INTRODUCTION

In my book "First Steps in Dowsing Therapeutics", I said very simple processes, allowing everyone to realize the reality of the mysterious radiation "colors". I ranked these vibrations in the range of the solar spectrum, to introduce a system and start. This became possible thanks to the "Universal Clock" from Chaumery and Belizal which is also the basis of all my experiences and observations, and which is the subject of this book. Without accurate classification of the range of "colors", what follows is purely arbitrary and unfounded. So to understand this book, it is essential to accept the classification proposed in the "Getting Started ..." and to become familiar with the handling of V.C.

The misfortune of dowsing is the fact, that there is no system generally accepted by all those who practice it, and each works in its own way and with his own instruments. Many dowsers get success, which are mostly due to the fact that he who practice itself is more or less gifted following his natural abilities. Most water researchers are not interested in studying the laws and develop a theory. What interests them is exclusively the result of their research, the success of which

they brag when they are silent the failures and disappointments. They do not look for reasons to eliminate and this precisely by lack of system.

There are two or three years dowsers a congress was held in England. Over one hundred people were present and curious fact, there were no two could not agree on the methods for obtaining dice identical events: each working in its own way and with personal devices. It is natural that in these circumstances a mutual control between operators becomes impossible, and the damage created dowsing is obvious.

Blur can we call "science" which has no solid basis, axioms accepted by all?

The enemies of dowsing have reason not to take it seriously and make fun. In addition there are many charlatans who take advantage of the credulity of the public by offering almost miraculous devices, capable of curing all diseases. These devices, very expensive, are but one miracle: it is enriching their inventors at the expense of poor gullible, duped by advertising tapageuse.- Moreover if one admits that some of these complicated devices (most based on the principles of TSF) can sometimes give some satisfactory results, we obtain the same or even more with very simple tools that everyone can make himself.

In his very interesting book Dr. naret tells how, having started at the beginning of a more or less complicated appliance featuring solenoids and ruler

slippery, he came to use later in a simple graduated board

The "biometers" bear magnets, almost radioactive materials, etc. can be replaced with the same result by a single ruler normally cm.

The point is the measurement: linear and angular, the instrument through which we take it does not matter.

All these complications are only required to give importance to the unit at layman's eyes and to raise the price. I have seen more than once how these inventors knew the psychology of their clients. One patient used to see a doctor fashion handle very impressive electrical appliances, look with scorn my boards which only contained a few lines drawn in ink.

As I made clear in the "Getting Started ..." what we call "color" in dowsing is not visible color that we perceive with our eyes. This is something totally different, and yet it is impossible to define exactly. If we call this vibration "colors" it is only to classify them in order of the spectrum. But radiation from much the coloration of the substance and shape of the object. Take for example the metals: the "colors" which they say does not represent their coloration (bp iron responds to red, green mercury etc ...). This is presumably their special nature, their individuality, if you allow me to use that word, their essence which manifests itself in a particular radiation corresponding

a color vibration. But the vibration of the red iron is not the same as the vibration emitted by a red fabric, although one and the other resonate at the same place on the V.C.

Axial drawn on cylinders from different angles give the full range of colors of the spectrum, the difference being obtained by the degree of inclination angle constituting the propeller. This is a form of vibration that can also be classified in the color spectrum while not being a "color". I will return to this issue that I will detail in the following chapters because it is precisely the aim of this book.

The ancient Egyptians knew the radiation emitted by the forms and ground and they knowingly used both in their construction (bp Pyramids) in appliances and tools, they said, had a magical force (s). The Chinese had

(I) The medicine was a science very developed in Egypt since the remotest times. Imhotep, the god of medicine of the New Kingdom had actually lived around 3000 BCE during the reign of King Zoser of Illème dynasty. He was simultaneously architect and doctor. As an architect we owe the construction of the Step Pyramid of Saqqara. As a doctor he is credited medical treatises and surgery, which we have fragments of later copies dating back to 12-14 centuries BC. He entered Greek mythology under the name of Asclepius and the Roman Pantheon in one of Aesculapius. Testimonials Diodorus and Herodotus praise the perfection of Egyptian medicine. The surgical papyrus said Edwin Smith, published by prof. Breasted demonstrates a scientific mind and a deep knowledge of anatomy. While the Berlin papyrus (says Ebers)

created about 3000 years BC YT Yang mysterious crown surrounded by his eight Pa-Kua which each sign corresponds to a specific color spectrum.

The idea of Yn Yang is the same as that expressed by the Egyptian Mut-F, and the Hebrew I-He-Vau. One is the principle of all life to manifest doubles, has two elements while distinct together form the A key, while not merging with each other. The letters used in the formation of this mysterious name of Hebrew sanctuaries up, clearly indicate how the mystery of life occurs. The I is the positive principle, the He and the negative principle Vau is the f-link-separation "that while uniting does not allow them to confuse one with the other. This is the point of balance is necessary so that a demonstration is vital.

The universe with all objects and beings that populate it can exist only in a state of equilibrium. Once out of balance is the dominant force becomes destructive by causing the object or being in the abyss of non-being.

This idea of three in one placed at the base of all the teachings of the ancients, like the Chris-

Leipzig, those in London, the University of California (said Hearst) and medical and veterinary fragments of papyrus Kahoun-prove the existence of the pharmacopoeia and chemical preparations. Remember that the word "chemistry" comes from the same name of ancient Egypt: KEMI (black earth), indicating the origin of this science.

trinity mysterious dogma of the Holy Trinity.

I will not dwell further on the subject; I shall return aware of this book, but if the reader wants to deepen it, he will find it explained in detail in my previous books.

What interests us at the moment is the question of balance. A disease is the result of an imbalance. This imbalance occurs when a foreign vibration to the nature of the subject confuses the normal rhythm of cellular vibration. The treatment consists in the rétablis- ment to the normal balance, or in search of a new equilibrium between the vibration of the subject and that it receives from outside (1). This can be achieved either by applying appropriate vibration, or by a chemical element whose essence is curative other than its vibration characteristic. So, basically, both methods amount to the same.

I have repeatedly observed that a drug was actually effective if it was emitting the same vibration as had been indicated by the V.C. as curative. I advise to always check the clock. drugs prescribed to realize if their vibrations are not contrary to the nature of

(1) A body receives radiation from adjacent bodies and rayon itself. Suppose that an additional radiation from neighboring molecules, comes affect the body considered. This results in the existing vibratory movement previously, a change that depends on the elements of this additional radiation.

"The Frontiers of Science"

patient (s). That's why I said in the "First Steps" that I was not in favor of standard medications. Because what may suit one can shift the balance of another There no disease but the sick, as taught rightly old.

And microbial diseases? me will say. Yes indeed, our modern science has found the cause (?) Of certain diseases which are caused, she said, by microorganisms. It is the spontaneous development in an unbalanced body of a microbe that allows the observation of typical symptoms that characterize a disease. How to fight the microbe otherwise by chemicals known effective? Of course, this is possible and often gives the expected results, often but not always.

We know bp as parasites such as bedbugs, mosquitoes or flies can be destroyed by chemical compositions based on pyrethrum. Acting on their airways they asphyxiate the killing or in any case by stunning them for a while.

Sulfonamides, so fashionable, attack microbes that invaded the blood stream. The sulfur which is the basis of these drugs, is carried by red blood cells and is exactly in the same way in asphyxiant microbes. But at the same

(I) It has been proved that the action of some remedies matches the color of the solar spectrum.

Dr. Babbitt.

time, as it replaces oxygen normally carried by red blood cells throughout the body feels the effect, not receiving the oxygen needed for normal operation. Thus the chemical, while killing the microbe, is simultaneously a way of unbalancing the life of the organism. Hence choking, the heart palpitations and other bodies of trouble signs.

Much of the drugs taken by mouth or injected into the blood, although perhaps effective against evil, are hardly tolerated by the body and often, especially in the case of weakening of the latter, are contraindicated. So what to do to fight evil? himself will be asked.

Here dowsing and ionization can render valuable services in no way affects the normal functioning of organs.

Microbe, like anything else, has its own rate of vibration. So just reverse this rate by stronger vibration and nature contrary to unbalance. He loses and all its virulence and may even be killed. Cholera experiments on microbes proved that they could be killed only by contrary vibrations in nature, in the space of two minutes. This is only one example among many others.

Another way also very effective in some cases is ionization. Applied properly, this method of introducing the healing vibrations of a chemical directly into the affected organ;

this without touching any other organ and so tired digestive tract or blood. In the "Getting Started" I gave an example of such treatment. I can not expand further on this interesting treatment method because the main purpose of this book is cancer, for which the ionization gives no appreciable result.

Cancer is a terrible disease, the study continued worldwide by many scholars and which has not yet found effective treatment. This terrible disease that seems to grow with the progress of our civilization can be controlled by means of radiation forms.

In the second part of this book I will detail the processes that gave me good results, making for total healing or at least in very advanced cases, easing pain to the patient a quiet death due to a general weakening of the body. Many testimonies of healed patients are indisputable proof of what I say.

In Part I of this book describes the different vibrations obtained by forms. I speak also of substances that naturally emit beams of dowsing vibrations as there are so-called radioactive substances. I explain how one little | filter these rays to obtain a vibration of "color" pure. Finally I set out the procedures for making a substance that is naturally inactive (bp water) radiesthésiquement

radiant, and how to unload against too strongly radiating object.

All this was achieved after long and careful studies and many experiences, as well as drawing on documents that come to us from ancient times. Half a century of studies of ancient civilizations allowed me to make some discoveries that laid a solid foundation for my experiences in guiding me on the path of former insiders.

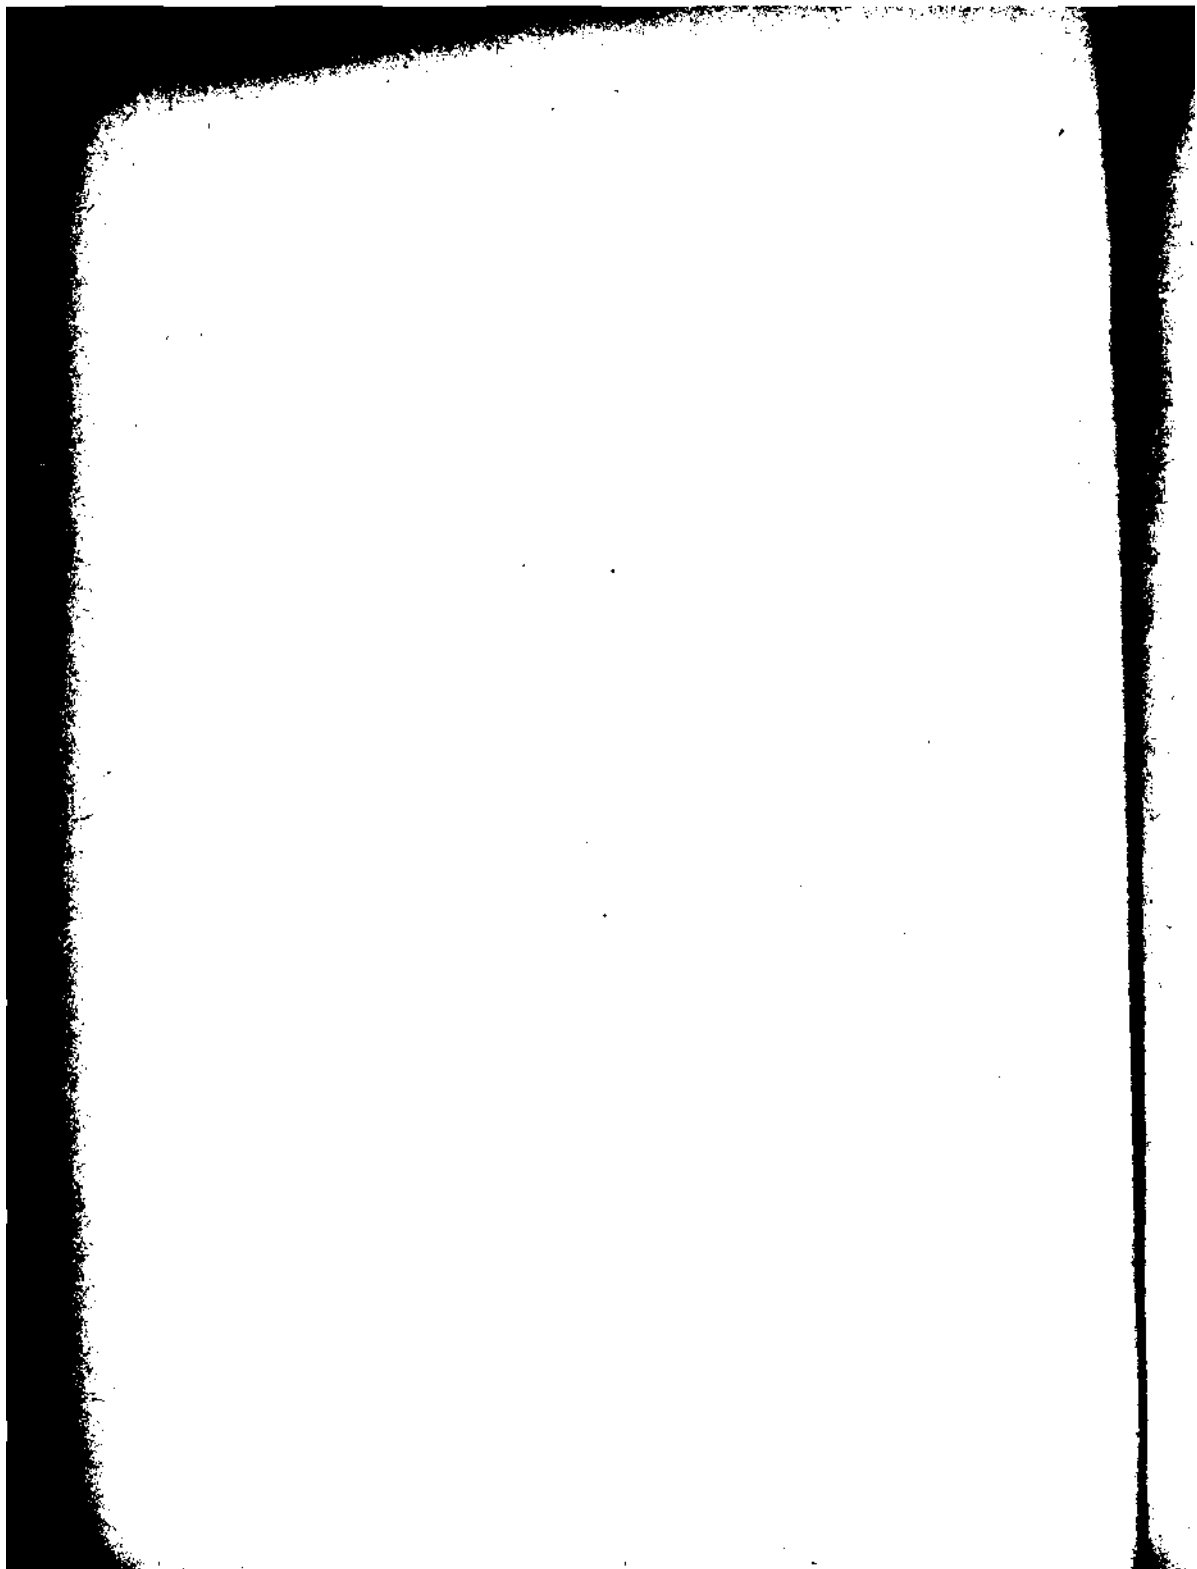

To make my processes more understandable, I will expose some of their principles, but I will try to do it in an easy to understand even by those who are not familiar with the teaching of the wise ago thousands of years.

The second part of this book is devoted exclusively to cancer. I present a brief overview of various theories issued on this subject by the scholars of our time and almost curative methods used by the contemporary medicine.

My work in recent years being devoted mainly to the study of cancer, I expose the system that I apply and that gave me satisfaction. I think I am on the right path. I hope that those who understand the principles outlined here will want to continue my experiences and come to control this scourge which such havoc. Each new case allows for new observations and refine my method. It is for this purpose that I put to them the results of my research.

FIRST PART

THE RADIANT OBJECTS

CHAPTER I.

THE PRINCIPLES

Until the nineteenth century the molecular theory was generally accepted. It was considered that all matter was composed of molecules:

small brick clasped

to each other in different combinations to create the diversity of hardware platforms. Then came the atomic theory which presents the material consisting of small solar systems with a central core around which circulate tiny satellites. The difference between the elements is derived, according to this theory, the number of satellites sailing around the core. It is the Table Mendeleeff which is the basis of the atomic system. It was discovered that the ions and electrons are electrically charged and their charges are of opposite polarity; which means that each atom is like a small battery electric radiant low vibration. It exists in the atom yet a third element: the neutron, whose name indicates its neutral nature, that is to say, neither positive nor negative. (Remember the principle-based Creation taught by all the ancient schools: Positive Principle, and Principle Principle negative balancing). The polarity of the applied elements constituting the atom must be balanced otherwise the two opposite disperse and disappear material. Bombing "one atom

ao

is trying to change the nature of the element by the removal of one or more satellites of the system. This idea seems to confirm that that obsessed the medieval alchemists, including transmutation.

The discoveries of science are approaching increasingly the premise that the actual material does not exist and that everything we observe in the physical world is the product of the movement in its infinitely different combinations.

We remember the theory of Aristotle who taught that everything was created by the movement: one line is the product of the motion of a point, a figure planimetric (circle, triangle, square etc.) is the product of the movement of a line, a three-dimensional shape in stereometry is produced by the movement of the plane figure of the second dimension. A Russian scientist, Mr. Morosoff, proposed a very curious theory about it. Starting from the Aristotelian system and going further, he explained the mysterious "fourth dimension" as also being a form of movement. The book "Tercium organum" Mr. Ouspensky is based on the theory that Mr. Morozov of this author has developed and tried to prove.

As we see all these theories are based on two principles: movement (or vibration) and balance.

The observation of the stars shows that they are constantly in motion, that this movement is spiraliforme: a system of satellites circulating around a core sun. These systems overall rushed into space and it is possible that they in turn

perform a spiral motion around a larger center and so on to infinity.

Astronomical and atomic observations of this attractive they seem to prove that the entire universe is governed by the same laws for all. This would confirm the old adage: "Quod superius sooner usque inferius" (which is above is like what is down) Sir Oliver Lodge had noticed the similarity between the laws directing the movements of atoms and those of the stars. he named the new science: "Atomic astronomy."

Nebulae, which appear to be the training course of a new solar system exhibit spiral, as it was revealed by the telescope. The balance that holds together all the countless systems, is based on the two opposing forces: centrifugal and centripetal from opposite polarities cores and satellites, which is determined for a body called the gravity force.

Let's see what are saying about the teachings of ancient civilizations.

Egypt in their initiatory texts (bp Book of the Dead XVII) say existed before the creation Nou, which could be interpreted as "pre-material" and also as a passive state of non-being. This name hieroglyphically was represented by a spiral placed below the surface of Calf. Being the verb exist, was written by the same signs reversed: the spiral placed above the surface of the water Oun.

