscript would never have gone through what seemed an innumerable number of typings and retypings, and without the judicious combination of knuckle-rapping and exhortation on the part of my editor, Bill Whitehead, the book would never have appeared.

CHRISTOPHER BIRD
Virginia Beach, Virginia
July 1978

And I say unto you, Ask, and it shall be given you; seek, and ye shall find; knock, and it shall be opened unto you.

For every one that asketh receiveth; and he that seeketh findeth; and to him that knocketh it shall be opened.

Luke 11: 9-10

"Such was my debut in the art of discovering sources of water with the rod and, since that time, I have had many wells dug, all of which have furnished results predicted by it. The proverb: 'By working at the forge, one becomes a blacksmith' applies particularly to this phenomenon, for an attentive study of the subsoil has led me, time and again, to the determination of a veritable network of aquiferous sinuosities which, traced on a map, was the faithful reproduction of what occurs on the soil's surface: a network of streams, primary tributaries and secondary affluents.

"This subsoil reconnaissance has permitted me to effect with success the location of underground water to alimnet the towns of Paimpol and Lanvrien and to augment the existing water-supply of Saint-Brieuc, all in Brittany.

"This method of proceeding unfortunately is opposed by two classes of detractors: the first being those in whose hands the dowsing rod remains motionless; the second, scientists who, unable to plausibly explain the phenomenon, find it easier either to negate it purely and simply by attributing it to charlatanism on the part of the operator or to include it among acts of simple suggestion. To the one, as to the other, class of such detractors we shall reply with our own experiments which we are willing to repeat at any time before unbelievers.

"Whatever the nature of the forces which cause the rod to move in the hands of those privileged to be adept in dowsing, to deny them is to demonstrate a closed mind and many times I have replied to persons who have remained stubbornly incredulous before such palpable results: 'Your negation of established facts matters little; it can have no value for those who practice dowsing and, through its use, benefit others.'

"It is not chimerical to hope that one day these phenomena will be explained when men of science will banish from their attitudes any idea of charlatanism or of suggestion and resolutely take up serious research like those who, in our time, have been led to the discovery of wireless telegraphy, the telephone and the phonograph."

Charles Catmezzante, President of the North-West France Regional Society of Architects, in a letter to Henri Mager, expert dowser and author of several books including *Dowsers and Their Procedures*, Paris, 1912, from which the above is taken.

An Uncertain Etymology

To *dows* is to search with the aid of a hand-held instrument such as a forked stick or a pendular bob on the end of a string—for *anything*: subterranean water flowing in a narrow underground fissure, a pool of oil or a vein of mineral ore, a buried sewer pipe or electrical cable, an airplane downed in a mountain wilderness, a disabled ship helplessly adrift in a gale, a lost wallet or dog, a missing person, perhaps a buried treasure.

When first introduced to this method of location that has long defied and continues to defy rational explanation, most people react with a knee-jerk response of rank disbelief—or, like primitives initially exposed to radio or TV receivers, with the same awe and amazement as small children witnessing a magic show. Yet just as radio and television have revolutionized human communication in the lifetime of still living grandparents, so dowsing, as one of a little recognized group of mental abilities called “psychic,” promises no less a revolutionary advance in human communication with the cosmos surrounding us, of which we know so little.

Like expertise on the violin, figure skating, acrobatics, and other virtuositities seemingly inaccessible to the average citizen, it can be acquired by the open-minded and therefore especially by the young who have not yet developed a mind-set against the “obvious impossibility” of so uncanny a searching art.

No etymologist is sure of the origin of the verb which first made its appearance in print in a dry seventeenth-century essay, *Some Considerations of the Consequences of the Lowering of Interest*, by the English political philosopher, John Locke, who only half seriously referred to a *dowsing* rod’s purported ability to “divine,” or discover, mines of gold and silver. His unorthodox spelling was likely an attempt to orthographize a local Somersetshire pronunciation of a word familiar to him since childhood. Even its present-day utterance is a matter of contention. While most Americans rhyme it with the noun, *house*, in other parts of the English-speaking world it is enunciated to be consonant with the verb, *hrouze*.

Despite Locke’s literary pioneering, the word was nowhere found in any publication for more than a hundred years, the possible exception being a reference to miners in the Mendip

New Mexican douser, 1930s, holding the stick in an unusual "palms downward" mode. (From the photo collection of the Library of Congress.)

Hills *foresing* for ore. It was not used in the *Mining Dictionary* of 1747 which otherwise provides a long description of the divining rod, or in William Borlase's *The Natural History of Cornwall* published in 1758 which refers to the same rod under its Latin name, *virgula divinatoria*; or in William Pryce's masterwork on Cornish mining that twenty years later extensively discussed divining for metals; or in 1770 and 1800 accounts of divining in the mines of Wales. Spelled as it is today, the word first appeared in an 1831 issue of *The Quarterly Mining Review* and eight years later in *Traditional Devonshire* by one Mrs. Gray who equated the whole process of dowsing to superstition.

Some have sought to relate *dowsing* to a proper name but it is probably only a curious coincidence that George Dowsing, a schoolmaster and necromancer at Saint Faith's near Norwich, was employed as a "hill-digger" by a certain Sir R. Curzon who had obtained a license to search for buried treasure during King Henry VIII's reign.

More likely is the supposition that *dowsing* is a loan word borrowed either from the miners of Cornwall, whose experience in digging out tin dates to the pre-Christian era, or from German mining parlance. The first derivation was suggested by the compiler of an 1887 *English-Cornish Dictionary*, Professor Frederick Jago. In Cornish, a now-dead language related to Gaelic and Welsh, "goddess" can be *deuys* and "tree branch" *rhodl*.

Their combination, *dowsing rhodol*, is corruptible on an English tongue to "dowsing rod." On the other hand, because early German references mention forked sticks "striking" downward toward the ground, at least one etymological dictionary ties *dowsing* to the Middle English word *duchen* which also means "to strike." Another line of reasoning postulates its descent from the German *deuten*, an umbrella verb variously translatable as "to show," "to indicate," "to point out," "to explain," and even "to augur."

From Concrete to Abstract

A common cliché of dowsing is that of a rustic walking across a meadow with a forked stick in his hands, searching for a place to dig a water well. When the stick snaps downward toward the ground, instruction and experience indicate that there a bore will be successful. This "walk-around" method termed *field dowsing* has led to the justifiable assumption that something directly below a dowser's feet associated with the presence of flowing water affects either the dowser, the rod, or both, but it does not explain how dowsers are able to locate underground anomalies other than water.

At one point "walk-around" dowsers are usually told that they can save a lot of sole leather by first standing at one corner of the terrain they wish to survey and check *the direction* in which a potential well site might lie. Then they need only walk one traverse to pass over a water vein and confirm what they have detected remotely. *Remote dowsing*, like navigation, can also employ triangulation wherein lines from two known corners of a triangle are projected to an intersection that reveals its third corner, but, unlike field dowsing, it cannot easily be justified by reference to something beneath the dowser.

The effect of any physical cause in the earth acting to disturb dowsers is completely nullified when they resort to an almost incredible method known as *map dowsing* used to locate a well site not on the ground itself but on a map or a simple sketch of a terrain that can be hundreds or thousands of miles distant. Again, triangulation can be employed to pinpoint a drill site or a vertical

Location of an underground water course
by field dowsing

Location of an underground water course
by remote dowsing

and horizontal grid-by-grid inspection undertaken. What is unbelievable to most people is that its representation on paper can substitute for a tangible portion of the earth on which a dowser can locate coordinates for a sought-for target.

No such representation is necessary in the case of *information dowsing* in which answers to yes-or-no questions are obtained. A simple "no" answer to the question "Can a source of fresh water sufficient to the needs of its owners be drilled on this property?" tells a dowser that no more time need be spent on the problem. The concrete physical aspect of dowsing in the field involving bodily sensing of something underground has been replaced by a wholly abstract mental process.

Garbage In, Garbage Out

More an art than a science, dowsing has never been adequately explained because of its intimate relationship to the unsolved *mind/body* problem, to which twelve pages are devoted in the eight volume *Encyclopedia of Philosophy*.

In his theory on the evolution of consciousness entitled *The Reflexive Universe*, the inventor of the Bell helicopter, Arthur Middleton Young, holds that one of the simplest and most amazing examples of animal behavior is the motion of an amoeba, a single-celled living mass of clear colorless jelly, which can reach out by extending a pseudopod, devoid of any musculature, from any place in its body. What causes the projection, asks Young, if it is not attention and intent?

Jan Merta

rod which he could move in a preselected direction by at will. How, then, could the dowsing rod move in a direction which was not preselected? The answer was that the rod was being moved by a force of a frequency as yet undefined by science.

frequency as yet undefined by science

The mystery of whether a "force" affects a dowsing rod

was still a mystery. It was a mystery that had been solved by

the work of a man named Jan Merta, a Czech-born

sea diver now working on oil rigs in the North Sea.

During the autumn of 1970 Merta attended the convention of

the American Society of Dowsers in Danville, Vermont, where he

was introduced to the world of dowsing. He was

the water dowsers' art into the realm of the extraordinary as

children, and successful searches for missing objects.

From knowledge gained in his experimental work at McGill

University in Montreal, Merta suspected that the movement of

the dowsing device had to be directly connected to *muscular*

contraction in the body—specifically in the arms or hands—of a

person using the device. He decided to construct a device

that could simultaneously record both the movement of the

dowsing device and any muscular contraction; he would be able

unambiguously to determine which came first.

Merta constructed a measuring instrument called an

instrument which could record the rod's every

movement through an extremely sensitive ball in crystal

including movements so slight or minimal that observers, unable

measure or detect them visually, believed that the rod was

motionless. When the rod was under tension and moving in the

hands of the dowser, its imperceptible motion was recorded on a

chart as a wiggly line. When it lay still upon a table, the

record on the chart flattened out into a perfectly straight line.

This was clear proof to Jan that the dowsers' muscular contractions

could move the rod even before he went searching for a target.

Merta next reasoned that one of the principal muscles

in the wrist area of the forearm. To test this idea he electrically

wired this muscle to his apparatus to allow any contraction in it

to be recorded on the chart together with any motion in the rod.

He began his experiment by having a technician pass a vial

of water in front of his face so that he could see it. This produced

a reaction in both the muscle and the rod. The pen graph

revealed clearly that the muscle contracted well before the rod

responded to the same contraction. Since two squares on the

chart represented one second, Merta found that the interval between the muscle's contraction and the rod's

movement was about half a second.

that the interval between the muscle's contraction and the rod's

movement was about half a second.

movement was about half a second.

movement was about half a second.

between 1850 and 1900. The first of these was the American Society of Actors, which was founded in 1850.

The American Society of Actors was founded in 1850 by a group of actors who were dissatisfied with the conditions of their profession. They wanted to establish a union that would protect their interests and provide them with a better working environment. The society was the first of its kind in the United States and it played a significant role in the development of the acting profession.

At the time, the acting profession was not well respected and actors were often paid very little. The American Society of Actors was the first to demand better pay and working conditions for its members. It was also the first to establish a code of ethics for actors and to provide them with a sense of community and support.

 District

For example, the amount of water that falls from the sky over the entire United States each year is about 1,000 trillion gallons. That's 1,000,000,000,000,000 gallons. But only about 1 percent of that water is available for use. The rest is lost to evaporation or runs off into the ocean. So, in total, only about 100 trillion gallons of water are available for use each year. That's not much water at all.

Approached by the committee, a driller well known in the local area told for sure where underground water is located," he said in the report. "The driller will be paid \$500 for the test and \$500 for the depth drilled \$50 if the well is cased."

During the winter of 1905 a hole was drilled down to a solid rock shelf one hundred feet below the surface. The water then rose to the surface and was used for irrigating grass.

The owner of the rice plantation, Francis Sargent, representing the fourth generation in a family who had pioneered the original ... and his father, Charlie, were counting on Livingston's talent for their very survival. Like hundreds of farmers all over the state of California, they were faced with impending disaster. For two years running, the lack of rain and ... turning their farmland slowly into desert. It was a drought the likes of which had not been seen for nearly fifty ...

Jack Livingston demonstrating ... Auburn, California, 1977, with a virtually unbreakable plastic rod that has all but supplanted the old forked stick cut from a tree. Jack employs the usual "palm up" method of holding the rod.

Well dugged by Jack Livingston
supplying 2,000 gallons per
minute. Left to right: Charles
Sargent, Jack Livingston, Francis
Sargent

When Francis Sargent learned of Jack Livingston's water finding exploits through a local newspaper, he drove over to Jack's small foothills cattle ranch to seek help. Just before the onset of the drought, he had drilled a deep well on his property about 100 feet down at a cost of more than two-hundred dollars per foot. This had netted him 250 gallons per minute (gpm) which he then used with irrigation water supplied by the local water district. It was enough to water his rice in any normal rainfall year.

Now, the water district had informed Sargent that he would get less than a quarter of his usual irrigation allotment during the hot, dry summer to come.

Of all crops, rice is the thirstiest. The rule of thumb for rice is about 1 to 500 gpm for one hundred acres. By applying that quantity steadily throughout the dry season, each acre is gradually afforded a total of 2½ to 3 feet of water which, week by week, soaks its way into the ground. Much more demanding than alfalfa, sugar beets, or wheat, rice requires up to 8 acre feet of water during one season to make a decent crop.

In the heart of the rice country near Chico and Gridley, northwest of the Sargent spread, the farmers were already in a panic. "I don't know what they're going to do up there this year," Charlie Sargent told Jack. "They're getting hardly any water up in that country. I was at a Rice Association meeting the other night where it was predicted that California may make only a third of its normal rice crop this year."

10. The first two columns of the matrix A are identical. Even if A is nonsingular, the first two columns of AX are identical. Hence, the first two columns of Y are identical. The same argument shows that the last two columns of Y are identical. Hence, Y is not invertible.

Jack Livingston teaching George Hightower how to dig at Pine Grove, California, in 1964.

edge of his property. But I've got to give Murphy credit. He told me that's exactly where we're gonna drill one of our wells." That was the problem.

Even in rainy times, lack of water has persistently plagued residents in California's mountains. Pine Grove, a small piedmont community lying across California State Route 58, ran out of water in 1964. By the following year, many of the settlement's residents, tired of trucking water to their homes, were talking about moving elsewhere. Faced with the emergency, the city called in a geologically trained civil engineer, who recommended that two wells be drilled near the little town. When sunk, they proved to be dry.

After Jack Livingston learned about Pine Grove's plight in a series of articles in the *Bea*, the Sacramento newspaper, he called the Pine Grove water authorities to offer his services as a water finder and was immediately invited to drive down from Newcastle. The well he found has been serving Pine Grove ever since.

Curious to learn whether the Livingston brought way affecting Pine Grove's well, Mark Blackman made the beautiful drive through the Mother Lode country made famous in America by the \$49 gold rush and also by Mark Twain, whose celebrated jumping frog has given rise to an annual frog jumping contest that takes place each year in Calaveras County, attracting croaking contestants from marshes and bogs as far away as Australia.

At two o'clock in the afternoon Jack pulled up at Pine Grove to find that the local water district, as many California water agencies are called, had built a cabin office over the mine shaft he had brought in thirteen years earlier. A minute or two later, a pickup truck with two men rolled up alongside his car. Out of the driver's seat jumped Charles Widmer.

"When Jack introduced himself, Widmer broke into a grin. 'I've read quite a bit about you, Jack. I've always wanted to meet the man who wished us our water,' he exclaimed.

Livingston asked shyly how the well was doing.

"Well, it just keeps going on and on. One son of a bitch just keeps pumping," volunteered George Hightower, Widmer's assistant. "Right now we're putting out about 45,000 gallons a day for a

month. But whatever we need, we just pump it.

"In recent times, Pine Grove is the only place in the area where that's not rationing water," added Widmer. "There was nothing in geology to suggest that any 100-foot-deep well would ever be brought in here in these mountains. If I had got us a lot more than that, it's a hell of a well. I still can't hardly believe it."

When they left, pumped this well at seventy feet, Jack reminded Livingston, "I didn't get any more drawdown. It tested out at 70 feet. That's all the pump could pull. At

Thinking in an automobile
Verdely, the German craftsman
on his driving ability, over the
years, Jack Livingston can not
detect water while riding in an
automobile. His road tests have an
indication, but it is a form of
water over which the automobile
passes out of the proper
direction, or even with, in which to
prevent a dry country, to find
water. As the car proceeds by a
series of dry hills, Jack's road
tests are in the dry hills of
there is an indication of water
under a given hill. The practice
has been to use a road to find a lot
of time by eliminating the need
for a more detailed search in an
area where the greater indication
suggests it would be fruitless.

February 10, 1978

Mr. Jack Livingston
7168 Ridge Road
Newcastle, Ca. 95658

Dear Jack

I thought you'd be interested in the well log data taken from the well which you drilled for us in December. You've certainly made a believer out of me after watching your performance. The other three fellows with me - Mr. Riser, Steve Boucher, and Mike Riser - also were very impressed.

I can understand how you can locate water, but it's beyond me how you are able to locate water depth. According to the well log, you missed the first water bearing strata by 4' or 5' feet, but hit the other 10' strata perfectly. I suspect the upper strata didn't have much water or just some in that vicinity that were less than 60 feet deep went dry last year.

According to the well log, the well test pumped at 25 gallons per minute for two days. The water level before pumping was 5' and 110' during the pumping operation. This appears to be one of the best wells we have on the ranch.

We feel you saved us money by not having to dig a deeper well. We followed your instructions and stopped at 40 feet. That compares with almost 100 feet for a well located 100 yards away in the same orchard. There we had a very difficult time finding gravel or sand strata.

Jack, thank you for your help. I'll be in touch with you when we get ready to dig another hole.

Sincerely,

Floyd Perry

7th World's Bobbing Stick Fallen, Nevada, 1977

Many discover a like Jack Livingston left away a long, straight, tapering stick, not unlike an oversized "bushy" winter. It is made of a plastic fishing rod. This wand can be used, in lieu of a forked stick, to find water, but it is usually employed to ascertain its depth below ground.

Jack holds the wand at its thinner end and allows the thicker tip to sink down a few inches from the ground. When it begins to move up and down, he counts the number of bobs, each one representing ten feet. When the tip of the wand stops bobbing and moves back and forth horizontally, he stops.

1977, 1978

If water is, say, 190 feet below ground, the wand will bob nineteen times, each bob representing ten feet. Starting at 190, the discover will count, this time one foot per bob. If he is accurate, the bobbing should cease when he reaches four

precipitation. It comes from deep subterranean sources that force their way up into the heights and then out into fractures in the rock where we find it. That's what I call live water. And it's good. As I said, I've never seen one of my wells go dry yet. I think this well of water will run indefinitely. It's one of the best wells I've ever located at these high elevations. I've had some much bigger ones, but further out toward the valley.

My experience with these type of wells is that you can never hurt 'em by pumping if you keep 'em active, if you keep

them constantly used. The harder you use a well, the better it'll develop as a rule. A lot of them increase their water flow because other little fractures or fissures get cleaned out on up the stem and add to it.

In his long downing career, Jack Livingston estimates he has

only 10 grain, they would produce over 10 billion gallons every year or enough to supply the daily needs of a city

has said. Downing in the hard rock of the Mother Lode is a heartbreaking task. It's not easy to go out on a man's property and tell him he has to drill maybe 400 feet in solid rock when

LEFT: Reproduction of a letter of acknowledgment from the Laven Land Company, Jack Livingston comments: "One reason a downer might miss the water in the upper strata is that it often is dead accumulated water and that is the reason the wells at that depth go dry after two years of drought."

good well at a rate better than average. I am most of the drillers
 and it takes them a long time to get the water down. The well
 has spread to our benefit and today we're the biggest
 water-drilling operation in northern California.

Thompson, who is 60, says he has been drilling for 35 years. He
 Weeks Drilling and Pump Company, located in the agricultural
 community of Sebastopol, east of Bodega Bay, of which
 Thompson is co-owner. Today practically every well the company
 puts down is dowsed beforehand either by Thompson or one of
 his sons, who are also drillers.

In Thompson's home county of Sonoma, 85 percent of the
 wells drilled produce some water, no matter where they are
 located. The other 15 percent are dry holes. "We've beaten those
 figures," gloats Thompson. "Our dowsed wells come in
 only about 95 percent of the time. But where we really
 excel is along with dowsing is in the *volume* and the *quality* of
 the water we produce. That's where we notice an enormous
 difference. We're not alone in this. Of the thirty-two drilling
 companies in Sonoma, the three which use dowsing all have a
 better success rate than average."

Thompson, now 60, was already twenty-seven years old
 when an amateur "witcher" stuck a forked stick in his hand for
 the first time. "It worked for me right off," he recalls. "It was
 scary at first, really spooky." For the next two years, Thompson
 checked his ability on wells that had already been successfully

drilled. "We found the water," he says, "in places where
 other people had failed. The reason I was able to do this was
 that I was being paid to work on the wells. I was not
 did not want to open himself to the risk of being heaped on
 dowsers, much of it by members of his own profession.

