TABLE OF CONTENTS

Preliminary Note	7
Foreword	7

PART ONE **A Glimpse into Ancient Radiesthesia**

1. From Prehistory to the Modern Age: Prehistoric hunting. Law of Similars. Wand of Commandment. The spell.	13
2. Chinese Radiesthesia: Ba-Gua. Yin-Yang. Radiesthesic acupuncture.	19
3. Egyptian Radiesthesia: Cross with handle. Pharaoh's scepter. Looped cord. Uraeus. Sphinx. The pyramids. Radio in the time of the Pharaohs. Radiesthesia compass.	21
4. Radiesthesia of the American Indians: The Indian conch.	33
5. Easter Island: Statues. Tablets.	35

PART TWO **Radiesthesic Detectors and Instruments**

1. The Sphere: Preamble. Radioactive planes. Color waves. Negative green.	41
2. The Universal Pendulum: Receptor pendulum. Emitter Pendulum.	49
3. The Hemisphere: Distribution of waves. Prisms of Radiesthesic radiations.	53
4. The Radiesthesic Battery	55

5. The Radiesthesic Accumulator	57
6. Radiesthesic Relays	59
7. Special Pendulums: Neutral pendulum. Virtual cone. Easter Island pendulum.	61

PART THREE

From Shape-caused Waves to Illness Waves. Noxious Waves. Teleradiesthesia.

1. Particle waves. Shape-caused waves: Pyramid. Mummy. Easter Island statues. Sphinx. Radiesthesic battery. Candelabrum with seven branches.	67
2. Medical Radiesthesia: Wave-sickness. Noxious planes. Radiesthesic touches. Medicinal plants. Wave-selection Instruments: the Snail and the Yin-Yang ruler.	77
3. The Beam. Negative Green.	87
4. Noxious Waves: Carrier waves, carried waves. Rupture of the Compensating Forces. Physics apparatus, stabilizer of the Balancing of Forces. Kaolin, impermeable screen to noxious waves. The re-equilibrator.	91
5. Theory of the Great Magnetic Currents. Research on Living Water: The problem of water. The great magnetic currents. Some research experiments.	97
6. Teleradiesthesia.	103
In conclusion.	104

PRELIMINARY NOTE

The material for this book comes, for the most part, from our book published in 1939: *Treatise on Experiments in Radiesthetic Physics*, which has been out of print for quite some time.

Many radiesthesists asked us to reprint. We delayed re-publication to update our work, giving it a more appropriate title and adding the results of our latest research, especially in the medical and toxic vibration sections.

We submit it, such as it is, to the reader. Our goal will be attained, if, after having turned the last page, you are our friend and collaborator. It is only with constant exchange of ideas and a mutual understanding loyal to radiesthetic fact that our art can one day hope to emerge from the current terrible disbelief and lengthy struggle.

This union does not have to come about with a single name, or a single method, but in TRUTH, reciprocal impartiality, and a profound faith in a cause which to both of us is so dear: to transform our art little by little, together, hand in hand, into an exact science, a magnificent conquest by man over the Invisible Forces.

FOREWARD

For a long time we were hesitant to write this book: radiesthesia has developed in two directions, one inclined more to the mental aspects, and the other based on the principles of physics with which, in fact, it appears to be connected.

These two apparently conflicting tendencies have, however, a common meeting point: the transformation and amplification of the radiation flowing through the body of man via the intermediary of vital fluid. This process is translatable, for a moment at least, by the movement of a detector (pendulum or rod). It is the interpretation of this movement that holds the key to the solution of our problem.

These two theories, mental and scientific, assure positive results in practice that can, in a certain measure, be considered equivalent. Personally, we consider the true radiesthesist one who orients himself with the latter path. Here he can benefit from recent discoveries in physics that permit him to elevate his art to a science.

Radiesthesia is more than ever the order of the day and, because of its multiple applications it seems to produce miracles. As simple amateurs we have no pretensions to claim miracles, or to lay an absolute foundation for a

rigid, error-free method. Moreover, the final success will not be, as in many other domains, the work of just one mind, but rather of a collection of minds. We only hope to bring, given our slender resources, a stone to the common edifice. This will be our contribution to this science of waves that has fascinated us since the beginning of our research.

One day we proved the presence of a phenomenon that until now seemed to have escaped the curiosity of radiesthesists (we hold this presumption at least, seeing that no works have appeared treating this important subject), the decomposition of the spectrum in a sphere.

This study, still incomplete, put us in an area that we believe to be unexplored, and that stems from terrestrial electro-magnetism bound to cosmic energies, those unsuspected but real forces that will warrant the most surprising future discoveries. We submit that this electromagnetism is in the sphere, the sphere being the intersection and center of emission of all vibrations. We have verified that a natural magnetic current passing through the poles crosses the center of emission. It produces at this center, in the form of visible and invisible radiations, a decomposition of wavelength analogous to those of a light spectrum, and these different color-rays distribute themselves on the spherical surface into precisely equidistant points. These radiations are identical to verified phenomena seen in the decomposition of a ray of white light through a crystal prism. It appears evident to us that we found ourselves in the presence of a complete scale from the longest wavelength, infra-black, to the shortest, which we have since named, *negative green*.

Our goal was to capture these different wavelengths for use in our radiesthesic work, thus birthing the *Universal Pendulum* and our theory of *The Decomposition Of The Spectrum In The Sphere*.

Please understand, the surprises were as many as were the discouraging moments. We found ourselves frequently faced with incomprehensible phenomena that we had never seen before. These phenomena were due to many causes: improper technique yet to be perfected, contamination of the waves, etc. We created more than two hundred detectors (instruments or experiments). Through all these trials, we have drawn conclusions and created a method, but we have merely caught glimpses of new horizons.

In pursuing our study of the sphere, we joined several spheres in juxtaposition by their opposite poles. In this way we were permitted to discover the *Radiesthesic Pile* [battery] in which the “voltage” is a function of the number of elements and the “current” that of the diameters used. Thus, we get, as in the electric battery, “voltage” and “amperage”. The ray

that emanates from one of the poles is always the green part of the spectrum, with its opposite, or “negative” green emanating from the opposite pole.