Thus, this word represented ideographically

the occurrence of a vital event, life out of the state of passivity and entered the state of activity: the spiral movement.

It is important to remember that according to the teaching of the Egyptian initiates, all life out of nothing: the light burst of darkness and the shadow is necessary to constraster light. Moses had borrowed this idea from the Egyptians, for each day of creation according to Genesis concludes with the words: "and it was evening and morning" .. (Gen. ch I..) He does not say the morning. night, but "evening and morning" specifying and a real event must emerge from nothingness, non-being, similarly for a child to be born must be the groundwork to happen in the dark the womb of his mother.

In my book on the origins of Genesis I discussed at length the issue, so I can stop myself no more.

What I wanted to make clear is that the ancient Egyptians were a vital manifestation spiral.

The question of balance is treated by them as well: the name of the Creator was or Tem Tem. It says in the text: he was the One, the one who had always existed, the Ancient of days who had no one to procreate .. Before the act of creation Tem existed "only in nou ", ie in a state of inactivity.

The first act that triggered creation was duplication of Vunité Tem two opposite poles balanced one against the other. This idea is expressed

. Among others by the epithet Tem: "Mother-Father" (Mou Tef) It is interesting to study Ja composition of this word means mother Mut and Tef - Father To show that it is.. their union to produce a new life the child, - the letter T which ends the word Mut and begins the word Tef is not repeated twice, but is common to the two words linked together (When it was. mother and father taken as separate beings and not the measure of their union, they wrote Mut-Tef). what there is significant still is that the sign T represents ideographically the sky, sunset and sunrise (evening and morning of Moses) and symbolically means: Balance.

So overall this mysterious word means: *The balanced union of two opposing principles which generates new life.*

The Hebrew education had expressed the same idea in the composition of the sacred name of the Creator IEVE. Here the two opposing principles: positive and negative IOD He, are balanced by the mysterious letter Vau has a dual function of union-separation. The two opposite polarity principles must join to give birth to a new life (the second He), but at the same time each principle individually must remain separate and not confuse one into the other. A book of the Hebrew Kabbalah, "Szifra Dzeniuta" says the idea of balance in these terms: "The balance is in the Ancient of Days," which means that the principle of balance is in Principle even of all life.

As we see, the idea of these two teachings is

almost the same and we may assume, I think, with reason that this principle was used by Moses in Heliopolis education, since he considered it of paramount importance.

We find an echo of the same dogma on the other side of the world, particularly in the Chinese education, almost contemporary with that of Egypt.

The mysterious image of Yn Yang graphically represents two intertwined spirals, one white and the other black, symbolizing the opposing principles: positive-negative, masculine and feminine, light-darkness etc.

The principle of balancing the Hebrew Kabbalah - Vau and the Egyptians - T led to the Chinese by the word Tao - the Absolute, the primary cause of all existence, the One that contains potential Tou (as Tem - All Egyptians).

To represent ideographically Tao Chinese surrounded the Yn-Yang of a circle and called the whole this figure T'ai-Kih. This new figure shows that the balance between the two opposites: Yn and Yang, is set in a definitive way by the circle enclosing the figure.

T'ai-Kih is thus the exact repetition of the idea that the Hebrews made by Iod He Vau and Egyptians by Soft-Tef Tem and expresses the triad of life that is the basis of any event (positive- négatif- balance).

The comparative study of ancient teachings from cultures that at first glance nothing in common between them, clearly shows that all derive from the same

and single source, because we find everywhere the same principles clothed only in different forms.

I apologize to the reader for this digression that may at first seem to have nothing in common with the subject of this book. But this opinion is erroneous, if the reader is not realized later that this incursion in antiquity was both logical and necessary. Besides I want to emphasize that I do not pretend to be a dowsing, in the proper sense of the word. The little I know is drawn from my studies relating the teachings of the ancient initiates and I pursue since one half century.

Contemporary science is material evidence confirming the teaching of the ancients, observing microscopic living cell. The life of the cell is characterized by its isolation (duplication). What differentiates a dead cell of a living, it is precisely the fact that it is constantly in a state of division in two. It is the actual reproduction of the principle enunciated by the Egyptian initiates: the beginning of life was the act of primordial Vunité of splitting into two opposing principles balanced relative to the other. I could dwell much more on this fascinating subject, but I would not weary the reader, and it seems to me that what has been said is sufficient to establish the essential principles of all vital manifestation.

Now to the subject of direct relevance to the purpose of this book, including the practical application of the principles.

It was said in the "First Steps" that the health of a

person represents a steady state and a disease is an imbalance between disharmonious vibrations caused by a microbe, or a weakened condition or disturbance of the functions of an organ. Treatment is to restore the normal balance of cell vibrations, or to create a new equilibrium taking into account the vibrations that the subject receives from outside.

Here are some experiences and observations that everyone can easily reproduce and prove that radiation from an object is from the movement to which it is subjected.

Bp Take a glass of water drawn from the tap. In auscultating through the V.C. you will find that it meets any color and with any other. In many countries, to fight against diseases, is introduced into the water pipes of Chemicals, bp chlorine. This wastes water its "color" natural and found that it meets the Black, if it is cold. If you heat the water in your glass, you will see the change "color" with the temperature increase and answered during the heating one after the other all the "colors" of the spectrum to arrive, when to boil, to respond to the "White". What is strange in this that seems to oppose the laws of physics is that the Infra Red (which is next to the Black) is the radiation of cold water - and Ultra-Violet (next to White) that of hot water, then we know from physics that the infrared is the caloric vibration. Note the peculiarity of dowsing laws.

Second experiment. Take a glass of cold water

in hand and make him run a whirl of 20-30 rounds in the direction of clockwise. (You can get the same result by placing the glass on the shelf of a gramophone and rotating mechanically.) What matters is the whirl and not your personal effort.

Now try the water gives te couleur as "the V.C. and you will find that it meets all colors (except green Negative). Thus the whirl forward direction instructed Skin, as well as glass that contained, in all colors of the spectrum.

To discharge this water just make him suffer the same number of turns in the opposite direction (counterclockwise wise).

What can we deduce from this? Is that whirl in the forward direction is almost "creator" and the opposite direction gyration is "destructive". This explains the reactions of the pendulum and proves that the definition of direct and indirect gyrations is not arbitrary, but rather well-founded and corresponds to the principle of life.

It is interesting to note that rain skin naturally meets all the colors V.C. and this proves that rain skin is virtually "living" and tap the skin has lost its vitality.

Rainwater has been subjected to forces of nature that made him run a vortex in its cycle of evaporation, rolling in the clouds until it falls to earth.

The same observation can do about the fine sand from some dunes. It is shaped by the movement of the winds made him run for thousands of years. Microscopic grains of sand present almost perfect tiny spheres formed by the continual rubbing of one against the other. I will return to this active sand in a later chapter I will explain how to use it for curative purposes.

Returning to our glass of water.

If instead of giving it a whirl one does sway some time, always in the same direction, taking it in freely and without muscular effort hand, we find that the V.C. reproduces exactly the same sway in the same direction.

So using the pendulum can recognize the movement which had been submitted object. But if you shake a glass top to bottom, by applying thereby muscular effort, we find that the content is responsible for the individual color of the experimenter.

This can be important in therapy. Very often it is marked on a medicine bottle "shake before use". Suppose you give a drug to a patient who suffers from an excess of positive influence and whether be red yourself. Following the prescription and shaking the bottle you are charging your color and therefore you provide red vibrations harmful to the patient.

Here is another observation that is not without interest.

If you add to the water that met all colors, a drop of alcohol, or a pinch of salt or other substance, you will notice immediately that the glass has stopped radiating colors as before. As against this is the table on which it was placed, which meets all the colors of the spectrum, but this radiation starts to ten cm. about glass.

I can not give an explanation for this phenomenon, which everyone can observe by replicating the experiment described.

What is interesting and important to know is that something that seems insignificant can trouble a dowsing effect and distort observations.

Here are some examples of unforeseen influences that may confuse the experimenter:

As the reader knows, each object emits radiation (color) that characterizes the individual, but this radiation is mostly quite small objects.

Consider two identical objects, two wooden cylinders bp exactly alike, cut from the same piece of wood. The both meet the same color. Let them online N-S Meridian to twenty cm. one of the other. Instantly the cylinder lying north resonate in all colors of the spectrum, while the one who is in the South lose its individual color. But if the cylinders are not exactly aligned N-S will be observed no particular effect and both continue to respond only to their individual color.

Let us now take one of these rollers (the other having

was set aside) and ask it on a small rise (bp on a matchbox). He immediately resonate with all colors of the spectrum.

I can not give more explanation to these phenomena, but I made a report to show how things that seem to have no importance affecting the functioning of the pendulum and the experimenter can induce in error in his diagnosis, if not taken into account.

The same concerns the measuring instruments such as the biometer bp. An insignificant thing like bp an open window or door ajar being in the line of biometer can influence the measurements and distort the deductions based on them.

So in order to get results with the maximum chance of résussite it. must always work under the same conditions: same orientation of the work table (N-S), the face of the operator towards the west. It must not be there on the table radiant objects and especially metal objects that could distort the deductions by their combined radiation. We need the table drawers are closed properly and not half open (creating cavities with strong special radiation). The light source must be always on the same side and the same intensity. The meter should be placed horizontally, the measurements seem to "drag" along the slope of the instrument either increasing or decreasing the number scored by the swinging of the pendulum.

A few more observations before concluding this chapter.

A magnet radiates its North P Ultra Purple Pole. Remember that any elongate object of any material (wood, glass, stone or metal) is biased (very slightly) in the same way that a loving and that his North Pole also meets the Ultra-Violet . This once again confirms the observation of Rochas who considered every and any object as having a dual polarity. In the man, he said, the left side would be positive (red) and negative right side (blue).

If we cut a magnet or any object in two, each half will have to end its north pole and the other of its south pole and if it continues sectioning this happen to infinity.

All this can be and should be checked by the experimenter who, once trained and become sensitive to the reaction of low radiation, will not fail to realize the truth of what I say.

One last note: the rays radiesthési- c light are governed by certain laws. They bp reflected by a surface they encounter on their way and they are refracted through a prism. The difference with the light consists in the fact that the surface which reflects the need not necessarily be a mirror - an ordinary wall produces exactly the same effect and the angle of reflection is the same as that under which the ray falls on the wall . It either must not be glass or crystal prism: it can be in any subject

opaque: wood, stone, metal etc.

We must therefore consider all these possibilities and know to remove the thetic radies- work gives accurate results, without any parasitic influence.

CHAPTER II.

MEASURES

The pendulum rod and perform some movements independent of the will of the operator and without any muscular effort on his part. This is an indisputable fact is that everyone can control. These movements are the result of the resonance of the instrument (pendulum or baguette) that responds to vibrations it receives from an object or a living being. To realize the resonance of the clock just to approach the poles of a magnet. Under the influence of one of the poles it will start AW-IPM and above each other it swing. This experience is known and proposed starting with all courses of dowsing. But there is another way to control the swinging movements that seems most striking to me and that obtained with the V.C.

Set the V.C. on any color, then start it by turning. It girera some time, driven by the force of inertia, its gyrations will subside gradually and then it will stop.

Repeat the experiment by launching your clock by turning over any object. If the color that is set the pendulum is not that emitted by the said object, the gyration will stop as if the pendulum was held back by inertia. But as soon as

you set the clock to the color of the object its gyration become continual and does not stop.

The braking the pendulum receives an object that is not resonant with its setting is very clear and everyone, even the novice can feel it in his hand.

There are various theories to explain the causes of commuting. I do not pretend to give or to explain the causes of these movements. Here are some observations that can give ideas, and are easily verifiable.

If holding your pendulum over an object (set to color) you press your free hand on a stick, the tip touches the ground, you will observe that the pendulum becomes stronger and clearer. We can deduce from this, it seems to me, it's the floor that is the force acting on the pendulum.

The nearby presence of the pendulum of some objects can enhance or hinder movement. For example the north end of a bar magnet, or a point facing the pendulum disturb his gyrations.

I stopped on the issue of radiation from various combinations of items in the previous chapter and I think it is these combinations, sometimes unintended and which one does not realize that are often the cause of failures and disappointments any dowser met during his work.

In the "Getting Started" I said we had to occasionally "relieve" the clock to clean the effects of remanence. There is more than that: the suspension of the pendulum string seems to accumulate

During the work of parasitic vibrations that distort the accuracy of tilting reactions. To clean virtually the string just lightly rub two or three times from the bottom up with a blade or pencil. You will immediately notice that the pendulum moves again become clear and sharp.

I had given in the "First Steps" some notions series of gyrations and swings. Many dowsers base their deductions primarily on these series which, according to them, characteristic of a metal or other element. up lists of up to a series of numbers for all Mendeleeff of table elements were established ... but the trouble is that as dowsing could not agree on the sets of figures and tables differ very substantially from one another. They get along more or less water, but otherwise each offers its serial number that is not the same for everyone. It seems to me that all these tables are very personal and can not be used for general use. I am willing to believe that he who composed his own table of numbers finds the correct answers, but only for himself.

So I pass this question so attractive for the establishment of a standard table pendulum reaction to different elements. It is too early to standardize this and deduce a law.

Let us now see what measurement tools can be useful in dowsing research

helping to compare the observed phenomena (bp to judge the progress of treatment).

There are the "dowsing market" a large number of devices, but I will not describe here the simplest and those who seem to be the best.

However, first we will wonder what connection it may have with dowsing action?

Here: the pendulum is an indisputable fact, but this movement can be more or less accurate, more or less strong. An experienced operator learns to understand his long pendulum and interpret his movements. He knows such a subject strong and in perfect health communicate pendulum net gyration and precise. A diseased organ results in a more or less strong sway. But between perfect health and disease there are number of intermediate states. Although there is no actual disease, the subject may feel weak, without energy. The experienced dowser will realize this state according to the varying strengths of its pendulum reactions. Eg. instead of running in circles girant, the pendulum will ovals, as if hesitating between gyrating and swaying. The dowser can deduce from these pendulum movements that the subject is not in a state of perfect balance, but that's all.

Long since the idea came to create an instrument through which one could interpret the different intensities of commuting so that the result is not arbitrary, based exclusively on the greater or lesser sensitivity of the operator,

but the result of observations can be translated into numbers.

The first to solve this question was Mr Bovis who created a device he called Biometer. His idea was generally accepted by all serious and different experimenters biometers were proposed by dowers. Each boasted his device which he outlined the special qualities of accuracy.

The essential part of a biometer is a rule divided in centimeters. The models differ in the length of the rule, especially by the "amplifier" of waves placed at point zero of the rule. These amplifiers consist of either a radioactive material called

Fig. x

either in a horseshoe magnet, or an adjustable-Yn Yang on different colors of the spectrum.

It is difficult to say which of these is best biometers. we can use and get satisfactory results with everyone. The key is to practice and get used to interpret the figures obtained by the device that has.

My experiences have shown me that all of these amplifiers, inventors boast efficiency and necessarily increase the price of the device, are useless. All you need is a wood rule of about 50 cm. of

length and 2 1/2 cm. width divided in centimeters which represents each centimeter five biometric units. One end of the rule is a square (2V2 LJI 2 cm.) Painted in black, this square is a placeholder for the product you want to measure. The numbers marked on the rule start from square (0-5-10 etc.) Each cm. 5 corresponds to biometric units.

The dimensions I gave to the rule are not absolute; it can be shorter or longer, but there is some relationship between the length and width that are of importance: a shorter rule must be wider and the opposite for longer rule. As the figures obtained on biometers of different lengths will be different. It is for this reason that in order to compare biometric figures and draw conclusions, we must always serve the same biometer.

To make a rule that could serve as biometry, it is important to observe that it must have a center line on which the divisions are marked. An ordinary rule, found in trade, can not be used because the divisions are marked along the edge of the rule. I can not explain why this particular, I think it comes from the fact that, apart from median la'ligne, brands make asymmetrical rule, which influences how dowsing vibrations. The reader is reminded that the basic laws of dowsing is symmetry. Any asymmetric FIG produces an effect that disrupts normal operation of the pendulum.

This is just a guess and I do not pretend

this explanation is final.

Now on to how to use the biometric ruler.

You place the ruler on your desk along the meridian, the black square on your left (south). On the square you have the object you want to analyze. Consider a simple thing: a golden object. Let us settle our V.C. the color of gold which is orange, and are bringing it above the zero point of the rule. He will live AW-IPM sense. Slowly we move the hand with the pendulum along the rule. At one point the gyration pendulum will stop and the ballancera across the rule. Note the figure marked at this point on the scale. It will be p. ex. 65. Interpretation will be there 65% of gold in the object. What is he still in the alloy? Presumably this is copper. Let's get the pendulum to the copper color (yellow) and start again our investigation from scratch. Gyration will stop and sway will be the number 30 indicating that the object contains 30% copper. $65 \text{ plus } 30 = 95$, so there is still 5% of any metal in the alloy, which can be determined by adjusting the pendulum on different colors corresponding to different metals.

It can be analyzed in the same way, using the biometer, any chemical or other combination and ascertain the elements and proportions in a combination.

In diagnosing the biometer also offers incalculable: it indicates the vitality of the subject, the proper functioning or weakened organ and all

this can be achieved through the biometer in precise and comparative figures.

When pursuing a treatment it is essential to daily mark biometric data indicating where improvement or worsening of the patient's condition. In addition, through the biometer can verify a drug and judge its effect on the patient. If the biometric figure drops, the drug is harmful and is not suitable for the patient's individuality; ie if swaying remains unchanged on the same figure, the drug has no harmful effect and can be used without fear. (To realize how the medicine is in this case a curative with respect to evil, employing the device of Dr. Naret, which will be discussed later.) Finally, if the biometric figure increases, the drug is clearly good for the patient. It remains to define the appropriate dose, it can be done both through the biometer than using appliances Dr. Naret.

To summarize, we can say that all biometer any system is based on length measurements and the figures obtained give a kind of percentage of the unit (which is the number 100) in analysis of chemical compositions or alloys of metals. Applied to therapeutic, biometric figures give an indication of the patient's health status in relation to its normal state. of the normal figure varies in relation to the individuality of the person's age. It is always around foo found, but bp to a child in good health

it will usually be to 105, while for an old man it will fall to 80 and even less. So we must judge each case individually: a child whose biometric figure dropped to 80 this alarming state, while the same figure 'for an elderly person is often natural and signifies a satisfactory state of health.

In addition to measurements of length obtained through the biometer can also be obtained angular measurements that help clarify the diagnosis. The best devices for this purpose are undoubtedly those of Dr. Naret.

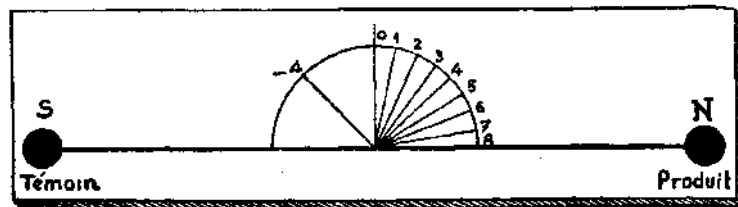

Fig. 2

The inventor gives their description and how to use them in his book, which I recommend to all dowser interested in therapy. So I will give here a short survey, to expose the principle.