When he started his own company, Thompson was
 successful in finding water in places where other people
 had failed. He was not alone in this. Of the thirty-two
 drilling companies in Sonoma, the three which use dowsing

all have a better success rate than average. Thompson
 started, as he puts it, "witchin' in the open." During the 1977
 California drought, Weeks Drilling was working almost around
 the clock with a dozen drills operating fourteen hours a day. Six
 days a week, from 6 a.m. to 6 p.m., the company was
 working until late in the evening. In mid-March the dowsing driller
 had a backlog of 152 well jobs which would take him eight to ten
 weeks to complete. One hundred twelve telephone calls
 littered his desk, appeals from people looking for water on their
 properties, to which Thompson could only say, "I'm sorry."

The steep rise in business was not limited to mainly in
 neighboring Marin, just north of San Francisco, where
 California's most densely populated county
 Thompson and his colleagues had worked in Marin for nearly
 eighteen years but, up to the time the drought set in, they had
 been able to find water in places where other people
 had no access to municipal water derived from reservoirs.

When the drought set in, the reservoirs were showing their bottoms to the sun.
 "Most of Our Water's Gone!" screamed headlines on the cover of
 the *San Francisco Chronicle*. The drought was so bad that

*Wanda Thompson and Tom Egger
 in front of Egger's Nursery in Alhambra
 during their wedding.*

The ceremony was held at the home of the bride's parents, Mr. and Mrs. J. H. Egger, in Alhambra. The wedding was a private affair, with only a few close friends and family members in attendance.

The bride, Wanda Thompson, is a daughter of Mr. and Mrs. J. H. Egger. She is a graduate of the University of California, where she studied for her degree in education. The groom, Tom Egger, is a son of Mr. and Mrs. J. H. Egger. He is a graduate of the University of California, where he studied for his degree in engineering.

The wedding was a simple affair, with a ceremony lasting about an hour. The bride wore a white gown with a long train, and the groom wore a dark suit. The ceremony was officiated by the Rev. J. H. Egger, the father of the bride.

The reception was held at the home of the bride's parents. It was a private affair, with only a few close friends and family members in attendance. The bride and groom were the center of attention, and the evening was a happy one for all.

The bride and groom are now residing in Alhambra. They are both employed in the same business, and they are looking forward to a bright future together.

The wedding was a happy occasion, and it was a pleasure to be present. The bride and groom are a lovely couple, and they are sure to have a successful marriage.

...but he did not permit a woman. And I knew he was not led
had them. Treadwell boldly explained that he was a dowser.
Far from turning him down, his superior suggested to
Treadwell that he first go out to a test. When he gladly accepted
he was taken out onto the Roche grounds and asked to mark on
the ground the locations of the wells. Treadwell marked the locations of
the wells between the Schwarzwaldsee and the railway
embankment.

Trial borings and pumping tests that followed got us wells
in the area. The first well was located at the Roche grounds.

We also charted a series of potentially productive holes near the
Roche grounds where the Institute of Human Geography
conducted Treadwell's water finding that Roche began
sending him on trips to foreign countries wherever the corporation
was considering the installation of a plant. In Australia Treadwell
found a large supply of water under sand dunes close to the
beachfront in a suburb of Sydney but for a variety of reasons
unconnected to the find, his company did not purchase the site.
In India, Treadwell found a large water source for water in the
Thane area where a factory site had been proposed at Thane near Bombay.
As Treadwell revealed during the interview, "I had no idea the

...the water was so close to the surface. It was flat with red sand as far as you can see. It's apparently hot and
for the life of you you find the wildest notion where water
might be found in such a wasteland. Then, only with the aid of
Treadwell's dowsing rods, a thin strip of water was found
all wide under which a vein of water is indicated.

Treadwell's feat at Thane so impressed Rupp at the time, the
technical manager for Roche in India, that despite his initial
skeptical disbelief, he asked his colleague to try the rods.
As soon as he tried it, it worked perfectly, and he was able independently to confirm other
prospective water veins located by Treadwell, some of them for

1950-1951 Treadwell teaching a Hoffman-La Roche employee to dowse. When the employee held the huge dowsing rod alone, he could get no reaction. But when he held one handle and Treadwell held the other, plus the employee's hand, the rod responded as if Treadwell were manipulating the rod by himself. Courtesy of Hoffman-La Roche Basel, Switzerland

other Swiss firms such as Ciba Geigy and Sandoz.

"Of all the challenges I ever faced as a water dowser," says Treadwell, "the most difficult was the search for water in the Swiss Alps. Where we were dowsing, subterranean veins of water existed only in 1 to 10 centimeter wide cracks in solid rock. On average, these cracks were no more than three feet or so each day. After ten weeks we reached a depth of 200 to 230 feet and struck exactly the same place right on the button! Our dowsing had to be that accurate. Some companies using water detecting instruments had missed narrow veins by 24, 26, and 40 inches or more."

Treadwell explained that because he had been taught to dows by his father, he preferred a slender, straight branch of green willow bent into a hoop shape and held palms downward. When he reached the water, the branch would bend upward. "I once tried to dows with a forked stick," he said. "It was not successful with a forked stick." "The only difference between my

It is important to note that the results of the study are based on a sample of 100 subjects. The sample size is relatively small, and the results may not be generalizable to the entire population. However, the study provides a preliminary indication of the potential benefits of the intervention. Further research is needed to confirm these findings and to explore the long-term effects of the intervention.

CHAPTER 3

From Divination to Dowsing

Divine or Diabolic

Throughout the ages, men and women have developed means other than reason the answers to questions reason could not reveal. In the past, they have used divination, or "knowing through hidden senses," with which dowseers have had repeatedly to contend.

Throughout the ages men and women have developed means other than reason the answers to questions reason could not reveal. In the past, they have used divination, or "knowing through hidden senses," with which dowseers have had repeatedly to contend. In the Christian era divination has been considered either a sacred or a diabolic art. It was, for instance, the favorite pastime of the ancient Egyptians, and the Romans, who used it to decide upon the fate of their emperors. In the Middle Ages, it was considered a diabolic art, and the dowseers, who were often women, were persecuted. In the 17th century, it was again considered a sacred art, and the dowseers were respected. In the 18th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 19th century, it was again considered a sacred art, and the dowseers were respected. In the 20th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 21st century, it was again considered a sacred art, and the dowseers were respected.

It was, for instance, the favorite pastime of the ancient Egyptians, and the Romans, who used it to decide upon the fate of their emperors. In the Middle Ages, it was considered a diabolic art, and the dowseers, who were often women, were persecuted. In the 17th century, it was again considered a sacred art, and the dowseers were respected. In the 18th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 19th century, it was again considered a sacred art, and the dowseers were respected. In the 20th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 21st century, it was again considered a sacred art, and the dowseers were respected.

Divining has taken many forms and many names. In ancient times, it was often done by women, and was considered a diabolic art. In the 17th century, it was again considered a sacred art, and the dowseers were respected. In the 18th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 19th century, it was again considered a sacred art, and the dowseers were respected. In the 20th century, it was again considered a diabolic art, and the dowseers were persecuted. In the 21st century, it was again considered a sacred art, and the dowseers were respected.

Astrology, the study of the position of planets in the firmament, from which the word *consideration*—originally meaning "the study of the stars"—derives, was another ancient

Rods

No other simple object has been more frequently employed to exercise magical power. As a pointing stick it goes back to the mists of the Stone Age and in the century was being used by the Aenima, an aboriginal tribe of central Australia, as a means committed by sorcery.

In Malaya the pointing stick became a *dagger* that was supposed to be its own and thus endowed with *mana*, a force or energy inherent in all objects. This energy recognized throughout the Pacific basin as far east as the Hawaiian archipelago, its manipulation by *kahuna* priests was studied in this century over half a lifetime by Max Freedom

It was sometime shortly after the year 1000 A.D. that the word *Wand* (which in Old English meant "wand" and written until the end of the eleventh century, had the meaning of "wand" or "wand" —in its leucon

The "washing" part of the word was later transformed into *Wand*. The rod in today's German is *Wand* and a dowling rod walks with the rod.

The Rod Forks

First known illustration of a forked stick, ancestor of the Y-shaped dowling rod.

The evening prior to the great enterprise you shall go and find a rod or verge of wild hazel which has never been touched and which is precisely similar to the one illustrated, said rod being forked. You shall touch it only with your eyes, waiting until the morrow, the day of action, when you shall go and cut it at sunrise. You shall remove all the leaves and small twigs from it, if it has any, with a steel blade that has been used to cut the throat of a sacrificial animal. Begin your cut when the sun emerges, while uttering the following words: "I ask you great Adonay, Elohim, Ariel and Jehovah, to give this rod the force and virtue of those of Jacob, Moses and the great Joshua."

From *Le Dragon Rouge* ou *L'Art de Commander les Elements* first published in 1521

All early references to divining or "washing" rods describe them as Y-shaped. The first known illustration of a Y-shaped rod is found in *Le Dragon Rouge*, a French grimoire (one of many occult works).

Variations of the Red Dragon's instructions on how to cut rods fill the archives of nearly every European country. One variation, from the 16th century, describes the use of a rod in the ancient mystery of self-castration. As late as the nineteenth century use in central Europe, including Hungary, where folklorists were avidly collecting them. In the late nineteenth century an old Hungarian widow was observed to hang the corpse of a black hen on a hazel tree from which she then cut a dowling rod at a single stroke while uttering a prayer. The rod was then taken home, stopped before sunrise on New Year's day, and used to find treasure. "I consume in this way we are bound to each other, betrothed as it were, and when the moment is come when the rod has reached the time when it must break out, then the rod must show me exactly where is hidden the treasure which I am appointed to raise."

Instructions on the use of rods, as detailed as they are obscure, were left in his last testament by Basil Valentine, a Benedictine monk and alchemist said to have lived in the Saxon city of Erfurt in the late 1500s and credited with the discovery of antimony, an element used today in the manufacture of paints, semiconductors, and ceramics. When Valentine found that traces of lead in the soil were causing the fattening of his fellow monks who had

In a hermetic vocabulary, the word "rod" is used in a variety of ways. It can refer to a kind of divining rod, or to a rod used in the detection of buried objects. It can also refer to a rod used in the detection of buried objects, or to a rod used in the detection of buried objects.

MUSIC FLOOR IN THE NAME OF AN ANCIENT SYNAGOGUE

Archaeologist Hannah Katzenstein of Jerusalem writes "It is time in his publication on the arch of synagogue (1912) that Aquinas, in Hebrew called *dali* meaning path is mostly he holds in his hand while in the Beit Alfa Zantun it is treated paintings suggests a high degree of wishful thinking.

It is long Susan Wu's proposition that the cracks were

Duin Gordon demonstrating his technique of diverting a water vein. The ropes on the lawn represent where a water vein is running underground toward the foundation of a house in the background. Gordon now pounds a crowbar with T-shaped handle into the earth with a maul. He then strikes the crowbar at ground level. The vein turns at a right angle and begins to flow in the direction of the maul's pounding. Photos by Bob Aker

An unfathomable mystery of underground water veins is being solved by Duin Gordon, trustee of the American Society of Dwellers, who has put it to practical use. A resident of Portland, Maine, Gordon has been engaged in diverting basements for nearly a decade. Through his technique, he has been able to divert water veins from 50 to 6 feet below ground at the same average depth of the

Says Gordon: "The vein is diverted by either forcing it through a crack in the floor or 'weeping' into the basement where the floor runs through the ground."

Gordon had been using a huge crowbar with a T-shaped handle to make holes into a high bentonite—a clay that swells when water is added to it. It proved to seal up channels into which water intruded.

One day, he happened to pound a bar down outside a house. So I grabbed an 8-pound maul and began whacking the daylight out of it to loosen it. Then I don't quite know why I struck my angle rods to check the vein running towards the house's basement and I couldn't find any trace of it—even though I was working on the back and the house itself.

I figured I'd done all the pounding against the bar in a direction at a right angle to the vein's flow. So, doing around the bar I found the vein had turned at a right angle and was now flowing away from the house toward the house. So I said to myself, then I'll try the use of trying to seal off vein

Gordon has used his new found method many times not only to divert water veins around a house basement but also to divert them towards a well some dry or to "cut" and turn a vein away from a source of pollution rendering its water drinkable.

To cite one example: he relates, "I found a vein flowing about 5 gpm that was running right past a well going almost dry. By putting my T-bar directly into a spot over its source, pounding the bar at ground level in a direction leading to the well, I was able to divert the flow of the vein into the well itself. You could stand over the well with a flashlight and see the water flowing in and filling up the well. That was five years ago in April and that well has produced ever since although before the d always gone dry during one part of the year even in the

I've had 90-95% success diverting water into dry wells and the method I use is really helpful to some poor devil who's got

CHAPTER 4

The Dawn of Dowsing

or even by the fingertips

Dowsing for Ore in the Erzgebirge

In 1901 *The Atlantic Magazine* in London published the first translation into English of a massive German opus on mining and metallurgy, the *De Re Metallica* by Georgius Agricola. It was so well received that it was reprinted in 1912, 1928, and 1934. In 1934, the first English edition of the book was published by the University of Chicago Press. The book was the thirty-first part of the *De Re Metallica* series, and it was the last one. The book was the last one to be published in the series. The book was the last one to be published in the series. The book was the last one to be published in the series.

Georgius Agricola, as illustrated in *De Re Metallica* in
the *De Re Metallica* (Courtesy Burndy Library,
New York, Connecticut)

Woodcuts showing signs of metal
in the earth—from Agricola's On
Metals.

For three years Agricola spent his nights reading every Greek and Latin text on mining he could acquire and long days with a microscope, a balance and a crucible, he worked on every facet of the industry. Bertram was able to say that minerals could be tested by skill too, such as the test with a hammer and anvil, which Agricola had learned he could use to determine if a rock was of the water or from them. The secret was to learn to see a vein of metal with water and could explain how the term "water-bearing" was used by miners of the day.

[illegible][illegible]

allowed him to stake a claim, he reverently named what he hoped was a nascent mine *Gottsgab*, or "God's Gift."

Lacking the capital for the enterprise, he set about its development by selling shares. As owner of one of the shares, Agricola was able to mine the rich veins of pure silver as no other mine that has existed in our town or our fathers' memories with the exception of the Saint George at Sebnitz. We, as a share holder, through the goodness of God have received the proceeds of this God's Gift since the very time when the mine began to bestow such riches.

His fortune made, Agricola moved to Chemnitz where he was appointed mayor and soldier. He was a leading mining statesman of the day, including Duke Henry of Brandenburg who was seeking advice on how to work new mines in the Harz Mountains. While in the Harz, Agricola heard a century-old tale about how the first rich silver mine in Germany was discovered: in the 650-meter-high Rammelsberg, a mountain at Goslar, in 918 A.D.

The mine, wrote Agricola in his *De Veteribus et Novis Metallis*, was found by a stallion named Rammel which, tied by his harness to a tree, was bored by the earth in his boredom. One day he broke through the hidden vein. I don't need to invoke the winged Pegasus whom Agricola recalled, "in poetic legend opened a spring when he beat at the rock with his hoofs."

Based on other evidence, Makarov, a Russian geologist and poet who took refuge in Saxony's Freiberg Mining Academy, claimed that the name Rammel applied not to the horse but to either a huntsman to Otto I, Goslar's suzerain. In our day, a Soviet geologist and mining engineer, M. M. Makarov, discovered that one of Otto's

One-and-a-half-ounce silver coin struck to commemorate the discovery of a mine on Rammelsberg, a mountain near Goslar, Germany, in 918 A.D. "The coin is a memorial to the history and mine working of the day," writes Soviet mineralogist M. M. Makarov in his article "Thousand Year Old Discoveries" published in the Russian journal Technology of Ore Deposits. "On it can be seen a panorama of the mine, a line for the levered transmission of energy from a place beyond the edge of the coin to the right, a grinding wheel, chunks of ore, subterranean structures, a system of mining shafts, a vertical shaft, and various methods of prospecting, surveying, and exploitation. Even a hammer is shown on the right. Above all, we note that on the left side of the ore deposit a figure is walking while working with a 'witching' rod and that on the right side, at a spot indicated by the downer, a hole is already being dug. The deposit is portrayed as a mine with a system of horizontal galleries and blind shafts which differ very little from those of today." (Photograph courtesy of the Smithsonian Institution, Washington, D.C.)

[illegible]

(LEFT) Woodcut from Agricola's *De Re Metallica* illustrating a dowsing rod being cut from a tree (center top) and two rods being employed (A) to locate places (B) where miners should dig for ore. The dowsers in the background holds his rod with an unusual "palms downward" method while the dowsers in the foreground grips his rod with one palm facing down ward, the other upward. This may attest to inattention or lack of interest in detail on the part of the illustrator or to insufficient data. Close examination also suggests that the rods were split into their forked shape with a knife rather than cut forked from a tree, the usual later practice.

During a quarter of a century of toil on his *magnus opus*,
 from hazel trees to find ore underground
 was no more consensus on the rod's efficacy in his day than in
 ours. There are many great contentions between miners
 use to discovering veins, and others deny it.

Agricola informs his readers that many dowsers preferred
 a metallic vein. This implied that the hazel wood, itself
 used a different kind of wood for each metal: hazel for silver, ash
 made not of wood but of iron were lauded. However, wrote
 Agricola in the first recorded description of field dowsing,
 wander hither and thither at random through mountains
 the twig immediately turns and twists, and so by its action
 from that spot the twig becomes once more immovable.

moved the rod and that an exceptionally "powerful" vein could
 even cause branches of trees growing nearby to deflect in its
 resulted in the veins of metal themselves, then it should be able to
 cause a rod to turn in anyone's hands, and that because the rod
 did not turn for everybody, then only those who employed
 mysterious incantation and other forms of witchcraft could
 employ it successfully.

Agricola would have sided with the USGS of his day for, in
 his treatise, he concluded that "a miner, since we think he ought
 to be a good and serious man, should *not* make use of an

to be drawn from the *magical magnetism* of the talismanic rod, and the other to be drawn towards the earth by the magnetic force of the earth itself. Kircher made experiments with, and watched others operate the hazel rod, but only he and a few other magicians could make it move. He reported that he had spent a year and a half in the study of the rod, but that he had not been able to make it move. He had, however, observed that the rod would move if it was held in the hand of a person who was in a state of magnetic excitement. Kircher was aware that the rod had sometimes been used on the part of a dowser, but he was not following instructions to move. To quote Kircher's seventeenth century opinion in full:

Reason can be given why a two-pronged rod grasped firmly by either branch, even with every consideration of magic excluded, could still experience so great an impulsive movement from metallic vapors, that they should draw it down. Certainly for my part I often undertook an experiment in regard to bodies of gold and silver, but was always disappointed in my hope. And I clearly noticed that the devil but of the person handling the rod, since he is duped by the power of his own imagination and thinks that the rod dips of its own accord towards the metal though he himself is inadvertently twisting it. I do not think that it can happen that

twisted so great and sudden a force that the rod is spontaneously caused to bend down even to the ground.

The idea of a two-pronged rod was developed by Kircher in the late 17th century. It was based on the concept of the *atomium*, first developed in classical Greece by Democritus and Epicurus. One of these was the French Epicurean philosopher and mathematician Descartes, Pierre Gassendi, who wrote in 1659 that the universe was made of atoms. Kircher taught that because the whole universe was made of tiny particles, the rod would be attracted to the metal vapors of the earth, and would move independently of the dowser. Others, such as the German philosopher Leibniz, believed that the rod was attracted to the earth by its own magnetic force.

Kircher's attempt to explain the rod's movement out of any consideration of dowsing was more successful than Agricola's. He was, however, abandoned. Caspar W. Smith, in his 1671 book *Magia Universalis*, reported that he had tried to use the rod, but had failed.

Some pretend that the hazel rod moves by the effect of a warped imagination. Others, of wiser mind, abruptly decide that the whole thing is a sleight of hand executed by an adroit swindler who causes the rod to move. Still others, who have not hesitated to say

that at the very least the thing was linked to an implicit pact with the Devil: this is why they warned me to use this rod without previously renouncing any such pact, and without ~~that~~ having preliminarily struck fully way to the end of the rod and even pronounced exorcisms while it turned in my hand.