We claim absolute paternity for this Radiesthetic Battery, its discovery, its properties, and its applications. Furthermore, it was, along with the Universal Pendulum, the object of patent number 816.132, dated April 1936. This battery gave us remarkable results, both in mummification of meat, fish, eggs, and vegetables, and the healing of cancerous complaints.

Our Universal Pendulum is not only a receptor, but it is also an emitter. That is to say that in harmony with a color of the spectrum, the Universal Pendulum produces a wave when the operator initiates a circling motion. Moreover, this vibration is of the electromagnetic kind, and the voltage increases by a factor of 100 because of the insertion of a battery of four elements in the center of the detector.

At this point, the radiesthetic accumulator took birth, since it was revealed in testing that a disk of metal or of wood (the material matters little) could receive and retain a vibratory impregnation. This disk is balanced in order to reproduce the form of the opposite wave or the healing wave, which can be applied to a distant illness. Distance does not limit the possibilities for this radiesthetic accumulator. We see that, with its intervention, it is easy to transport waves or to impregnate a diseased organ at a distance, and even to establish a relay station by which any person, even one ignorant of radiesthesia, could, with the aid of a diagram, pick up the broadcast vibration and transfer it to his chosen place (his bed, for example). This transfer takes place through the intermediary of another accumulator, clear of all charge, which will impregnate itself automatically with the emitted wave. This wave is easily discharged in order that a new one be taken on each time that the accumulator-distributor changes its wavelength.

Since we possess a calibrated detector, we have been able to study the vibrations emitted by certain symbols or by statues such as those of Egypt and Easter Island.

The spherical pendulum and those derived from it, used as a receiver, permit us to make an inventory of these shape-generated waves, to determine the actions of the rays, and to determine the direction and location of their toxicity. This is not a result of our imagination, for we have furnished proofs, either by mummification of meat under the unique influence of the radiations from these shapes, or by the clear sensation of fatigue perceived by affected persons.

The reversibility of our detector leads us to think that sensing or detection is not the only possibility for radiesthesia. It is also an opportunity for giving. As always, in any case, the human body is the necessary intermediary acting like a sort of mysterious telemachine whose mechanisms are yet to be understood.

Further, in antiquity immensely powerful waves can be attributed to the enormous mass or shapes of the emitting apparatuses in which the waves were formed. Massive form was for some time the only sure way the ancients had at their disposal to coordinate the instruments they produced.

Could there not be another, less cumbersome, but just as vigorous way to produce radiesthesic energy? Here we want to talk about the radiesthesic dynamic, *movement*. Powerful in a different way, this alternate method would be capable of producing effects superior to those produced by means of mass; we have noticed that some machines designed to give a calculated ray impart the same radiation to a state of movement (in the form of a spinning top or disk), but of considerably increased intensity. Could this powerful speed-wave produce disintegration of matter within a naturally reduced field?

The Reece saw, whose circumference is smooth in comparison to ordinary saws, permits cutting metal without touching it: the cutting head advances regularly in the manner of a trolley with screw, without immediate contact with the saw, the metal edge throwing sparks. Curiously the metal casting falls without elevated temperature so that one can hold it in the hand. The explanations given by its constructors, unmindful of disintegration, do not seem convincing.

The diameter of this saw is 1.066 m. It runs at 2300 revolutions per minute, and its tangential speed in this case is 7700 m/min.

We think that explanations for many other phenomena will be found later by radiesthesia, but the most thrilling solution would be the discovery of an entirely independent automatic pendulum. In our opinion, the Universal Spherical Pendulum would be the most likely candidate to attain this end. The discovery would require effort, because it implies the existence of a radiesthesic motor. This is analogous to the way that the antique magneto was the ancestor of electric motors and of the monstrous alternators that emit waves that so disrupt our work. If our goals are realizable, they will require lots of experimentation and work beyond our own present possibilities.

So, on the whole, the content of what the reader will find in this book in the form of studies is, alas, still quite incomplete. Nonetheless, we

proceed with tenacity, delighted to receive aid or criticism from more expert authority, as we serve as path-clearers for a new way in radiesthesia.

PART 1: A GLIMPSE INTO ANCIENT RADIESTHESIA

CHAPTER 1: FROM PREHISTORY TO THE MODERN AGE

Prehistoric hunting. Law of Similars. Wand of Commandment. The Spell.

Radiesthesia has already excited many patient researchers who have done important work, and, after many years it has taken its place in modern life. It is not, as certain minds might suppose, a novelty of our century or a brilliant invention emerging from the mind of the post-war human. The word *radiesthesia* is certainly new, but it suggests a science as old as the world inhabited by intelligent beings. Surprisingly for some, it is a science ruled by laws: secret laws from the highest antiquity.

How did the ancients discover these mysterious forces, then use them for hunting and tracking purposes or for satisfying their revenge, while having so little-advanced a civilization that their only weapons were their carved flint points and Herculean strength?

Without a doubt, this question will always remain. We find, however, at the bottom of the grottoes and on the walls of caverns occupied formerly by our ancestors, traces of this inborn radiesthesia.

Audacious explorers, like Norbert Casteret, have discovered, crudely sculpted in the subterranean caverns of the Pyrenees, proof of the black magic which permitted the hunters of the prehistoric epoch to paralyze big game first in order to capture it more easily.

To arrive at this end, they drew on the walls of their underground homes the form of the desired animal that was spotted beforehand on one of their hunts. Then a stylized hand, placed ordinarily on the flank of the beast, marks the will and the power of the human over his victim. (See Figure 1.)

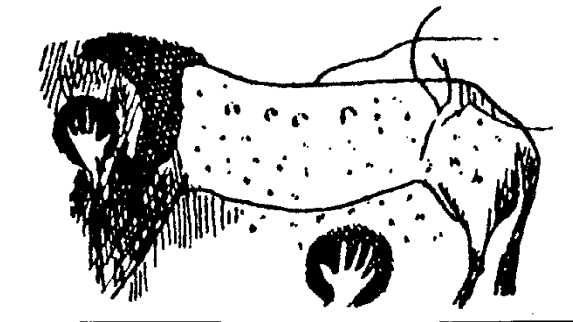

Figure 1. Prehistoric bewitchment through the action of the hand.