As I mentioned in the "First Steps", to compare two objects simply arrange them in a certain distance from each other (about 30 cm.) If the objects are of the same nature, the pendulum girera when it is brought above the imaginary line joining them.

One of the devices Dr. Naret has an elongated board of about 35 cm. In the center is a semicircle drawn a line through the center ends at each end by a painted black circles. The right one is labeled North and South of the left, indicating the direction of the board along the meridian. The operator sits facing the bed. On the site is available South Witness listen we want, and the location the North product. This can either be a nosode or the drug you want to check. A line perpendicular to that uniting the N-S from the center of the semicircle cut into two equal parts. The N-O segment is divided by radii into 8 equal sections labeled from I to 8. The number 8 falls on the N-S line. S-O portion of the segment is divided into two equal parts by a single ray 450 of inclination.

If available on both sites (N and S) two objects of the same type (eg two witnesses to the same person), the pendulum moved over the center of the semicircle will swing along the NS line, indicating that 'there is complete agreement between the two objects.

If we place the witness at S and N Nosode point, the pendulum will indicate by its movement if the person suffers the supposed evil and also the intensity of the condition. We can realize by observing the declination angle of the pendulum swinging. If evil is very strong and fully invaded the patient, the pendulum will swing along the line N-S (as in the case of

two identical products). If instead it is the beginning of a condition, it will swing along a marked rays i, 2, 3 ... The angular variation indicates the intensity of evil, as it is more or less large.

The effectiveness of a drug or dowsing radiation can also be judged by the pendulum swing angle: a drug (placed at the N slot against the witness still S) which is good for the patient brings the pendulum swinging on the perpendicular line (EO).

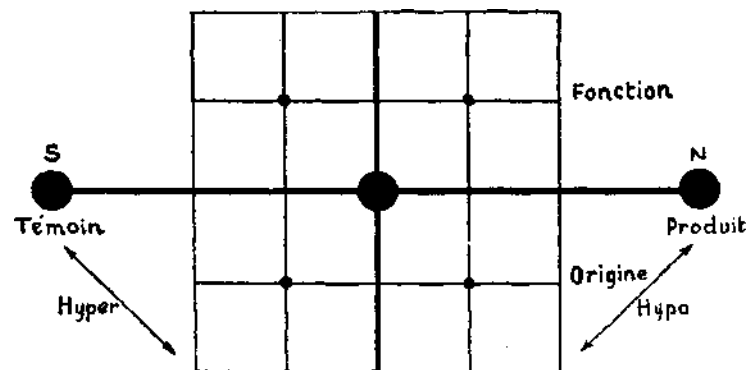

Fig. 3

Another device of Dr. Naret, the idea is pretty much the same, consists of a square board divided into four equal parts by two perpendicular lines intersecting at the center of the main square and forming four small squares. The focus of each small square is marked by a black dot. A

of severing lines the main square is extended out about 10 cm. on each side of the square. At each end of this line is a black painted location, as in the already described lath. One of these locations is marked N and the other S, and the unit must be oriented to the meridian as the previous one. Witness is placed at the location S and the nosode or medication to N. location causes the pendulum to set individual color control, above the center square. Health status is interpreted by the pendulum swing: along the line perpendicular to the line N-S, perfect condition; declination N (right), hyperplasia; declination to the S (left), hypoplasia.

The divisions of the main square to help clarify an evil deviations of the pendulum in the square from above (West) indicate functional disorders, while the square below (East) relate to the original disturbance. Bp can realize if an organ is missing following an operation or if it is irreparably degenerate. If instead of swinging above the central point of the square N.E. the pendulum starts or stops AW-IPM: it is a sign that the body that is being auscultation is missing. Many times I have observed that when it came within a bp or gallbladder amputees.

Interpretations of the pendulum movement to the square board are roughly the same as those described for the previous device.

The square board is very useful to establish a bp

Individual dietary regime, or the correct dosage of a drug. The witness and the product to be studied are placed respectively to S and N locations; declensions of the pendulum to the right or left indicate if the product is Hypo or Hyper for the patient.

For the determination of a medicament is carried out as well. If it drops, is placed on a container replacement N wherein account dropwise the drug to be monitored. As soon as the pendulum reaches swing along the E-O line is an indication that the dose is sufficient. If you exceed the dose, the pendulum swing tilts to the left of the center line, ie to S-O.

It seems to me that these explanations are sufficient to give an idea of the use of appliances Dr. Naret. For more details the reader is referred to the work of Dr. Naret mentioned.

I found the best pendulum to work both on the biometer Naret devices, is the universal pendulum adjustable cone MM. Chaumery and Belizal, we rule on the patient's individual color. The tip that concluded this clock provides very clear indications, marking precision with the smallest gaps on one side or another. A spherical pendulum, even very small, can never give results as accurate.

CHAPTER III.

The dowsing radiation are electromagnetic order.

There are about 100 years that Baron Reichenbach made the discovery of radiation he named O-D. We can consider this discovery as the first stone laid in the foundation of the new science is now called dowsing. The experiences of Coi. Rochas are a continuation of those of Reichenbach. Both have proved the existence of radiation emitted as much by living beings as inanimate objects. These radiations are polarized, that is to say positive or negative * 1 Reichenbach as well as Rochas were using their sensory experiences of subjects who, being placed in the state of receptiveness, saw radiation as a kind of brightness, red for positive and blue for negative.

Each pole of a magnet emits the radiation corresponding to its polarity. The human body is positive (red) to the left and negative (blue) to the right side. For women it is the opposite.

An imbalance or illness resulted, according

(I) The crystals and living organic beings are as magnets a marked polarity.

them by a failure of either the positive or the negative. the balance were possible to restore by strengthening the faulty component or reducing the action of the one who caused the disturbance. Reichenbach as Rochas saw nature of this radiation as distinct from electricity and magnetism. Reichenbach dénomma the "OD" and Rochas, who was essentially tied to the study of these rays with respect to the human body, LCS called "sensitivity" or "traction." In a series of experiments of great interest he managed to externalize this force and to soak in, as it were, some items, for most liquids. I refer the reader that this subject would interest the works of these scholars. he will find a detailed presentation of their discoveries .

This situation remained at a standstill until the end of the First World War, and had even forgotten the discoveries of Reichenbach and Rochas. It is through the development of the TSF, and stimulated by military necessity, we began to seriously study radiation and waves. We discovered the possibility of transmitting the waves at great distances by using carrier waves, called radio, after the name of the man who discovered them.

The vibrations we now call radies- thésiques could be studied and classified by applying by analogy certain laws regulating the airwaves of the TSF. Those working in this field realized that though obeying certain laws discovered for the TSF, the dowsing waves were kind of dif

ent. That's when we looked them names to distinguish them from electrical waves.'

They offered different terms to define this new science was born. Some called it "rabbdomancie" other "Tellurie" by deriving the name of the stick (RABD) or radiation from the ground. The English call it "dowsing", a word which corresponds to "dowser" in French. But all these names were not satisfactory because they only partially defined the new radiations. It is true that it is dowsing who gave the first idea of unknown rays rising from the earth. But we soon discovered that it was not only water or earth that had such radiation, but that every object and every being beamed around him different waves of those known and classified as electro-magnetic. It was then that proposed the name Dowsing, that so-called defined these waves more general way. Although this name is not more explanatory is accepted for want of better, waiting Further experiments reveal the nature of these unknown rays that appear to play the most important role in the life of the Universe.

Some consider that it is the cosmic rays that are detected by the pendulum. I will not express my opinion about it because I admit that I have not yet formed. The only thing I can confirm is that the dowsing radiation is of order or electrical or magnetic. These waves accompany, so to speak, electric currents, as they have something

common with magnetism * 1 *.

In the "Getting Started" I said we could use the électrique taken which were adjusted a simple string which transmitted the dowsing rays, but from my observation, from my personal experience that not only we could do without the outlet, but even the proximity of the electric current had a rather negative influence on the dowsing wave. Observations and many experiments have proved that the driver of these waves is significantly different from that of electricity. Which is an insulator for electricity is a conductor for dowsing waves and what is a conductor for electricity is an insulator or at least a filter for dowsing waves. By setting a non-conductive wire to an electrical outlet, you get dowsing radiation that pass not by the electric wire, but by its insulation. And this is not the source of the electrical current that generates them, but they come directly from the earth. So just attach a non-metallic wire to the wall and away from an electrical outlet to observe through the biometer the presence of dowsing vibrations. These vibrations simultaneously meet all the colors of the spectrum. This proves that these waves back to earth by conduites masonry wall.

(I) This force (POD) has its own, independent existence of magnetism, although it is never freed from a certain connection with POD.

Reichenbach: "Physical and Physiological Research".

supporting two different metals. One bp is the copper base and aluminum foot. We can judge the effectiveness of a well insulated by the biometer device, which immediately shows great enhancement of the selected and isolated wave from that which is not isolated.

We see in these observations that everyone can easily verify that the dowsing waves are different electricity. And it is for this reason that I consider electrical nature of device (amplifier, speaker etc ..) with some dowsers use as not only useless but harmful, because all electrical power only scramble rexpérimen- feeler which can not observe the effects of radiesthesic waves in their purity.

Experience with the string attached to the electrical outletmetric shows the influence that the electric current has on dowsing wave and proves that this influence tends to blur.

Regarding magnetism, I also described in the "Getting Started" how we strengthen the influence of a "color" using a magnet horseshoe.

My past experiences have proved that it was not necessary to use a magnet to get the same result. An iron-shaped object on horseback any material produces the same effect. What is important is primarily the (horseshoe or open angle) and secondly the mass. a horseshoe, even wood, the same effect that a loving but

more weakly. But if one makes the horseshoe weighty matter, force increases in proportion to the weight. And lead a horseshoe (absolutely non-magnetic metal) is more effective than a magnet of the same size. Can be judged by the biometer of increasing the strength of rayonnement radiesthesic with increasing the mass of the horseshoe.

It will make me watch as prominent dowzers use of the magnet in healing purposes. I admit the possibility of the use of the magnet for some conditions, m | ds not the magnetism of the magnet acting in these cases, but the "color" it emits. I said that the N pole of a magnet always responds to the Ultraviolet. So if the condition needs this color to restore balance, it is clear that the magnet can be useful and will act as a remedy in this case.

But it would be wrong to assume that the magnet can be a kind of panacea that can cure all diseases.

And I repeat once again, this is not the magnet magnetism that has a dowsing power but only the individual color, weight and the particular form horseshoe, which will be discussed in the next chapter.

CHAPTER IV.

THE RADIANT FORMS

In the "First Steps", I said that the radiation of an object not only from its color but also and especially of its shape. As an illustration I gave an example of the difference in radiation between two pieces of wood cut from the same piece and different only by their respective length. The first book is for the beginner, I did not want to pursue this issue. So I come back here and I will explain in detail.

CHAUMERY and Belizal in their fine book, gave some idea of radiation from the Pyramid, Easter Island statues and some items found in Egyptian tombs. With the development of the Universal Pendulum they could observe the presence of a mysterious radiation they called the Green Negative because of place on a sphere is diametrically opposed to green spectrum. I recall here the arrangement of colors on a sphere so that the reader can follow more easily the following: Black, Infra Red, Orange, Yellow, Green, Blue, Indigo, Violet, Ultra-Violet, White.

Between Black and White, the south pole of the sphere, is that the mysterious radiation and Chaumery

Belizal have called the Green Negative. Other dowsers call the Grey, considering it as a mixture of Black and White between which it is located. I prefer the definition of CHAUMERY and Belizal because the Grays depicts that vibration from the point of view of mixing two neighboring colors. What gave these researchers the idea of appointing Green Negative is the observation that they made the pendulum set to green running on the Green Negative reversed. So I'm going to use the name Green Negative to set this vibration

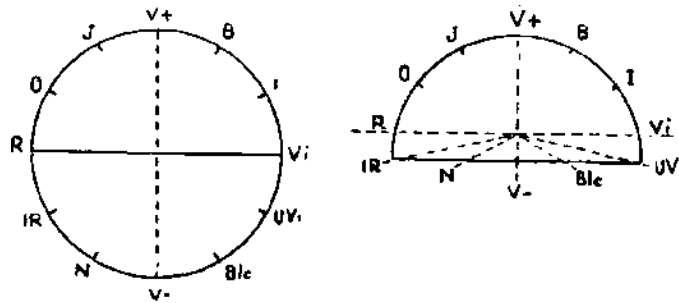

Fig. 4

unknown tion. Going further in their research, the same investigators observed that if we cut the ball in half by the plane of the equator, there would be a very curious phenomenon.

Line with virtually the color center of gravity in the sphere, was the equator in the hemisphere this line substantially moved to the North Pole and with it, the red and purple colors

mark the two ends of the visible spectrum. The invisible colors in the sphere were in the South, are arranged on the flat portion intersecting the sphere in two; these darker colors are more well spaced from each other in the hemisphere.

This provides a hemisphere overthrew a radius of V-cleaner, more pure, that is to say without being mixed with other radiation. The reader will see later how important this is.

The same experimenters watched more than the pyramid shape gives exactly the same radiation that toppled hemisphere, that is to say, we find the positive green spectrum at the top of the pyramid and the Green Negative the center of the basic clear of other radiation from the invisible spectrum.

Pushing their experiences later, they realized that many objects used by ancient and from different parts of the globe and separated periods from each other by thousands of years, many objects, I say, and especially objects of worship, the V- strongly emitted. Such issuers were by mysterious statues of Easter Island, the Chinese Yn Yang, statuettes and other ritual objects of the ancient Egyptians.

All this gives the idea that the former not only knew of the existence of this radiation, but knew how to use it for specific purposes. Experiments proved that the strength of radiation of a form depends on the volume and mass of the object and also the number of objects of identical forms together

together and forming as a battery elements.

It has been observed that a battery of four elements provides the best results and can be used for safe treatment. If we increase the amount forming a battery, the radiation is becoming stronger and acts destructively on a living being. A battery containing 9 hemispheres of about 10 cm. diameter is sufficient to mummify a few hours a piece of meat or fish subject to its radius. If we increase the number of elements the time required for mummification becomes shorter.

I have to do here a little digression to the reader to realize the reasons that told me the way to establish a new form of treatment known to date, and which will be discussed in the second part of this book . These are my long Egyptology studies that gave me the first idea.

In my book on the origins of Genesis, I presented some details on the construction of the Great Pyramid of Giza. In another book about the mystery of life and death that will be published soon, I give many others. Here I come to the question that I will present a succinct manner.

There are over 500 pyramids in Egypt. They are all funerary monuments built to contain royal tombs.

The symbolic meaning of the word pyramid, PR- Ms hieroglyphic language, means "go out to the birth." This strange pile of rocks was the first land release in peak shape of the mass of

waters to the creation of the world. An ancient Maya civilization of the document shows the Aztlan peak having the outgoing pyramidal water.

Thus the shape of the pyramid symbolizes the resurrection, the birth (or rebirth).

All the pyramids of Egypt as well as those of South America were built the same way. First we built the burial chamber with passages to introduce the coffin there. They were carved into the rock on site or built stone made. Then amassed over a pile formed of earth and waste, we covered this mound of cut stones adjusted to one another to form the outer coating of the pyramid. Having entered the burial chamber the coffin is sealed passage through sometimes very ingenious ways to protect the tomb of the intrusion of thieves.

I said that all the pyramids were built as well, all except one. The Great Pyramid of Giza whose construction is attributed to Cheops (Khufu), was built a completely different way. All the stones of which it consists are cut and tailored i'une to the other in a perfect way, with care taken a jeweler would have to cut a gemstone. There is no filler, no wastage. From bottom to top it is a fit as we can not introduce a knife in a joint between two stones. I will not stop here on astronomical data which are revealed by this wonderful monument, as this would exceed the objective of this book. What interests us is inside the building.

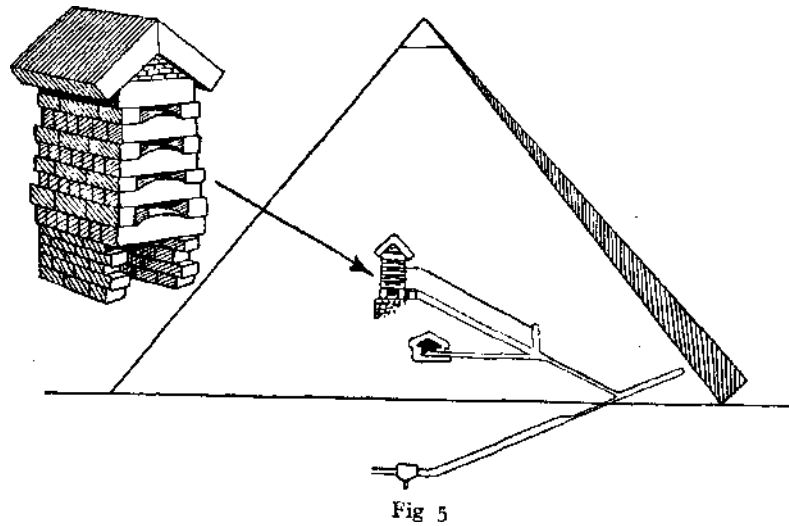

A 30 degree slope gallery whose ceiling is about as high as that of a cathedral, leads to the chamber called "Royal", in which there is an open granite sarcophagus, which was never intended to serve coffin. A perfect ventilation system ventilates the royal chamber, air ducts have been fitted through the body of the pyramid. This fact alone should have been enough to prove that this building was not meant to bury the dead, but rather, it was made for the use of living organisms that need air. By what remained of the entrance passage had been forced by the treasure hunters of past centuries, we see that a tilting of stone! A very ingenious system originally closed the entrance. Gela proves once again that we should use it to get in and out of the building, while all the funerary pyramids, once the funeral conducted, the entrance was sealed tightly.

In my book on the mystery of life and death, I was able to reconstruct the rite of spiritual rebirth that was celebrated in the Great Pyramid and where the passage back to the sarcophagus of the room as much as the same sarcophagus, have a as deep symbolic meaning. I will return to this issue later.

But what nobody has been able to explain satisfactorily, it is the presence above the chamber called the king of four huge stones stacked at a certain distance one above the other, and all covered with a kind of roof.

The assumption that this strange structure was fitted

to ease the pressure of the building on the king's chamber is purely childish. The roof of the sloping corridor that leads to this room could need to be strengthened, as it carries in its length the enormous weight of the whole building. Yet nothing of the kind is planned.

No, this strange structure above the sarcophagus, which was not required of the architectural point of view, had a different purpose and that purpose was very specific.

The pendulum reveals the whole sarcophagus is under the constant influence of the V- issued both by the entire shape of the pyramid, that concentrated the structure above the royal chamber, which is formed of four stacked identical elements stack. The Ray

These four elements emit is not enough to mummify or harm the health of a living being, but instead can be used either for curative purposes, or to produce another effect, the explanation of which would take me too far from the goal of this book.