Title page of Occult Physics by
 Abbé de Yvermont

The most common way of using a distilling rod is to take a forked hazel branch — one from a nut tree — a foot and a half long, thick as a finger and no more than a year's growth, as far as possible. One holds the two branches, A and B, in the hands without squeezing them too much, so that the back of the hands are turned toward the earth and the point C of the rod projects forward and is parallel to the horizon. Then one walks among those places where water is usually supposed to lie. One should not walk too fast for otherwise one will walter the volume of vapors and the process will be less perfect. The place where one lies and which one should walk toward, the rod, causing it to turn

There are those who hold the rod in another way. The method of Monsieur Florent is to hold it on the back of an outstretched hand in balance. This is how he describes his method. "In order to find water one should take a forked branch cut either from a hazel, elm, oak or apple tree about one foot in length and thick as a finger so that the wind cannot easily move it. One should place it on one of the hands as much as balance is possible, then walk slowly and when one passes above a course of water it will

The Jesuit Father Kircher says that he saw this kind of distillation practiced in Germany in an entirely different manner. One takes a straight hazel sprout without knots and cuts it into two pieces of equal length, one carries the end of one piece into the form of a tiny basin and the end of the other into a point such that the tip of one stick can enter into the tip of the other. One holds this combination between the two index fingers as the figure shows. When one passes over water the pieces move and incline.

There is another way which I have seen used only by a few persons who practice the water-seeking art. They take a long sprout of hazel or any other wood straight and smooth like an ordinary cane. They hold its ends in their hands, bending it slightly into an arc. They carry it parallel to the horizon and when they pass over a water source, the rod turns and the arc twists toward the ground."

[illegible]

not move when they crossed over metal, and vice versa

quartz, the only explanation for the dowsing rod's movement over matter such as water and minerals was its attraction by

cases which having neither α nor β necessarily to produce the same results under similar circumstances.

When it came to settling boundary lines or adjudicating the rights of man and beast, the rod was effective in such cases. Then the ensembles had to be intelligent, moral, and supernatural. Because God and the angels could not be expected to be concerned with the minutiae of every human squabble, the causes necessarily were the work of infernal spirits. Malinche concluded that dowsing rods should be used neither to find material objects nor to decide moral questions.

Lebrun countered that the purely physical relation between matter weight and the red should allow its use in burning for

men and even children. In the ensuing debate, Madebranche's

only abstain from using the dowsing rod but prohibit their predecessors from doing so.

Widening press coverage of Asmar's doings and the private debate between Labrous and his fellow ecclesiastics began to unleash a furious public controversy. Asmar's dowrying ability was put to test in Lyon on September 3, 1692 before a number of distinguished witnesses including a respected physician, Pierre Garnier, who published the results of the trials in a 1694

post Philosophical Frontine in the form of a Letter to Monsieur de Neve Seigneur de Flecheres, in Which it is Proved that the Extraordinary Faculties by Which Jacques Agout with a Dining Meat, Poisoned Murderers and Robbers, Drowned and Water and Burned Silver Re-established Landmarks, &c. Depend on a Very Ordinary Natural Cause.

Lehrbuch referred to a strange dowsing practice involving the
 albeit insufficiently, in *Giambattista della Porta's* compendium
Natural Magic that had come out in 1569. The method was
 supposed to be particularly advantageous in seeking out buried

No way of illustrating this bizarre practice would have been
 possible had it not been for the author's fortuitous encounter
 with Cherie Andrade, a Mexican student in Washington, D.C.
 During a conversation on dowsing, Cherie, who up to then had
 never discussed or heard of the subject while in the United States
 and excitedly that her grandmother, Senora Maria Esther
 Andrade, a native of Nayarit Province in west-central Mexico
 had a set of four forked rods made of steel which, when not in
 use, she always kept tied together with a skein of crimson wool.
 When Senora Andrade visited the American capital in December
 1976, she brought the dowsing rods with her and, together with
 her granddaughter, demonstrated how to operate them.

The only known dowsing method utilizing the cooperation of
 two individuals requires some practice before one is able to move
 with one's partner together over the ground while keeping the
 rods, called "Spanish needles," in contact with one another.
 Successfully coordinated, the rods will move to left or right, up
 or down, to indicate the direction of the treasure sought. Senora
 Andrade believed that the rods in tated here had been handed
 down in her family for more than 100 years, indicating that at
 least one use of dowsing entered the North American continent
 shortly after the publication of della Porta's book. Today

is known mostly in parts of the American
 West first colonized by Spanish

CHAPTER 6

Dowsers Tested— By Skeptics and Electricity

"Rare Articles"

It is not surprising that the dowsing controversy has produced a number of interpretations, and contradictions about the action of a dowsing rod and the cause of its behavior that are still current today.

On one side of the controversy stood proponents of a supernatural force that could be used by the individual, the community, the military, and the army.

Neither of the two camps were unanimous in what they believed. Some of the skeptics, for example, considered the dowsing method at best uncertain, largely because it could not be explained by the scientific method. Others, on the other hand, attributed them to otherworldly sources and those who attributed them to infernal realms skilled not only in meting out gross injustice to innocent victims but in exposing dowsers, however unwittingly, to metaphysical self-abuse.

In 1700 a thick German book written by Johann Gottfried Zedler, *Year Concerning the Dowsing Rod as a Universal Tool of Knowledge Hidden from Man*, underscoring the enigmatic nature of the art. Supporters of dowsing and skeptics alike were represented. The book was a collection of essays, some of which were substituted for a forked stick. On the other, it sarcastically referred to the dowsing rod as a "universal tool of knowledge."

The book was a collection of essays, some of which were substituted for a forked stick. On the other, it sarcastically referred to the dowsing rod as a "universal tool of knowledge."

no reaction when I cross over a seam or work near one." This is the perfect example of a good welder. I think anyone who has done this work knows who who. With the right technique and the right equipment, you can weld any metal and any thickness of the metal. The only thing you need is movement of the dowsers' muscles and "if one adds superstition and outright cheating, the art is perfected."

[illegible]

The "Bishop's Rule"

A,B,C — dowsing reactions
A to D — depth of water vein

Illustration of how Blaton held his rod. From La Verge du Jacob, 1694. This rod was in use in Germany before that date since a letter written by a "distinguished physician" to Dr. Pierre Thouvenel states that "some in Germany use a simple rod placed across the back of the hand or like Blaton, on the two index fingers"

where he performed countless tests and experiments, some of them while perched atop a tall tree. Blaton also purported to have discovered that a rod would get a dowsing reaction not only while standing directly over a water vein but at a given distance on either side of the vein. He used the rod to find water in wells dug under the bishop's supervision. Its apparent efficacy was so appealing that ever since it has been incorporated into dowsing annals as the "Bishop's Rule."

It was only in deference to local custom and to those who had used the rod before that Blaton adopted the instrument of an unusual configuration. To the common fork shape of the rod he added a small ring to be placed on the tops of his two middle fingers. Over the flowing water the rod would rotate on its axis thirty to eighty times per minute depending, as Blaton surmised, upon the rate of flow.

Not convinced himself of Blaton's dowsing ability by his success in locating the still famous mineral waters near Contrexeville at the foot of the Vosges Mountains, the duke of Lorraine turned to the doctor for the wealthy and led to the doctor's appointment as crown as Inspector General for Mineral Waters, charged with writing a history of their past and their future development.

Blaton's fame spread throughout France and the University of Nancy Medical School was writing in 1700: "Blaton, a physician of the University of Nancy, was the first to publish a treatise on the use of the rod for the Poor. The two physicians sought to get to the bottom of the phenomenon by correlating the rate of rotation of the rod or his fingers and the

To his work. Then, when the brother replaced the sign with the other one, he was surprised to find the birds with effort in their little mouths, as they were used to the low hanging red worms. Then, as the birds grew used to the worms, he put them just as they would be placed in water by Saurians to get rid of their excess. The appearance of his birds once more attracted the feathered world in flocks and caused by the turning of a body, the rising power of five or six inches, including the length of the neck, who suggested the use of a restricted diet, a confinement, which he immediately put to work at his own and a success. He was very happy.

On May 25, 1982, in a series of interviews, one of the blindfolded captives, x_k , was asked to give an account of the 14 days x_k spent in the "Sancti Spiritus" military camp. He reported that the captives were not given food or water. When the captives were taken to the toilet, they were made to squat. x_k also reported that the captives were made to sleep on the floor, with their hands tied behind their backs and their feet shackled together, and were kept spinning crazily on his fingers.

The *Journal of the American Medical Association* has published a study which indicates that the use of a certain type of birth control is associated with a higher rate of breast cancer. The study, which was conducted by the National Cancer Institute, found that women who used oral contraceptives for five or more years had a 50% higher risk of developing breast cancer than women who had never used them. The study also found that the risk was higher for women who started using oral contraceptives at a young age and for women who used them for a long time. The researchers concluded that the use of oral contraceptives may be a risk factor for breast cancer, and they recommended that women who use them should be aware of the potential risks and should have regular breast exams.

conviction, about his ability -

[illegible][illegible]

"For so long now gentlemen, you have been talking about flying ships and turning dowling rods that one might at last think that you actually believe in all this lunacy or that the scientists who cooperate with your journal can do nothing to dispel such absurd pretensions. It is demonstrated in every way that it is impossible for a man to raise himself from the ground or even to support himself in the air."

Joseph-Jerome de Lalande 1782

"A few years later on June 5, 1783 at Annonay the Montgolfier brothers took off on their conquest of the sky and Lalande's anathemas prevented neither balloons from flying nor dowling rods from turning."

Dr. Armand Vire 1915

discovery at the age of twenty-one of the earth's distance from the moon had already won him admission to the Berlin Academy of Sciences and a post as adjunct astronomer at the Paris Academy. In a letter to the *Journal des Savants*, a publication well known for the arrogant tone of its criticism, he opened

alibises or even to observe a twofold chatulants of which he causing a piece of curved metal to turn in his hands, not

in such a way that the summit of the arc is lower than its two extremities, but that the whole is in near equilibrium the slightest drawing together of the fingers, were it a distance no longer than one *ligne*, would suffice for the extremities, in turn to move and for the summit of the arc to come to the top. If one separates them the summit will instantly descend and with a similar alteration, the movement can continue as long as one

needs only the slightest trembling movement which is hardly to be perceived if one is not warned about it. Lalande sarcastically

his attention

Lalande nowhere addressed the crucial question as to whether this trembling was voluntary or involuntary. Because blinking one's eyes is usually an involuntary action, this does not mean that one cannot blink them on purpose. As in the 1700s, dowlers today, aware that they can cause a reaction in a dowling, but wait until the motion occurs nonvolitionally.

As so often in the history of science, Thouvenel's spirit of sincere inquiry did not carry the day against 'authority'. The

book, *White Magic Unveiled*, giving precise instructions how

The dowser Pennet, subject of Dr Pierre Thouvenel in Italy, as depicted in Della Raddomanzio *Ussia Electrometria Animale* by Carlo Amoretti, Milano, 1905.

When Thouvenel accepted the task, the Count requested Vassallo to assist him in his quest. But Vassallo, already a dowser himself, was not qualified to be with a dowser. After Pennet's arrival, he founded the first dowser's association. As a result, he was able to establish a dowser's club in his home town. The club's members met regularly to discuss dowsering and to share their experiences.

Fortis, whose account of an extended journey taken with Thouvenel and Pennet throughout southern Italy coincided with the time of his own dowsering activities, arrived at three important conclusions about dowsering tests.

The first was embodied in his criticism of Thouvenel for "too much reliance on the experimental method. He frequently used metals which may fail because of the limited volume of substances buried." This was particularly true if linked to his second conclusion that sudden variations in atmospheric conditions "may be due to the local conditions and to the particular nature of the soil, but they are also due to the natural climate" in which he worked. The attitudes of dowsering were also reflected in the method of the dowsering tests. Pennet succeeded best when he was tested in a lighthearted fashion rather than under conditions of great solemnity.

Finally, "concluded Fortis, "if the facts here reported are not to be regarded as the result of a mere coincidence, it is necessary to conclude that the dowsering tests are not a mere game, but a serious and scientific method of dowsering. The dowsering tests are not a mere game, but a serious and scientific method of dowsering."

Thouvenel also turned to one of Europe's most renowned scientists, Spallanzani, to help him in his quest. Spallanzani paved the way for Henri Pasteur in the nineteenth century because Thouvenel knew that Spallanzani had referred to Pennet's dowsering feats as "the dreams of a sick mind and fantasies of a bad novel." He had Pennet hand deliver a letter to the professor so he could talk to the dowser in person.

As a result of his meeting with Pennet, Spallanzani—considering his hasty opinion, took the dowser to places in Pavia where known currents of water flowed below the city and in the courtyard of the Botla mansion, Spallanzani's home. He was so impressed by Pennet's dowsering that he wrote a letter to the dowser, in which he mentioned that he had seen his curved red moved on his fingers as if animated by a white force.

Spallanzani was sufficiently impressed with Pennet's initial dowsering that he wrote a letter to the dowser, in which he mentioned that he had seen his curved red moved on his fingers as if animated by a white force. Spallanzani was sufficiently impressed with Pennet's initial dowsering that he wrote a letter to the dowser, in which he mentioned that he had seen his curved red moved on his fingers as if animated by a white force. As he moved toward an area where earth had been disturbed, As he moved

The first of these is the fact that the earth is not a solid body, but a fluid one. The second is the fact that the earth is not a uniform body, but a body of varying density. showing rods illustrated by Carlo Amoretti in his *Delta Radiomanus Over Electrometers Ammirale*. Some of the rods seem to be related to those of the Swiss drawers, Trenchard and Flapp, and in the world rod illustrated on page 212.

all. I asked my friend who he thought was doing just an excess of what he did twice, he said, "I had it only as a trifling excess, as it is usual." To physics and alchemy, a completely new chain linking the two general worlds had been found. If hands, or attached to his feet, the rod would turn in one direction when put in his hand in the sense of a crown in the other.

It seems that while the electrified Pennet was able to produce a rotary motion in the rod, her subject could not associate the fact. Several minutes insisting that the motion effected by Pennet could be caused by his holding the vertical glass rods with pressure, actually grew so dissipated in their efforts to prove their assertion that they broke them. Experimentally, however, the experimenters were not that Pennet's demonstration of the rod varied according to weather conditions.

The pioneering efforts of Thouvenel to create the dowsing and electricity, though not conclusive, renewed interest about some kind of natural energy in the body that he termed magnetism of Franz Anton Mesmer and the "animal electricity" of Luigi Galvani had already anticipated Thouvenel's work. It was not until the late 18th and early 19th centuries that the scientific community began to take dowsing seriously in the nineteenth century.

Galvani's experiments with frog legs and electricity. From Abbe Bertholoni, *De l'Electricité des Végétaux*, Lyon, 1781.

CHAPTER 7

Physical or Sidereal: A Pendular Question

A Dangerous Frontier by Thomas M. Wright, Jr., and Robert Wright

A Dangerous Frontier

While working on the pendulum in the Apartment of Unaldo, Abbot Fortis was introduced for the first time to a phenomenon that was little known in the West. He had a handful of silver coins under a heavy blanket. One of his friends was swinging a piece of gold jewelry on a silken string between his thumb and his index finger. As he moved his hand, the string and the gold piece swung in a regular pattern. When he let it go, the piece fell. It took a while before Fortis understood that the swinging motion was not due to the piece's weight, but to its motion.

When Fortis tried to swing a piece of gold jewelry, he found it was not as easy as he thought. He knew it was affected not only by silver but by a variety of metals each of which would cause it to swing in a peculiar pattern.

When Fortis drew the phenomenon to the attention of a clerical colleague, the priest recalled that as far back as the first century A.D. the Roman writer Marcellinus had referred to a "pendulum" as a device used to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread.

Fortis was not alone in his discovery. In the Middle Ages, it was evident to Fortis from a bull issued in 1326 by Pope John that the pendulum was used to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread.

Why, wondered Fortis, did a pendulum on the one hand have the power to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread.

Why, wondered Fortis, did a pendulum on the one hand have the power to detect the presence of divination, from which hung a ring on a thread. Used in conjunction with a circle showing the letters of the Latin alphabet, the pendulum was used to detect the presence of divination, from which hung a ring on a thread.

Illustration of a pendulum with a snake coiled around it, from a 19th-century book. The pendulum is shown in a vertical position, with the snake's head raised and tongue flicking out. The illustration is from a book titled 'On the History and Theory of the Sideric Pendulum' by Father Andreas Reuch, Innsbruck, Austria, 1901.

...he by then was a scientist who day in and day out was working on the subject of clairvoyance. He had been told that one of his friends, a fellow scientist, had received a letter from a fellow scientist traveling in Italy revealing that one Francesco Campetti had discovered a powerful force that could be used to create a surface.

Fascinated by the report of what to him was a completely new phenomenon, he immediately set out to investigate. He was told that Campetti was a young man of about 25 years of age, who had been born in the town of Munich, Germany. He was told that Campetti was a very intelligent and energetic young man, who had been studying at the University of Munich. He was told that Campetti was a very talented and energetic young man, who had been studying at the University of Munich.

On November 21, 1806, Ritter set forth to Italy where he was to meet Campetti. He was told that Campetti was a very talented and energetic young man, who had been studying at the University of Munich. He was told that Campetti was a very talented and energetic young man, who had been studying at the University of Munich. He was told that Campetti was a very talented and energetic young man, who had been studying at the University of Munich. Amoretti.*

muscle, physical. There was, it could easily be said, a difference as to the kind of relation between the exertion of certain muscles and the thought that caused the thought, but not yet the intent to command the muscular organs."

When Chevreul was standing at a table, that weight or weight of thought was not in the hand, but in the motor movement. Chevreul came within a hair's breadth of concluding that the movement was not the movement of the hand, but of the motor movement, but that it was not from them solely by mental effort and, by altering the objects without touching them.

Chevreul's summary of the dowsing enigma, 1850: A dowsing device's movement can be explained either as being part of the mental world and having a spiritual cause derived from

- a God or the angelic hierarchy
- b the devil or his minions
- c the mind of the dowser

or as being part of the material world and having a physical cause derived from occult properties associated with matter which

- a the 4-elemental propensities called sympathy and antipathy
- b the Cartesians called corpuscles, vapors or subtle matter,
- c Chevreul's contemporaries referred to as electricity, electro-magnetism, or electro-organism (dynamism)

Figure 1

Apparatus constructed by Monsieur P. de Biche, Secretary General of the Prefecture of Loiret, France, around 1818 that ostensibly proved a pendulum's movements were not due to involuntary muscular movement.

On a table a crosspiece 20 to 23 millimeters thick, 17 to 18 centimeters wide, and 16 centimeters long was mounted on two uprights 30 centimeters high. In a silk cotton, hemp, or linen thread 21 to 22 centimeters long,

a pendulum made either of a ring, a tiny ball, or a metal cylinder (silver, copper, or lead) was attached, the upper end of the thread being fixed to the crosspiece by a ball of wax which stuck to the wood. It was said that the pendulum exposed to a substance placed beneath it would rotate or oscillate whenever a hand was played on that part of the thread lying on the upper side of the crosspiece. Monsieur Albert de Biche in his book *Science*

Histoire naturelle et physique de l'homme stated that the pendulum would move as desired by a sensitive operator holding his finger on the motionless portion of the thread.

Rutter's magnetoscope

Other experimenters, however, were to come to conclus-

ive results. Monsieur de Biche tied the thread of a pendulum around a support 11 to 12 centimeters high, and fixed it to the top of the support. Though he could not have

known it, he was actually using a magnetoscope, for what substance lay directly below it.

Independently of de Biche, one Rutter, a resident of London, had also constructed a similar apparatus, but because it was assumed to detect "magnetic" currents emanating from all substances, was called a *magnetoscope*. It consisted of a glass tube 10 to 12 centimeters long, closed at one end of glass by a silken thread attached to a metal arm. The other end of the thread was fastened to a small sphere, which formed a spherical protuberance, to be fastened to the top of a wooden column. It was sufficient that Rutter only lightly touch the sphere for the pendulum to leap into animated motion.

The Englishman's experiments came to the attention of a famous Austrian chemist, Baron Karl von Reichenbach, discoverer of the "magnetic fluid" or "magnetic electricity" which he

called "magnetic fluid" or "magnetic electricity" and

to sense emanations coming off substances and even identify

them. He published his results in 1826, and his experiments

were repeated by many others. He was the first to give the

name "magnetic fluid" to the substance which he called

"magnetic fluid" or "magnetic electricity" and which he

called "magnetic fluid" or "magnetic electricity" and which he

called "magnetic fluid" or "magnetic electricity" and which he

Joseph Winnier, a gymnastics professor and mathematical physicist, was a close associate of Heinrich Himmler, chief of Hitler's dreaded SS.

Working at the Anatomical Institute of the University of Munich between '3 and '6 in the afternoon three times a week, Winnier and his colleagues used a dowsing rod to measure the thickness of various elements. They found the rod to be 1.2 millimeters thick. Over given elements they found the rod to produce a revolution of 40-50 degrees, nitrogen 40-50, phosphorus 440-460 and cesium 600-620. They went on to obtain corresponding values for fifty-four elements on the face of it were it not for the fact that research by Soviet and underground anomalies.

Like their predecessors, Wast and Winnier eschewed all previous names for the active force which they measured as traveling at a rate of 42-45 meters per second, or a little faster than the speed of sound. Instead they opted for two more

Louis Probst's invention

To cite but one example of an instrument purportedly based on the new wave theory, French dowser Louis Probst's invention, of what he called a *radio-captant*, began with a simple metal spike driven into the ground, was centered between the poles of a horseshoe magnet mounted inside a flattened box. Into the side of the box a metal

wire was then attached to the ring and isolated from the earth by a series of stakes topped with porcelain fixtures.