Here is more on the subject addressed by Norbert Casteret in *Ten Years Underground*:

The Aurignaciens and the Magdalenians, essentially hunters, aimed to favor the success of their hunts by preceding them with ceremonies of which the significance appears to be better and better understood as the prehistoric discoveries are carried out.

During enchanting magical séances, they painted the animals they hoped to kill, including wounds, thus killing the animal in effigy, in order to make sure, on the day of the hunt, of the real capture of the previously bewitched beast. (See Figure 2.)

Thus are the signs, the holes, the arrows, axes, and clubs that show on many of the animal drawings explained. Sometimes the intention of the primitive hunter is even more explicit: the animal is shown falling into a trap, into a net, succumbing to a stoning. This theory certainly appears incontestable when one considers the lions and wolves of the Montespan cave, which are riddled with blows of spears and arrows, placed with precision in the animal's vital parts and with so much violence and furious energy that, sometimes, the statues have crumbled.

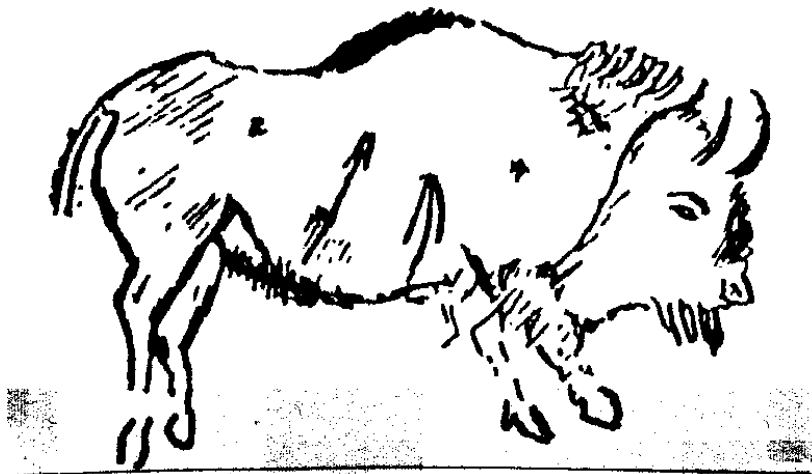

Figure 2. Prehistoric bewitchment by means of blows.

From all the evidence, the prehistorics knew about bewitching, which is an aspect of the power of waves. How does this mysterious power operate?

We are certain that it acts by the play of continuous waves through the Law of Similars, which we will try to explain briefly.

We accept that all bodies radiate, vibrate, and emit waves, which, simply because they are not apparent to our senses, cannot be denied existence. These infinitely small, yet so potent, radiations originate from the same principle of life. We live in a healthy body when we vibrate in synchronism with the wavelength determined by the Creator. This wavelength corresponds to a state of perfect health. Should the harmony of this equilibrium be disrupted, sickness or death rapidly ensues.

And yet, these vibrations of living matter can be collected and photographed through the marvelous lens of the human eye, which then registers the shape-generated waves for transmission to the brain, which serves as the sensitive film or plate. With eye as intermediary, the brain reproduces an image in the same way a projector produces the positive of a photograph on a sheet of paper, the surface of a wall, for modeling a statue, etc.

The print of this invisible snapshot possesses absolutely identical form and vibration with the original. Because of this, the print remains mysteriously linked to the original by the field of continuous connecting waves that always build up between two like things. Henceforth their condition is tied together, and all injury received by the “double” will be felt more or less strongly by the chosen victim. All poison rays sent will touch it and disequilibrate its state of health. Is the targeted organ vital? There will rapidly be illness, paralysis, or even death, according to the state of resistance or deficiency of the central nervous system.

In reality, man, through his eye, is sensitive to radiations of the animal image that he paints; and the primitive people, who possessed the remarkable talent for radiesthesia quickly made use of this power for the success of their hunts.

For tracking big game, they had an instrument known as “the wand of commandment”. (See figure 3.) This wand was simply a pendulum featuring drawings of animals on its surface. Generally constructed of wood or reindeer bone, the magic wand of commandment was a perfect long distance detector for hunting the pictured animal. Straight or bent, it was pierced at the top by a hole serving as a passage for a cylindrical shaft of wood or bone that the man held horizontally in his hand by its end. The wand-pendulum danced around this support (through the law of

continuously connected waves), as soon as the hand of the other arm, forming an antenna, captured the deer-radiation at whatever distance the animal would be found.

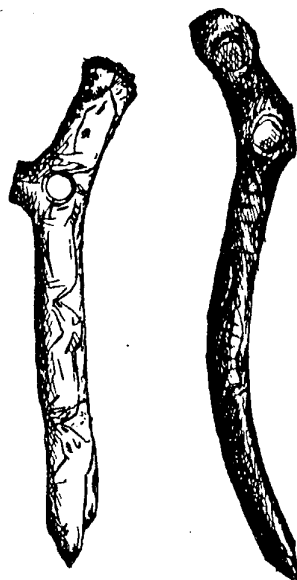

Figure 3. Wands of commandment.

In order to spot other big game the Magdalenian eliminated from his brain all the drawings of the animals delicately carved on his wand in order to retain only the object of his hunt: this is called mental selection. The man was then certain to capture radiations from the coveted animal by using his brain like a selective radio receiver, ignoring all the waves except those he wished to receive.

This power of radiesthesia, of “sorcery”, was known in the Middle Ages by the name of bewitchment (in Latin *invultuare vultum effingere*: to make an effigy of someone). “Bewitchment”, “sorcerer”, “diabolical influence” were terms used at that time. Today we say, “Law of Similars” and “fields of continuous waves”.

If radiesthesia obeys the rigorous laws of physics, then it demands to be practiced with a pure and right conscience. While God has created man free, there is no freedom from responsibility or from the moral obligation responsibility requires. The radiesthesist worthy of the name uses his art only for purposes of good and of noble causes.