CHAUMERY and Belizal have understood the reason for the installation of this device in the body of the Great Pyramid constituting a powerful radio station dowsing rays. According to them, the ancient Egyptians, who did not know the use of the compass, ventured in their travels as much at sea and in the desert by capturing the beam inside the Pyramid.

I stop here and I summarize the main points which the reader has to remember: 1) the pyramid shape emits a specific radiation; 2) four elements preferably shaped inverted pyramids or hemispheres, but all the same, constitute a battery that continuously emits the mysterious wave which we have called the Green Negative.

We return to this subject several times in the course of this work. Let us now see what other forms are radiant and how we can focus and enable their removal.

I said in the previous book it was abbot Mermet who first, used land planes on which he made discoveries as successfully as on the same grounds. Based on the same principle is established the process of auscultation of a patient using her witness and anatomical charts.

He came to me so the idea of getting the V- not the

same shape, but its representation in plan. Experiments confirmed that it was possible and I could get this radius using a wooden cylinder around which were marked with ink circles separated from each other by the same distance. This represented as yaws bunk hemispheres, that is to say formed a battery which could increase the number of control elements adding circles. In developing this idea, I tried another drawing

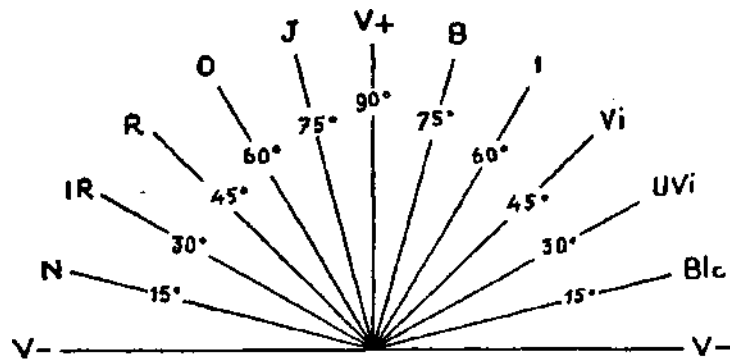

Fig. 6

parallel lines along the cylinder. This design gave the positive V as radiation. So I got a right angle (90) between the positive and negative V V. It seemed reasonable that the spectrum colors, arranged in order between these two limits on a sphere, could also be found on the cylinder.

Experiments proved the correctness of this

supposition and I could make cylinders answering each of the colors of the visible spectrum as invisible. The difference in color depends on the angle that the parallel lines drawn on the cylinder form with its axis. These lines constitute a helix whose pitch is more or less inclined, enveloping the cylinder body. These propellers can be right or left. Straight propellers emit negative color (blue) and the positive color left helix (red). To differentiate a color next have to change the pitch of the helix of 150. Thus the Green lying in the plane of the cylinder axis we take for 00, Blue (color her neighbor) will not be issued the right propeller whose lines constituting the steps are inclined towards the axis of cylinder 150, indigo - 30 ° and so on. For positive color that will be the same, but the propeller will be left. For example the Red, which is the third color from Green, ask an inclination of propeller pitch 450.

The snail CHAUMERY and Belizal, I spoke in eçPremiers No ", is based on the principle of the spiral approaching that of the propeller.

The discovery of radiant cylinders each one pure color makes great services which I will discuss in a later chapter. I will also explain how it should be used to obtain the best performance. The fact that two lines drawn perpendicular with respect to the other two opposite colors give explains why even a grid to run the ink on paper establishes a sort of "cage

Faraday "not allowing penetration dowsing radius.

Now let's take a quick look at other forms radiant. It will be very short summary, since a detailed exposition of this subject would require very special knowledge and thorough and necessarily long enough studies.

Any route sign emits radiation. This should be clear from what has been said about the rolls. We have seen that to draw lines from one angle is sufficient to create radiation.

The letters and signs that constituted the mysterious teaching of ancient initiatory schools were not drawn randomly. They represented the forces of nature and their own hieroglyphics emitted forces they expressed. The so-called magical figures which mocks our modern civilization, presented in the sight of the elders not a fantastic design, but very real force accumulators whose effectiveness was proven "thousands of times" without leaving any possibility for doubt.

Among the ritual objects of ancient Egypt, there is one named Wr-HeKau, "in the great spells." This is a snake-shaped wand with the head of a ram. Is it not, perhaps, the cane which supposedly changed into a snake which was using Moses to perform miracles? Namely.

In any case I can say that I experienced the enormous strength of this instrument and I had all sorts of difficulties to protect me and to neutralize it.

The Yn Yang is further evidence of a drawing emitting radiation. Can be formed by superimposing batteries Yn-Yang, such as by changing the balance of the figure drawn by the field increase in either the white or black field. It gets that way sometimes unknown and dangerous vibrations that can act destructively on health. On the other hand, if it surrounds the Yn-Yang of a circle of eight signs Pa-Kua is found that each of these signs shall remove a specific color.

Before closing this chapter, thus says a prominent dowser, Mr. Louis Chouteau, exposing his method of treatment of the idea, as the reader will see, is much closer to those discussed in this book.

^{ff}I studied and selected in plants, in metals, in minerals, not as usual their substance acting on our bodies or on microbes, but the nature of the movement that derives from them formed ... This n 'chemical quality is more interested me but available to the masses and atoms that vibrate in each subject, as the power and mode of action exerted by this material is mainly in the vibration mode it transmits our organs. It may therefore be in the medical field an action that is unrelated to the chemical composition of the material. Nothing is undeniable. And this action, conventional medicine uses it, sometimes empirically "

I'll stop here. If the reader is interested in the topic I give here a very rough idea, I refer to my previous works where they are treated more fully.

CHAPTER V.

THE RADIANT SUBSTANCES

Any object like any living being radiates a vibration of its own and identifies or I differentiate from another object or another being.

To facilitate the distinction of these radiations, they are classified according to the colors of the visible and invisible spectrum.

In the "Getting Started" I gave the correspondence of some metals with colors.

The radiation elements had been known since the deepest antiquity. Doctors at these remote epochs were typically used metals to practice ionization. The curative effect metal applications on the skin was widely practiced for certain diseases. Aristotle, Galen, Paul of Aegina, Alexander Trailles Paracelsus mention. Gold and magnet were considered to be the most active.

In the nineteenth century Dr. Burg indulged in systematic studies and found application efficiency metal plates on various body parts. He found that "the same metal is not suitable for all subjects alike, but the particular idiosyncrasies of each individual requires the use of a special metal, therefore variable, but determined rule." According to the

experiences of Drs. Bennet, Westfaal and Dujardin- Beaumetz, several wood species also possess healing qualities (bp yellow cinchona bark, cedar, mahogany etc ...). Drs. Schiff and Mag- giorani confirmed the reality of these phenomena thus explaining the "Miscellaneous assets bodies are animated very rapid molecular vibrations (radiation) can be transmitted to the human body, even through non-conductive inert substances of the electricity "... They added (and this is of the utmost importance) that these" vibrations could have an effect when they were not in some relation to the natural vibrations of the body with extremely different vibrations following the nature of the disease and the current status of the patient.

Experience alone can decide whether a particular metal timber will be effective for a particular person. "

In 1885 the Drs.Bourru and Burot, the Rochefort School of Medicine, after a series of experiments and demonstrations in front of the medical profession, managed to prove the effectiveness of ionothérapie acting on patients or by the direct contact of a metal or of a chemical substance, or even by transmitting the vibration influence of the substance to a certain distance. They published a very interesting book on the subject entitled "action at a distance of toxic and medicinal substances" (Paris, Bailliers 1887).

All this shows that employment for healing of radiation substances is not new, but the idea is very old hand.

It is important to note that a particular item, object or being, shall remove one color that characterizes it and that is, so to speak, the resulting vibrations different in its composition.

But there are elements that radiate simultaneously all the colors of the spectrum and invisible colors. It is the study of these elements that I devote this chapter.

The discovery by Curie radium laid the foundation stone for all experiments on radioactivity. This unfortunately led to the atomic bomb that can ultimately lead to the destruction of humanity. Research in the field of radiation elements continued in the world, it seems to me that the reader will not be surprised to learn of the nature of elements that emit radiation dowsing simultaneously on different lengths waves.

Ordinary sand grains, sifted very fine offer under the microscope irregular shapes. This sand can be used to neutralize the dowsing radiation. Can be employed for this purpose not only sand but also any fine powder (eg. Of sawdust, powdered coal, lime etc ...) A container containing a certain amount of fine powder stops the pendulum movement, absorbing virtually the dowsing radiation that causes.

A great expert of the sand, Mr. Capes, who is also a prominent dowser, recently published a book on

the sables0 During his research he found in the upper layers of some dunes north of Egypt, a sand that has extraordinary qualities. The grains of sand that have microscopic almost perfect, homogeneous spheres. This suggests that it is the product of millions of years of movement and friction of the particles against each other.

Auscultated at V.C., the sand gives simultaneously all the colors of the spectrum. His presence in a room upsets all appliances that resonate at all vibrations without distinction. A pinch of this sand-worn in a pouch, causes after a time of discomfort, headaches, heart disease etc ...

This is understandable: the vibrations that occur simultaneously on all wavelengths of the spectrum disturb the normal vibrations of the cells. Prolonged Application of this sand can lead to serious consequences, even to diseases perhaps still unknown, from the imbalance of cellular vibration.

It was essential to find a way to paralyze the harmful vibrations of the sand and look if it was possible to filter it to make it usable. Experiments proved that once locked in a tin can he not issued a single ray of color, including blue. It was necessary then continue

(I) JL Capes: "Sand Dunes". A description of dunes in Egypt and observations on Their training.

experiments by placing the sand in boxes of different metals. These tests gave full satisfaction and proved: i) a metal generally acts as a filter, 2) each metal passes only a ray stops and all the others. For example, zinc yellow ray filter, aluminum - Infra Red etc ...

Thus the use of sand in healing purposes was easy. Instead of applying a fabric of a certain color, which according to the indications of the universal clock restored the functioning of an organ, we could use the active sand filtered through the metal giving the necessary color. The sand of the radiation power is much greater than that of a colored cloth. Whichever gives the biometer the maximum figure 70-80, the sand gives 130 to 150. Thus, if one considers the color as a medicament, the sand is nearly a double dose. The effect of the sand is accordingly faster and stronger; but so that we can hold a color without contrary for hours and even days, we can do the same with the sand that must be removed at the onset of discomfort.

It is important in any treatment dowsing know how to balance the vibrations. A color vibration having once accomplished its role and restored the disturbed balance, is as harmful radius troubling turn this balance.

This fact is comparable to an unbalanced balance. To restore the balance just put on the board the missing weight, but if this amount is exceeded

the balance is lost, the plateau falls under the excessive weight.

The same thing happens with the dowsing vibrations.

Also should you proceed with caution, especially when it is not of pieces of fabric colors, but of radiant products. It is the same for any kind of treatment dowsing: one must observe and check very carefully the effects at least twice a day.

What is interesting and what I would like to draw the attention of the practitioner, is the fact that different metals filter the same color. Eg. the infrared is filtered through aluminum, copper and lead, but the radiation filtered by different metals, although conforming to all Pinfra-red, are not identical. I think here comes in the fact that the infrared (that caloric wave) with 8 octaves and not a single specific color such as the visible spectrum. So I think the different metals, although filtering the wavelengths of which are in the range of infrared, each give a different infrared. In the treatments I have seen some cases, as individuals, requiring the infrared, responded better to one than another filter. In all these cases auscultation universal clock indicated the infrared as a healing color. Trying by the board Noret this color filtered by different metals, one can find the filter that best suits each case.

It is painstaking work that requires a lot

patience, but the result amply rewards the effort.

One word to end the sand. To keep and to completely stop its radiation just hold it in two different metal boxes: bp in a tin box which itself is inserted into a copper box. Each metal allowing only one color beam, two different filters stop any flow of vibrations.

Another radiant product is naturally wheat seed found in tombs of ancient Egypt. It was pointed germinate and grow in France seeds from original seeds taken in these tombs. They can be purchased in Sauvageot Brothers under the name "Wheat of Osiris."

The radiation from these seeds is of extreme power and can not even be measured biometrically because it exceeds the length of all the biometric rules and almost instantly filled the room, upsetting devices. This wheat naturally radiates red. Employees metals filters for sand are of no use and we had to find another filter means. All kinds of means were tried without result, and this is only the "principle of form" which allowed to control this radiation, one of the strongest people I know.

To stop the radiation and to keep the seeds in a room without that upset the balance of the people therein, and do not disturb the devices, you must put them in a box (cardboard

or wood) which will surround a kind of "Faraday cage". A strong enough grid, but grid should surround the entire box leaving no exposed portion. The filtering is done using certain combinations of shapes made from the teachings of the ancients.

I can not expand further as it would require too lengthy explanations and carry me too far from the goal of this book.

I advise those who want to learn about this topic to study carefully my "Trilogy of Rota."

The effectiveness of treatments using the Osiris wheat is sometimes almost miraculous, but given its extraordinary strength, it is dangerous to use it without having previously acquired a great experience. The action of the vibration wheat Osiris can be compared in medicine at a very strong poison that can be successfully used in healing purposes, but in the hands of a layman can be disastrous.

It exists in nature yet other substances which radiate simultaneously on different wavelengths (e.g. alum), but their radiation is not comparable in strength to the described elements. This radiation can be filtered to obtain a pure beam of a specific color, which is essential for treatment.

I think the damage caused by radium precisely from the fact that this substance simultaneously gives a vibration beam (Alpha, Gamma and Beta) and not a pure ray.

This fact causes cellular disorders, because if one of

beam radiation is a curative manner, others are harmful and destroy the beneficial effect. Filtering by metal plates is not enough to stop the Gamma ray called "hard" in its penetration through all obstacles. But the radium is not the subject of this book I mention it only in passing.

The substances discussed radiate all colors of the spectrum except V-. The same concerns water charged by the turning. It seems to me that V is a special kind of vibration that has a certain relationship with life. The mechanical rotation can not communicate with an object the V, but only the spectral colors. The V- lying enter the White and Black, "between life and death" would it be the mysterious fluid tree of the knowledge of good and evil in Genesis? The ancients knew well to use and it is not without reason that they loaded all their magical devices Green Negative.

methods and act both directly and indirectly, to arrive faster to the desired result. But there's even more than that, and I'll explain why I prefer the indirect treatment to the direct application of dowsing rays.

When one examines a patient there are points on the body that are out of balance. From their location it is assumed that it is this or that body is disturbed. It is true that the witnesses bodies can be established with some precision that evil comes from a specific office but this accuracy is only relative when it comes to care. In a complex case, it is not enough indeed to apply the healing ray on the skin in the area of the diseased organ. First, because the body before reaching the beam will act on the layers that separate the skin and can be on other organs which may disturb normal operation. Very often it is only a point determined and not the organ in its entirety must be treated. Finally there are certain organs, bp endocrine glands or the nerve centers it is impossible to reach by applications on the skin.

Evil can also come from the pituitary gland parathyroid or adrenal one.

A ray applying directly on the patient's body can not give further satisfactory results and is likely to create unrest to neighboring organs.

In all these cases, the anatomical drawing of the body which allows a concentrated treatment only on this organ, or even on the affected part, is indicated.

Moreover auscultation gives much more accurate if done on an anatomical drawing if it is conducted on the patient himself.

The indispensable for the success of this kind of traffickingment is obviously thorough knowledge of anatomy and the use of the more detailed drawings, found in large anatomy course (bp as Grey's). In these courses a member is shown not only in its entirety, but sections and cuts both vertical and horizontal. By listening carefully such drawing we get to locate the affected areas with greater precision. It happened to me many times to do (p. E.) The design of a tumor which, compared with a radiograph, 'was identical, showing not only the exact location but the form in all its details.

Like this, I could give many examples in my files. But my goal is not to brag about successes or weary the reader. In the second part of this book I will present some typical cases of cancer so we can be aware of my procedure.

Having found the affected part of a body on anatomical charts, we made a sketch that joined the witness (preferably blood) of the patient.

The assembly is exposed to the action of a transmitter set to the color that restores the balance.

This way it is only the affected party receiving curative radiation and it does not bother any other organ.

Like this, I could give many examples in my files. But my goal is not to brag about successes or weary the reader. In the second part of this book I will present some typical cases of cancer so we can be aware of my procedure.

Having found the affected part of a body on anatomical charts, we made a sketch that joined the witness (preferably blood) of the patient.

The assembly is exposed to the action of a transmitter set to the color that restores the balance.

This way it is only the affected party receiving curative radiation and it does not bother any other organ.

Sometimes different layers of the same body are affected and require different radii.

To make this clearer idea I will cite one example.

A subject suffering from the wrist of the right hand swelling, immobilization, poor circulation, pain. The X-ray photograph showed a condition of the supposed carpal joint of tuberculous. The surgeon thought the inevitable operation, and predicts the immobilization of the wrist. The patient, a poor man forced to earn his living by manual labor, did not consent to this operation, which would have rendered invalid. He spoke to us begging us to do everything to save his hand.

Direct auscultation indicated the need to use mercury (radius Green). Ionization mercury continued for a month did not give satisfactory results; the patient continued to suffer and swelling did not diminish. So I embarked on auscultation anatomical charts, and I felt the affection sitting in the bones constituting the carpal joint, called the anti-tuberculosis radius is in the green beam. But auscultation showed more than the ligaments of the wrist were also affected and could be restored by the Ultra-Violet. Two sketches, one of the carpal joint and the other ligaments were each subjected to the action of respective radii. The result was most satisfactory; within weeks the swelling disappeared, the circulation was restored and finger movement. The pain has completely stopped and

patient was able to resume work. I chose this example in to show how the complicated uncal direct auscultation gives a false impression. applicable the transmitters used are simpler and each can manufacture itself.

adjustable boom. This device is based on the idea of the imaginary cone pendule à CHAUMERY and Belizal. planchette

square about 10 cm. de side (or. encirconférence of même diamètre) is traversée au center by tige qu'on can be avancer soit back at will.

The angle between the pointed end of the rod and the edge of the board is an imaginary cone that gives the various forms. that gives the variations which radiate at the e

indicated on the rod by transverse lines spaced apart from each other at equal distances. To find the beginning the colors we will use the V.C.

fixed on a screen, the sketch of the organ we want to treat the patient joined the witness then adjusted the arrow on the healing color. then directing the point on the body or the part that requires treatment.

Clipboard and stem wood (never metal).

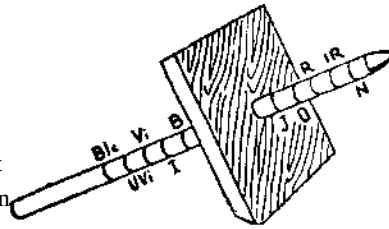

Fig. 7

To enhance the action of the arrow it is good to attach using a string to the wall, but we need both ends are secure (one wall and the other to the rod) so that the radiation from the earth reaches the device. To prevent the loss of "current" it is good to put on the metal that will serve as the board isolont the tip of the rod resting on the table. One can also employ plates tinplate or aluminum.