"waves" emitted from an underground water source or metal ore deposit were in some way "captured" by the spike and, assisted by the magnet, sent along the wire. The dowser would then straddle the wire and frog walk along it until he got a reaction. The direction of the reaction would be ascertainable further along the wire.

Suitable for shallow targets, the method obviously was impractical for those at depths of one hundred feet or more underground. To get around the difficulty, Probst wound wires into coils of varying length which, arranged in series, were held to provoke a dowsing reaction if the total length of the wire

The same contraption was also supposed to be adaptable to this particular method to work, dowsers were to station themselves with the instrument at their backs, then sidestep around in a circle until they got a reaction. By moving the instrument to a new location they could then ascertain a new area for more detailed on-the-ground survey.

Using this method to search for gadolin, near

... I discovered that the instrument was not so sensitive as I had thought near a village 11 kilometers distant.

The whole method depended on the idea that waves from the objects were somehow received by the instrument stuck in the earth and transmitted to the dowser in its vicinity. But as Vire noted in his book, 'our sensitivity, having become more and more refined, was not so good when the instrument was stuck in the ground as it was when the person was in contact with it.' The results? Pondering this fact, we at first thought that our nervous systems themselves were receiving waves emitted by sought-for bodies like a radio receiver picks up waves from a transmitter. We therefore got rid of the metal spike — and after a couple of years the practice achieved remarkable results! The whole physical part of the phenomenon seemed to have disappeared and we were left with a purely mental phenomenon.

Psychical Physics

So the time-old question remained: Was dowsing basically a problem for physics or psychology? Opposing answers were proposed in the very titles of two capital works, one German and the other English, that appeared in the 1920s. The first was called *The Dowsing Rod as a Scientific Problem with Appendix: Conclusive Experiments Made by the German Commission for Scientific Research* (1924). The second was *The Dowsing Rod and the Mental Factor* (1926) by Sir William Barrett, professor of psychology at the Royal Society School of Experimental Psychology, and the cultural anthropologist Theodore Hesterman.

A reading of the two books in conjunction reveals instantly why they were so important. Whereas the German work was devoted to *field dowsing*, the Englishmen swept wider to include notions of *remote dowsing* and to formulate a theory — based on a word coined by Nobel

CHAPTER 8

Icebergs or “Waters of the Earth”?

Water for humanity: the hydrologic cycle and the water crisis

Hydrologic Doctrine vs. Primary Water

In 1977, a conference was held in Stockholm, Sweden, to discuss the possibility of moving icebergs from the Arctic Ocean to the Mediterranean Sea. The icebergs, which are 100 to 200 miles long and 100 to 200 miles wide, contain 20 billion gallons of water, but they are too large to move. The conference was held next to the coast of a desert country to serve as a “miniature water reservoir.”

The proposal to solve a shortage of water by moving icebergs halfway around the world was only the most recent in a long history of water transport. The first at the turn of the century was the construction of canals, and later, the construction of earth or aqueducts set above it, and the construction of ever more costly dams have been favorite choices.

By the time the conference began, a feasibility study for displacing a mountain of ice was already in the works. The study was done by a French engineering firm, to solve the problem of the Red Sea port of Jidda. Some observers at the First International Conference on Water Transport, held in Stockholm, in 1977, thought the study was no faster than a nautical mile's pace of half a mile per hour. The study was done by the Red Sea port of Jidda. Some observers at the First International Conference on Water Transport, held in Stockholm, in 1977, thought the study was no faster than a nautical mile's pace of half a mile per hour. The study was done by the Red Sea port of Jidda.

Then there was the melting problem. Wilford Weeks of the U.S. Army's Cold Regions Research Laboratory protested that anyone who tried to drag an unprotected iceberg from the Arctic Ocean to the Mediterranean Sea would be “dragging a mountain of ice” but a tow-line. Not disagreeing, Egyptian nuclear engineer Abdel Halim El-Sayid, who was also at the conference, said that a bergs up to five by ten miles in size could make the voyage. The study was done by the Red Sea port of Jidda.

No one at the conference was aware of the fact that over 100 million people in the world are already getting water from the sea. The study was done by the Red Sea port of Jidda.

Vitruvius's method for finding water: "To locate ground water lie flat on the ground before sunrise with the chin on the ground in order to confine the search to what can be seen from that position. Water can be expected to lie under those places where vapors arise from the earth." (Reproduced from 151

Details of Water Available in Various Types of Soils, According to Vitruvius

| Type of soil | Depth at which water may be available | Amount | Taste | Remarks |
|---|---------------------------------------|-------------------|------------------|--|
| Clay | Near the surface | Scanty | Not good | — |
| Loose gravel | Lower down the surface | Scanty | Unpleasant | Muddy |
| Black earth | — | — | Excellent | Available after winter rains |
| Gravel | — | Small & uncertain | Unusually sweet | — |
| Coarse gravel

and in another which flows from the hills in waterfalls.

In the *National Geographic* magazine for December 1951 an article entitled "The Ghosts of Jericho" reported that a British archaeologist had discovered a wall at Jericho which was 7000 years old. A drawing of the wall was published in the magazine. The wall is identical to that drawn by Elisha as reported in II Kings 2:16-18.

The Am F. I. Spruce Co. has a saw mill in Fairbanks, Alaska, which is the largest in the world. It produces 500,000 ft. of lumber a year. It is owned by the International Bank for Reconstruction and Development, which has been utilized in a structure since Roman times.

flow has average 563 cubic meters per second (about 132 m³/sec). The water quality is very good, its temperature and pH are relatively constant (near 14 degrees Centigrade and 7.9 respectively), its turbidity is low, and bacteriological contamination is practically nonexistent.

Brown's supporters claim that water could be located next to the rock and used at Newburgh, the southeast corner of New York, where there is a narrow strip of water only a few miles away from the Long Island Sound. Proponents of this plan say that water can be pumped from the Sound into the Hudson River and then used to power a power plant. But the plan has been rejected by the state and the federal government. The plan is also opposed by the local people who live in the area. They say that the plan would destroy the natural beauty of the area and would also cause a lot of pollution. The plan is also opposed by the local people who live in the area. They say that the plan would destroy the natural beauty of the area and would also cause a lot of pollution. The plan is also opposed by the local people who live in the area. They say that the plan would destroy the natural beauty of the area and would also cause a lot of pollution.

[illegible][illegible]

At a depth of 4.5 m, the total horizontal distance from the base of the pile to the point of maximum deflection was 6.5 m. It was also noted that the maximum deflection was 13.7 mm (0.54 in.) at a depth of 4.5 m. The deflection perhaps was not produced by the lateral force but by a horizontal force at the pile head which was 100 N (22.5 lbf) applied perpendicular to the pile axis. It happened that the water was below ground.

Cases in which the ground water is confined to the rock water supply is flooded with water and the bed is covered with a layer of sand. The ground water is then in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The ground water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water.

But the water is not in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water.

The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water.

On the other hand, the water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water. The water is in a state of equilibrium with the rock water and the ground water is in a state of equilibrium with the rock water.

Ground water movements and perched water

where they are laid bare on the faces of cliffs.

During his years as a construction foreman building Interstate Highway 88 through the Sierra Nevada, Livingston first noticed water seeping out of the rock, especially after heavy exposures had been cut through the rock. For a long time, he thought that the water in rock is "living water." Kervran avers that this water is constant in motion and that where the flow is more than 100 feet it can be easily detected by dowsers. This explains why dowsing is an old-world habit used in rocky regions like Brittany to pinpoint the exact location where one must dig to contact flowing water. The locations are detected by the dowsers with great precision.

During the 1976 drought in Brittany, the French Geological and Mining Bureau lent its drilling equipment to be used to prospect for minerals in the American Mountains, to a crash program to drill new water wells. In 1977, *Quest France*, the newspaper with the highest circulation in the French Republic, reporting on the Bureau work, emphasized that France had its wells in Brittany drilled not only in the traditional sedimentary terrain which has long been erroneously reputed not to be water bearing.

Why can't geologists submit to the evidence?" asks Kervran. It is easily possible to find water in so-called impermeable rock

*Enormous boulder with fissure

Look at the graph and think about it as being similar to the work you know. So, what does this graph mean? You can see that the number of people has increased over the last 10 years. And what is the rate of change? Well, the rate of change is the slope of the line. So, the rate of change is 100 people per year.

countries, to provide water at much lower cost than northern
 Aruda's good fortune far from serving to inspire WRD
 and its associated PR methods goad Aruda to reject the
 aid of academic geologists in their effort to discredit him.
 First to attack was Dr. Ulysses S. Grant IV, professor at the
 University of California at Anza, was skeptical of why it
 seemed that water would be found at 100 feet something
 about them in a scientific journal. Next came University of
 California ground water geologist, Dr. John F. Mann, Jr., who
 warned his television audience that Riess's ideas about a source of
 what he now called "primary water" were delusional.

Heater then came to the attention of Kenneth Hendrick,
 Chief of the Pacific News Bureau of the *Christian Science*.
 Hendrick, who investigated the area around Anza, told Mann
 had recommended a well site on a large farm newly purchased in
 the Anza Valley by specialty crop farmer Harry Purche. He
 already fruitlessly expended \$40,000 to drill for irrigation water.
 California is a community. Mann told Purche that his next chance
 was to probe a sand fill where "water might have collected. I ex-
 pected to find water but it was not there. \$12,000 later, Purche
 had only 4 gallons per minute, which was insufficient for his needs.

Told of the farmer's plight by Hendrick, Riess had Purche
 bulldoze a road up a 350-foot high granite hillside and clear a flat
 space for a water-drilling rig. News of this undertaking spread
 through the valley and attracted the attention of date-growing
 workers in the area who informed their home office in
 Sacramento about the development. The next day six members
 of WRD arrived at the Purche ranch and were sworn that
 his new attempt to locate irrigation water would only add a
 superfluous chapter to his lengthy saga of hardship. One of them
 proudly guaranteed to drink every drop of water that came out
 of the bedrock underlying Riess's site.

Riess's answer was to predict before any drilling commenced
 that he would strike water at 100 feet. The water was ranging
 from 300-1,000 gpm. The first water came in at 302 feet. The
 flow was increasing the day it was not rain. Something in
 the bedrock was blocking its natural return. A hole put down the

CHAPTER 10

Gusher!

or a dead German knockwurst which, turning in the hands, bursts open

The Doodlebugger and the Wildcatter

The man was hunched over an empty cylindrical ice cream can, which he had turned upside down and placed over the spot where an oil-drilling rig was spudded in to seek a new well in the hills near Aliso, California. The man kept counting to himself and, every so often, writing something in a small notebook.

After nearly an hour, the man rose and ambled over to J. K. Wadley, one of the most successful wildcatters in the oil business. "I think I've found it," he gasped, "a tremendous find for drilling," he said drily, "they're going to hit an excellent commercial deposit. You're on a productive oil trend."

"How deep does the oil lie?" asked Wadley skeptically.

"At 2,700 feet, a little bit less than half a mile, and your oil will come bubbling up like champagne," he said confidently and unequivocally.

Wadley looked hard at the man for a moment, trying to size him up. He was a little fellow, a little over thirty years of age. Lee Davis, one of Wadley's close friends and a fellow wildcatter who had made history when he drilled a 5,000 B/D barrel a day discovery well, a bore that opened up a brand new field for the University of Texas and made it one of the wealthiest institutions of higher learning in the world.

Davis told Wadley that he had found a really top-notch doodlebugger—a dowser had long been known in the petroleum industry—who was uncannily able to foretell the

Clement Brown, the dowser, was no unlettered rustic but a graduate of the Massachusetts Institute of Technology who had worked for many years in electronic engineering and later dowsed successful wells for Robert Muddier, president of the Mobil Oil Company.

Wadley cleared his throat. "Look here, Brown," he shot out sternly. "I've worked with a few dowsers in my time. A lot of 'em will come to a wildcat location like this and tell me I'm going to

or precision as you just have

I have the definite impression that in dowsing I use my transmitter to send down a mental wave which is reflected by deposits of whatever I am searching for. The answering reaction is not instantaneous but has a few moments time lag. The signal seems to proceed at exactly 80 feet a minute. I have dowsed for oil, gas, water, and other things. I have found that the depth of the reaction depends upon the size of the reservoir, the oil, and the porosity of the oil bearing formation. During the years I worked with J. K. Wadley, he never would drill in those areas where I said there was no oil. And people who later did drill in those areas never struck oil.

1 443 6 31 4 304 314 114 205

He paused, waiting for Brown's ear-worm of qualification. The down-cast, leveled gaze but remained silent.

"You've spotted her right between two of the 100,000-acre Richfield Oil Corporation test holes—the ones drilled by the Seaboard Oil Company. But something tells you're right," concluded Wadley. "I'm going ahead with this project. And you'll be working regularly for me."

To back up his statement Wadley led Brown over to a bank of dirt in the shade of a tall eucalyptus grove, sat down next to his new oil consultant, and drew up a contract retaining the downer at a fee of \$100,000.

Less than two weeks later, in his home office at Teckona, Wadley looked pleased. "Well," he growled to Brown who had just arrived from California, "our prediction was pretty close. The bubble well struck oil at 2,700 feet and it's making 1,000 barrels a day. We drilled three more wells into the trend and each is producing 150 barrels a well."

W. J. "Red" Brown stepped into the reason for Brown's trip east. "I was looking at the dower that he had recently acquired," Brown said. "I saw it was a 160-acre tract of Little Rock, Ark. property. I decided to begin an expensive drilling program. 'You go ahead and drill,' I told him. 'I'll take my chances for success,' he ordered. I had a geologist surveying the property. He found no oil and gas, but none in paying quantities either. I thought, 'He's on the wrong land, so I called on a few of the local owners who assured me that yes, they'd leased their ground to Mr. Waller. So there was nothing to do but call him and let him know the bad news.'

Wadley's curt reply revealed his shock. "Come back to Teakama right away and meet me in my office at ten o'clock."

Brown could reply. Wadley hung up.

He was greeted by maps of the Searey household spread out on a large table. With more than a little

This well site was located in an industrial district and for various reasons was not drilled. Environmental problems among others prevented the securing of a drilling permit. The well may be drilled in the future. The people concerned are competent independent operators.

Monday when he had ~~_____~~ _____ he went in and
_____ _____ the next day. By _____ out of the way
_____ _____ they turned out _____ nothing and he _____
Wednesday came on. And the boys thought _____ they parted
_____ _____ went down to _____ _____ where _____
himself on his own lease he drilled five wells all at the same
_____ _____ of the _____ _____ _____ then I've
heard his luck run out."

Spurred by curiosity, Brown made a trip to Abilene and asked Al Myers if he was there before he could buy the truck. Myers had a car on his way to the dealer and told him to wait 300 feet from the store, saying he was late at the point of delivery. The 40-year-old man and the woman Myers was with walked over to make a closing offer.

[illegible]

But no success. I'm planning to punch a third one in to the northwest. Will you see if I'll get out?

What Brown found was that if Murray drilled in the spot he thought would be the best place to make an oil well, 44 percent of the time he was right. Murray would be as good as betting his money on a 44 percent chance of success. You could locate a new oil well just as easily by throwing a coin and betting on any side of Murray's coin. The chances of being right are 50 percent.

[illegible]

Paul Brown had been working on electronic methods to search for oil and gas when one day he saw several men

Turning the watch face around, Brown actually started to see the needle's hand pointing at the 12 o'clock position. He expected to see a pocket of petroleum hanging on the end of a string.

Taking out a stopwatch with its face graduated, not in minutes of time, but feet of depth, Brown explained his

method. "I'm going to keep putting the string down and watching the depth of the needle. I will stop the watch when the needle stops. A good clue to the oil zone is when the needle stops. It is usually within a few feet of the oil zone. I don't know how to put it. The needle will then rotate counterclockwise until the watch hand reads 5.120 feet, clockwise, and then it will stop. I've seen it rotate 100 feet, but I don't know how far it can go."

Using the same method, Brown proceeds down into the ground locating any oil zones deeper than the first one.

After a few minutes, he has located the first oil zone. He then goes down to the next zone. These he classifies in one of four categories: "not much oil, good oil, good oil, and very good oil."

An Expert Impressed

Asked who might substantiate his fascinating account of his

method, Brown said, "I don't know. I'm an engineer with nearly forty years experience in the field. He'll support my claims."

A graduate of the California Institute of Technology, Chet Davis, president of the California Institute of Technology, one of America's largest oil companies, related

the story of the method. "I've seen it. The method of finding oil was fantastically accurate."

Davis at once grew uncomfortable. "Listen," he told his audience. "I don't want to make any money out of my reputation on some magician. Even if he really does have something to offer, I wouldn't get a good reception with our people. I don't want to be putting them out of a job."

For years, Davis had run across "doodlebuggers" who had sworn they could find oil without error, but every time they tried, they failed. "I don't know how to put it. It's even even a simple test. 'All of them always wound up with some alibi,'" says Davis. "Today the chemistry of my body has changed. It's a tragedy."

Refusing to be put off, the promoter continued over a period of two weeks to show the method. "I don't know how to put it. It's even even a simple test. 'All of them always wound up with some alibi,'" says Davis. "Today the chemistry of my body has changed. It's a tragedy."

SHORT SUMMARIES OF TYPICAL PREDICTIONS BY PAUL C. BROWN AND ACTUAL RESULTS.

| | <i>Predictions</i> | <i>Results</i> |
|---------------------------------|---|--|
| Signal Oil & Gas Co. | Some shows only below 11,000 feet but not commercially productive | Oil was at 11,000 feet. Well abandoned as nonproductive. |
| Standard Oil Co. K.C. 27-1 | Well will discover a new field. Oil sand about 40 feet thick at about 7,000 foot depth | Well completed as a new discovery. Oil produced from 7,004 to 7,943 feet depth. |
| Standard Oil Co. 67-21-10 | Well will be a dry hole | Well drilled to 12,705 feet. No oil encountered. |
| Standard Oil Co. K.C. 44-1 | Well will be a dry hole. No zones wet | Well drilled to 8,400 feet. Objective sands wet. |
| Standard Oil Co. (7-52) | If drilled straight, well will find all objective sands wet. If redrilled to SW commercial production will be possible from two upper sand series. | Straight hole drilled to 7,791 feet. All sands wet. Well redrilled to SW. Two upper sand series produced 1268 B/D and 220 B/D. |
| Standard Oil Co. (7-53) | Well will find all sands wet. Possibly a marginal well can be obtained in Placoides sand. Fracing will be necessary to establish commercial production. | Well drilled to 9280 feet and all sands wet. Redrilled. Placoides sands yielded 50 B/D. After fracing well produced 265 barrels a day. |
| Getty Oil Company No. 1 NE 7-51 | Upper and lower Carneros sand series will be productive if hole drilled straight down. | Well completed as a dual upper and lower Carneros zone producer. |
| Standard Oil Co. 12-548 | Only upper Carneros sands will be productive. | Well completed as an upper Carneros zone producer. |
| Rothschild Oil Co. Kiewit No. 1 | Well hole will result in finding the objective sand wet. | The objective Stevens sand was wet. |

It is a fact that Paul C. Brown has been successful in many cases where other operators have failed. This is due to his ability to make accurate predictions based on his extensive knowledge of the oil field and his ability to interpret the results of his tests.

test him, because I could take the first to a well high on the structure, then to another well low on the structure.

Paul C. Brown has been successful in many cases where other operators have failed. This is due to his ability to make accurate predictions based on his extensive knowledge of the oil field and his ability to interpret the results of his tests.

...the better oil pool to go at. He drilled at the rate of 90 feet a minute. When it encountered oil, the signal was ... Brown was the ... where ... but he called it at 12½ feet thick. I was impressed to say the least."

It is known that the ... well ... but it ... from above the ground to move subterranean oil after gas ... that it was, or had been, a producing well.

Within minutes, Brown told Davis, "You know, this well is ... The ... trace of oil at 7000 feet but it's not commercial."

"You've hit the nail on the head again, Paul," Davis said elatedly. "You're just incredible."

At another oil field that same day Brown was no less ... the ... depths and thicknesses of the *reservoir*."

During years of oil dowsing for Wadley, for which he still receives royalty checks, Brown was able to travel extensively throughout the United States from the Pacific to the Midwest. He estimates that he may well have walked over 10,000 miles in his ... extraordinary that, if one day proved correct, they could

... each nearly equidistant from its neighbors.

It's as if they were obeying some natural law," Brown ... depths. For instance, if you go to the big oil field at Tampere ... are all arranged in straight lines. If you search out the dry holes, ... 'the ... production and more are being wildcatted.' The straight

... also at varying depths.