This is why, in other times, people who indulged in spellbinding practices on wax statuettes that were connected to the form of a designated individual were condemned to torture by fire. The justice system states that

the pin that pierces the heart of the statuette each day eventually causes a mortal wound in the unfortunate whom the statuette represents. Similarly, to dry out or melt the figurine in the fire causes its original to disappear fairly quickly.

History furnishes several examples of accusation of witchcraft. At the time of the trial of Enguerrand de Marigny in 1315, Louis X desired leniency, but Charles de Valois, who wanted to bring about the downfall of Marigny, pretended that the wife of Martigny had attempted to bewitch the entire royal family. This destroyed all the feeling of mercy in Louis' heart.

Later, in 1617, Leonora Dori said Galigai, widow of Concinci, Marshall of Ancre, had hounded her and condemned her for having dominated the spirit of Marie de Medicis; she said also that she had put waxen images in some coffins.

This kind of spell was an ancient tradition and one finds the following passage in the book of the *Laws of Plato*:

It is futile to try to prove to certain strongly prejudiced minds, that they do not have to worry at all about the little figures of wax which one would put at their door, or in the squares, or on the tomb of their ancestors, and to exhort them to scorn them because they have at one time confused the truth of these evil spells. He who sets the charms, enchantments, and all other evil spirits of this nature, has black designs by these feats. If he is a seer, savant, or versed in the art of committing these acts, "qu'il meure" (may he die). If he has no knowledge of these arts, he is convicted of having used evil spirits; the tribunal will decide that he must suffer in his person or in his goods.

In the sixteenth century, the casting of spells was quite popular. They know that the duchess of Montpensier frequently used evil spirits against Henri III and that she resorted to the dagger of Jacques Clement after several failures probably due to an incomplete knowledge of the Law of Similars.

Catherine de Medici also used enchantment on herself several times, while in every respect anticipating terrible punishments. Until La Mole and Coronas had delivered the final tortures, she demanded to know if they had bewitched her. This is, indeed, the moment that the efficacy of this practice was admitted. There was no more security, even in the bosom of absolute

power, and the guard watching over the barricades of the Louvre could not defend the kings from it.

CHAPTER 2: CHINESE RADIESTHESIA

Ba-gua. Yin-Yang. Radiesthesic Acupuncture.

We just briefly described certain practices used in the prehistoric period and in the Middle Ages that seem radiesthesic to us. Between these times was an even more interesting period in China during which radiesthesia attained a degree of perfection that raised it to the level of a science.

Indeed, the Chinese epoch, around 3000 years before the Christian era, saw the development of what we can call the radiesthesia of the material plane.

The instrument for study of the shape-generated radiation from surfaces is the Ba-Gua, invented by the emperor Fuh-Hi, and actually still very much in use in China. It is a board of eight signs formed by broken and complete lines arrayed in an octagonal layout. The center of the octagon features a circular and moving figure, the yin-yang. (See Figure 4.) With unequalled precision, this is an emitter-receiver of the properties of radiation of all the vibrations of the universe, from infra-black to negative green. The radiation escapes from all sides of the octagon and the complete cycle of the spectrum can thus be detected in the area surrounding the entire circumference. Placing it exactly on the North-South line can further augment the powerful emission of this brilliant instrument. A witness placed at the center permits detection at the same time of both the malady-vibration and the remedy-vibration. In exposing the torso of a sick person to the action of this healer wave, he can obtain the most encouraging and positive results.

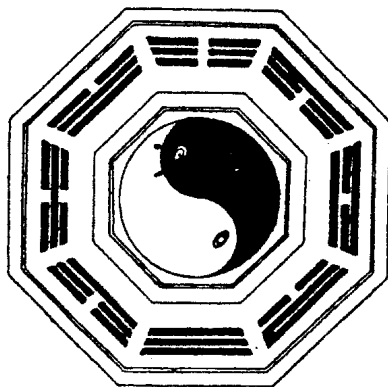

Figure 4. Magnetic combination of a Ba-Gua associated with its Yin-Yang.

What was the detector used by the Chinese to classify the waves of their Ba-Gua? Was it a pendulum, a rod, or simply the sensitivity of the subject? (It is known that certain radiesthesists are actually able to detect radiations through particular sensations affecting certain parts of their body.) It is very difficult to learn about it because the holders of the Chinese mysteries are associated with sects that observe absolute discretion. Their affiliates know that a release of secrets made by one of them would lead to a condemnation whose execution would always remain a mystery.

Nevertheless, in studying the Ba-Gua with a Universal Pendulum, it is very easy to analyze and to catalogue the vibrations that are emitted from the sides of the instrument.

This instrument was certainly designed for multiple uses, including the study of ground radiation (ores, springs, etc.), which in toxic wave detection are called “veins of the Dragon”, and on which the Chinese are careful not to build. It serves yet, as we have said above, for the study, detection, and healing of illnesses, because these very observant people have judiciously noticed that two people having the same malady emit identical waves corresponding to the same signs of the Ba-gua.

It is among the infinite abilities of this instrument that we locate these marvelous possibilities of ancient Chinese radiesthesia, possibilities that even today remain alive in this country where all continues unchanging, since its principal foundation instrument is still used. This method, having given satisfaction for thousands of years, speaks for itself.

And who knows if acupuncture was not discovered thanks to the Ba-Gua? It is a certain fact that a Universal Pendulum, charged, or rather, harmonized to the contrary wave, can neutralize a wave-illness it detected by “piercing” the patient with waves or radiesthetic touches. Doing this, one affects the central nervous system; the nerves automatically conduct the healing wave to the location of the illness and nullify it.

The Chinese practitioner, a patient man for whom time counts for naught, has meticulously discovered the specific points on the body that correspond to each illness. Ignorant of healing by radiesthetic injections, he stirs up the central nervous system with a real needle.

CHAPTER 3: EGYPTIAN RADIESTHESIA

Cross with Handle (Ankh). Pharaoh's Scepter. Looped Cord. Uraeus (Cobra). Sphinx. The Pyramids. Radio in the Time of the Pharaohs. Radiesthesia Compass.