This device gives very good results in benign conditions. Its action is not very strong and allows long exposures safe, which is an advantage.

coil cylinders. I explained in a previous chapter the theory of propellers, so I will not come back here. The easiest way to make the cylinders is: one size in a well-rounded piece of wood (bp broom handle) about 3 cm. diameter, 12 pieces of about 10 cm. in length. I give these dimensions approximately because a greater or lesser length or thickness of the cylinder does not matter. Over the long cylinder is greater its strength, but it becomes more difficult to handle. So I give the average length and convenient. Is glued around the paper cylinder striped as follows: A cylinder consist of stripes in the lengthwise, parallel to its axis (this gives the Green), the second stripes going through the axis thereby forming circles around the cylinder (negative green color). The remaining cylinders have the helical lines differing from

the other by an angle 150 of inclination.

Thus we get the set of all colors of the visible spectrum as invisible, corresponding to V.C. or snail.

Each cylinder will have a hole at its end, drilled approximately 2 cm. Depth will be introduced in which the stem of the bracket. Constructed in the latter will be two different metals (e.g. the aluminum rod and the base copper). The two metals are essential to isolate the table the apparatus on which it is placed. A string attached to the support attached to the wall.

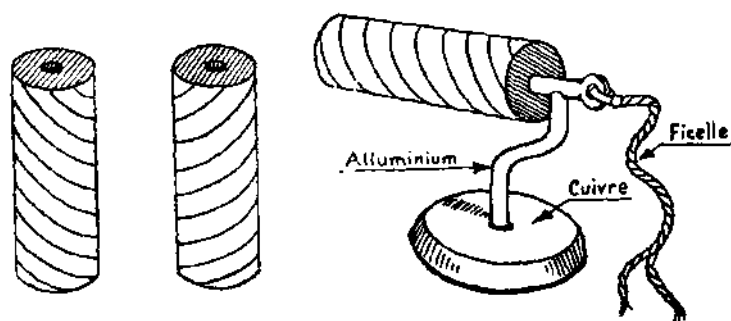

Fig. 8

The best result is obtained when placing the screen with the sketch of the organ to be treated at a distance of about 75 cm. of the cylinder. The radiation emitted by this device is much stronger than that of the arrow so it is advisable not to take long

exhibitions. 20 minutes or half an hour usually sufficient for mild cases and the "burden" and given by the cylinder lasts about 48 hours and often more.

The advantage of the roller mill is the fact it can be used both for the indirect treatment (of control) for direct processing. Thus headache causes neuralgic to pass magically under the direct action of the appropriate cylinder.

ÜEscargot. Like device to very low radiation can be Servic of "snail" of CHAUMERY and Belizal (described in the "Getting Started"). the control member is placed and one wants to influence by any color in the extension of the selected colored line which is marked on the snail. In the center of the device is placed an active transmitter (bp radiant sand filter in a metal box the necessary color). The witness will receive a small healing vibration that sometimes, in some mild cases is sufficient. The disadvantage of this device lies in the fact that all the colors of the spectrum are canceled simultaneously by the snail-rays, which can confuse the devices in the vicinity.

The Pa-Kua. The eight signs corresponding to the seven colors of the spectrum and the negative Green can also serve as transmitter snail. We can strengthen its work by superimposing several Yn Yang one above the other in the center of the circle of Pa-Kua. But I do not recommend the use for it in the same

disadvantages as those of the snail, that is to say, it shall remove simultaneously all the colors in all directions. It is impossible to concentrate actions exclusively on the witness.

The Magnet. It can also project a color radiation using a magnet or a generally horseshoe shape of nonmagnetic material, as explained in a previous chapter. Between the two ends of the horseshoe color is placed (or metal) that we want to project. It is directed to the control by an indifferent material shaft having a tip at its end.

The exhibition can be extended because the emitted radiation in this way is quite low.

pyramids & Hemispheres. For the negative green beam is used four pyramids or hemispheres superimposed one above the other, being installed above the control at a distance which does not exceed the height of each element (pyramid or hemisphere) make up the battery. I stress the number four that should not be exceeded without risking harm to the patient.

In the second part I will return to this mode of treatment which relates especially to tuberculosis and cancer year.

Oscillator. This device was designed on the idea of oscillation High Frequency G. Lakhovsky; but it differs essentially from the latter: i) There is no electricity, and 2) instead oscillate simultaneously on all wavelengths leaving the diseased cell the choice of vibration healing, allows a special device of

concentrate all the oscillations on one wave which is thus strengthened and emitted by the device. I will give a more detailed description of this device in the second part of this book when it is question of the treatment of cancer.

ABSTRACT

To establish a diagnosis and find the treatment to follow we do this:

1. Find the patient's individual color using the V.C.
2. Realize his general state of health by placing the indicator on the central point of P "snail" of CHAUMERY and Belizal (if the pendulum gire forward direction on the extension of the line marked Violet, the general condition is good; if gire balance or in reverse, the patient is ill).
3. Establish the biometric figure (B) show the vitality of the patient. To achieve this we must place the lamp on the black square of biometer and slowly move the hand with the clock (set to the individual color of the patient) along the rule to the digit where it starts to swing across the rule . This figure will be the vitality of the patient.
4. Holding the pendulum with the right hand, and advanced with the witness in the left hand, listen on an anatomical chart organs one after the other by touching them with the tip. If the pendulum gire live meaning the body is healthy, it gire balance or in reverse, the body is affected.
5. We are looking color that restores direct gyration by changing the position of the loop of V.C., or by presenting fabric ribbons of various colors.
6. the color is applied by a means found

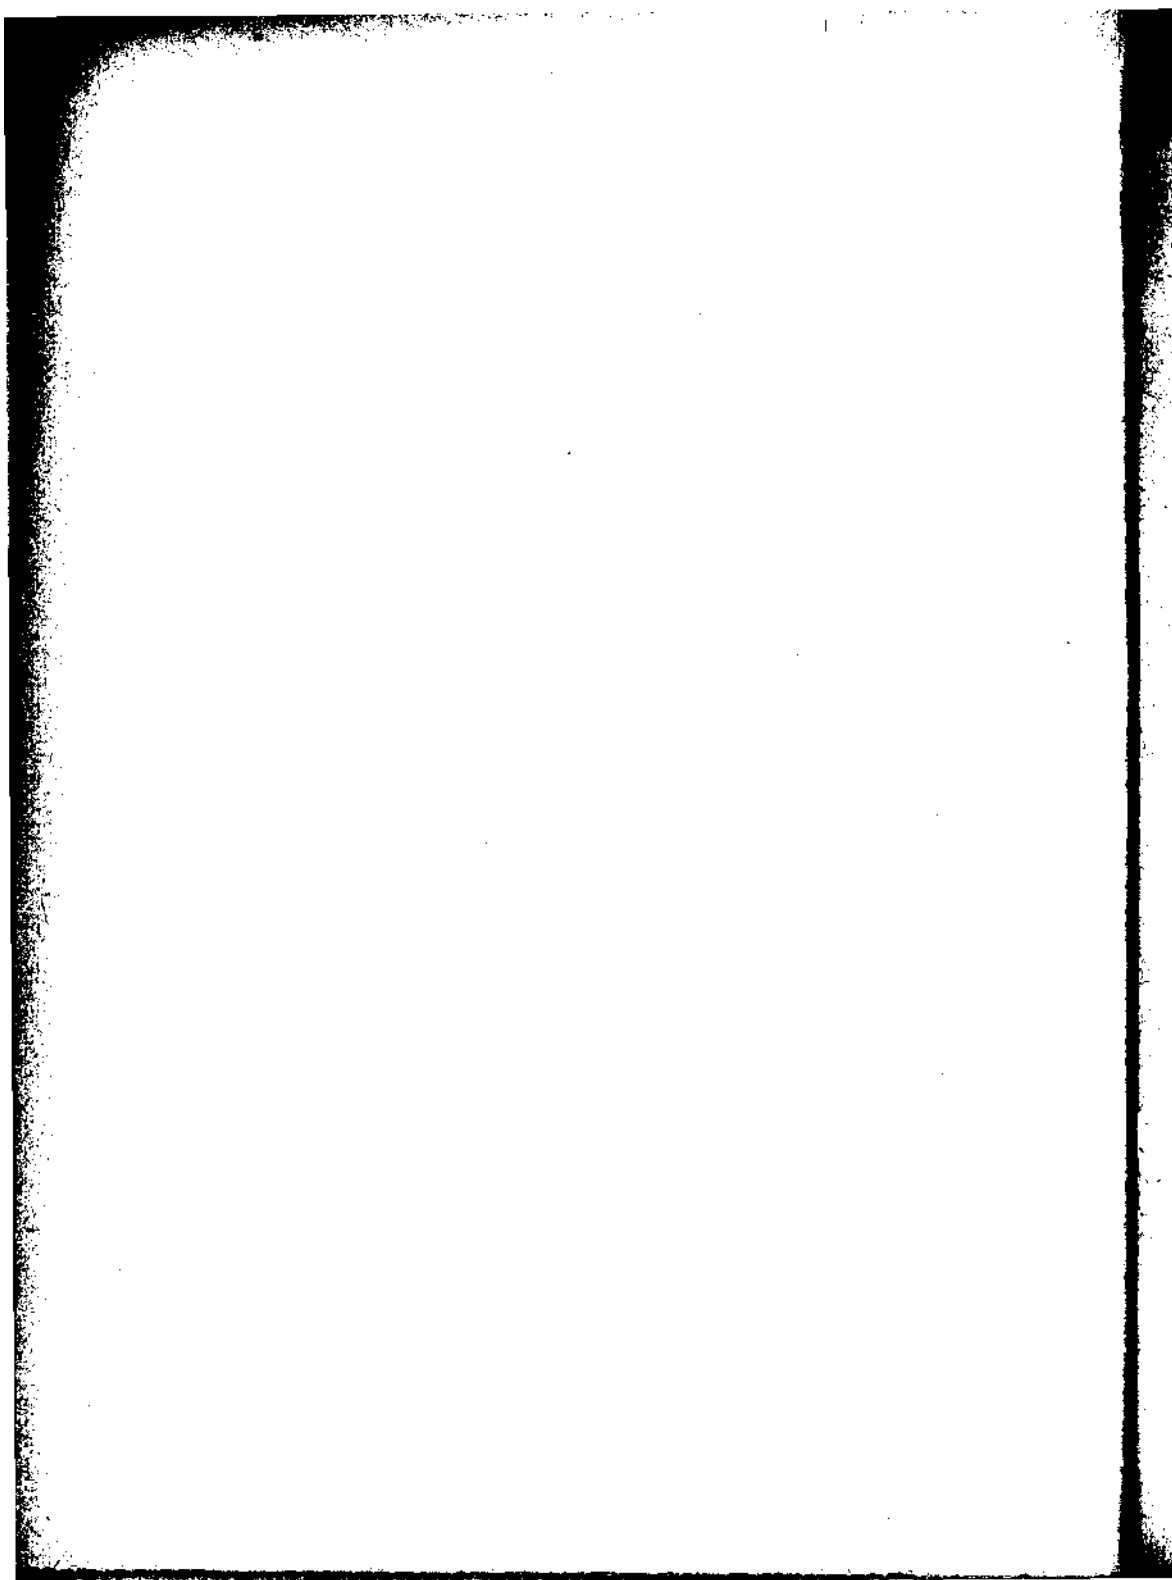

indicated: a) directly: placing on the patient at the site of the diseased organ a piece of cloth from the color found; b) indirectly by projecting the joint witness the drawing of the affected organ radius of the appropriate color using one of the described devices.

7. To verify the diagnosis obtained by auscultation on anatomical witness is placed on the board on the South Naret location, and the body in question, taken in the "Dowsing Kit" on the North location. The angle formed with the line E-O by the swinging pendulum will indicate the degree of affliction.

8. Curative radius or medication that restores the balance can be checked also by Naret board by placing either the color or the drug on the North location. The pendulum swing, indicating the restoration of balance, must return to the E-O line (perpendicular to the line joining the two black points).

SECOND PART

CANCER

CHAPTER I.

CANCER.

DEFINITION AND CAUSES

I hope that the first part of this work has been understood and that the reader is familiar with the principles of indirect treatment and various forms of radiant dowsing vibrations.

By this treatment the cancer that I'm developing, I often got complete healing, but still an arrest of development of the disease and the disappearance of pain. This part of the book is devoted solely to cancer and I start with the definition of evil.

Cancer is a degeneration of the cell that develops a chaotic form of neoplasia. All searches of a microbial agent or virus were unsuccessful until now.

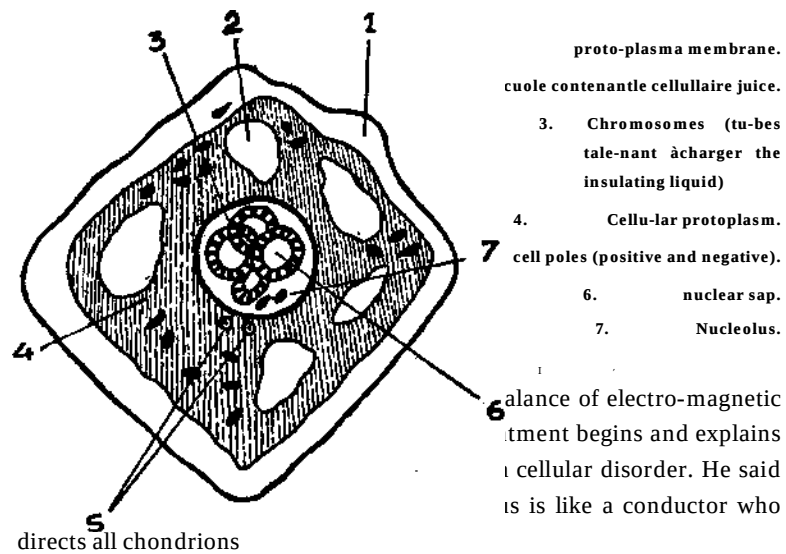

In medieval medical treatise dating from the fifteenth century, this disease is called canker and is considered "a fretting beste". The proposed treatment is truly extraordinary: to prevent the "beast" will be nourished at the expense of the patient, we give him to eat fresh meat which is applied to the sick area. This, supposedly, is out

the beast of the patient's body and thus gets rid of evil.

I wanted to give this curious process for montrerque even in those early days was known cancer

<And that it was looking for ways to cure.

The opinions of scholars today are partagéesau about the origin and development of cancer.

as compared to musicians. If for some reason the conductor disappears, the musicians begin to play every man for himself, that is to say, the cell vibrates simultaneously at different wavelengths, which creates a chaotic state of the cell. Each chondrion wraps a membrane and begins to multiply without order. It is this disordered state of the cell is observed under a microscope and allows the physician to recognize with certainty a cancerous tumor.

G. **Christian** agrees of Lakhovsky defining cancer as an evil that East inside of the cell.

Dr. Benoit Institut Pasteur precise and confirms the same idea, for in speaking of the organization of the cell he said in part: "The order is one of the laws of life," and further, on cells neoplastic "it looks like anarchy began in society. Everything is upside down "...

G. Lesourd while sharing the view of Lakhovsky adds, concerning the causes of cancer, there may be other factors that cause. According to him these factors may be moral shocks, feeding mistakes, solar radiation, carcinogens such as tar bp. According to harmful vibrations that could favor the onset of cancer in a point of the body and then only among those at ground impregnated with cancer (genus loci minoris resistentiae.) According to the same author that always it existed physical trauma:

shock, drop occurred perhaps in infancy and that affected the sanctity coocygienne region. This would confirm the opinion of Lakhovsky concerning the disappearance core (conductor) cell that is the first step in the development of neoplasia. A blow or a fall can crush a chromosome. This allows chondrions to grow chaotically.

According to L. Chauteau, whenever a body lack of oxygen and creates hydrocarbon is under the threat of cancer.

The teacher. Fergusson believes that grief can cause a cellular imbalance and cause cancer.

The beginning of the imbalance may precede the manifestation of twenty years of cancer; then comes the *prétumorale* latent period of cancer impregnation (undetectable by current medicine); then this is the period tumor: presence of clinically observable tumor, finally the last stage is metastasis.

Are there possible cancerous contagion? Most doctors speak out negatively: cancer can not be transmitted either by contact or by inoculation. As against it is transmitted by the office of the cancer cell as well as virulent as waves emanating from the same patient that objects used by him. This last assertion may seem like fantasy at first, but experiments conducted by prof. Castaldi on aquatic plants (*Eloden canadiensis*, *Asolla caroliana* etc.) seem to confirm the influence

radiated by substances (or colors).

Plants in aquariums were placed on iron plates. They grew with extraordinary speed (effect of Red), but having reached maturity before they died witnesses who grow naturally.

When tanks were placed on copper plates (yellow) or zinc, plant growth was less pronounced (the positive radiation is less strong). Lead (purple) stopped growth and caused the death plante.- the other hand Dr. Ried experimented on radiation chemical elements (calcium chloride, sodium etc ...). Under these animal products accelerated the development of the animal cages (early coupling of a month), but the products were born with necrotic tails.

Still according Lakhovsky, blue radiation (bp methylene blue) have a certain destructive action on the cell. Some doctors are seeking the cause of cancer in the food. Thus, according to the work of Dr. Bellows on tomatoes, it seems that the result of this fruit chondrions cause induction of chondrions forced oscillation of the animal cell. Shaped tomato inoculated bacteria sticks rat sarcoma were causing him. This seems to confirm an old German belief that eating tomatoes end up having cancer. It could be that other vegetables and fruits also have assets chondrions. But to get the contagion of cancer must be inoculated direct these chondrions

into the bloodstream and unabsorbed.

So I think we can conclude from all these opinions, I wanted to mention, it's the cell imbalance that is the basis of any neoplasia. There is no reason to seek a microbe or toxin that is the cause.

In the "Getting Started" I already gave an idea of the inner formation of a cell. In his book on neoplastic formations, Lakhovsky gives several schematic drawings as representing a normal cell neoplastic cell. Gela very clearly shows the chaotic state in which are the chondrions of a cancer cell. The reader can learn about it in the work cited.

Now let us see what causes the birth trauma of cancer besides destroying the core of one or more cells.

Observations and statistics conducted for years proved the existence of houses in cancer and even entire regions where cases of cancer were repeated with more frequency. Maps of Paris and its suburbs prepared by Dr. Debeauquin show, by districts and suburban areas, the percentage of deaths due to cancer. By studying these plans we are struck by the fact that there are two almost parallel and continuous lines through Bagneux, Villejuif, Rugis the eighteenth arrondissement, Issy, Neuilly, Nanterre. Houses built within these two lines are on top of a seam and contaminated water also contaminated on faults. This striking example

and absolutely correct based on the statistics of the Health Department.

Dr. Durand de Courville considers these areas to cancer appear to be conditioned by the water regime of the soil and immediate basement. Dr. Lagarde presents a list of cancer cases occurred in some homes where whole families were dying of cancer. Other tenants took possession of such a house and having no relationship with the original occupants, contracted the same disease and died. Dr. S. Labat in Belgium cites a case of eight people from the same family died in the same house all cancer.