Brown holds the heretical belief that as much or more oil ... the ... Wadley ... California, Wisconsin, and ...

and a "lost" chemical brew. The same is true of oil. We have "lost" it. And in this country, the oil companies just don't know where to look for it."

At the time, the "lost" brewer, Howard Brown, alleged in a letter to the Federal Bureau of Investigation that he was "a chemist of long experience" who knew that he was "in the oil-dispatching business" in the Los Angeles area. He was "informed" that the "lost" brew was "in the hands of the oil men" and that they had "lost" it. Brown said that the "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts.

On the fact that the "lost" brew was "in the hands of the oil men" he was "deluded" by the oil men, he held to be the most promising tracts. The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts. The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts.

As for the "lost" brew, the New York Times reported that it was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts. The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts.

In view of their track records, one may well ask why the "lost" brew was "in the hands of the oil men" and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts. The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts.

The Truly Scientific Approach

The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts. The "lost" brew was "a chemical brew" that was "worth \$500,000" for the right to drink it, and that it was "the oil men" who were the "first" to "operationalize" it. Brown was "deluded" by the oil men, he held to be the most promising tracts.

I wouldn't know how to explain the whole thing anymore than one can explain how a baby learns to walk or a young bird to fly. But I am able to do what I do naturally and only while on the physical sites themselves but with the help of a map." To demonstrate how this seemingly unthinkable process works, Kremen put the tip of his pencil down on a map where a spot indicated the top of a mountain peak.

I like to start on a peak," he said. "I don't know why. I then project myself not physically but mentally, down into the section of country surrounding the mountain. I put my pendulum containing whatever it is I'm searching for into motion so that it is swinging. It swells into a backwards and forwards motion along on a path and I get behind it to see exactly what direction it is tracing. "When I see the line clearly, I mark it with a ruler.

Then I begin over again at approximately right angles to the line I've marked and when the pendulum settles into an even back-and-forth swing again, I draw another line. Where the two lines cross, that's my starting point.

From the starting point, I use the self-same pencil and begin moving it away in any direction. At the same time I set my pendulum to rotating. When the spinning stops I know I've reached the approximate boundary of the deposit. (Of course, this can only be precisely determined by going to the location itself and shooting straight down. I've done this from the ground, from automobiles, from helicopters, and from airplanes.)

Well doused in the 1950s by Paul C. Brown for J.K. Wadley, was purchased together with storage tanks as the first step in its entry into the oil business by the Occidental Petroleum Company, today a giant oil and gas producer that has recently signed a multi-billion dollar deal to develop hydrocarbon resources in Siberia.

It has to be deep-mined. But the company won't find it because they're going to stop short of it.

On a map of New Mexico Brown has drawn a line running east from north of Culbertson County, Texas, to Trinidad, Colorado, where he maintains a gold streak or vein of gold.

Years back, a very famous day when he returned and took a lot of rich ore. He found it by passing. He mined a cavity, a kind of underground cave where he got a very good amount of ore. The ore he brought out he took to town and then sold it. He got a lot of it made him a lot of money. He sold some six months or so. Then he'd go in and get another load. When he died, hundreds of people looked for his mine but no one found it.

SECRET FINDER DEVICE USED

Sunken Ship With Millions in Aztec Gold Believed Located

CHAPTER 11

The U.S. Marines Learn to Dowse

two candle snuffers

A Village's Unseen World

Continuing with the Brewster, the film features a survivor who, as a consultant to the United States Marines, was asked to take time out to view a film in November 1986. In the presence of Marine Commandant General Center at Quantico, Virginia, Matacena saw Robert McNamara, the US Secretary of Defense, question the value of war, help to answer insoluble military problems.

One problem that particularly attracted the surveyors' attention was the lack of S.M. data for the extremely large expanse of Vietnamese jungle terrain for openings of enemy tunnels. The S.M. data was very sparse. As a result, the surveyors had to rely on the limited data they had to estimate the length of the tunnels. The surveyors had to estimate the length of the tunnels by using the data they had to estimate the length of the tunnels. The surveyors had to estimate the length of the tunnels by using the data they had to estimate the length of the tunnels.

incredulously. Matsumi got out two L-shaped metal rods, of so much length that they were nearly as tall as he was, and held them straight ahead of him; he walked across the basement under

The reaction of the audience was not one of universal awe. Some of its members glared at Mataea in hostile disbelief. But since the majority of the onlookers, as well as the rods, seemed to be responding well, Mataea decided to release more "top secrets." In his soft Virginia countryside drawl he told the Marines that, with the help of his rods, he could tell through which of the pipes overhead water was running, indicate how many degrees off the horizontal they were leaning, or find pipes

Hearing these assertions, some of the officers began to stutter

Louie Matacam marking the course of a 10-inch underground pipe for contractors. The pipe's exact location was determined with a pair of T-shaped rods.

... and walk away. Others shook their heads pityingly as if to say, "He's already gone mad. A few of the more experienced men, however, thought Matacam's seemingly

Major T. P. Matley was an all-around good man. He was a good man to look further. At his initiative a full-scale test of what now were called Matacam's wire rudders was scheduled for November 14, at 1445. The site selected was a mixup of a typical southeast Asian village, complete with its own houses, bridges, trails, and even graves. Located on the Quantico base, the village was used for tactical training of Marines on their way to Vietnam.

Scattered throughout the village were devilish booby traps, or to those deceived by Viet Cong guerrillas—pung pits, into which a man could step to have both sides of his leg from ankle to knee impaled by sharp steel spikes covered with excrement to guarantee almost instant infection. Trip-wired grenades festooned in series along a trail to be detonated simultaneously by a single VC hiding in a tree, and other representatives of a booby-trapped world. Below the ground ran the underground network of tunnels, secret passages, ambush caches, stores, lairs, and hiding places. The question was: What the Marines wanted to know was whether Matacam could locate the subterranean passageways while working with his "wire rudders" on the firm ground above them.

Hardly had Matacam arrived on the scene than he set to work. He began by driving a long metal rod into the ground between two points of the village. The rod was then pulled out, protruding in front of him like the antennae of some insect, eerily swung outward to point directly at the houses now on either side of him. "Well, now, that's got to be a tunnel of some kind," he said triumphantly. The Marine observers only silently nodded their

Well Tunnel Complex above was discovered near Ben Cat in September 1963. It is a series of multi-bunker tunnels with angled connecting tunnels. Each bunker has space available for fifteen to twenty men. The entrances to and exits from the VC bunkers are built into the walls of actual or simulated wells which are twenty to thirty meters deep. Access to these skillfully camouflaged entrances and exits is by way of notched dirt steps or by the use of long notched bamboo pole ladders. These wells also serve as deep pit man traps. (Courtesy of the United States Marine Corps.)

As Matacia was talking, Townsend noticed a captain passing by. He held his hands out, took a few rods from the bundle, and said, "We're going to use these rods to find out if there are any tunnels here. Take these rods and hold them loosely in your hands, like this. Now just walk forward and see what happens."

The young captain, who had not the slightest idea why he was being asked to do what seemed to him an odd little task, took the rods in his hands and moved out as he was told. When he was about to go up the well, he said to Major Matacia, "What's the question? Did you feel those rods turn in your hands, Captain?"

The officer stammered, "Yes, but what made them turn? I didn't change my grip on them."

"That's a first time for him, isn't it, Major?" said Matacia. "It goes to show how basically easy it is. A little experience and a few rods are all you need to find out what's going on below and around buildings to determine any subsurface structures. I can also tell how big underground caves are by outlining their edges."

Flushed with success, that same evening, while he was in the C Church, Virginia, Matacia wrote a solicited letter to Major General Stanley, Chief of the United States Marine Corps, in which he suggested that the Corps would enhance current Marine Corps operations in Vietnam by adopting his technique. He suggested that his technique be used in other areas. Its applicability is limited only to the use of the rods. It is inherently simple, easy to learn, and the equipment is simple. Major Matacia suggested to the USMC that it undertake a testing program to determine the full potential of his technique and informed Stanley that he would be available for future demonstrations and discussions. The USMC, in response, sent a letter to the Vietnamese, asking them to cooperate in the testing program. The Vietnamese, in response, agreed to cooperate in the testing program.

Macata, who up to this point had founded a business advice to the Marines for nothing, waited expectantly for an answer, but searched his mailbox in vain as the days went by. Several weeks and many "assholes" later, he began to think the entire potential of what he had chosen to do was being shovelled. So he took it upon himself as a private citizen to write a general letter to the 5th Marine Amphibious Brigade, which he would sign with a letterhead.

Estimating that only one out of 100 recipients would pay any attention to his letter, Macata spent the day and night of Tuesday, 18 March, at the Defense Department in Washington and every command's inclusion to Special Warfare, across the Commander General of the Expeditionary Corps of the

Shades of Black Magic

Marines On Operation Divine For VC Tunnels

Da Nang (USMC)—An old-fashioned method of locating water in arid areas, the divining rod, has been updated and put to military use in Vietnam.

A method for locating underground structures and other objects by use of wires, "Macata's Wire Rudder" was used by Marines during the final three days of Operation Independence, three miles west of An Hoa.

Macata's Wire-Rudder is two identical wires, 3/16 inch in diameter, bent in the shape of an "L," with an overall length of 34 inches. The longer side of the "L" is 26 inches in length.

Marines operate the divining rod by holding one in each hand, level with the ground, pointing in the direction of their movement. As the wires move over, under or along a hidden structure,

the wires will swing into alignment with the structure.

Introduced to Marines of the 2nd Battalion, 5th Marine Regiment, the divining rods were greeted with skepticism but did locate a few Viet Cong tunnels.

Private First Class Don R. Steiner, Soudasde, Ohio, a battalion scout with the 2nd Battalion of Marine Regiment, tried the rods for the first time on a recent patrol. The rods spread apart as Steiner passed a Vietnamese hut.

Upon checking inside the building Marines discovered a tunnel that led to a family bunker underneath the trail, right where the rods had reacted.

In this day of nuclear powered devices it may seem that there is still room for the old, if you happen to be a believer.

the suit to be officially adopted by the Marine Corps. In spite of this, the unofficial use of the device was spreading. Marine engineers and technicians were by then savvy enough they knew how to build them, and using them worked. That led academics or intelligence experts.

D-Day at Camp Lejeune

Baldwin's report and the extraordinary drawing successes of Marines in combat in Vietnam now laid the basis for an extraordinary day-long drawing demonstration staged for routine personnel. On May 12, 1968, at 8:00 a.m., two groups of men gathered in the Office of the 2nd Marine Division at the USMC's Center for Military Warfare, Command and Control (CMWC), Camp Lejeune, North Carolina. The first group, consisting of Marines and civilian staff, then made their way to the classroom about what they had heard was one of the most remarkable approaches to drawing without ink. On hand were two civilian instructors, noncommissioned officers, all instructors at CMWC and all Vietnam combat veterans. Their assignment that day: training in drawing.

The council group comprised six professional teachers: Leonard Brown, a watercolorist from Upper Black Earth, Louisiana; Arthur Sawyer, who had studied wood water for the US Forest Service before he met Lewis; Gustafson;

the two expert watercolorists; and two private teachers, including Hugo McCaffrey, a former engineer working for the Navy Production Manufacturing Company, Carl Schuchman, a systems engineer, and Louis Motaciu.

During Motaciu's initial drawing demonstration, he learned that a lot of people were not drawing well. He tried to be helpful and he came back the next day to do a waste of time for all concerned.

During the second day Motaciu was asked to sketch a

individuals, met with a few professional skeptics.

The U.S. Marine showed how a dowsing rod could be used in lieu of a compass for orientation in unfamiliar terrain. The retired U.S. Marine took out his rod and slowly rotated it in a clockwise direction. When he felt it was about north, he said, "It's about 15 degrees off the true north when his rod abruptly snapped down. Raising it again, he rotated in the direction of the compass.

"Can anyone tell me if I'm pointing to magnetic north?"

After checking with his compass, one of the Marine sergeants said, "Correct, right on target."

Captain Platt broke in to inquire of Matacia whether he could use the same technique with which the dowsers had found the howitzer earlier that morning to locate a modern Vietnamese village called Tri-Me No. 1, the siting of which was known.

The Marine sergeant asked Matacia, "How far away is more than a mile?" Matacia fulfilled the request, adding, "Now, I'll tell you how far away it is, Captain. Do you want it in feet or meters?"

"In meters," said Platt.

"Do you want the distance to the center of the village or its edges?" probed Matacia.

"The center."

Taking a glass ball attached to a string from his pocket, Matacia held it between his forefinger and his thumb and, facing in the ascertained direction, asked, "Is the distance to Tri-Me No. 1 more than 1,000 meters?" After a few seconds, passing the ball to the Marine sergeant, he held on a rod to Matacia's indicated an alternative answer.

"Is it more than 2,000 meters?" inquired Matacia.

The ball continued its clockwise swing.

"More than 3,000 meters?"

The ball slowed, stopped, then reversed its swing in a different direction.

"Okay," Matacia told the Marines, some of whom were

Conviction, Confidence, and a Sixth Sense

the pendulum renewed its spinning motion.

The 34th cottage "not be right near here," he affirmed.

You could be much closer," explained Captain Platt who put his ~~map~~ finger on a ~~map~~ point on Mataca's. "You're right next to it. The camp's exact location is under my finger."

The group moved two miles east of Tri Me No 1 to a forested area and dispersed with pathways along one of which a cache of military supplies had been buried. The captain asked Matrone to be on guard through the night. "We'll try," said Matrone, "but I'm not sure I can go out there as it is late in the day and I've been following for several hours now. I can't see a trail of footprints. With me, a woman and two dogs, setting out in a large circle of ashes, the remains of a burned out campfire

‘This seems like a crazy place to bury supplies,’ he admitted—but this is where I had the cache.

"You've hit another bull-eye," said the captain "and though it appears crazy, that's exactly where a lot of caches have been found in the Vietnamese jungles. The squirrels dig holes in the ground bury a quantity of material for future use then build the chamber over the hole with bark or moss and leaves."

What he wanted. "Do you want me to tell you what's in this package?" he asked. "Give me a list of the possible items it might

are. The equivalent is ammunition boxes, unboxed ammunition, food, clothing, medical supplies, and weapons.

None of the birds had all items were present except unbaked bread crumbs, worms, seeds and Buggy cream.

The three-way proved 100 percent correct.

As the whole group trooped back to the beach, waters building the Marines told the divers that from now they had and done they were convinced that dowsing could help them enormously in antiguerrilla warfare and self preservation.

There all had "was a real blow up by Mc after." I can't have believed it unless I had seen it. Personally, I learned more in eight hours than I had in some thirty years contact with the subject, and all my preconceived notions about ESP phenomena were shattered. Dr. [redacted] was a good man, but a little bit of a [redacted]. We wound up at the end of the day with all participants being able to get good dowsing reactions, even though some had initial difficulty because of lack of experience.

This opinion was evidently not shared by higher military authorities. McJannet presented a memorandum which the Staff Judge Advocate, 1st Cavalry Division, dated 10 June 1968, stated that the Staff Judge Advocate, 1st Cavalry Division, was not in a position to make a final decision on the matter. The principal objections being that the technique was not a "100 percent reliable" or "100 percent reliable." But what was the "100 percent reliable?" McJannet countered that the "100 percent reliable" was a "100 percent reliable."

The islands, nearly 100 miles off the east coast of Vietnam and due south of the Chinese Island of Hainan, Long disputed by the Chinese and Vietnamese, their possession to be improving. When a task force of Chinese ships landed troops to assert Peking's sovereignty, the South Vietnamese admiralty sent a flotilla to retel them.

was Captain Vo Sum, who had been introduced at the age of 15 to the profession of literature by his father, and who was now a member of the collection of French books on the subject.

What especially motivated Vo Sum to learn how to get on with his work for his country, was the sight of his father sitting alone at his desk, pendulum in hand waiting for Vo Sum's elder brother who had disappeared without a trace. By watching the pendulum's movement the father came to the horrifying conclusion that his son was severely ill and had died in Marseille. It was not until several years after this sad finding that a Vietnamese returning to his homeland from Marseille the French Mediterranean port

When the publisher of a new weekly *When the Hagen Ri* (Hagen) was asked to publish an article on the Hagen Ri, he thought it would be of great service to his compatriots if he could apply drawing to the search for some of the thousands of persons who had been lost during the protracted hostilities in Viet Nam.

a "Mail Box" column in the magazine suggesting that, with Ink

GENERAL PATTON'S WATER DOWSER

Ralph Harris, a Californian reuther, was born in South Best, a Virginia, where he learned to dowsse for water from his grandfather who was a country nine quarts of water. After his discharge as a private in the U.S. Army in 1941, Harris proceeded to the rank of captain. He was noted in the landing of American forces in Africa, commended for General George Patton. His

The Germans had blown up all the water wells in the desert when they landed not far from Comblance. The army engineers were drilling in the windy desert country to no avail. A lot of water

One of our geologists said there was no way to pinpoint water without first bucketing the sand away so he could see the

When I found out how badly our army needed water, I decided to inform General Patton that I could find it by dowsing. I had a hell of a time trying to get to see him but finally I came face to face with him. When I told the general what I could do, he only asked, 'What can I do?' I said, 'I can find water.' He said, 'All right, but I want to see it without much delay.' Patton immediately called for his field telephone, called his

Patton immediately called for his field telephone, called his. I went a willow tree down in the desert. It was impossible. The army officer must have asked a question because Patton shouted, 'No, I'm not crazy. I want a willow tree. I don't care a damn where you get it but I want it here on the desert.' So the next day they flew in a willow tree not quite the height of this room with about a couple of cuttable forked sticks on it. I cut one and went out and found what I had to be an underground

about 400 feet wide and 400 feet down to water and 400 feet deep running on. I dowsed. I took a colonel of engineers at there to show him where to drill. He said there couldn't be water there.

I challenged him. 'Colonel, would you like to bet some money that there's about 5,000 dollars? I've got that much in my pocket.'

'Would you like to put up 5,000 that there's no water here?' 'Would you like to do that?' 'Colonel, I'll bet you 5,000 that there's water here.'

'Then what you're saying is just talk. Why don't you bet me 5,000 that there's no water here?' 'I'll bet you 5,000 that there's water here.'

'All right, then what you're saying is just talk. Why don't you bet me 5,000 that there's no water here?' 'I'll bet you 5,000 that there's water here.'

'All right, then what you're saying is just talk. Why don't you bet me 5,000 that there's no water here?' 'I'll bet you 5,000 that there's water here.'

'All right, then what you're saying is just talk. Why don't you bet me 5,000 that there's no water here?' 'I'll bet you 5,000 that there's water here.'

alternator. At 18.00 that evening the radio again showed a rise after passage of Saigon from 45 meters North to 100 to 152 meters East of 101°N and the low frequency was 200 kHz.

Opium Smugglers Apprehended

At Saigon, April 1974, a Vietnamese official told the author that he had been told that the author's ship was a "superstitious" vessel. The author was told that the ship was a "superstitious" vessel and that the crew would be accused of "superstitious practices".

In the summer of 1974, news of Vo Sum's feat came to the attention of Captain P. M. Kline, Assistant Chief of the Vietnamese Navy, South Vietnam. Captain Kline told the author that he had been told that the ship was a "superstitious" vessel and that the crew would be accused of "superstitious practices".

of opium smuggling vessel

it was to be taken into custody only at daybreak. In the afternoon, however, the junk, June 27, since it had been overtaken ten hours earlier, it seemed that his forecast for the time of the seizure was wrong. The junk was searched for opium from the time of its capture to 1:00 A.M. on June 27, at which point the destroyer radioed the Sea Operations Command that its crew members had been able to find only a cargo of vegetables, rice and fish, but no drugs of any kind.

Khue looked at Vo Sum askance.

It looks like you're mistaken," he chided.

Undeterred, Vo Sum checked with his pendulum for contraband opium aboard the junk and received a strong positive indication that it was in fact present. He turned to Khue.

Order the search to continue," he demanded. "Have them strip that junk inside out."

The doubtful Khue complied.

Upon receiving instructions to continue hunting for the junk, the search party now decided to probe all the way to the bottom of the ocean tanks packed with ice and fish. At 2:30 A.M. they came upon their first batch of raw opium. Spurred by this initial success, they continued searching and, precisely at 5:00 A.M. on June 27, the destroyer commander reported to Khue that

Gordon MacLean, a chemical engineer now in his eighties, still works full time directing the analytical laboratory for Portland Head Lighthouse, a small lighthouse on the coast of Portland, Maine. On sunny days, MacLean will take visitors out to the lighthouse, but on most days he will sit in the office, looking out the window at the horizon.

Knowing that an endless procession of oil tankers advances westward to deliver fuel for distribution throughout Maine and other parts of New England, MacLean smilingly asks his companions whether they would like to know the exact time the next tanker will appear on the horizon on its way into the harbor. When the offer is accepted, he takes from his pocket a small, apple-shaped red dipstick of plastic and surveys the horizon. At a given moment the red dips.