In a region much longer than that of China, the people of Egypt reached a high degree of civilization using radiesthesia with extraordinary mastery. This was only a prerogative for the upper class. The priests transmitted Radiesthesia orally through the centuries; the secular people saw nothing. Radiesthesia was kept hidden, and waves were disguised in forms that did not alter their behavior.

In Egypt, radiesthesia was understood more completely than in China. Shape was the foundation of wave emanation, but if in the country of the Son of Heaven it always showed chiefly on two-dimensional surfaces, by the shores of the Nile it was practiced simultaneously on surfaces and in three-dimensional volume and mass.

We submit to the reader the fruit of our observations from the radiesthesic perspective that bears on the study of particular Egyptian expressions.

The consequences of desecrating the Pharaohnic tombs, in particular that of Tut-Ank-Ammon in 1922, have surprised the public; but we know that almost all the persons who participated in Howard Carter's discovery of this tomb died prematurely. The deaths remain mysterious and defy medical authorities.

They have alleged, in order to explain the deaths, that the tomb of Tut-Ank-Ammon was intentionally erected on toxic earth-waves issuing from the soil. It appears indeed that toxic waves existed beneath and around the tombs, but they were not found powerful enough to cause death in man, and certainly not the deaths of all the members of the Carnavon mission. These natural waves, if they were dangerously toxic, would have the same destructive power outside the tombs as inside, and the numerous travelers through the Valley of the Kings will be its constant victims.

It is then permissible to suppose or admit that these radiations have been created artificially to protect the remains of the pharaohs? By what process? Very probably by violently poisoned waves carried by the shape-generated waves that were no secret to the Egyptians.

We treat this important issue of shape in the third part of this work. When the reader knows that it is possible to make and obtain the shape-

generated waves of infinitely superior power to those found in their natural state in the soil, he will certainly make the same conclusions as we have.

If Egypt knew the processes for rendering a healthy environment toxic, she also possessed ways to protect against this toxicity.

THE ANKH (cross with a handle). The handled-cross, or the Key of the Nile, might be in Egyptian translation, Sign of Life or Gift of God. Here is the proof of it. It was a talisman (See Figure 5.) reserved for the aristocratic class. Its efficacy was no doubt due to the requirement that it be held by a man in the right hand, and by a woman in the left hand (if the polarity at the home of one or the other was not reversed). This ankh was, nevertheless, very harmful outside of the usage for which it had been designed, and harmful if it was not held by the handle or by the proper hand. This toxicity makes it a two-edged weapon, for its vibration is not in harmony with human vibrations. Indeed, through its handle the Key of the Nile emits positive green of the spectrum. Through its very tip comes the contrary wave known as negative green.

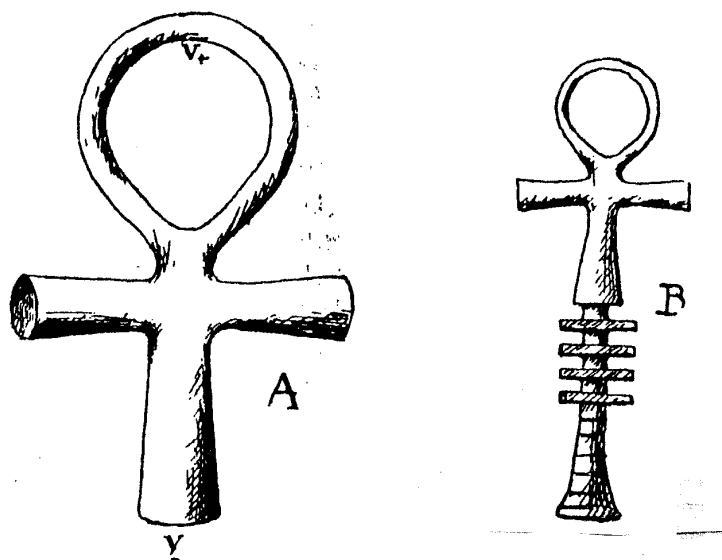

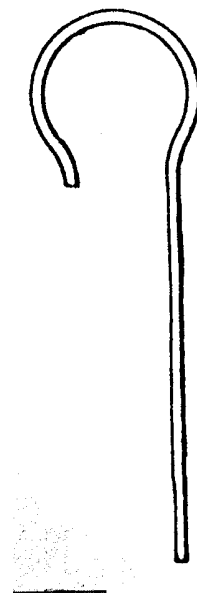

Figure 5. Egyptian handled-cross. A) Simple model. B) With battery.

THE PHARAOH'S SCEPTER. The rather ordinary Pharaoh's Scepter (See Figure 6.) with the recurved hook form resembling a horseshoe magnet of unequal legs possessed the same beneficial properties when it was held by the longer end. It is, moreover, an excellent detector when the loop rests on the edge of the forefinger, making movements like the ancient wand of commandment.

Figure 6. The Pharaoh's Scepter.

THE LOOPED CORD. Another way to banish noxious waves was to hold in the hand or carry in the belt a looped cord (See Figure 7.) bent backward $\frac{2}{5}$ of its length. This process was often employed by shepherds who used it at night for protection against cold.

Obviously, the identical processes of these three forms did not come about by chance. The Egyptians became masters of the science of waves to the highest degree. They studied the effective shapes and put them in obvious places while veiling them in ordinary appearance.

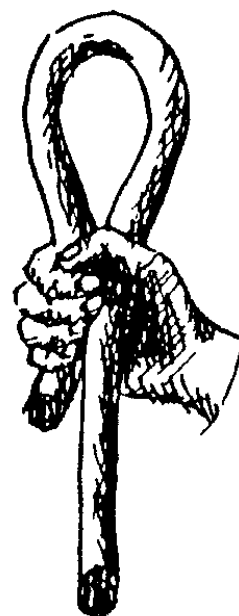

Figure 7. The coiled loop.