Two Hungarian doctors, Drs. Hernodi and Vegh, in their multiple conferences, support the same theory on the origin of cancer from terrestrial radiation.

I could continue this list endlessly dreary citing the observations of doctors from various countries. But I think this is sufficient to support the view that these are fumes rising from the earth and with respect, as assumed, with underground rivers, which are the main cause of cellular imbalance manifested in cancer .

Dowsers call these emanations rising vertically from the land of "harmful waves."

This fact was known in antiquity. In China were called "dragon's teeth" and before building a house we studied very carefully the ground to see if it was not contaminated. In ancient Egypt

we also made a thorough inspection of the proposed site for construction. The Etruscans, the ancient Rome also knew these harmful radiation and took precautions.

It was found that birds avoid making their nests on houses built on a wave * harmful. Animals are generally more sensitive than humans to dowsing radiation and away from a place that is under the action of such a radius. M. G. Discry experiments on mice subjected to the action of harmful ray confirm this fact. A beam was directed onto a portion of the body containing mouse. We soon saw them shake and move their nests in the part of the body that was not under the influence of the radius. They were subjected again to the action and the same effect was repeated, and this repeatedly. It was clear that the mice differed markedly contaminated places of those who were not.

The harmful radius rises vertically from the ground up; This was recognized and proven by Dr. Machts (Dr. Rambeau study on the work of Dr. Machts and Baron Pohl). By flying at high altitude he could distinguish houses to cancer.

But it is time to stop and try to put in order all this mass of observations to draw conclusions.

What basically a harmful radius and is its action on a living?

As I explained in "First Steps" the living cell vibrate in a particular way for

each person and the regime of this vibration is individuality (color) of the person. I also said that the man, like a wireless receiver receives different vibrations from its surroundings as animate and inanimate. These foreign vibrations are generally quite low, the "receiving station" the man adapts easily to their diet. But there are vibrations of a different order, "a higher voltage", if I may make this comparison. These vibrations reverse the normal operation of the cell and act to create a disturbance that leads to long chaotic development of the cell which was discussed above.

To better understand already made back to the comparison of man and wireless device Suppose your position be built for a 100 VT voltage. What happens if you pair it with a higher voltage? The lamps that are its essential part will be burned and the station no longer work, die, so to speak. This can happen either immediately or in the long run, it depends on the difference greater or lesser voltages. Yesbp you pa device 100 VT. at a circuit 200 VT. the lamps burn instantaneously. But if the voltage of the current is only 120 Vt., Deteriorating lamps produce more or less slowly.

Between the "voltage" of harmful ray and that of the human cell there not a very strong difference, and it's That for the wrong caused by this vibration evolved slowly and often takes years to develop

and affect humans. In cases of houses in cancer was observed for contracting this terrible disease the people were staying there a long time (15-20 years).

Are there opportunities to accustom his body to vibration of harmful ray? The following observation seems to answer this question.

The city of Memphis in America is built on a strong emanation of cancer radius from groundwater, but extraordinary, statistics prove that there are no cases of cancer among the people who stayed there all their lives. For against all cancer cases that have been seen by registered there were for foreigners coming to settle there, so that was not born in this city. How to explain this strange phenomenon that seems to upset everything that had been said about the harmful rays? The only explanation I can give and that seems to me to answer the question is that drinking water serving the town is particularly taken of the water stream emitting cancer vibrations. Thus the inhabitants of the city, consuming this contaminated water from their childhood are, so to speak, inoculate the virus, or in other words, gradually accustom their cells to harmful vibration (vibration when their diet fits) and thus they become immune against evil.

It was observed that the radius harmful affects not only humans, but also animals and plants.

The work of G. Lakhovsky the geraniums cancer appear to have proved this. Additionally M. G.

Discry proposed the following method for detecting the presence of a harmful radius. He simply place in different parts of the ground floor of the house where it is assumed the presence of harmful ray few male fern leaves (*Nephrodium felix mas*). "You will place the leaves in vases with water in different parts of the room and you will find the following: After 24 hours the leaves that have stayed on the field will be entirely harmful roasted and have not consumed water; by against those who have not been placed on the field will always be as green as if you were to place and have absorbed a large quantity of water. "

Rabbits and mice in state of gestation length have been subjected to the action of cancer radius low put stillborn, and after 2-3 months contracted themselves cancer.

All these experiments confirm our view on the origin of evil is precisely the disruption of normal cell vibration through the intervention of a strong vibration of a different regime (higher voltage). I Are there ways to protect themselves from this dangerous radiation? Certainly yes. Above all, once we note the presence in the house of radiation cancer, we must take action without delay. Best to leave the contaminated house. If this is not possible we must define the exact place of the harmful radiation in the home.

If one piece is contaminated, it would be better not to use it and certainly not to do or a room

bedroom or an office where one is forced to spend long hours. If one has no choice, it takes at least that neither bed nor the work table are placed above the beam. Rarely is a harmful beam has a large thickness. Its direction is always vertical and horizontal section (thickness radius) ordinarily does not exceed 25 to 30 cm. It is very rare that the radiation is of such width that it would cover the entire area of the building. But if that were the case, there would only leave the house.

There are number of devices whose inventors boast the power to stop or divert harmful I beam. But the effectiveness of these devices is very questionable and in any case, if momentarily succeed in stopping the radius, it does not last long and it will penetrate through the obstacle or appear next, having made a detour. The most effective of these devices seem to be those that are designed on the principle of the Faraday cage. Oscillators or helical turned properly, that is to say taking into account the polarity of harmful ray. To paralyze a positive radius must be used for solenoids turned in the negative direction and vice versa.

In her cancer treatments, from plants, M. Lakhovsky had used oscillators which read as follows: A copper wire is shaped to form a circle. There must be a space of $\frac{1}{2}$ to 1 cm. between the ends of the wire, thus splitting the circumference. The diameter varies from case more is to cover space, more the oscillator must be.

Placed above or even near a radiation such oscillator stops net.

The reader can easily make a simple experiment that will show him the accuracy of what I say.

Twist a copper wire (or any other material) to form a strap, the ends of the wire being slightly spaced from one another. As you know by etPremiers No ", your pendulum gire forward direction over the palm of your left hand when it is set to your individual color. But if you spend the bracelet described wrist while swinging movement stops immediately, the oscillator (which constitutes the split strap) absorbs vibration. If you join the ends of the wire and so delete the breach, the pendulum starts to AW-IPM.

A sheet of paper on which we made a simple grid ink can stop for a while harmful ray. This sheet placed on the floor covering the radius. But this judgment is only temporary and more or less short-lived: the radius deviation and will appear next to the sheet. It is the same with a metal grid fine mesh or a lead sheet, used sometimes. Solenoids used to deflect the harmful ray which was discussed above have the drawback that the ends is placed in a container containing chemicals (e.g. a mixture of charcoal and sulfur powder). This mixture must be renewed approximately every week, without which installation * loses its effectiveness.

I got myself in case I managed to deflect the

radius harmful by this process, but usually interested people forget to renew the chemical mixture and protection becomes zero.

Here is an interesting case that I extract from my files and confirming what has been said about the origin of cancer from harmful ray.

A lady spoke to me last spring. She suffered for five years from digestive problems which worsened increasingly. There were enlarged liver and spleen and gas accumulation that pouvaient be evacuated in any way and were pressing, causing internal pain. She had lost weight, but her stomach, she said, was "like that of a woman in the last stages of pregnancy." She also had a strong leukemia (120,000 white glob.). The doctors had voted for the "blood cancer" and gave her a month to live.

The auscultation of dowsing very detailed anatomical drawings showed a cancerous tumor between the spleen and left kidney.

The case is too advanced and irreparable damage, I concentrated work to relieve the last weeks of her life.

After two weeks of treatment on witness I received from her a letter which reads in part: "This is a week that all the pain disappeared completely and I even forgot I had suffered ... Regarding the belly bloat I can not say that this has completely disappeared, but here too it is better without any comparison and gases that could not evacuate

by no means out of themselves now and cause me more pain, stomach laxative works without ... "

I managed to keep it in this state for about five months and she died quietly and without pain, weakness, the heart is too tired.

I received a letter from her husband in which he begged me to look after him, his doctor who told him he had "something in the prostate." He sent me the necessary witnesses. Auscultation showed on anatomical charts he had a small cancerous tumor on the right side of the prostate. Fortunately the disease was at its beginning and there was every reason to believe in a speedy recovery. I asked him to send me the map of his home and especially the bedroom with the exact location of the bed gum might be supposed there was a fair-cancer radius in the middle of the bed, which is the organ where the disease had manifested itself in both spouses, including some near the middle of the body (kidney for woman, prostate for the husband). They had lived in this apartment without changing the place of the bed for 19 years and the house is precisely in the area bounded by parallel lines (in Paris, XVme Ar.) which was discussed above.

Statistics indicate increasing cancer in different countries. Some explain this by the fact that nowadays the medical services of civilized countries are better organized and thus the case that once beyond the control and 1 ^ statistics are now all recorded.

I do not think that is the only reason for the apparent increase of this evil. It seems to me that in addition to better health control death reasons, giving the figures in gradual increase, there is a real increase of this disease and that this increase is due precisely to civilization.

Let me explain: As it has been shown, the view more generally seems to attribute cancer to the influence of terrestrial radiation, particularly those amount vertically underground waterways. One of the first things the civilized countries are concerned, is to bring water into the houses and install sewers. There is thus formed in the same houses almost continuous water currents and pockets where standing water accumulates.

From these observations houses to cancer I could infer that in most cases the harmful ray seems to be related in some way to the sewers. In most cases the parts that are affected are those that are adjacent courtyards in which are concentrated the flow conduits. Or what are the pieces on the walls which pass water or drains.

I exposed the role of electrical outlets that lead with the current dowsing rays. They seem to use electric current as of carrier waves.

Here's an interesting case I had the opportunity to observe: In a room of a house inhabited by very wealthy people there were constantly exceedingly smell

unpleasant. Or fumigation or perfumes could not fight it. Thinking that maybe a rat had died under the own floor made up all the floor, but they found nothing and the smell still persisted. One day, during a conversation, the owner complained of this phenomenon which annoyed him so much that he had to close the room. This interested me and I brought me there to try to solve this problem.

Auscultation showed that there was a point near the middle of the room was forming an evil influence and it is precisely there that the smell was stronger. There were three electrical outlets in the room, all flush with the floor. If we trace the lines from each taken their intersection fell just at the place indicated by the pendulum. When two plugs were suppressed any odor disappeared and the pendulum no longer detected the presence of harmful ray.

These examples from among many others of the same kind seem to confirm that this is the modern amenities due to our civilization is to blame, at least in part, for the increase of cancer cases registered in civilized countries.

The reader will probably laugh at me if I say we might be happier and healthier when we went to get her water from the well and the evening was lit his modest effort.

CHAPTER H.

DIFFERENT METHODS USED BY THE MEDICINE TO FIGHT CANCER

If we open the Larousse Médical the word cancer, it says: "now cancer treatment is a medical myth" ... This confession at least is honest, but neither is encouraging for patients who suffer without any hope of being cured, or for conscientious doctor who knows from the outset that science, it serves itself recognizes its impotence.

The only means that has conventional medicine are: surgical removal, the radiothérapie and radium; but the essential condition for success are recorded to the credit of one of these means is an intervention as soon as possible. If the cancer has gained ground and if a local affection originally invaded the body through the lymphatic and blood system, none of these methods can not stop and rest at the doctor only care to appease the patient's suffering by narcotics increasing more doses.

rapidly examine these three possibilities of official medicine:

THE SURGICAL ABLATION to be effective must be

made at the beginning of evil, when the tumor is localized, as it has not sent its remote tentacles in the lymph nodes. The transaction must also be wide in order to destroy all the infected cells that may have come off the home and form groups around him. Thus, to increase the chances of success surgeon he often prefer a mutilating operation, or refuse to operate in general if it finds that the evil has gone too far. Many lives have been extended through early surgery, but, as said Prof. Verneuil "removal does not destroy the constitutional state under whose influence neoplasias occur."

Radiotherapy. We first thought that X-rays were destroying only diseased cells without affecting healthy cells. They thought they had finally found really effective remedy and able to stop evil without mutilating the patient by removing healthy body parts. But this opinion was not confirmed by practice. Instead, we quickly realized that all healthy or diseased cells are also sensitive to X-rays These rays, acting on -the healthy cells in the same way that the harmful rays, causing disruption to their vibratory regime and provoked and neoplastic development. This is what is generally called metastasis. The remedy becomes, therefore, worse than the disease. "How many cancer patients are dead," said Dr. MAURY, "not because they are evil, but a negative impact attributable to radiation too abruptly applied."

RADIUM THERAPY. The discovery of the Curies in turn provoked new hopes: we thought he had finally found the panacea that would free mankind from the cancer. Such was the raucous calls of the press, who eagerly seeks any excuse to feel. But, alas, the well lit hope in the hearts of the poor martyrs was only short-lived. The effects from the application of radium tubes proved turn too destructive nature: if the cancer cell was destroyed, the healthy cell was not spared. As the reader knows, the radium identifies three types of radiation: alpha, beta and gamma. Alpha rays are positive polarity and their penetrating power is quite low. Beta rays are negative and through a lead plate 1.5 m / m thick. Finally gamma ray, defined as "hard rays" are more or less similar to X-rays but have a shorter wavelength. Their penetration power is considerable: they penetrate 10 cm. lead. So they pierce easily throughout the body, causing damage along their path.

Gamma vibration causes dermatitis - deep ulceration and rebellious. One can say the same X-rays that often cause karykinéthiques phenomena. It is impossible, by generally known means to separate these three vibrations from each other to obtain a pure ray, or to make a dosage would reduce their destructive effect.

At the end of this book I will return to this issue and make some suggestions processes that seem

possible to control and filter the radiation from radium by making only curative.

Those are three ways currently available to the official medicine. Sometimes one of these means used to obtain time of success, but unfortunately the percentage of success is minimal. And in any case the patients do not have long survival as a result of these therapeutic.

Let us now review other methods that have been proposed by various scholars and on which experiments are continuing in different countries.

THE DIATHERMY is the use of high-frequency currents. They do not destroy the healthy cell and sometimes give good results in cases of superficial cancer, but these currents can penetrate deeply and reach the affected organs.

They are helpless in all cases of neoplasia internal sies.

OSCILLATORS LAKHOVSKY. There are two kinds of oscillators, one single and one multi-wave wave. The first was described in the first part of this book and it is precisely with this kind of oscillator that the eminent scientist was able to get such beautiful results in geraniums cancer treatments. The multiple wave oscillator 11 consists of concentric circles copper wire insulated from each other, each circle being slotted (such as single wave). This armature is mounted on an adjustable support and resonates at the high frequency current. Because the device simultaneously emits a large number of waves of different

frequencies, the diseased cell, according to the inventor, can choose among these waves which approach it to restore its normal balance.

Mr. Lakhovsky obtained using this device very remarkable cures, but only in cases where the tumor was superficial. Deep tumor affecting an internal organ does not lend itself to this kind of treatment since the wave from the oscillator has no penetration.

In the next chapter I will return to this very interesting device, and I will explain how this idea oscillator with some changes could be adapted to the selected dowsing ray emission.

SYNTONITHERAPIE DR. REGNAULT. We seek to be the destructive pace of neoplasia or the personal rhythm of the patient by strengthening the harmonics.

The idea of this treatment is very interesting and significant approach to that is the basis of my theory. Unfortunately I do not have enough facts to judge the effectiveness of this treatment.

ELECTRONOTHERAPIE DR. ABRAMS. is designed on the idea of a oscilloclaste vibrator, according to the inventor, used to find the electric current capable of neutralizing the condition. If there has been much controversy about this device and case supposedly registered cancer cure have not been adequately controlled. It is therefore very difficult to form a just opinion.

It is worth mentioning here the opinion of Dr. Leprince regarding the use of electrical appliances in

cancer treatment: "The current which by its voltage, intensity and polarity back to normal radiation deflected the patient is the only one able to cure this patient by restoring the body's vital energy it lacks for triumph over evil. "

THE HOMEOPATHY naturally could not stay out of the cure for cancer research. Formulas were proposed by Bourdoux abbots, Ball, Dr. Nehel Lausanne, Mr. G. Discry Belgium. Everyone claims to have found a tuned medication that gave satisfactory results in many cases. Not being myself homeopath I can say with authority, but it seems to me, given the origin of cancer, no drugs or allopathic or homeopathic is able to fight it. Radiation chemicals are not powerful enough to destroy neoplasia and restore the normal vibration of the cell.

The same refers to metallothrapy that in many diseases with excellent results, but is not effective in case of neoplasia. I can not leave without mention colorful Badigeonnages by which Dr. Regnault says he sometimes obtained cures cancer.

Dr. Bobeau worked for many years on the venom of the cobra he considers, after some preparation, as a powerful factor to fight cancer. Research in this direction were continued in the Paris Faculty of Medicine, Brussels and at the Pasteur Institute. There were some successes, but nothing

decisive. One could claim to have found the cure. Dr. Maury considers bee venom causing rheumatic attacks, as a possible treatment in some cases of cancer.

The latest research of official medicine are oriented on Hormone Therapy, that is to say on the extracts of endocrine glands. Dr. Dumoret bp considers inadequate pituitary and pineal glands as the basis of every neoplastic formation. According to Dr. Lifchits some cancers can be stopped, if not cured, by the administration of hormones gland corresponding opposite: "A prostate cancer can be arrested by female hormones and breast cancer with hormones males. "

This theory is still too recent to judge from the results, effectiveness. Some cases of cures or improvements are not sufficient to rule and form an opinion. In any case it seems to me that the work on the endocrine glands may be useful in cancer therapy as a means to reconstruct the ravaged cells, but the hormone therapy alone is not able to destroy the neoplastic cell. This requires the intervention of a powerful enough vibration to stop the chaotic state of the affected cells.

It is the same war; it's heavy artillery, tanks and bombers that destroy the defenses of the enemy, and only after that comes the infantry to occupy the land ransacked. And since we are talking about bombers, here's the latest theory with

compared to the atomic bomb and that naturally comes from America. I mean the treatment isotopes, that is to say by radioactive products.

The idea of the use of these products may be good in itself and could be the start of dosing radium I mentioned above, but it is still too early to judge. I am aware of cases handled by the isotopes, the result was not the one expected.

So a short overview of just about all the principles that are the basis of theories and cancer treatment experience, which continued in the world. What can we deduce from all this data cluster? and what conclusions can we draw?

Before the sine qua non of success by any of these means, generally recognized condition remains accurate diagnosis. As long as evil has a local affection and has not taken root and invaded the body, a complete removal of the tumor may save the patient. Such as applications of X-rays, or diathermy, radium, or oscillating lothérapie successful in cases of superficial cancer, carcinoma, but are not useful and instead certain vibrations (eg as X-rays and radium) are even harmful in deep neoplasias organs, because they destroy the healthy cells along with the affected cells.