"That's where the next one will appear," chortles MacLean. "Let's see how fast she's moving. Is it 18 knots, 17, 16?" The red remains motionless. "Is it 15?" The red dips. "Is it between 14 and 16 knots?" The red dips again. "Is it 15.1 knots?" No dip. "Is it 15.2, 15.3, 15.4?" Still no dip. "Is it 15.5?" The red once again dips down vigorously.

MacLean grins. "Well, now we have the speed, let's get the distance. By a similar procedure this is estimated as forty-seven nautical miles away from the point where the tanker should appear. By a simple arithmetical calculation, MacLean forecasts that the tanker should show up within three hours and two minutes.

And it does. And MacLean has repeated this incredible feat many times, but so far, of course,

Gordon MacLean dowsing time of an oil tanker arrival near the Portland Head Lighthouse in Maine. (Photograph by Alice Brown.)

The first phase of the fifth day period lasted until March 29 when the city of Ban Me Thuot, the greenhatched area, had to be evacuated, and the French command was reinforced by soldiers and armaments. Most of the results obtained by VC and PL forces in the first several days of the first period showed a proportionally significant percentage of the southern provinces had yet been captured by the Communists. Negotiations were conducted by subsequent dispatches.

In the midst of a situation described as "confusing" by a New York Times news columnist, the U.S. military has taken a "downing course" that their new recruits have at least helped to save the lives of soldiers in the army. The commander of a military post at Chikara in mountainous Plokin province wrote to say that one of his noncommissioned officers who had been taught to "work by the book" was "compelled to make the toughest decisions he could make in the face of a very pressing situation."

[illegible][illegible][illegible][illegible][illegible]

So, in the end, I think my pretty selfishly that I can't blame a whole nation for doing what was amounting to a holocaust, that the high command would send a mission to rescue the stray company. The captain, however, did not want to risk a four-hour wait to see if Hoang's rescue prediction would materialize. Just after 1300, when they were beginning to doubt the dowser's prognosis, the mission began. The captain ordered a search party of 100 soldiers moving toward the sea from the south. One of the soldiers immediately fired an emergency flare. When he and one of the 20 armed boys were properly identified by radio, the boat stopped, and the men were airlifted to safety.

April seemed to find my work pretty much done. So I thought I'd better be on hand in a while. On my return, I found a letter from a friend. A Saigon newspaper, *the Evening Star*, had asked me to write for it. I had to send answers to the paper, provided information on whether or not I had found a body, and I had a hard time finding the living body or the corpse.

After a few days, I saw a newspaper article that indicated a streaming of refugees, first toward the east coast, then southward. I went to the coast at An Long, near the island of Phu Quoc, the westernmost point of South Vietnam's territory south of Cambodia where facilities for refugees had been hastily organized. Because of the general confusion during the debacle, Vo Sum and his team had to rely on rumors to tell them whether their drowning prediction had proved out to be correct or not. Many of them never bothered to report back. Nevertheless, a great many successful cases were confirmed.

A typical happy ending involved Vo Sum's naval colleague, an ex-boat commander Ho Duy Duyen, who anxiously wished to know what had happened to his sister. A month after the wreck, a United Fruit boat came to what was a safe anchorage, the Tan Da pier in the port of Nhatrang. Witnesses saw her load pulled from the water and stretched out on the dock where she lay motionless. Vo Sum told his colleague that his sister was not dead, as observers had suspected, but had somehow managed to get all the way to Phu Quoc Island. Two days after Vo Sum's correct prediction, the captain of the United Fruit boat, the *Thien Hai*, reported at Phu Quoc that his sister had been taken to a place for surgery. The overjoyed brother, who had been unwilling to believe that his sister had not perished, rushed to the airport to meet her.

After learning of Duy's sister's case, Chief Petty Officer Tran Ngoc Quang of the Naval Logistics Command came to Vo Sum, showing a photo of his son. Tran Ngoc Binh, who, as the father, could not look down on a child's claim, tried to get back up the boat, but was stopped by the high command. In response by a Communist patrol, Tran Ngoc Binh's was taken away by an American boat. Amidst the panic and confusion, one of the boat's crew had suspected that his was a lost Saigonite. He told Binh's disconsolate father that his son had been wounded, perhaps mortally.

One week after the students had begun their journey, a weary Appalachian Mountain Club search party heading north from the observatory in deep snow found the students in a shelter on Edmund's Col midway between Mts. Adams and Jefferson. Weather conditions were so severe that it took a week of effort to bring them out of the wilderness to safety.

After the rescue, says Ater, dowsers never get any feedback. "I never got an appreciative letter from Mr. Tengel thanking me for my effort and affirming that the two bikers were found exactly where I predicted and their car had indeed been parked at Crawford Notch rather than Crawford North."

Take No Sun, Ater counsels beginning dowsers to persevere. "Anyone trying my method," he says, "should never be discouraged by lack of immediate success. I have been working with it for several years and am still developing my talent. The method is not foolproof, but it is not foolproof either. It has been proven. If you can develop a passion for the art and really enjoy it, you will undoubtedly be successful."

No dowser has enjoyed more success than the French engineer-inventor, and the most famous, Jean Auscher, who more than any other has been successful in finding lost objects and people.

CHAPTER 13

Pay Dirt

an intertwined fork and knife

The Biophysical Method

In the early spring of 1968, a group of 236 Soviet geologists, geophysicists, hydrologists, biophysicists, medical doctors, physiologists, and psychologists from ninety-eight research institutes and economic planning bodies all over the USSR assembled in Moscow at a "Symposium on the Problem of the Biophysical Effect." Sponsored by the Section for Technical Parapsychology and Dowsing of the Society for Science and Technology of the Instrument Building Industry, the symposium's attention was focused on the *rodzhidun prut* used in the art of *bezakhiditsa*, as the "magic rod" and dowsing were known in old Russia.

The new appellation "biophysical effect" (BPE) and its corollary, the "biophysical method" (BPM) were probably inspired by the life work of Professor Leonid Vashley, who specialized for thirty years in the study of telepathic communication at the Institute for the Study of the Brain and Nervous Activity in Leningrad.

During the Stalin era when psychological research was

all but nonexistent, but after the advent of a much freer intellectual climate under Khrushchev, he finally was able to publish his classic *Mysterious Phenomena of the Human Psyche* in 1959. One year later he brought out another volume, *Biological Radio Communication*, formally introducing the thesis that biological organisms were capable of transmitting and receiving information "in an unidentified carrier wave. Since a vital, unidentified wave had long been postulated to account for the dowsing phenomenon, it seemed logical to find a new name for the searching art that—dispensing with magical overtones, would return Vashley's idea of a link between physics and biology. The "biophysical effect" can therefore be credited, directly or indirectly, to the Leningrad professor.

Just as dowsing migrated westward out of Germany, so it diffused eastward to Russia where miners in the Ural Mountains were using it to discover ore more than three centuries ago. Before World War II, it was employed to locate water for

I. Kevkhishvili recounted how, before World War II, he was

Using several different rods RPM anomalies were noted over ore bodies. In our opinion, those for steel rod No. 2 better indicate the morphology of the ore bodies as well as their content of useful minerals than the potentials recorded by electrical instrumentation. There are bodies between stakes 10 and 46 where three BBT maxima, the intensity of which increases in an easterly direction. Because of the absence of test holes the nature of the first maximum (between stakes 10-13) is not certain. The second maximum (between stakes 35-41) partly coincides with the westernmost edge of ore bodies which in turn is located at a depth of 21-35 meters. The third, most intensive, maximum (between stakes 40-46) corresponds to an overall increase in size of vein-hosted copper ores and to their relative proximity to the surface, as well as to the location of bodies of solid copper-zinc and zinc ores. In the same profile still another biophysical anomaly (between stakes 52-56) was detected which is correlated with contacts between layers of diabases, apatites, and porphyrites. This anomaly is detectable with steel or aluminum, but not with copper rods. It would appear, therefore, that the selective capacity of rods made from different metals can be utilized to differentiate the geological nature of different biophysical anomalies, in this case between those connected to ore and those connected to contacts. Where the electrical method marks an anomaly linked to carboniferous limestone (between stakes 75-90), no biophysical anomalies were detected by the rods.

southern Russia for remains of settlements such as those
established by ancient Greeks on the Black Sea littoral.

They have also been used in Central Asia by geologists
to have become buried over the centuries at depths up to five
meters around the Chacha (stadel) near Tashkent's Stark
furniture factory. The head of the dig reported: "The
experiments must be continued but so far their results show
that this autumn, when we begin excavation of the Aleksandra
(stadel) Bondarev will be able to let us know in advance the
placement and depth of objects to be excavated, as well as
that exist under thick layers of earth and this will greatly
simplify our work. It appears that the use of the biophysical
method is a promising one and will be used in the future."

FOUR WELL-KNOWN SOVIET GEOMAGNETIC EXPERTS. As described by Dr. Alexander P. Dubron, author of *The Geomagnetic Field and Life* and a proponent of dowsing, they are:

1) The well-known Soviet dowsing and geophysical engineer Alexander Ruzhenov engaged in prospecting work. I can add that he is one of our best dowsing specialists and, like Pluzhnikov, has worked on projects for the restoration of old architectural monuments in Estonia as well as in geological work.

2) The Soviet dowsing expert Tatiana Burova during her working traverse in the mountains of Kirghizia. Since Burova's pronouncements on dowsing are included in the book, they need no further amplification on my part.

3) Soviet master dowsing expert Yegor Yegorin demonstrating his self-designed P-shaped dowsing instrument during a search for copper-nickel sulfides. Yegorin devotes a great deal of time to biophysical effect and works very productively in this area. He holds his unique instrument either hand. Over complex copper-nickel sulfides it turns at an angle up to 210 degrees but over tectonic disturbances it makes a 180 degree turn to the left. In Norilsk in the dead of winter he works holding the instrument with a heavy fur glove.

4) Yegor Yegorin

"kooky" by conventional science. To those he feels are "moving into a respectable position on the frontier of science" he awards a scientifically palatable four stars but there is only one in this category: the existence somewhere out there of *extraterrestrial intelligences*. Further out on the frontier he situates *extrasensory perception* and *acupuncture* which, because they still don't have wide acceptance, are awarded a scientifically

... Beyond them in a fringe area he subject

"unappetizing" two-star category that, according to the physicist, probably never will amount to anything." UFOs and abominable snowmen fall into this bracket. A lowly one star is pasted on scientifically inedible topics hovering at the extremity of the fringe such as the mystery of the Bermuda Triangle, the Loch Ness monster, astrology, remote viewing, and spoon and key bending "à la Uri Geller." With respect to the latter, Treibl sniffs contemptuously: "Forget it."

Nowhere in his article on pseudoscience does Treibl refer to the lengthy Pothoff-Larg experimentation on remote viewing at the Stanford Research Institute or to brilliant research performed by American, French, and British physicists and metallurgists on the ability of gifted young people to bend metal objects at distance.

When it came to dowsing, Treibl at first found himself straddling a fence. "Ordinarily," he wrote, "I'd give this one star but a student recently showed me not only that he could ~~see~~ an underground water pipe but that I could too. There's probably a neurological explanation."

If Treibl had sampled his scientific literary menu a little more carefully before cloaking himself in the mantle of the "Duncan Hanes" of physics research, he would have found that a scientist and fellow Virginian had published an article in the *Virginia Journal of Science* eight years before Treibl's *Saturday Review* contribution appeared. Only the first in a long series of subsequent papers, it put forward a convincing explanation for head dowsing.

The saga behind its conclusions could begin on Hallowing

Dr. Zuboj V.

Harvalik of Fairfax, Virginia

with some of the equipment
he designed to test dowsing

equipment by an artificial
magnetic field. The black box
on the table is a DC variable
power supply that permits
variations of current flowing
through the ground, thus varying
the intensity of the magnetic field
to which the dowsers is exposed.

Next to it is a "randomizer," a
device permitting the switching
on and off of the electric
current without the dowsers or
Harvalik himself knowing it. This
randomizer establishes a "double-
blind" experimental condition.

A spit of land jutting into the two-mile-wide Potomac River
has a rocky protuberance called Crane's Island. One sunny
spring afternoon in 1968 anyone passing a modern house of
brick and glass facing the island could not have failed to notice a
crowd of people gathered in the front driveway. One after
another they were walking with dowsing rods in their hands over
an empty stretch of ground—except in the middle of which
stood a small table to provide an audience. The rods, anyone unfamiliar with
dowsing might have concluded that the inmates of some
madhouse had invented a new game.

What actually was taking place was a scientific experiment
designed by Dr. Zuboj V. Harvalik, a professional physicist and
scientific advisor to the U.S. Army's Advanced Material Concepts
Agency, a 100-man top secret unit which was meticulously
planning America's army for the year 2000.

Harvalik's interest in the dowsing phenomenon began in the
early 1950s when, in his native Czechoslovakia, he encountered a
peasant walking over his acreage with a forked branch cut from a
willow tree. When the peasant explained he was looking for
water, Harvalik asked whether anyone could do likewise.

By no means, the peasant replied gruffly. "This talent is
granted by God only to a few."

Harvalik was skeptical. While finishing up his studies for a
doctorate in physical chemistry, he had taught himself to
dowsing—but the more he read, the less sense he could make of
its seemingly contradictory conclusions. When he emigrated to
the United States, he continued to read, and he was struck by the
fact that dowsing was a common practice in many cultures.
In one of his earliest experiments, he noticed that when a thin
copper wire was an electric wire on the ground with a current
running through it, the dowsing rod he was holding would react
just as if he or it were a compass.

The idea of using an electrically charged wire came from a

Harvalik's attention was caught by the English researchers' theory that the earth's magnetic field, or the magnetic vector as it is known in science—might play a role in the behavior of the birds. He was also aware that the Director of the Physics Department at the University of New South Wales in Parkville, Australia, had affirmed in his book *Le signal du territoire* that what dowagers were detecting was a *gradient* or slight change in the earth's magnetic field above ground which he believed to be caused by electric currents from water filtering through the earth below.

To test this idea Hocard wrapped a coil of electric wire around a 1 x 2 meter wooden frame to see whether dowsers walking through it could obtain a "signal" when the current ran

less than 100 percent accuracy suggested either fatigue or boredom in many subjects after a short period of testing or

world for his research was taken from in the French
scientific literature and that he also sought to electrically
stimulate the brain. His work was published in the
French literature on the subject. He took a very
strong interest in the work of the Jews.

During the time that he spent in 1940, Hatzidakis
found that the French scientists had made further progress in
the work of the Jews. He was not
satisfied with the results of the battery. After leaving the
Army to work for the French government with the U.S. Army
Corps. Engineers at Fort Belvoir, he decided to continue his
work and this was completely prevented by a disease which
prevented him from doing so.

During the next few years he continued his research
on the human brain. He found that the brain was not
just a passive organ but an active one. He
expected the work to be done. He decided to continue
his work and this was completely prevented by a disease which
prevented him from doing so.

When the disease began to appear, he continued
his work on the brain. He found that the brain was not
just a passive organ but an active one. He

Marvalik had provided one

As discussed above, the results reported in the second four columns of Table 1 are based on the use of the same set of variables as in the first four columns. As a consequence, the variables selected in Table 1 are the same. (The only exception is the State University of Western Kentucky, which is not included in the data set used for the first four columns.) The results are also based on the use of the same set of variables as in the first four columns. As a consequence, the variables selected in Table 1 are the same. (The only exception is the State University of Western Kentucky, which is not included in the data set used for the first four columns.)

[illegible]

that of cats which can see in the dark or dogs which can hear ultrasonic frequencies inaudible to any human.

Modifying his method for determining the sensitivity of dowzers, Harvath had de Boer walk between the pipes, now with the dowzer rod in his hand, and ask him to point out to them with varying degrees of sensitivity. Harvath at once

thunderstorms to radio and television waves for which they should be able to serve as detectors.

To test this supposition Harvath took de Boer out into his back lawn next to the river and asked him to program for the 570-kilocycle frequency of WGMS, Washington, D.C.'s good radio station. De Boer rotated in place until, when he was at an azimuth of about 45 compass degrees, his rod snapped. He then switched on a cheap transistorized radio receiver, turned it to 570 kc, and rotated with it until the sound of the broadcast reached a minimum. At this

dozen more radio and TV stations scattered through the Washington, D.C. metropolitan region. Any dowzer wishing to check his own ability, says Harvath, can use this procedure anywhere in the inhabited world.

During several successive annual visits by de Boer to Harvath's home in Lorton, the innovative scientist and the hypersensitive dowzer worked together to check whether the

out exactly where in the body sensors for it might be located. The

 Harnisch

Wally was a young boy who had both genius and tragedy. Only 13 years old, he had lost his bird-drawing ability.

They pinpoint the sensor in the head. Flursbush experimented with a strip of aluminum wire only one-sixteenth of an inch wide. When he placed it on the forehead of a subject, he found that the subject could feel the wire. Flursbush placed a two-inch patch of aluminum taped on the forehead, slightly higher than and midway between the eyes, also blocked any closing signal which might be directly exposed to the sensor. Flursbush's measurements indicated to Flursbush that a closing action might be located in the vicinity of either the initial or the final gesture.

He further conducted by a team of biologists, chemists and physicists to improve and confirm his results. Harelik was credited with having discovered that in addition to sight, hearing, smell, taste and touch, there is a sixth bodily sense in humans for detecting changes in the geotectonic field and that dowsers may be the world's potentially most sensitive geotectonics.

Electromagnetism ... and Beyond

Harvalik's discovery is of singular importance if only because it lends weight to Malcolm Rae's assertion that physical approximating the limits of observation in behavior with monitoring instruments. This is not simply that hardware far more sensitive than any available today be invented. In fact, it is the possibility of such hardware that has led him to a self-taught genius.

*Radionics box designed by the
anti-Corsets Dr. Le. Warrick,
Oxford, England (Photograph by
Dr. Harrison & Lane)*

are fundamental to dowsing devices in that it is asserted they combine with their operators to form a bio-physical unit to search for and identify vibrations emanating from both animals or inanimate objects. Facts about human beings, usually related to their health, are determined from a sample of blood or from a photograph incorporated into the circuitry.

Warrick brought one such box back from New Zealand where it was alleged to produce fantastic results. When he opened it to examine the circuitry underneath the dials on the face plate, the box was empty except for a small handwritten note reading "Ha ha, there's nothing in this box!" If the dialing mechanism worked at all, it obviously operated only as a function of its operator's belief.

Harvath, even the boxes equipped with electronic components, operate nonsensically or in such a manner that no explanation of any physically identified radiation is possible. He has thus arrived to the conclusion, irritating to some, that the devices are merely a form of training aid helping operators to program their minds to react to and recognize stimuli of a given or distinct pattern.

In addition to checking the dial settings with a pendulum, operators also use a rubber plate attached to their boxes. If, during the rubbing, their fingers move back and forth freely on the plate, the answer to a programmed question is "they stick to the plate," yes.

That the rubbing plate, and the box as well, might be completely dispensable came to Harvath when he met Franz Karelly, a dowser who, as a trained laboratory technician, had made a prolonged study of radionics devices during the 1950s for Arthur Young's Foundation for the Study of Consciousness in Philadelphia. After mastering the rubbing technique and dial manipulation, she was one day introduced by Young to a book, *Witchcraft, Oracles and Magic Among the Azande* by the English anthropologist Edward Evans Pritchard.

How a Zande witch doctor made a little round disk with a handle and another disk with a handle. Evans Pritchard described how the African native sat down and placed one on the tail of the first disk to steady it, then rubbed the other disk over it while asking, for example, if his neighbor's pig had died. If the disk stuck to the tail, the pig had died. If it slid smoothly, the pig was well.

Karelly would provide an answer. The rubbing method would work for her. After she tried it, it worked so successfully she has never used a dowsing method other than rubbing the top of a table or a desk to obtain answers.

At the First International Meeting on Psychotronic Research held in Prague, Czechoslovakia, in 1973, Czech scientists who had heard Karelly lecture asked her on the spot to tell them the age and origin of a small mineral sample that one of them took from his pocket. After sitting at a table and rubbing out answers to their questions, she told the group that the sample was 10,000 years old and came from a meteorite. The scientists

where U , C , A , and k is the best judgment of their experts; both answers were correct.

When he was informed of the result at his home in London, Faraday spent a few days in the laboratory of a scientific institution of the country, which were completely unknown to him. After several days at this small level.

From the first number of papers, during the six months, he was able to send a few scientific papers.

Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter."

At the time this question was asked I did not know the answer. However, a subsequent experiment with a machine (the Faraday cage) showed that the voltage gradient was about 1.400 volts per meter. The answer was correct. The voltage gradient was about 1.400 volts per meter.

Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter." Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter."

Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter." Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter."

Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter." Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter."

Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter." Faraday: "When is the first time a large gradient of voltage per meter (or better said negative) is produced? Answer: 2 statvolts per meter."