THE URAEUS. The Uraeus, the sacred serpent (See Figure 8.) that decorated the friezes of monuments and the pschent, or double crown headdress of the Pharaoh and the forehead of his spouse, project powerful waves. Aligned in series, they combine their strength until they produce a dangerous environment for human creatures finding themselves in range. What could be the use of this serpent on the brow of the kings and queens? One could suppose that it was, through its powerful wave, intended to carry the wave of the thought of the thinker, to give it more force, and to make it penetrate to advantage into the brains of the subjects.

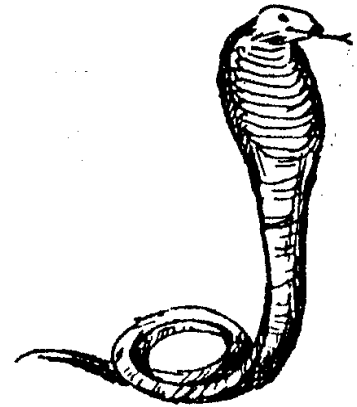

Figure 8. Uraeus

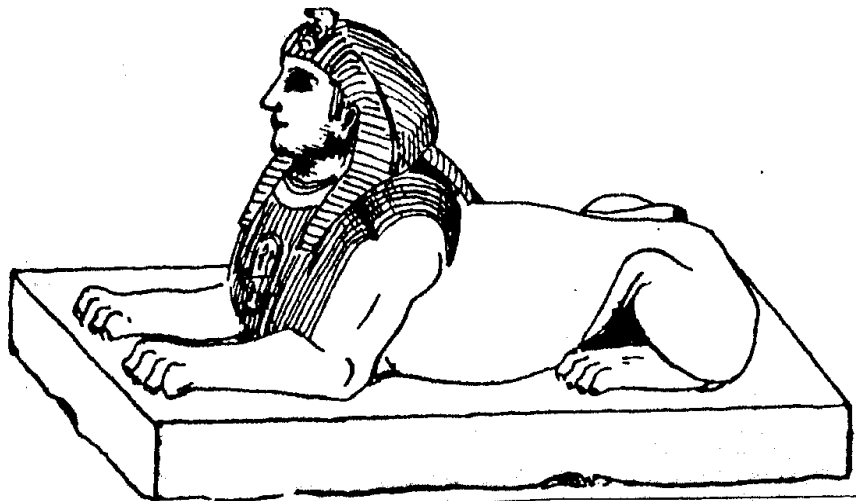

Figure 9. A type of Sphinx.

THE SPHINX. The sphinx is a fabled monster of Egyptian origin. One finds it represented in the form of a reclining lion, with the head of a man or woman. Sometimes it has a ram or sparrow hawk's head. Other types of sphinx: the *androsphinx*, a sphinx with the head of a man; the *criosphinx*, a sphinx with the head of a ram; and the *hierocephalic* sphinx, with the head of a priest or sacred being. (See Figure 9.)

In Thebes, the visitor arrives at the grand Temple by a long avenue bordered on each side by a line of sphinx. The largest sphinx to be discovered in Egypt is found near the Great Pyramid. It measures 17

meters from the ground to the top of its head, and 59 meters from the end of the tail to the ends of its paws. It is carved almost entirely from a single block of rock, and its construction dates from before the construction of the Pyramids. It is not imaginable that the Egyptians undertook such colossal travail for the sole pleasure of making works of sculpture. It is very certain that this form had another objective. The rays that it emits seem to indicate that the sphinx possessed a radiesthesic role of premier importance.

If one studies the sphinx in its setting in Egypt (in one of Champollion's illustrations) with the aid of a detector and empty witness, positive responses occur on the body of the animal. These reactions seem to be situated in the intestinal area, implying a sort of labyrinth whose end disappears under the Great Pyramid.

THE MUMMIES. Everything reveals that in Egypt, radiesthesic science was applied in a unified way. The colossal statues, in their standing priestly bearing, have their range of projected waves, but the statues of the mummies found in museums or collections emit the same amount of very powerful waves. The particular posture of these statuettes (See Figure 10A and 10B), otherwise known as the "double" of these mummies is legs squeezed together, arms crossed against the chest, giving height to the forearms, and directing very powerful emitted waves. We assume, or, rather, suppose, that in a genuine mummy they have inserted a violent poison: the waves produced by the shape and form become carriers of the poisonous wave. This acts on the living with all the intensity of a venom absorbed by the organism.

Figure 10A. Egyptian sarcophagus.
Figure 10B. Statuette of Egyptian mummy.

The statuettes are themselves dangerous and we personally have had experience with them. M. Lacroix-a-l'Henri shipped us one lot of authentic statuettes that the owner wished to get rid of because of health troubles he had experienced since he had been in possession of these mummies. M. Lacroix himself had trouble working and experienced violent headaches when these statuettes stood on his desk. Although given warnings, we are skeptics, and at the end of several days we succumbed to the same illnesses, aggravated by the complete loss of sleep. It became necessary to surrender to the evidence and find ways to neutralize these contra-polar toxic effects and bring them back to the magnetism of the earth.

Remarks: Technically, we can confirm that a pendulum having a well-defined polarity, negative or positive, reverses its polarity if one tests it on the inverse wave close to the mummy. This demonstrates the power of the emissions of this form.