Official medicine she has a means for determining a cancer at its beginning? We are forced to recognize that it has none. some signs

such as bp breast ulcerations, blood loss without apparent reason, continual digestive disorders, ulcers language etc ... are warnings that make suppose the doctor the presence of cancer.

Fibroids, tumors obstructing organs and the doctor can feel by listening the patient also and more so the indications are that fear a neoplastic formation. But all this allows the physician that the assumption: a tumor can be benign as well as malignant. Only the microscope can resolve this issue and we must then do a laparotomy in order to obtain the material necessary for microscopic observation.

Very often the intervention of the knife is so as to accelerate the spread of cancer. And that's why we use this medium but only in cases where the operation is considered inevitable.

I repeat that essentially have the greatest chance of success in the treatment of cancer is early diagnosis. Worldwide scientists of all nationalities are looking for symptoms that may indicate the presence of a neoplastic formation.

One of the latest methods, which comes from America and has been the subject of a report to the laboratories of the atomic bomb in Oak Ridge, is to introduce into the body of isotopes (eg phosphorus or radio iodine -Active) and follow with a special instrument (the Geiger counter) the portion of the isotope in the veins and its absorption by the tissue. It was observed that

bp in breast cancer absorption occurs at a higher speed * in the affected parts than in healthy tissue. All this is still in the experimental stage and nothing decisive can not yet be inferred. I wanted to give this new form of detection of the disease only by reference.

Dowsing is also going to participate in research of cancer detection means. Dr. Roux Vichy who practice dowsing for twenty years, believes he has found "the sign of Cancer."

Let him speak: (Truth about diagnosis medical dowsing) "knowing the nature of the injuries which were affected two patients, I tried to confirm the clinical diagnosis by remote diagnosis I dowsing ... Or for the one as for the other I first get some positive gyrations and negative gyrations separated from each other by oscillations and so on. Commuters baffled by these reactions to which I understood nothing, I left there this experience ... "So he went to see Mr. Turenne who confirmed that every time he would see the reactions of the pendulum in patients he could think about cancer. Having found the same commuting in similar cases, here is his explanation of this phenomenon: "Cancer is a proliferation of diseased cells grafted on normal cells which they appear intimately united, commuters reactions at the 'organ affected are those of normal cells (positive) and those diseased cells (negative) ".

This observation of the eminent doctor more

important to me as this approaches the discoveries I made qufi and helped me in many cases to detect cancer in its early and thus to control it without any difficulty.

If Dr. Roux had used in his research of a V.C. of CHAUMERY and Belizal (either spherical to handle or adjustable cone) would have obtained positive for cancer gyration on the V wave. This needs explanation. As the reader will remember what I said about it in the "First Steps": the negative Green is on the sphere diametrically opposed to the South Pole and Green spectrum between the White and the Black. This is why some dowsers call gray (mixture of white and Black). But it seems more correct to me to approach this issue from another point of view: the negative Verde is among the shortest wavelength (shorter than ultraviolet) and longer (longer than infra- red) or between the negative vibrations sector and positive vibrations.

So it is virtually the link and at the same time differentiating between these two opposite polarities, which he borrows from each of its characteristic feature. Role in the Hebrew Kabbalah is played by the mysterious letter Vau - "Union-separation". In Chinese Pa-Kua eight signs in the circle surrounding the Yn Yang correspond to the eight colors: Seven those of the visible spectrum and the eighth which simultaneously a beam composed of white, black and negative Verde. Thus in Chinese representation across the spectrum of visible colors is condensed in a

only sign that contains particular the positive principle (it to be), the negative principle (non-being of that) and the principle balancing between these two opposites. I apologize to the duty drive address a topic that seems to exceed the scope of this book. But it's hard to explain the extraordinary powers of this mysteric vibration, we call the Green Negative, without having to delve into the transcendent.

"Today's science is forced to reconnect with the traditional" rightly says Dr. Maury.

In education insiders of ancient Egypt, the first act of the Creator that triggers all creation was its splitting into two opposing principles perfectly balanced with respect to the other. These two poles are called one "the infinitely Large" and the other "infinitely small" and all that has been created between these two limits.

Green Negative is placed where meet these two incompatible vibrations and constitutes their particular point balancing. *J*

It is no wonder that ancient civilizations attributed to this wave of supernatural powers and used them in mysterious goals. We have seen that what we call the negative Green differs from all the other waves and possesses extraordinary powers (eg drying of the skin) and a strength and reach of much higher than any other wave . I must say that what we find on the V.C. south pole is not a single vibration, but a vibration beam of different wavelengths that

I apellerai to be more exact: "Green beam negative". In this beam entering many vibrations that resonate one to cancer, another TB, others to other serious conditions. Universal Clocks that I described in the "First Steps" are not specific enough to distinguish all these rays. This requires other more delicate instruments. But in any case the dowser can use the negative green beam whose resonance in auscultation used to indicate that this is a serious condition, perhaps cancer.

CHAPTER m.

RAY THE PI

Traditionally, the Pyramids of Egypt attracted the curiosity and admiration of people around the world. It was by far and contemplate since the remotest times we wondered what could represent these colossal and rigid forms "that swallowed their own shadow." The first "tourists" visiting Egypt Greek BCE, described their orientation established exactly according to the cardinal points. The mystery seemed to surround these massive prisms. Of course this if they said, was important and a certain meaning. We wondered what message the builders of these giant buildings had wanted to preserve for eternity and transmit to the generations that come. Thus the Pyramids are ranked among the 7 wonders of the world. Herodotus tried to lift the veil surrounding the mystery of the Pyramid (the Great Pyramid of Giza whose construction is assigned to Cheops) but what he says is very vague and intentionally hidden. He claims to have received revelations, but that in this respect "his mouth is sealed." We can deduce from his allusions that mystery with respect to the cult were celebrated around so that in the same pyramid. But we can not know if

attended itself or if insiders were given explanations by devoting the secret.

The Bible texts speak repeatedly of the Pyramid as the "altar erected to God in the land of Egypt, which will serve as a sign and testimony of God" (Isaiah XIX, 19-20) "God set signs and wonders in the land of Egypt even to this day. "(Jeremiah XXXII, 20). It is clear that" the altar erected to God in the land of Egypt "refers specifically to the Great Pyramid truncated Giza, the stone that was to crown the summit (the pyramidion or ben-ben) was never implemented by the manufacturers. Why ? himself will be asked. Was there an error in the size of the stone is not exactly fitted to the building? This seems to be confirmed by the passage of the Psalm: "The stone which the builders rejected" (Ps 118: 22.) Or was it done intentionally to show that the building was waiting for his symbolic summit, his spiritual coronation. ". the stone which the builders rejected, itself became the apex of the corner. "(Matthew XXI, 42). This assumption seems to me the most accurate and consistent with Scripture. In his prophecy concerning the coming of Christ the prophet says: "And He will release the final stone ..." (Zechariah "IV, 7). "You are built upon the foundation of the apostles and" prophets, Jesus Christ Himself being the Master and the "cornerstone that ends all joined together building" to be a temple of God "(Eph II, 19-21) says the apostle.

I could also cite many texts dealing

the Great Pyramid, but I think these few passages suffice. The reader probably does not know that the oldest worship insider Egypt kept at Heliopolis the initiation school (On, after the appointment of the Bible) was notably that of Logos - Word Creator that triggered (named) all Creation. The first chapter of the Gospel of St. John "In the beginning was the Word ..." is reproduced almost verbatim in the Heliopolis teaching text, referring to the creation by the Word. I can not enter here into more details on this and I refer the reader that it interested in my book on the "Origin of Genesis." He will find all explanations based on the original texts. I wanted to report by this short incursion in antiquity, the special role and greater importance was attributed always to the Great Pyramid, a role that puts quite apart from any other monument of ancient Egypt. The revelations of astronomical order that we draw is enough to understand that this monument was designed and built to maintain forever the acquisition of knowledge had reached humans, or, perhaps, who had was revealed from the beginning. The shape of the pyramid, leaving aside its symbolic meanings, was designed to withstand any disaster: earthquake or another, to keep his message intact until the end for those who are worthy of the understand.

Since this book is about the radiation forms, see what revelation we can
learn about it

the Great Pyramid from the perspective of dowsing.

I think it is CHAUMERY and Belizal who first published their work in their comments on the role of the Great Pyramid as a transmitting station wave that can be received at greater distances. They discovered that the vertical axis of the pyramid down perpendicularly on the top Ja base gave the green flash at the top of the spectrum and base the negative green, like the sphere to the cardinal points of the N-S axis. Given the enormous mass of the Pyramid delisted vibration form are of considerable force. It is therefore understandable that even at a great distance we could capture this powerful wave and so accurately direct the course of the ship at sea and that of a caravan in the desert. This will explain how the ancients could undertake long sea voyages without using compasses, the use of which was not known to them. Inside the Pyramid, above the chamber called "the King's Chamber, there is an installation consisting of four radiating elements in turn the negative Green wave directed on the sarcophagus located below. I have described in a previous chapter of this extraordinary machine that has no need of other architecture. What is important to note is that this device is not in line with the axis of the Pyramid, but is offset to the south about 10 meters. This was done intentionally so that the sarcophagus does not receive the Green negative vibration down along the axis and for reasons we can only assume, was

considered too powerful for the purpose which was to serve as the sarcophagus. Let me explain: in the chapter on different shapes radiating I described the role of a battery containing hemispheres or pyramids. I said that as many elements constituting a battery should not exceed four for the wave that emerged from becoming harmful to a living organism.

The "mysteries" or rites that were celebrated in the Great Pyramid and which refers to Herodotus, were the supreme initiation, when the follower, having undergone numerous tests (lasting a long time) was finally die in material life and reborn spiritual life-all this symbolically. He was placed after many ceremonies in the sarcophagus under the action of the beam which was that of death and life. The length of time it could withstand that vibration was the sign of his detachment more or less full of everything he had in him to land. An adept worthy of initiation did not feel suffering, just like a real fakir piercing his body with swords and is buried by stopping for a while the functions of his body.

In a book on the mystery of life and death, which will be published soon, I explain as much as possible the rites of the Great Pyramid. so I do not stop myself more here. What interests us in relation to the use of Negative Green is precisely the fact that it can be used safely if the battery which generates does not exceed four elements.

Based on this notion I made many experiences and I have observed that a battery containing 9-11 and more elements (it is always better for that kind of experience to form batteries odd numbers of elements) withered flesh burning, so to speak, cells and killing microbial life. I have also observed that the use of powerful batteries was dangerous. The beam that emanated had such force that invaded almost instantly throughout the room and it persisted for several days after the removal of the battery. order disturbances of very special and very serious manifested in people who remained in the room. This necessitated above all find a means of protection in order to continue these experiences. I managed to protect myself and to locate radiation, using oscillators Lakhovsky types (single wavelength) and Faraday cages kind. Thus it could spread into the room and invade the apartment.

This allowed me to continue my experiences increasing more and more the strength of the batteries.

Using these powerful devices desiccation (some authors call mummification) happened much faster and drying of the cell was more complete.

I had the idea and try applying the Green negative radius in healing purposes, including to destroy the neoplastic cell.

A case was considered hopeless appeared. Cancer that began in the matrix and

the right ovary, had spread in the intestines and had invaded much of the ascending colon and adjacent portions of the small intestine. The surgeon who opened abdomen was discovered that the operation was impossible because it would have taken off much of the digestive system. It recousut the wound and declared for a month of life at most.

Having learned from my research on cancer, relatives of the patient is addressed to me. I warned my deductions were purely theoretical and I've never tried to put them into practice on a patient. They have asked me to try anyway since there was no other hope. Thus I started this experiment very timidly and with all possible precautions. I applied the indirect system of witness that I have described. I made the anatomical drawings of the exact location of the tumor that I attached to blood witness and subjected to the action of a battery of four 10 cm hemispherical members. diameter each. The witness was constantly under the action of the device, and I went out several times a day, just to realize the effects of treatment. I was checked through the biometer and segments clipboard Naret.

The patient had suffered martyrdom and was to be injected ever increasing doses of morphine. Now she felt after a few days an improvement in such sensitive point she had no recourse to narcotics. This was the first encouragement that showed me that I was on the right path. The wound had healed

and the patient was able to leave the hospital. She continued her domestic work and say feel good. She even began to go out, go to the movies and to parties, although I begged her not to overdo it and do not consider themselves cured. The second greatest satisfaction was when it stood at the end of two months, his surgeon was amazed to see coming and more clear after auscultation that the tumor had halved. "I do not understand how this could happen," said the surgeon, "but I have seen it." On the other hand the midwife who had examined her previously confirmed what had found the surgeon, and could even give measurements in cm., showing the decrease of the tumor.

These observations absolutely impartial specialist doctors encouraged me. I set to work, with the hope not only to rescue the sick and alleviate their suffering, but perhaps even to cure.

Very carefully I renforçai the device carrying the battery in six elements, but the patient is in felt and complained of feeling unwell. So I went back to the four elements and at the same time I added the homeopathic treatment with Thuya 200 which seemed to give good effects. But this lasted only 5-6 days. It was then remove the drug.

Treatment was started on January 26 and March 25, exactly two months after the sick commencement- I had taken 2 kg. 500.

Meanwhile I had read in an article that M. G. Discry had composed a tuned homeopathic formula

had given him a satisfactory result in a similar case to mine. I made contact with him and sent him the witness-blood of the patient in order to tune to a drug. He very kindly sent me the drug that he had found effective, prepared in Unda laboratories in Liège. The formula of this preparation is No. 48: Gonolobus, Calendula 3rd d, Lycopodium, 22me of Sabina, Aur... 6, P.B. i8med.

I checked this drug relative to the nature of the patient and it seemed well tuned.

I continued my therapy department and added the mentioned drug. The patient felt better and better and seemed to forget that she was not healed to the point that she began to lead his normal life. She left the summer at the seaside and took baths as if she was doing quite well. In autumn she returned home and always felt good. On my devices I could see that evil (though controlled in the sense that it was spreading even more and that the tumor had significantly narrowed) however persisted and I 'was not able to overcome permanently.

I tried various changes and modifications, but I did not succeed and I felt he was missing something I did not know to bring the treatment to the point.

On November 12, the patient had a fall that shook the entire body and left a deep scar on the forehead. From that day there was a sudden change: his condition worsened. Biometric angular figures and made a leap. The patient was bleeding from the anus

with shreds of bowel tissue. The analysis showed that in the waste there were more cancer cells, but only dead cells. It was clear to me that the walls of the colon eaten away by cancer did not resist the shock had broken, causing peritonitis UUE whose patient died on 20 November.

But what was comforted and encouraged me in my research is that until her death she no longer suffered from pain caused by cancer and treatment with my life was extended by 11 months.

March 3, about two months after the beginning of the treatment described, another patient presented. She underwent surgery in right radius and 80 sessions X. She was in terrible condition and I saw immediately that she was doomed.

X-rays had ravaged tissues, it was covered with burns and metastasis were changing. I had all the trouble in the world to obtain a drop of blood from the tip of his finger. Instead of blood she had a kind of sparkling water very slightly colored, and finally some small pieces coagulated.

I could not appeasing his suffering, and died about a month later (April 7) quietly choked with lymph node metastases neck.

These first two cases were of great help to me. I learned a lot and continuous observations enabled me to improve the treatment to the point that few other cases that followed could be not only relieved but completely healed. It is true that

these cases were not as advanced as the first two. In the next chapter I will give some typical examples taken from my files. Now back to the treatment process - changed as and when new experiences and as currently used.

In the short overview of treatments dowsing rays in general, I stressed the importance had to obtain an absolutely pure ray, devoid of any other parasitic vibration. When dealing with the simplest means described in the "First Steps", that is to say by applying colored pieces of cloth, we choose the color that restores direct gyration of the pendulum and the 'applied to the affected part. It is the vibration produced by the color that is one of a fairly small way to cause any unexpected disturbance. But if you use appliances or radiating materials must take all precautions. It takes all of ABRD get a pure ray and then make an exact dosage that checks at least twice a day.

By studying the negative green, I realized that this is not a radius, but a beam and that beam is particularly dangerous because it is composed of opposite polarity rays. (Negative Green being himself, as has been said, the link-separation between the two opposite poles). So he had to look into the beam radius one answered the cancer, then try to isolate it.

After many experiments I managed to do it and at the same time, to my astonishment, I discovered

the same rays other beam can be used to treat other serious diseases such as tuberculosis bp. When I made use of pure water, free of any vibration, the result of the treatment became clearly faster and more efficient. The radius feature of cancer is exactly $6^{\circ} 15'$ angular variation compared to OE plane perpendicular to the NS axis of the sphere, on the positive side, that is to say between the point Nadir (what we call negative Green) and Black. The radius of tuberculosis is in contrast to the negative side (between V-and White). When I managed to isolate the radius cancer, I noticed that the first application on the patient gave as batons and made down the intensity of cancer (judged by the biometer and Naret devices) of a range of degrees. The patient went instantly into account the impact that I was doing to his witness. Here is an example.

One patient had cancer in the right ovary and sufferings were such that she was almost out of bed and throw himself out the window. It was set (that is, its blood control) under the action of the device to 3 hours. p.m. At 5 pm. p.m. she telephoned to say that all the pain had stopped and she got up. The cancer pain are never returned and the patient died of severe jaundice, because she refused to have surgery of the gallbladder. This had nothing to do with cancer which she was cured, which was proved by laparotomy and analysis.

Having isolated the specific radius cancer, it

had to give it a name, and I have chosen the Greek letter pi, which, it seems, well defined. Why have I chosen among all the letter, although it is a mathematical term that determines a number indefinite fraction? Precisely for this reason, because among many other scientific data stored in the Great Pyramid the number pi is important (see for details the book of Professor A. Strauss "Die Verzal Pi" and Prof. Franzel, "Die Cheops- pyramid und ihre Elementare").

On the other hand, since I found the starting point of my discovery in my studies specifically on the Great Pyramid, it is understood that I wanted to attach the name of the department that I have, so to speak, taken from this eternal monument. The syllable pi begins the word Pyramid which itself is full of meaning: PR-MS (Pyrmus) in hieroglyphic language meant "get out at birth" or perhaps spiritual rebirth.

Now, as the role of this department in my cure system is precisely to revive dead tissue, it seems that the name pi is appropriée.

At first, as I said, I was using batteries of four elements formed hemispheres, with 10 cm. mahogany wood diameter. Or the same number of pyramids stacked one above another to constitute a battery. The patient's witness was continually exposed to the action of this battery and exhibition lasted sometimes for months. Later I noticed that it was better at the beginning of treatment subjecting the patient to short shocks through many devices

more powerful. So réduisis earth elements by making them smaller, but increasing their numbers in a battery. This -Fampérage diminished but increased the "voltage" of the device, to use electrical terms.

I found that by shocks from 15 to 20 minutes of exposure spaced interval of several days, we managed to a much faster result. Then, when evil is mastered, the treatment is continued by batteries of four elements until complete recovery.