CHAPTER 15

An Electronic Dowser

Noxious Rays from Underground

In 1975, Herbert Douglas, a businessman living in Shaftsbury, Vermont, drove to a neighboring town on a mission of mercy. Arriving at his destination, he took out a plastic dowsing rod and went over every room in a two-story house, being particularly careful to check the area around and under the bed where a twelve-year-old girl with a double curvature of the spine had been sleeping since early childhood.

Douglas found that the house itself had an unusually high
less than thirty-by-ten intersections of veins under the afflicted

would run under it. For the next ten days the child told her parents that the chronic pain in her spine was increasing. Then
girl's doctor who noticed, during a visit to fit her for a full-body brace, that the curvature had noticeably decreased.

Several months later Douglas received a letter from the
to obviate any necessity for the brace.

The notion that the onset of disease might be linked to telluric emanations came to Douglas as a persistent theme in observations by English authors before World War II. In his book *Dowsing*, W. M. Trinder had written: "There seems to be very little doubt that rays given off by subterranean water are, if continuous contact is maintained with them, definitely harmful to suffering from nerves and also cases of rheumatism. In all these cases the sufferers were spending a large part of every twenty-four hours right over a subterranean stream and this was slowly having the most deleterious effect on their health."

Echoing Trinder, Marguerite Maury in her own book *How to Douse* stated: "Whatever may be the cause of telluric emissions—sheets of water, subterranean streams or dry faults—the electric

emission at the surface will be particularly bad.

Wondering whether there was any substance to the idea, [redacted] decided to try it. He dug a hole in the ground and found it difficult to find that his rod *always* detected veins of water beneath them and more significantly, that two or more veins would directly under the part of the body that hurt.

In a two-part article in the *Birmingham (Vermont) Banner*,
the author reported that the FBI had been receiving reports
of "disappearances" from five days to three months. Forwarding these
reports to the U.S. Department of Justice, Washington, D.C., he
stated that the Bureau had been unable to locate the missing persons.

However, he added, "It would appear that the research of medical men overseas, coupled with my own experience, has led to the discovery of a new explanation of why the disease occurs."

U. S. D. is reported: "I have now checked twenty almost uncountable number of dowsing signals coming from the clefts or breaks in rock ledge foreground. I thought that the underground veins could be best illustrated if I laid out a series of wooden laths on the bed to show the direction of their flow. When I did this I asked the best to lie down in the position they were lying in, and ask: 'Where is the crossing of the laths indicates precisely where the person is affected.'"

LEFT: "The person who slept in this bed has been operated on for lung cancer. For several years she has been sleeping on the right side of the bed. Notice how the network of crumplings are concentrated at the point where her chest would be resting while sleeping," Herbert Douglas.

Over a period of ten years, I checked sixty cases of arthritis, twenty cases of cancer and nine cases of cataracts. In every single one of them, I found downing reaction lines. In thirty cases, I found a network of water veins creating anywhere from thirty to fifty crossings.

In 1978, Douglas had a German article translated into English. The article, at first published in *Scientific American*, described the work of Karl Fichtelberg, a Swiss geologist who for years had drilled successfully for water in his country. Fichtelberg had also found mineral springs for the construction of a health resort on the shores of Lake Constance.

That radiation from subterranean water veins might be linked to disease came to Koppy's attention in the Swiss Rara Valley community of Grabs in Saint Gallen Canton, where he discovered a village lying directly under a new barn. Asked whether there had been cases of animal disease in the barn, a village official simply swung its door back to reveal it empty. So many animals had become ill when housed in it, he said, that it had been abandoned.

Kopp went on to discuss a personal dosing survey of 140 barns in which cows contained 100 to 200 ppm of PCBs. He had a high incidence of reproductive problems, abortions and in the joints and uterine deterioration to marked weight loss and

bed before maturity. He found that one or more strongly flowing veins of water ran under every one of the brood-flags he observed and that in many cases, the cattle affected with disease were bedded at spots directly above them. Learning of his work, the farmer who owned the brood-flocks of cattle, and who had located directly over a water current suffered from bloody flux, while animals in adjacent pens free of such an underground influence were healthy.

Various effects of underground water veins as illustrated by Dr. Joseph Knapp. In addition to disease in humans, animals, and plants, it has been observed that auto accidents repeatedly occur at points where veins run under roads and highways. As far back as the turn of the century, the German dewer, Gustav Hutter-Buthkamp discovered that "far from never striking twice in the same place," as the old folk adage has it, lightning is prone to be attracted to trees growing over an intersection of two water veins. I would not dare to make such a statement, a role Hutter-Buthkamp, had I not been able to confirm it in all cases, of which I have had more than a thousand. (Reprinted from The New York American Society of Dewers, Danville, Vermont, 1974)

varying cancer incidence only to find that they could in no way be linked to the faults. When the researchers examined the five major geological faults that all of them agreed ran near the city, the researchers were astounded to see that the faults traversed those districts with the highest rates of cancer mortality. They promulgated the theory that some kind of radiation emanating from the faults might be an important cause of cancer that had been completely overlooked.

The Wunzer-Melzer survey stimulated the German aristocrat Gustav Freiherr von Pohl who, in 1929, began the first systematic survey of cancer in a town in the zone of maximum radiation. In Adelsburg, a community of 1,500 with 8,000 inhabitants, he dosed its entire populace under the watchful eyes of the mayor and local gendarmes who signed a protocol describing the survey. On a 1:1000 map of the town, he had traced those veins of water which he considered important enough to play a role in cancer etiology, after which he proceeded to the plotting of cancer incidence. In 1930, by one Herr Adelsburg's medical records, 100 cancer examinations were next made of those houses only partially affected by the water veins and the body of cancer patients were examined to have actually stood directly above them.

Cancer specialists openly scoffed at the new report which they considered worthless because, as they claimed, the incidence of cancer was so high and Adelsburg so small that von Pohl's conclusions about radiation-produced cancer meant nothing.

Not at all. He moved von Pohl asked the Bavarian Office of Statistics for the name of the community with the lowest incidence of cancer in the whole province. This turned out to be

Section of a city map of a German city with indicated irritation zones. In the black-marked dwellings, during a period of twenty years, one to two cancer cases were observed. They are located without exception in irritation zones.

4. A case of morning fatigue and weakness of the eyes of a male, exhaustion, breast cancer metastases, operated, recurred after three years. After relocation of the bed a noticeable improvement of state of health. This male writes to the physician, Dr. Blum: "I am glad to be able to tell you that my wife and I feel like neighbors after relocation of the beds. Fatigue and extreme tiredness disappeared. Experience striking to the significant reduction of the weakness of my eyes."

Grafenau, a settlement of 2,000 souls in the Bavarian Forest. Dr. von Pohl made a dowsing survey on May 4 and 5, 1930 to find that each of the persons who had died of cancer during the previous seventeen years had been sleeping over the indicated zones that he had delineated. One and one-half years later a second check determined that ten more cancer victims had succumbed in the interim.

It was the work of French dowsing researchers in the early 1930s that first pointed to the possibility of cancer-related harmful radiations. Articles by two authors in the *Cote d'Azur Medical Journal* in 1932 described the method of measuring the electrical conductivity of the air through the detection of the "cancer dowsing" which by gain or loss of an electrical charge was a function of the degree of cancerous contamination.

Correlation between ionizing radiation and the incidence of cancer was made during a seven-year-long study by a French physician, Pierre Cadi, just before the outbreak of World War II inspired by dowsers who told him that the inhabitants of many houses in the French port city of Le Havre had died of cancer. Cadi, a cancer doctor, used an Ekster and Geste electrometer to check the concentration of air ions at points in the yards of houses lying directly under more than 7,000 cancer

18. The woman in the bed, located in the hot bed indicated irritation zone, had attacks of severe neuralgia and gall bladder illness. Six years she was totally bedridden. A gall bladder operation was unsuccessful. After removal of the bed relocation was done. After nine days the woman, who for six years was bed-ridden, was found by her physician doing the laundry. After several months, the pains completely disappeared and the woman was in good health.

19. In this case the physician diagnosed a terminal leukemia. The patient was in a tuberculosis sanatorium and was bedridden because of an ill knee for two months. Six days after bed relocation a noticeable improvement was observed. Four days later cough and expectoration disappeared. After two weeks the patient felt better and got up from time to time. The physician, Dr. Pohl, "Soul Animations as Causes of Illness," J.E. Huber Publishing House, Herborn, 1942.

Illustration of Pierre Curie's work

For example, when a woman whose husband had succumbed to cancer was typical. He placed an electrometer in its cedar directly below the exact location of her cancerous growth when she was lying in bed and an identical instrument was placed in the same position in the bed of a healthy woman. It was further determined that the band of radium was no wider than a meter and a half.

The second instrument was then moved to within fifty centimeters of the first. Readings taken over a full year at 8, 10, 12, 14, and 16 hours each day showed exactly the same difference. The band of radium was therefore shown to be vertical as it came out of the ground and did not diffuse laterally.

This critically important conclusion has recently been confirmed by the work of the French physicist, M. Curie, who has shown that the reaction field over water veins or geological faults is vertical. This discovery was made with the help of Treadwell and Rupp, the two Hoffman-La Roche executives who so successfully had dowsed water for their

Findings of Dr. Angelo Cominetti

a long multistoried building where a typical dowsing reaction zone had been correlated with a water vein tapped by a successful well that produced large quantities of water.

On five floors about 3 1/2 meters one above the other two meters each, 10 x 10 meters wide were recorded. In spite of three layers of heavy reinforced concrete that separated the top floor from the bottom, the zones of an emboloidal radiation called the D agent (D for *dowsing*) by Cominetti were found to lie on a straight line that in this case deviated 1 1/2 degrees eastward from the vertical. The rod reaction was equally strong for all five floors indicating no attenuation of the D agent radiation by the concrete.

His experimentation, said Cominetti, should be repeated in tall buildings of modern design, and in the case of geophysical prospecting.

It occurred to Cardy that the telluric emission might be due

to the fact that the time needed for its discharge rose from seven to ten minutes when the telluric emission was in place for more than a month because discolored by

Cardy stated in emphatic terms that many cases of physical ailments produced by telluric radiation were ameliorated by subjects' beds away from the radiation zone or by shielding with lead sheets. In his book *Experimental*

Plautersbach
16 September 1955

disease was retarded. If the sheet was not renewed after several months malaises took a sudden turn for the worse.

Though Cody's work was supported by the eminent physicist and director of Duke Louis de Broglie's laboratory, Louis le Prince Ringuet, the engineer's startling conclusions were given no findings of von Hold and other German researchers more than ten years before.

After World War II dowsing scientists in Germany gathered more evidence that biological effects in humans were being caused by exposure to telluric radiation.

Johann Walther, who later received an honorary medical degree, was the first to coin the term *geopathy* for the study of suffering from degenerative disease to have their homes dowsed. Forcing patients back in bed where they could be exposed to noxious radiation, he said, was like driving horses back into a burning barn.

In 1955, Dr. V. Fritsch, a German geophysicist, underscored the need for combined research by dowsers, medical doctors,

We must not forget that what has been called the problem of the dowsing rod is but one of a number of allied problems and that for medicine.

The same year, Dr. Joseph Wost and others for the first time worked with Geiger counters to prove the emission of gamma radiation, one of the chief results of radioactivity, directly under cancer beds in the town of Plautersbach in September 1955.

From Stängle . . .

A successive studies of this type were taken up; an engineer living near the Württemberg metropolis of Ulm, Jacob Stängle, was beginning to design a new instrument that, by the early 1970s, seemed not only to settle the gamma ray conundrum once and for all but bid fair to fulfill a long-standing dream of dowsers: the creation of a dowsing machine that could prove beyond the shadow of a doubt their assertions that water flowed in veins.

When gamma rays penetrate a crystalline sensor in Stängle's device, they cause it to scintillate, or throw off extremely weak flashes of light emitted by atoms in the sensor material as they return to a normal energy state after having been ionized or material. These are converted, in turn, to electrical pulses and

*Edmond de H. geneve
Physician in Charge the
City of Zurich, Switzerland*

"In the not too distant future it should be possible to draw up regulations making mandatory the examination of existing and future building sites to discover whether they are affected by pathogenic telluric influences. No hospital or school should ever be constructed without checking for subsurface water currents below its prospective foundation. An effort must be made to introduce the concept of prophylactic planning to the world. If this can be accomplished, I believe we shall witness a marked decline in degenerative disease."

Dr. Joseph Koop

University of Zurich

"If we consider the alarming reports about pathological long range effects of certain narrowly confined areas such as described by a discover with a rod we can but thank the small number of people who have devoted themselves to that problem with serious and well meant intention. More than that, we've reached a point where science has to take on just this kind of problem in order not one day to be exposed to the reproach that it neglected available evidence to the detriment of humanity."

... to Bickel

Unknown to Stangle, Dr. Armin Fickel, a German born research engineer and scientist, who began his career at the German development centre in Peenemünde where he worked on the V-2 rocket and ended it at the NASA's Western Missile 1 at Hanger 14, Los Angeles, California, was challenged after his return to develop instruments that could be of benefit to ecological

Hundreds of cancer institutes all over the world have spent

$$f(x) = \frac{1}{2} \left(\frac{1}{x} + \frac{1}{x^2} \right) = \frac{1}{2} \left(x^{-1} + x^{-2} \right)$$

$$f'(x) = \frac{1}{2} \left(-x^{-2} - 2x^{-3} \right) = -\frac{1}{2} \left(\frac{1}{x^2} + \frac{2}{x^3} \right)$$

$$f''(x) = \frac{1}{2} \left(\frac{2}{x^3} + \frac{6}{x^4} \right) = \frac{1}{x^3} + \frac{3}{x^4}$$

$$f'''(x) = -\frac{3}{x^4} - \frac{12}{x^5} = -\frac{3}{x^4} \left(1 + \frac{4}{x} \right)$$

$$f^{(4)}(x) = \frac{12}{x^5} + \frac{48}{x^6} = \frac{12}{x^5} \left(1 + 4x \right)$$

Prace, 1997, 1998, 1999, 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050, 2051, 2052, 2053, 2054, 2055, 2056, 2057, 2058, 2059, 2060, 2061, 2062, 2063, 2064, 2065, 2066, 2067, 2068, 2069, 2070, 2071, 2072, 2073, 2074, 2075, 2076, 2077, 2078, 2079, 2080, 2081, 2082, 2083, 2084, 2085, 2086, 2087, 2088, 2089, 2090, 2091, 2092, 2093, 2094, 2095, 2096, 2097, 2098, 2099, 2100, 2101, 2102, 2103, 2104, 2105, 2106, 2107, 2108, 2109, 2110, 2111, 2112, 2113, 2114, 2115, 2116, 2117, 2118, 2119, 2120, 2121, 2122, 2123, 2124, 2125, 2126, 2127, 2128, 2129, 2130, 2131, 2132, 2133, 2134, 2135, 2136, 2137, 2138, 2139, 2140, 2141, 2142, 2143, 2144, 2145, 2146, 2147, 2148, 2149, 2150, 2151, 2152, 2153, 2154, 2155, 2156, 2157, 2158, 2159, 2160, 2161, 2162, 2163, 2164, 2165, 2166, 2167, 2168, 2169, 2170, 2171, 2172, 2173, 2174, 2175, 2176, 2177, 2178, 2179, 2180, 2181, 2182, 2183, 2184, 2185, 2186, 2187, 2188, 2189, 2190, 2191, 2192, 2193, 2194, 2195, 2196, 2197, 2198, 2199, 2200, 2201, 2202, 2203, 2204, 2205, 2206, 2207, 2208, 2209, 2210, 2211, 2212, 2213, 2214, 2215, 2216, 2217, 2218, 2219, 2220, 2221, 2222, 2223, 2224, 2225, 2226, 2227, 2228, 2229, 2230, 2231, 2232, 2233, 2234, 2235, 2236, 2237, 2238, 2239, 2240, 2241, 2242, 2243, 2244, 2245, 2246, 2247, 2248, 2249, 2250, 2251, 2252, 2253, 2254, 2255, 2256, 2257, 2258, 2259, 2260, 2261, 2262, 2263, 2264, 2265, 2266, 2267, 2268, 2269, 2270, 2271, 2272, 2273, 2274, 2275, 2276, 2277, 2278, 2279, 2280, 2281, 2282, 2283, 2284, 2285, 2286, 2287, 2288, 2289, 2290, 2291, 2292, 2293, 2294, 2295, 2296, 2297, 2298, 2299, 2300, 2301, 2302, 2303, 2304, 2305, 2306, 2307, 2308, 2309, 2310, 2311, 2312, 2313, 2314, 2315, 2316, 2317, 2318, 2319, 2320, 2321, 2322, 2323, 2324, 2325, 2326, 2327, 2328, 2329, 2330, 2331, 2332, 2333, 2334, 2335, 2336, 2337, 2338, 2339, 2340, 2341, 2342, 2343, 2344, 2345, 2346, 2347, 2348, 2349, 2350, 2351, 2352, 2353, 2354, 2355, 2356, 2357, 2358, 2359, 2360, 2361, 2362, 2363, 2364, 2365, 2366, 2367, 2368, 2369, 2370, 2371, 2372, 2373, 2374, 2375, 2376, 2377, 2378, 2379, 2380, 2381, 2382, 2383, 2384, 2385, 2386, 2387, 2388, 2389, 2390, 2391, 2392, 2393, 2394, 2395, 2396, 2397, 2398, 2399, 2400, 2401, 2402, 2403, 2404, 2405, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, 2415, 2416, 2417, 2418, 2419, 2420, 2421, 2422, 2423, 2424, 2425, 2426, 2427, 2428, 2429, 2430, 2431, 2432, 2433, 2434, 2435, 2436, 2437, 2438, 2439, 2440, 2441, 2442, 2443, 2444, 2445, 2446, 2447, 2448, 2449, 2450, 2451, 2452, 2453, 2454, 2455, 2456, 2457, 2458, 2459, 2460, 2461, 2462, 2463, 2464, 2465, 2466, 2467, 2468, 2469, 2470, 2471, 2472, 2473, 2474, 2475, 2476, 2477, 2478, 2479, 2480, 2481, 2482, 2483, 2484, 2485, 2486, 2487, 2488, 2489, 2490, 2491, 2492, 2493, 2494, 2495, 2496, 2497, 2498, 2499, 2500, 2501, 2502, 2503, 2504, 2505, 2506, 2507, 2508, 2509, 2510, 2511, 2512, 2513, 2514, 2515, 2516, 2517, 2518, 2519, 2520, 2521, 2522, 2523, 2524, 2525, 2526, 2527, 2528, 2529, 2530, 2531, 2532, 2533, 2534, 2535, 2536, 2537, 2538, 2539, 2540, 2541, 2542, 2543, 2544, 2545, 2546, 2547, 2548, 2549, 2550, 2551, 2552, 2553, 2554, 2555, 2556, 2557, 2558, 2559, 2560, 2561, 2562, 2563, 2564, 2565, 2566, 2567, 2568, 2569, 2570, 2571, 2572, 2573, 2574, 2575, 2576, 2577, 2578, 2579, 2580, 2581, 2582, 2583, 2584, 2585, 2586, 2587, 2588, 2589, 2590, 2591, 2592, 2593, 2594, 2595, 2596, 2597, 2598, 2599, 2600, 2601, 2602, 2603, 2604, 2605, 2606, 2607, 2608, 2609, 2610, 2611, 2612, 2613, 2614, 2615, 2616, 2617, 2618, 2619, 2620, 2621, 2622, 2623, 2624, 2625, 2626, 2627, 2628, 2629, 2630, 2631, 2632, 2633, 2634, 2635, 2636, 2637, 2638, 2639, 2640, 2641, 2642, 2643, 2644, 2645, 2646, 2647, 2648, 2649, 2650, 2651, 2652, 2653, 2654, 2655, 2656, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2665, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2674, 2675, 2676, 2677, 2678

our own time medical authorities continue insistently to

I am prepared to point out counter-producing groupthink games to the most confirmed skeptic and let him judge.

$x_1, \dots, x_n$ are the coordinates of the point x in the space E_n . The coordinates of the point x in the space E_n are given by the vector $x = (x_1, \dots, x_n)$. The coordinates of the point x in the space E_n are given by the vector $x = (x_1, \dots, x_n)$.

live and to its radiation. Once this is clearly understood, a door
 is opened to a new world of knowledge and understanding.

prospecting in the detection of water, oil, and minerals underground.

Armin Rickel came up with a black box, weighing no more than 100 lbs., that compares to Stängle's instrument as the Volkswagen Beetle compares to a Mode T Ford. A black box, built in 1977 by William Cunningham, it is assertedly able to pinpoint with accuracy the length, width, and dip of mineral deposits as well as their approximate quantity at depths as great as 10,000 feet and to detect oil-bearing strata down to 10,000 feet.