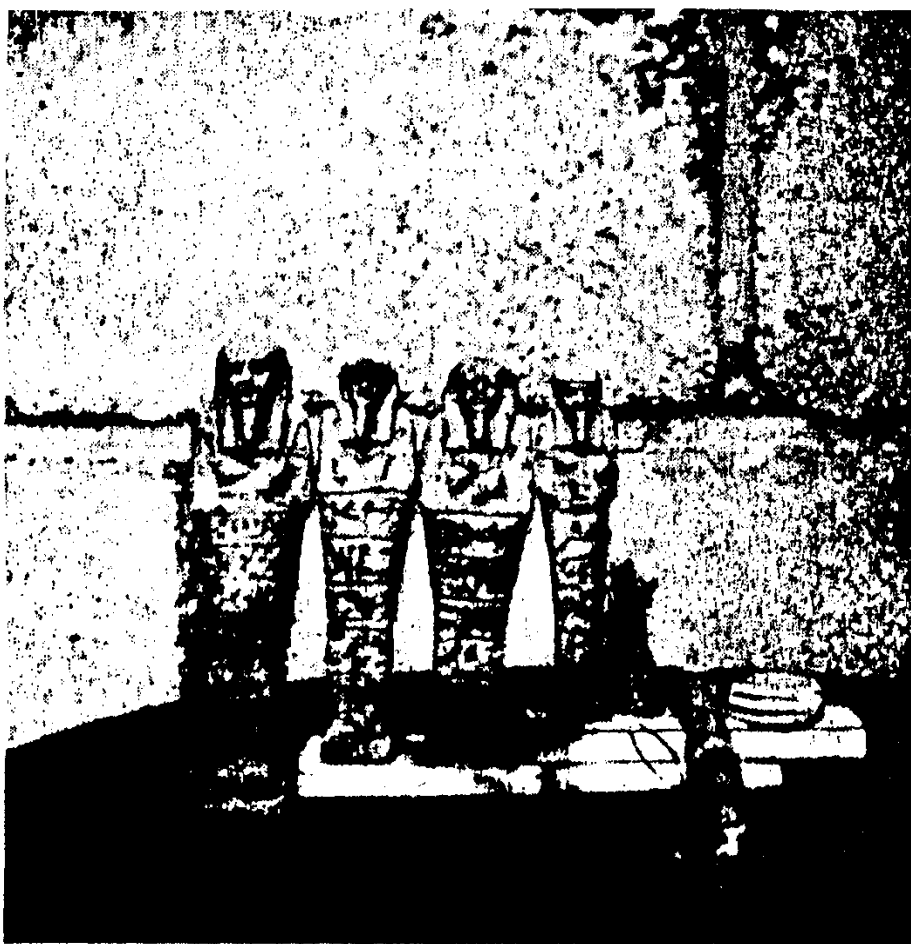

Figure 10C. Statuettes and genuine Egyptian objects.

Egyptian science: the first hypothesis: *The Pyramids are radiesthesic beacons*. This knowledge held by the Egyptians, in all domains, as much in astrology and mathematics as in geography, is of a precision that still confounds qualified scholars. How can we accept that this science was so advanced in an epoch when the scientific instruments and precision were so far from equaling ours?

They measured, for instance, the diameter of our planet with a disconcertingly rigorous exactitude (*Mysterious Science of the Pharaohs*, by Abbé Moreux).

They even built the Great Pyramid 30 degrees from the Equator, and on a meridian that not only divides the delta of the Nile precisely at the crossing of its diagonals, but also divides the landmasses of the earth into two equal parts, while crossing the maximum number of continents.

In an epoch when science and nautical construction did not allow for adventure and exploration from one hemisphere to another, such precision remains a mystery. Ancient maps made even after the pharaonic centuries were vague sketches, and they did not actually represent the exact geography.

Two explanations occurred to us: either the Egyptians held secrets from the distant past of their Atlantean ancestors; or, they called upon their prodigious radiesthesic knowledge in place of exact science, and they used the process of detection on the map, or teleradiesthesia, as was emphasized twenty years ago by Abbé Mermet.

Next we will study the pyramids. They are the most interesting if we examine them with our precision instruments.

Were the pyramidal qualities that we hypothesize used in other times? It is difficult to imagine that their radiation was not known and that the construction of these pyramids, especially that of Cheops, was not conceived with radiesthesic objectives alongside other scientific objectives already indicated in numerous works.

This is why we hold the belief that they were used as a radiesthesic beacon serving not only sailors, but voyagers in the desert as well. Although deprived of its limestone covering the huge mass of the great pyramid still emits a wave that is estimated at 2°5 in the East-West direction. This radiation is considerably augmented when oriented in the North-South position, and is in good accordance with the geography of Egypt along its entire length.

How can this beacon function? just by its form. The experiment is easy to verify: a pyramid in the laboratory (See Figure 11.) was placed in

the center of a piece of paper. Then we used the Universal Pendulum to detect emitted waves. Consequently, it was possible to document a sort of spectral compass-rose composed of colors in their invariable positions from infra to ultra.

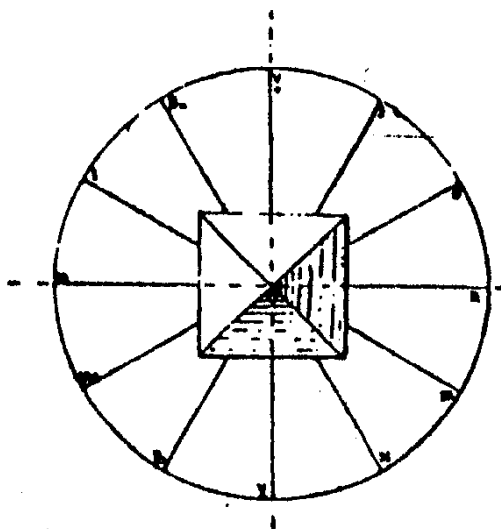

Figure 11. Horizontal distribution of the rays of color emitted by a pyramid.
 12:00 – Positive Green, 1:00-Yellow, 2:00-Orange, 3:00 Red, 4:00-Infra-red, 5:00-
 Black, 6:00-Negative Green, 7:00-White, 8:00-Ultra-violet, 9:00-Violet, 10:00-Indigo,
 11:00-Blue.

One can now easily comprehend that a navigator or a traveler in the desert, with the aid of a pendulum giving the complete range of the spectrum, could translate the color in degrees in each sector of waves thereby obtaining his orientation through resonance with the emitting monument.

One might object that three pyramids of considerable mass, consequently giving off three parallel rays of the same color, separated from each other by a maximum of about two hundred kilometers, could spoil the precision of the operation. Certainly it would affect only the observer finding himself at about a thousand kilometers away, for example.

On the other hand, it was possible to recognize the characteristic ray of each pyramid; each of them had its own radiation propagated on the color-ray in the manner that a modulated wave is carried on a Hertzian wave. They had, respectively, waves in accord with orange, infrared, and black, as our signal towers have their special indexes and frequencies and their own length. The characteristic colors for each pyramid were perhaps related to their different masses. In any case, one could hold in the hand the

chosen color (orange, infra-red, or black) in order to capture only the rays of the pyramid that emitted them, eliminating the other two automatically.