To diagnose cancer I use two means of which overlaps and confirms another: 1) I have a series of cuts and pathological histology slides that consists of all forms of cancer (épithelion, sarcoma, mioma etc.) in all organs and body parts. 2) I managed to make a special clock that only meets the vibration cancer. I noticed that although the neoplastic cell can develop into various tissues of the body: (Bp the epitelioma-tumor epithelial; sarcoma tumor-conjunctiva, etc.) however they all met at the same rate of vibration that was captured by the pendulum detector cancer.

To diagnose cancer I proceed as follows: Having established through my V.C. a disturbance in an organ or tissue that is not amenable to treatment by any of the colors visible and invisible, I approach my cancer detector that starts AW-IPM if even a single cancer cell. If instead the evil is not neoplastic origin, the pendulum remains motionless. After finding by

the pendulum the presence of cancer cells, I place the lamp on the Naret board segments in South location, and one after the other blades of different shapes of the organ in question cancer until my PU (Adjustable cone) begins to swing in N.O. sector indicating its declination, forming angle with the center line, the intensity and development of evil. I get so two measures:

Moon angular Naret by the board and the other length by placing the lamp on the biometer plate and causing the cancer detector along the rule until it starts to swing across. These two measures give me the opportunity to judge the progress of the treatment and the figures obtained in this way are marked daily in the patient's individual record. In the next chapter I will give as an example a listing of this kind raised in my files.

Before closing this chapter I would like to note some tests I made with other devices.

I built oscillators, drawing inspiration from those Lakhovsky, but with some changes: i) there is no electricity and all the "current" that is the oscillator receives from the land I captured by a string attaching the device to the wall. 2) the second feature of my oscillator is that I managed to concentrate his power. He thus makes one vibration, and its choice depends on the operator. J ' I managed to get this by placing in the center a moving arrow. by changing its length more or less changing the shape of the imaginary cone formed by the end

arrow with the outer circle of the oscillator. The idea, as the reader sees, dates back to V.C. Cone CHAUMERY and Belizal.

This device gave me satisfaction in some cases of skin cancer, but for neoplasms of internal organs penetration force is not sufficient.

The other machine that I tried is the coil cylinders whose propeller declination angle is the one corresponding to cancer, including $6^{\circ} 15'$. This device gave me satisfaction in some cases not too advanced and not requiring great concentration of power. Both devices can at a pinch be used in the direct treatment of cases of superficial cancer.

To conclude this chapter and to set a shorter form of the cancer treatment process on which we have deliberated extensively, we can say that the remedy lies in the evil itself and that is by using the vibration caused the cellular imbalance that manages to restore the normal balance of the cell. *Similia similibus curantur*.

CHAPTER IV.

SOME EXAMPLES

I have already said and every doctor, every medical book will confirm. What is essential to have healing chances of cancer is early diagnosis. As long as evil is only localized, it lends itself easily to treatment and an operation made at this stage a lot of chances. But then, how to know that internal derangement that does seem to be no gravity is the beginning of cancer? A button on the tip of the tongue, lip crevice, a persistent sore throat, a callus in the breast, all this can be the beginning. And even if the informed patient is for a doctor as soon as he notices something abnormal, what means has the learned practitioner to distinguish whether it is cancer? None, except the microscope. It can observe the presence of a tumor (and not always), but cautiously say that it can be benign as well as malignant. It is still the microscope alone can solve this problem. But to get a room to study microscopic must make an incision in the same tumor. Yet it has been observed that when the knife touches neoplasia is like a boost for the evil that begins to grow much faster. Knowing this,

conscientious surgeon hesitate long before taking this decisive act.

This is the reason that pushed me to make every effort to find a safe way to diagnose cancer at its beginning. I think I succeeded in creating my detector. Anyway, until now I have not had a single case where it was mistaken in ruling either for or against a cancer, when doctors had assumed that a tumor was malignant in nature. Microscopic analyzes of these two kinds of cases (positive and negative) confirmed the diagnosis whenever my sensor.

Here as examples some cases of both genders identified in my files.

Case No. 20. Tumor on right shoulder blade with a bump of about 2 cm. high and 3 cm. of diameter. The detector indicates: Cancer. The measurements show a rather strong virulence: Cancer Biometer 35 and very strong growth: Clipboard Naret 7. Since the tumor is in its external and much evil is still concentrated and does not spread roots in the ganglia I advise an operation at the earliest. The same day the patient is operated and malignancy egg-shaped may be detached. The wound quickly healed and there was no metastasis.

Case No. 90. Children 3 years treated by many doctors who had diagnosed cancer. Evil began with a tonsil operation that was not necessary because it was the para-thyroid was affected. Thus the operation was the cause of the ganglia disorders

Lymph creating in different parts of the body that took tumors to metastasize.

The application of X-ray worsened the condition causing burns and leukemia, the child wasted away visibly.

It spoke to me, asking my opinion, and a control (blood) was brought to me. The sensor remained motionless - no cancer. when we even had a laparotomy confirmed that the negative diagnosis.

CASE NO. 92. Medical and X-ray diagnosis: lung cancer, it is necessary to operate at the earliest.

The X-ray shows a light spot in the right lung. The detector refuses to confirm the presence of cancer. The spot is probably due to traces of an ancient bronchitis. The analysis fully confirms this diagnosis.

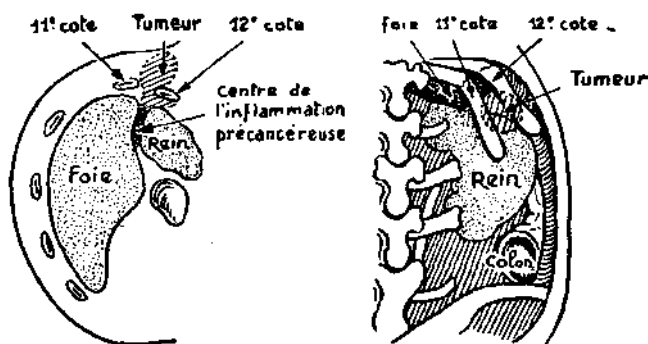

Very often doctors were amazed when I showed them the picture of the exact location and shape of a tumor. They compared my drawing with radiography. "But how could you do it?" They asked me. "This is my detector trace me," I'd say.

Indeed, whenever I find the cancer in an organ, I provided my detector. I walk slowly advanced I hold in your left hand on the affected organ. As the tip is the area of the tumor, the gire detector as soon as the tip touches the healthy flesh, he stops. Thus it is easy to trace the contours of a tumor in detail.

And here's a case where I had the chance to observe the beginning of neoplastic training I managed to master

in the space of a week. This case is so interesting that I will describe in detail.

CASE NO. 81. A LADY OF 60 YEARS AGO IS IN THE 2/9 / 1949- SHE COMPLAINS FROM 2-3 MONTHS OF PAIN SOMETIMES BACK SOMETIMES IN THE LIVER AREA. THE MEDICAL AUSCULTATION

A. Horizontal section at the height of the lumbar reversion.

B. View of the outgoing tumor between 11th. and 12th. side.

makes suppose unrest in the gallbladder, but the prescribed treatment does not provide relief. The dowsing direct auscultation suggests rather the right kidney and adrenal gland right as the home of evil. The indirect auscultation on anatomical and precise control that affection is not in the organs, but in the space between the liver and right kidney. It is the connective tissue serous filling this space that is inflamed and it is infrared, which responds in resonance.

From my observations of many cases I was able to deduce that this color is often the sign of a precancerous condition. So I begin to observe very carefully, checking the condition of the patient every day. At the same time it still continues his medical treatment, but to no avail. My alarm still shows no sign of cancer. Thus weeks elapse, the patient still complains of pain.

Suddenly the 22/10 in the evening, while I was doing my usual auscultation to check the condition of the patient, the detector began AW-IPM between the nth and i2ème coast up to the st> vertebra-lumbar. I was able to trace the tumor that had formed way out, so to speak, towards the back. It is interesting to note that the patient came to complain the next day she felt "like a ball in the back of the right side" which inconvenienced.

The measurements by devices indicated a low virulence and development: B.C. 5 <2.

I immediately submitted the witness shock for 15 minutes by the unit N ° - 101 high power.

The result of this initial shock gave a reduction in numbers: 1 and PO <0. 23/10 The next day, I repeated the shock by a weaker unit, which further reduced the numbers: B.C. 0 and <0. The 24/10, there was a slight rise: PO 2 and <1. I subjected the witness to the battery of the action in 4 elements. The 26/10 there was a last increase, but lower: 1 and PO <0, and thereafter evil seemed masted. Although the detector might give signs of life I continued the treatment until

what I got on board Naret the angle of 450 of the S-O side. (From the observations I have made on many other cases, it is only then that we can consider cancer as finalized).

The 29/10, just a week after the beginning of treatment, my devices indicated: B.C. o <-4 (ie the pendulum swung to the line of S-450 O).

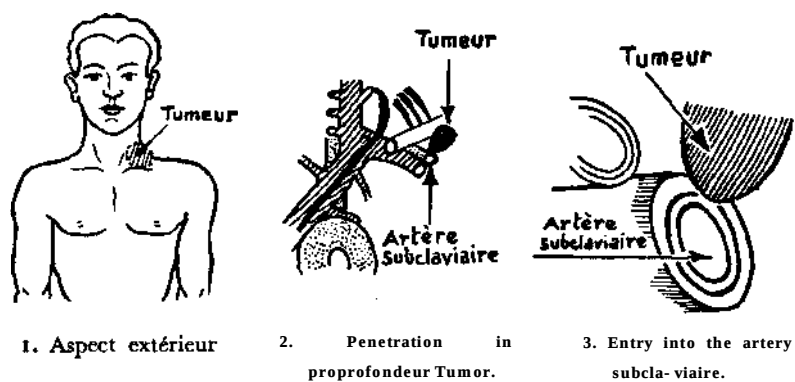

The cancer was cured and the patient felt good, but I still continued treatment for two weeks to strengthen the effect. Then having taken the control of the device, I was checking occasionally the state of my former patient who persisted in being good.

Some will say that in this case my diagnosis was not confirmed by microscopic analysis, I do not have the right to assert that it was cancer. Certainly there was no laparotomy and it is only through this that evil could be healed as quickly. If the knife had touched this neoplasia in the making, who knows what could be the consequences and how long it would take to restore the sick. I'm sure my detector sounded the alarm in time to put out the fire before it spread. If there are doubts, too bad, I think my detector that I have yet never cheated. Furthermore the control-witness had confirmed cancer diagnosis.

This is another case for unbelievers. This one has "medical degree" of unquestionable cancer, because he had been operated on twice.

Here are the details:

Case No. 76. A patient, a young woman, had presented the 26/03/49. She complained of a malignant tumor which was operated twice in the space of a year, she had also suffered a series of X-ray applications (fortunately not many), but the tumor re-formed again. Outwardly she had mild swelling at the root of the left side neck. Surgical procedures were well healed and the swelling had the appearance of a small light colored harmless bump.

Auscultation of anatomical charts showed that the tumor deep down slightly conical shape until subdaviaire artery. She had eaten URIE portion of the outer layer of the body of the artery (Tunica) nearly touched to the central layer (Tunica Media). It was clear that in this case an operation could not succeed. We had to

ablate up the artery without touching the part of the tumor which penetrated like a wedge into the body of the artery. Surgical point of view the problem was insoluble: if extirpate the root of the tumor artery, there would have been bleeding and sudden death; if by against the recessed root was left in the artery, life would be extended, but the tumor would push again (which actually came after the two operations). It is obvious that the surgeon had chosen the second solution.

The left arm was beginning to feel the effects of the presence of the tumor, and doctors had advised the patient to make the fewest possible sudden efforts.

This case was very interesting and I set to work. The measurements showed a virulence development and not very strong: B.C. 8 and > 3 . I was sure you can control this cancer and in fact after the application of the 4-cell battery, the measurements had descended to the BC $1 \frac{7}{4}$ and > -3 (one recalls that a complete stop marked Development Naret the board on the line at 450 SW is conventionally registered > -4). And the development was almost stopped. What was not concerned me the same cancer, but the threat of bleeding in case the area that closed body of the artery was abruptly eliminated. I had well in mind the cases mentioned by Lakhovsky: when a tumor that affected one of the great arteries were removed, it followed a fatal hemorrhage.

So my problem thus posed: 1) stop the develop

ment neoplastic and 2) push healthy cells to plug the hole gradually as the corner formed by the tumor embedded in the artery narrowed.

So parallèlement cancer treatment by the radius Pi I had to encourage the development of healthy cells. The waves that were given me to reach that goal were a combination of Infra Red and Orange.

Everything worked and the 09/10/49 I saw the complete cure. B.C. and O> -4. The skin resumed its normal appearance and seemingly healthy cells had done their task of repair. The patient felt perfectly well. I continued watching until the end of December and everything continued to go well.

This case was very much interested and I was very useful to develop my process. The cancer could have been stopped much faster, but I was afraid to destroy the tumor before the healthy tissue has been reformed. It is for this reason that I have not used shock, but only a soft and necessarily long treatment.

One day Dr. M. R. who was interested in my treatment system, would realize if my detector could actually distinguish cancer. He subjected me witnesses of three different cases. After two days I brought him my diagnosis:

1st Case, Sarcoma amputated right arm was spreading metastases in the lymph nodes of the armpit.

2nd Case, Rhino Scleroma, benign tumor due to the presence of bacilli Frysh left nostril and larynx affected.

3rd Case, Rhino Scleroma, malignant tumor located in the right nostril, having penetrated through the cribriform plate of the ethmoid at the height of the left frontal sinus.

A detailed sketch of the tumor accompanied each case.

The doctor was convinced, because the three diagnoses were consistent to the smallest detail with its own findings and radiographs.

*
* *

Here is an interesting case:

CASE NO. 67. A young man confined to bed for several months in agony, treated for sciatica left. Diathermy, injections gave no effect. Auscultation revealed on anatomical osteosarcoma of the left femur. The measurements were: 30 B.C. and p "1, indicating a relatively high virulence, but slow development.

Treatment was started on 12.25.48 by a battery of four hemispherical elements. 28 of the same month the B.C. marked the number 10. There were several relapses, evil unwilling to yield to treatment. At the highest relapse the B.C. climbed to 20. The development persisted in> 1.

I must say here that the days of this treatment I had not yet developed the new method of shock by powerful devices. I think with this system I would have got a faster effect.

* 45

In short, it was not until August of the following year (1949) that the patient could be considered completely guérj, the measurements being B.C. o> -4. But long before complete healing, about two months after starting treatment, he felt already restored: no pain, free leg movements to the point he could even dance.

* * *

I could have continued to take on cases in my files, but I think these few are enough to prove the effectiveness of both the diagnosis and the treatment method.

Gum the reader could judge, cancer taken from the beginning and is easily masted one can be sure of healing. Advanced cases depend on the location of the tumor. If it is in the system / iigestif - esophagus, pylorus, duodenum and colon - it is very difficult to avoid an operation. The treatment that I practice requires quite a long time. But the patient needs to feed not to lose his strength, and the food making its way through the digestive tract pressured the tumor, which causes suffering. It follows that the patient fears all food and prefer to abstain to avoid the sometimes excruciating pain, hence weakening, heart disorders and even starvation.

I have had several cases of tumors of the pylorus or duodenum, where I advised the operation. If after surgery

surgical tion is continued to keep the patient under the action of anticancer radius, any risk of metastases was removed and the success of such an operation can almost be guaranteed. Provided, however, that it was made in time, that is to say, when the tumor is still concentrated and neoplastic cells are not yet parties traveling dispersing evil in the surrounding tissue.

Neoplasia in the genitals are more easily amenable to treatment and often can cure the disease without resorting to the scalpel.

The case is more severe when there has been many applications of X-rays or radium. In these cases the treatment that I practice is impotent. It stops the cancer, which was proved by analysis, but it can not combat the effects left in the tissues by the gamma ray. And the worst is that these destructive effects persist for months after radiotherapy sessions.

I have in my files several cases of patients who were not cancer deaths, who was arrested, the analysis has demonstrated, but precisely deep burns and lymphatic system disturbances caused by X-rays

*
* *

Would it not be possible to experiment with both radium with the X-ray non-direct application to patient, but on indirect witness, inspired by the dowsing system that I exposed?

I confess to being, profane radiotherapy, but what I suggest is perhaps not as silly as it may seem at first glance. If dowsing vibration applied remotely to witness, give undeniable effects, which has been proven many times, why, used in the same way, X-rays or radium do not they give the same result? Anyway, this way the danger of burns and other damage could be eliminated and we could concentrate all the curative power of the diseased organ without affecting any other tissue or organ neighbors.

Why not try?

CONCLUSION

I hope that this little book is clear enough and that the reader could understand my system I tried to expose in detail the application and gave me encouraging results.

It is regrettable that the majority of representatives of the Medical Corps dowsing reject with contempt. However, it could be very useful to doctors, especially in cases of difficult diagnosis.

What are they afraid? Dowsing that would compete with medicine? This is absurd and can not be in question.

Dowsing can not be considered only as 4'aide of medicine, like chemistry for analysis or radiography that allows the doctor to realize the state of an internal organ.

The dowsing auscultation on anatomical reached the same goal, and I have had many confirmations of the accuracy of the route design through dowsing devices when compared him to x-rays.

But dowsing drawing has an advantage over X-Ray: is that it provides a representation of a tumor (pe) not only to a single angle, but it can also show the deep penetration and destruction caused to the affected organ. CUNE thing qu'au- radiography is able to do. Simply

obtain these details to use anatomical representative sections of organs at different heights.

This is the opinion of a great doctor who is also a renowned diviner: "The safety of diagnosis. and the certainty of an effective therapeutic largely reward those who study the medical dowsing and do them. They will not only make the diagnosis of lesions currently in development, but identifying those, only beginners, do not have sufficient characteristics to be diagnosed clinically ... "(Dr. A. Roux," Truths about dowsing diagnosis medical").

There are number of diseases whose original seat is an endocrine gland, lymph node, or a nerve center.

Contemporary medicine has no way to listen to these centers, and the doctor can only guess, more or less just, cause harm. For the treatment he has to be content with giving drugs that act (or so it is assumed) on the lymphatic and nervous systems in general. It is obvious that this kind of treatment is long (if it is successful), and another côté the drug can disturb other centers that are refractory him.

The process I am developing and I have outlined in this book, can direct the healing wave only about presenting the causal center of the disease. So the effect is not only effective but also fast.

Of asthma, psoriasis, eye diseases etc. (All considered incurable) were cured in a relatively short space of time, always acting on glandular or nervous centers and only with appropriate radiation directed at these centers.

Unfortunately in dowsing (as indeed in all sciences) there are many charlatans who, knowing very little is aventurent to treat patients in ways they do not know the effects. These characters do the greatest harm to dowsing and often hurt the patient who relies on them.

It is to avoid this activity profane and to protect the patient should have been that dowsing is officially recognized and scientifically studied in medical schools.

I wish with all my heart that this happens at the earliest. Once incorporated into medical education, dowsing find number of scientists who will work to develop it to make it an exact science.

In presenting to the public this little book I do not claim to have the last word, on the contrary, I recognize that this is only the first syllable, not even the first word.