Fine shots of large lemon grown by Dr. Arnan Bickel compared with normal lemons. Bickel achieves this growth by treating the lemon tree's roots with a specific frequency of ultrasound. The tree then produces three to four lemon blossoms where only one would normally bloom. When all but one of the group of flowers are plucked, the remaining flower then produces an ultra-heavy lemon: the so-called "ultra-lemon," a specimen of particularly strengthened flesh that the lemon will not fall from the tree. Bickel has also produced sunflowers up to eighteen inches in diameter. In palm-tree palm, he treated ultra-sonically has grown more than twice the height of similar trees planted at the same time.

Hydrogen atom: not very complex

Neutron: 1.67 x 10⁻²⁷ grams
Proton: 1.67 x 10⁻²⁷ grams
Electron: 9.1 x 10⁻³¹ grams
Neutrino: 1.6 x 10⁻³⁶ grams

Helium atom: 6.6 x 10⁻²⁷ grams
Proton: 1.67 x 10⁻²⁷ grams
Neutron: 1.67 x 10⁻²⁷ grams

Carbon atom: 1.99 x 10⁻²⁶ grams
Proton: 1.67 x 10⁻²⁷ grams
Neutron: 1.67 x 10⁻²⁷ grams

Equipped with a photomultiplier tube with a quantum efficiency of 35 percent, it can register information from an ore stimulator of 5-10 percent. The device can pick up only one foot of distance.

Bickel, who has also been able to perform such miracles, is growing six-pound lemons by stimulating the roots of lemon trees with specific ultrasonic frequencies. Says that his "Algor Super Scintillation Counter" depends on the fact that constant changes due to crystallization in geological formations that have been

isotope detection, through the proper use of isotope detection, provide clues about what lies below ground.

Before 1913 it was believed that each and every atom of any element was identical in mass. Then it was discovered that an atom could, under certain natural conditions, lose a particle, thereby altering its mass and energy state. These altered atoms, which were later produced artificially in atom smashers, needed a new name. Called isotopes, their nuclei had the same number of protons but different numbers of neutrons.

By 1921 Francis William Aston in England had detected 232 types in seventy elements. Today the number has risen to more than 1,500 with an average of four to each element. Only 10 percent of all known isotopes are found in nature where they can be produced by the interaction of radiations from cosmic distances in the interior of the earth or cosmic rays from outer

The rest are engineered by a special excitation. These are called as "artificial" and are not found in nature. The Latin word "artificial" has 197 heavier particles in the group of which 79 are charged particles and 118 are uncharged. They are altered to produce different isotopes from $^{197}\text{Au}^{197}$ to $^{197}\text{Au}^{198}$, only one of which, $^{197}\text{Au}^{197}$ is found in nature. It is the energy from this single natural isotope which is detectable by the Bickel invention.

In May 1974 Bickel was invited to explore the area around the Paul Isard gold mine 150 kilometers from Saint Laurent de Maroni in French Guiana. From an airplane, his device gave average readings for gold above the mine. The readings indicated "hot

Author holding device and
listens for auditory signal as Dr.
Z. V. Harvalik turns tube
mounted atop tripod. Photo by
Tom Pengetty

The instrument pictured above is one of many contraptions
designed to purportedly improve or enhance the art of diving
while at the same time seeming to heighten its scientific

in the distance of patent examiners.

Invented by Stanislav Tabata of Leningrad, Czechoslovakia, the
device consists of a metal tube 3 mm in diameter and at least 150
mm long. The tube is closed at one end with a metal plug with a
0.2 mm hole pierced through its center, at the other end with a
similar plug to which a microscope is attached.

A metal sleeve around the tube allows it to be mounted on a
goniometer (angle measuring device) fixed atop a surveyor's
tripod. It is claimed that by turning the tube while holding the
diving end at the ready and with the microscope plugged into
the ear, a diver will obtain a signal only of standing acoustical
waves originating from a water vein reach the tube when it is
aligned perpendicularly to them. The method is supposed to
allow the precise delineation of the water vein, its rate of flow
and its depth.

Dr. Harvalik, shown here rotating the tube while the author
manipulated the ear comments: "This is the first document I
have seen in which it is claimed that a diving signal can also
be acoustically perceived. The search tube would not seem to
constitute a collimator for electromagnetic waves concentrated in the
tube into water compressions and expansions of air. If the
tube cavity were tuned to the exact frequency of an acoustic
signal, it could be a collimator for sonic waves but this does not
appear to be the case because the patent reads that the tube can
be of any length as long as it is longer than 150 mm. I can think
that the same device is also another programming device, a means
to allow divers to focus their attention on the problem at hand.

Some reports flicker: the graph continuously traced on paper
looks like a cross section of a volcanic crater. The raised rim
corresponds to the halo of the circle or ellipse-shaped device.
The central depression, the lowest level of the negative reading
on the graph, marks the most likely spot to drill an oil well.

It's a device that entirely replaces existing oil

A Child Saved

[illegible]

The following April the same physician was no longer hopeful. At this time a physical examination of the patient was reported to be normal. At this time the patient's reflexes at the ankles were retarded and irregular. Blood tests revealed an insufficiency of cholesterol. An X ray of the head was declared normal.

The doctor could not decide what to do next.

[illegible]

Papa: Her doctor believed her to have permanent motor and mental dysfunction which he attributed to microbes contracted by the mother during pregnancy.

The headset filled out a meshed face, carefully noting all the facial features, and the computer, which did not wear

particularly alarming to the mother: all treatments to date and

... from his pocket and began to ask a series of questions.

When his drawing revealed the seat of the child's trouble to the spinal cord, the healer was perplexed. The conclusion

way to accord with the laboratory tests or with the physician's certainty that there was something awry with her brain function.

The dowser then inquired via his pendulum: "Is there something wrong with the girls' fate?" The pendular reply was:

The ϵ is given continued

What value should be attributed to the F.T.C.? Answer:

After consulting the laboratory tests that had seemed so significant to the doctor, he next decided to pursue a line of treatment which would correct what he considered to be the body's "acid-alkaline" imbalance. He prescribed a course of homeopathic remedies.

pharmacopoeum and wrote out a prescription

Founded in the 1700s by Christian Samuel Hahnemann, a German physician, the school of medicine relying on infinitesimally small doses of natural products in solution which, if administered in strong doses, would produce the same symptoms as the disease treated, has become popular. The principle of homeopathy is that the dose of the remedy should be so small that it does not interfere with the body's natural healing process, but rather, differing from those of the disease treated. In contrast to homeopathy, which regards symptoms as a means of natural healing—or a form of self-defense to which a doctor should ally himself—allopathy views them as an antagonist of nature, or a self-directed aggression against which a doctor must employ a counter-aggression.

that his method was bred in Europe during a severe epidemic of Asiatic cholera in 1817-18 when in London 20,000 died. In 1854, 100 of 150 who were treated by his method survived, while over half of those treated by other means succumbed to the disease.

Allopathic medicine is constantly on the hunt for specific cures for heart disease, arthritis, cancer and other as yet untreatable diseases. It's like looking for a needle in a haystack in terms of disease itself as the physical, mental and emotional factors are all treated separately. The cure for one ailment may well be another. Seeking them out takes much longer than the rote prescription that is becoming prevalent in an age when mass medicine and even "computerized diagnosis" is in the ascendancy.

As one expert, Dr. Harris Coulter has it: "Homeopathic

That same evening the mother called the healer to say she

Abbé Bouly. The dedication reads: To Monsieur Lambert, worthy collaborator in our eudæsthetic work. A well known dowser. At Lambert is survived by his widow who runs the world famous dowsing supply house. Moson de la Rodiæsthesie on Paris rue St Roch

The Birth of Medical Dowsing

thing back the way it should be a rag. The rag had been out of use for so long that it had become a rag. It was out of bed and, for the first time in months, walked without tripping. At the time of the first visit to her doctor, the new word, "Mama." At a visit to her doctor two weeks later, when she was pronounced well on the way to full recovery.

Marie-Hélène's case is recorded in the *Journal of an Outlaw* by the man who prescribed the remedies to her mother. Father Jean Juron, a Catholic priest in the Champs, who, before his untimely death in 1977, had devoted himself to medical dowsing in Paris.

Both were born in the same place, the same forested plateau east of the Seine River which was the scene of heavy fighting in both world wars. Juron spent the first half of his working life as a demonstrator in Catholic colleges in the Paris area. He was introduced to the dowsing art in 1930 by a fellow priest in the countryside near his home who used a pendulum to locate lost objects and, in the process, looked on the practice only as a hobby. Juron lost her gold ring while packing up her belongings between layers of hay.

Entering the shed where the packing was done, Juron driven more by curiosity than purpose, held his own string suspended nickel-plated coin over several baskets that, filled and covered, were ready for shipment to market and was surprised to find the coin in the direction he was looking for a positive answer. He opened the basket, removed the protective layer of hay, then redowned for the exact position of the lost ring. The pendulum was only active over one specific apple. When he gingerly lifted it from its resting place, there was the ring lying on the apple beneath.

Over the next several years, wrote Juron later, "a mixture of successes and failures made me understand that the dowsing process requires the development of a subtle sensitivity, the creation of a personal style, a lot of try-and-error practice and, doubtless, other conditions."

After World War II, during which Father Juron was awarded the Croix de Guerre for refusing to obey a cowardly officer who had ordered him and his unit to surrender to German forces, that the priest began seriously to consider the use of dowsing in medicine. His inspiration came from the accomplishments of three dowsing priests who had pioneered the art. The first was Abbé Alexis Bouly, curate of Hardebot Plage, a small seaside village on the English Channel, who became so well known as a water dowser that, after finding commercially

important supplies for French manufacturers, he was contracted to do likewise by other industries in Belgium, Portugal, Poland and Romania.

At the end of World War I Bouly was summoned by a

Abbé Bourdoux. (From Jean Louis Bourdoux, *Notions Pratiques de Radiesthésie pour les Missionnaires*, Desforges, Paris, 1963)

Abbé Mermel. (Copied from Jean Louis Bourdoux, *Notions Pratiques de Radiesthésie pour les Missionnaires*, Desforges, Paris, 1963)

... Captain ... R ... he ... in his alleged ability to locate unexploded shells buried in the ... late whether they were of German, Austrian, or ... manufacture prior to their unearthing. Impressed with ... less performance, the general recommended the dowser's talents to the Ministry of War in Paris.

After the war Bouly founded the Society of Friends of Radiesthesis, and for a new word he coined for dowsing an amalgam of a Latin root for "radiation" and a Greek root for "perception," which he hoped would make the searching art ... finally hit on what he called "the world of microbial vibrations." "I was bold enough to tackle it," he wrote, "but to start with I had to learn about microbes, to study their nature and their influence on the human body."

When word of his new interest spread throughout northern France, those doctors who regarded the prelate as a scientific investigator rather than a competitor were glad to assist him in his experiments, most of which he carried out in the hospitals of Besançon-sur-Mer, Breck Plage, Lille, and the Belgian city of Liège. Put to repeated tests, Bouly was able, simply by ... tubes just as easily as if he were observing them through a ...

In his acceptance speech the newly knighted priest declared: "This Crown of the Legion of Honor is awarded in my ... For my own part, I have spent the rest of a life I have tried to dedicate to ... and the ..."

A second medical dowsing pioneer who inspired Father Jean-Louis Bourdoux, who spent sixteen years as a missionary in the jungles of Brazil's Mato Grosso. Of delicate health, he was struck down with a nearly fatal case of galloping consumption and later by a six-week-long fever contracted while on an apostolic mission into the wilderness from which he returned at the point of death on a stretcher. Both times he was brought back to health with saps from local plants prescribed by Indian parishioners.

His health restored, Bourdoux launched into a study of the medicinal properties of Brazilian plants, extracts of which he took back to France where they were tested in dilution by homeopaths who confirmed their salubrious effects.

For the Abbé, the knowledge of plants as well as the study of herbals native to France, Bourdoux decided to write a ... The main question bothering him was: How can they be taught which plants in a particular region would act as specific remedies for specific ailments?

In the midst of his deliberations, Bourdoux met Father Alexis Mermel who had learned to dowse for water from his grandfather and father in Savoy. As early as 1906, Mermel earned

Modern medicine has

[illegible]

Mermet's well-publicized results convinced Bourdoux that there was something to the process. "If the Abbe Mermet can do it, why can't I?" he wrote. "If I had only known about this art when I was in Brazil."

After years of study and practice, and another visit to the

cancerologists pronounced him free of disease.

1. The first step is to identify the key components of the system. This includes understanding the hardware, software, and network architecture.

2. The second step is to analyze the system's performance. This involves monitoring various metrics such as response time, throughput, and error rates.

3. The third step is to identify the root cause of the problem. This can be done by using tools like network analyzers and log files.

4. The fourth step is to implement a solution. This may involve upgrading hardware, optimizing software, or reconfiguring the network.

5. The fifth step is to test the solution. This ensures that the problem has been resolved and that the system is performing as expected.

6. The sixth step is to document the findings. This helps in future troubleshooting and provides a record of the problem and its resolution.

7. The seventh step is to communicate the results. This involves sharing the findings with the relevant stakeholders.

8. The eighth step is to review the process. This helps in identifying areas for improvement and ensuring that the same problem does not recur.

9. The ninth step is to implement preventive measures. This can include regular updates, backups, and monitoring.

10. The tenth step is to conclude the report. This summarizes the findings and provides a final recommendation.

embezzler a con man, or a murderer."

[illegible]

$\mathcal{A} = \{A_1, \dots, A_n\}$ is a family of n subsets of S , then $\mathcal{A}$ is called a λ - $\mathcal{A}$ -family if $|\bigcap_{i \in I} A_i| = \lambda$ for every $I \subseteq \{1, \dots, n\}$.

The first thing I noticed when I stepped
 out of the car was the cold air hitting my face.
 It felt like a giant hand reaching out to shake me.
 I shivered as I walked towards the entrance.
 The door opened with a soft creak, revealing a dimly lit hallway.
 A faint light emanated from a doorway at the end of the corridor.
 I hesitated for a moment before stepping forward.
 As I approached, the light grew brighter, and I saw a figure sitting on the floor.
 They were hunched over, their head buried in their hands.
 I stopped a few feet away, watching them for a while.
 Their shoulders began to tremble, and I could hear muffled sobs.
 My heart ached for them, but I knew I had to keep moving.
 I turned back towards the entrance, ready to leave.
 Just as I was about to step out, the person looked up at me.
 Their eyes were red and swollen, filled with despair.
 They reached out a shaky hand towards me, pleading for help.
 I froze, unsure of what to do. In that moment, I realized
 that sometimes, the greatest challenge isn't finding your way out,
 but knowing when to stop and offer a helping hand.

1801A TEST: Aubrey T Westlake.
 H L M B. B. Chir Cantab
 M R C. S. I R C P. & I P M.
 (1801A 1801A) Officers of the
 Medical Society for the Study of
 Endothorax Dr Aubrey
 Westlake was president of
 British Association Dr Lawrence
 was president of Physiologists
 courtesy of Dr Aubrey Westlake

Westlake also abhorred the proclivity to explain down-
 purely in terms of modern physics, and maintained that like the
 explorers of old, downers must forge ahead into undiscovered
 territory if they were to acquire the vital substance of
~~_____~~. It was by setting sail that Columbus had proved wrong
 the main opinion that no land lay beyond the western ~~_____~~ on
~~_____~~ and ~~_____~~ and only progress in their art by
 transcending equally deep-rooted but misled conceptions as to
 how it works.

Westlake's conviction was particularly encouraged by a retired member of the Indian police force who had served in intelligence in the Middle East during World War II. W. C. Wynn, who had been a member of the Special Air Service, was always keenly aware that for thirty years the art had made very little advance in technique; he was of the opinion that it was something to be held in the highest regard. He called to Westlake's attention the fact that when someone asked Signore Parry, the most successful Italian practitioner of medical drawing to define the art and its limits, Radiesthesia, replied Parry, is a means of knowledge and of action which is exercised inside the ambit of the five physical and intellectual senses; there are no limits to the art, save those personal to each

Equally impressive to Westlake was a lecture by the Reverend I. A. C. Murray that demonstrated how various nuclear accidents had shattered supposedly unshatterable concepts in science. "In the process of being dynamited," he declared, "scientists have become more open-minded in regard to certain aspects of experience which previously they had ignored. They know that reality is a jigger than the facts which they have gathered about it. On the department of science, experience has

Medical donkeying has long been practiced in veterinary medicine. Above is a French donkey diagnosing a malady in a huge Percheron draft horse first published in the magazine La Vie à la

Campagne April 1, 1951. Below, another French donkey is determining an illness in a little lamb first published in the journal La Côte d'Azur Médicale Toulon, August 1952.

What Westlake and his friends found with respect to specific geometric patterns and their relationship to medical problems is set down in a remarkable book, *The Pattern of Health*, one of the best sources on medical dowsing.

What was new in the unknown way introduced by George Laurence who, after a successful medical practice, came to the conclusion that outward symptoms with no clue as to their fundamental cause.

Only when introduced late in his career to the medical dowsing society did he find the concepts missing in medicine that he had been seeking.

He developed them, he showed out a special diagnostic pattern that was used to determine the degree of deviation from a state of dynamic balance equivalent to perfect health which in Jurion's case could usually be rectified by therapy other remedies. He also came to the conclusion that a vast number of primitive maladies gave rise to thousands of chronic ailments. Due to what Hahnemann had somewhat opaquely called "miasms," they were either transmitted from acquired infections such as mumps, passed from generation to another by an ethereal fluid, or a concept known as "vital force," a doctrine that man possessed not just a physical body but an immaterial one which controlled it. Because no one had been able to do this, he was able to establish a connection between the problem, at last was seeing when he administered his own organic dowsing of RNA and DNA, the two products organic chemists had found so crucial to the transmission of genes to cells in embryonic growth.

George Laurence formed the Psychic Medical Society to propagate his new teachings which, in the eyes of Westlake who became one of its charter members, incorporated four essential features. Simple in both theory and practice, it required a minimum of equipment, it focused on fundamental internal causes, it was applicable to internal or inherited could be used to determine the cause of particularly intractable chronic ailments and he purported, these could be eliminated with remedies found to be specific to them, the course and invisible results of therapy could be monitored throughout treatment.

The prepondering emphasis on the occult also lies at the heart of a method adopted in American professional engineering with illnesses named by French and English dowsers.

Since his retirement from Texas Instruments, Edward Jastran has devoted his time researching the possession of persons by nonmaterial entities that cause mental and physical disorders of a

relativistic quantum theory, the answer can be found to the riddle of existence.²⁷

In *The Structure of Matter*, a monumental work of over 1,000 pages, written in collaboration with his son, S. W. Kramers, Dirac examined the anomalies of the relativistic quantum theory of the electron, and he showed that the theory could be made to fit the experimental facts only by accepting such anomalies.

Dirac's theory of the electron, which was the first step toward the development of quantum electrodynamics, was a triumph of the imagination. It was a theory that was not only in agreement with the experimental facts, but it was also a theory that was in agreement with the principles of relativity, or both. This reduction of the idea to a

[illegible][illegible]

In this article we have described a certain number of deformations and transformations of metals obtained under unusual conditions. The place where these tests took place and the people who observed them are named. The only constant presence common to all these tests was that of Jean Pierre Girard himself. There was consequently a correlation between his presence and the apparition of the particular effects observed. It would thus seem that we have the right to say that Jean Pierre Girard is part of the "cause" of these effects. But during these deformations or transformations we neither observed nor recorded any intervention on his part of muscular force or physical effects, capable of producing them.

It is not our intention to draw conclusions from these experiments, nor conclusions as complete scientific truths. But we have believed it our duty objectively to set forth the conditions and results of these experiments. We have not found an explanation for the observed effects either in present day physics or in potential trickery or cheating, but others, perhaps, may disagree.

J. Girard, Professeur, Lycée Kolhauss, Paris, and J. Boudier

The intersection of the grids

These findings were necessarily dealt with by the Frenchman.

Working with Walter F. Curry, an American Medical Director of the Medical Biodynamic Institute in Rochester, Minnesota, he discovered that the intersecting lines of the grid in which the water veins are found corresponded to the telluric emanations associated with water veins.

One of the most popular healers in the established medical community was a young doctor named Dr. Nikolaus Hartmann, founder of the world's first Society for

Weather, Soil, Man, and author of a book *Sickness as a Problem of Location*.

When Hartmann began his own careful study based on the foregoing research, he found that the meshes of his *GlobaNetzgitter*, or universal grid, as he christened it, were made of vertical and horizontal lines spaced 25 centimeters apart. He found that the lines of the universal grid intersected at points that were 25 meters apart. When he studied the intersection of the universal grid with the lines of the telluric emanations, he found that the intersections indicated the breadth of the same grid. The lines to be respectively twenty-five and fifteen centimeters apart, that if their intersections coincided with water veins, their potential lethal effect was greatly increased.

Hartmann's universal grid

THE DIVINING HAND

The 500-Year-Old Mystery of Dowsing by Christopher Bird

The art of searching for water, oil, minerals, and other natural resources or anything lost, missing or badly needed