The ability to discern one's direction on the sea or on land, by resonance with a fixed point, was already a large advantage, but there was another piece of complementary data necessary to fix one's position: the distance from the fixed point of the navel of Egypt. This was possible, either with the Universal Pendulum, or with a ruler graduated in distance measurements related to a determined point and used as a neutral pendulum.

Second hypothesis: *The pyramids are signal towers.* Outside of its role of radiesthetic beacon, the Great Pyramid, which, following the wise conclusions of the Abbé Moreux, was the living and complete form for Egyptian science, must have embodied other properties than just those of the sciences of mathematics, physics, and astronomy.

Was it not the signal tower at this epoch that permitted the pharaohs to communicate and to dictate their orders to the people? A sort of radio was functioning then, although no one until now has ever discovered the mechanism.

To this point of view, however, the interior study of the pyramid of Cheops is the most suggestive. We know from the work of the Abbé Moreux: *The Mysterious Science of the Pharaohs*, that the king's chamber contained a trough considered by some people to be the interior part of a sarcophagus. This is not the opinion of the Abbé nor is it our own. The trough, too deep and vast to serve as a coffin, is of a perfect size for a rectangular prism. Its interior capacity is exactly half of its total volume, and this is probably the proportion that gives it the property of resonating like a bell at the slightest blow. On the other hand, this trough is placed in a rectangular chamber of which the volume, 50 times larger, is indicated on the walls by the obvious joints. Over the chamber in question are five cells of the same base surface area, it seems, but of smaller height. These spaces attributed by the Egyptian scholars to the constructors need to discharge the enormous weight pressing from above. This reasoning does not seem to us to conform to reality, especially since the queen's chamber, situated well below, and by consequence beneath a mass yet more formidable, does not have these compartments, and yet resists the pressure it receives.

From our point of view, the five cells over the king's chamber (actually in communication by a central hole that did not exist at the time of construction) had an essential radiesthetic role: for us they were a radiesthetic battery necessary for intensifying the wave carrying the color

blue which mounts vertically from the king's chamber. Was this wave considered the best for transporting sound? Perhaps one day in the future we will have sufficiently advanced our work to be able to confirm this without error.

Nevertheless, we find again this blue wave in other instruments, even Hebrew ones, as in the Molten Sea, where the blue wave is engendered by the support structure of twelve cattle in four groups of three animals each.

In addition, there were the twelve vases of bronze in one-fiftieth of the volume of the Molten Sea, which was, itself, the same volume as the king's chamber. A curious coincidence, leaving us to suppose that the Hebrews were intercepting the Egyptian secrets.

And the receptors for these waves? one might ask. One exists in our museums, at least at the Louvre: an Egyptian piece of furniture or stand that is encircled by the Key of the Nile and the radiesthesis battery. These ornaments afford this piece the property of blue emission on its flat top and at the center of the vase. (See Figure 12.)

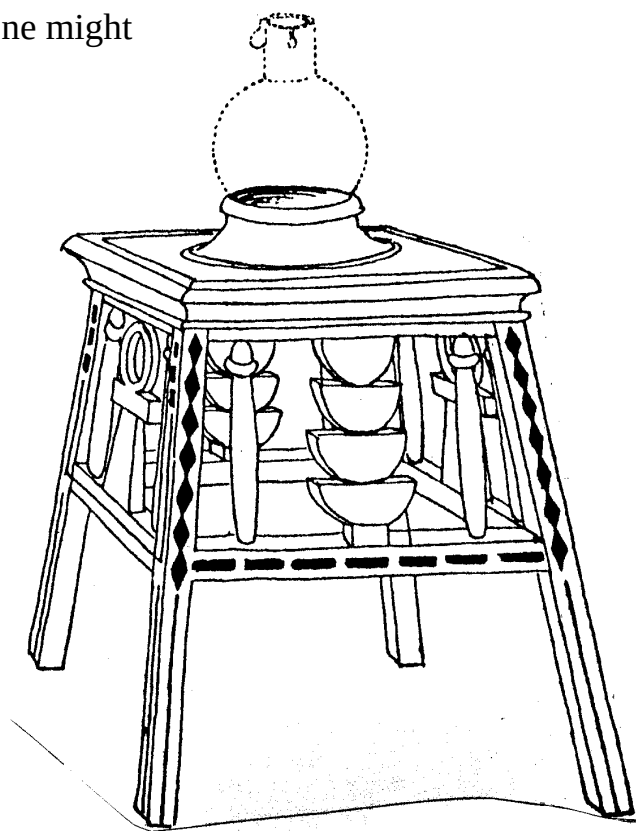

Figure 12. Egyptian furniture that emits radiesthesis waves.

What was the vase of this receptor like? Was it a resonator sounding F# in the shape of waves actually existing in physics, or a vase in which something could be kept and simply by its shape emitting the blue wave?

We do not have a conclusion, but it would be strange that all these things together had not been conceived for a special objective, and that seems to us to be the transmission and reception of sound.

The radiesthesic compass. One might ask how navigation in the pharaonic period could have been accomplished under conditions of safety necessary for the relatively distant expeditions at that time.

We are coming to the view that navigation in an area rather near to the delta of the Nile was already an easy thing, but like the influence of the rays from the pyramids, was confined to a limited distance. Another mode existed, outside of the compass, for making one's way on the sea. The compass was not yet known, and it is certain that Egyptians called upon radiesthesia for navigation.

Here is a process that we have formulated that may have been possible: imagine a disk of a common substance. At its center we place a proportionate pyramid such that in the middle of one of its triangular faces a special pendulum detects the positive green ray.

If we permanently fix a system on a boat in such a manner so as to align this ray of the pyramid with the axis of the vessel, we discover on the circle of the disk two areas where the detector gyrates (See Figure 13.), one at the positive green on the face of the pyramid, and the other at a variable point according to the direction of the boat.

This second point corresponds, we think, to geographical North. The direction of the boat by relationship with North could be read in degrees on the disk.

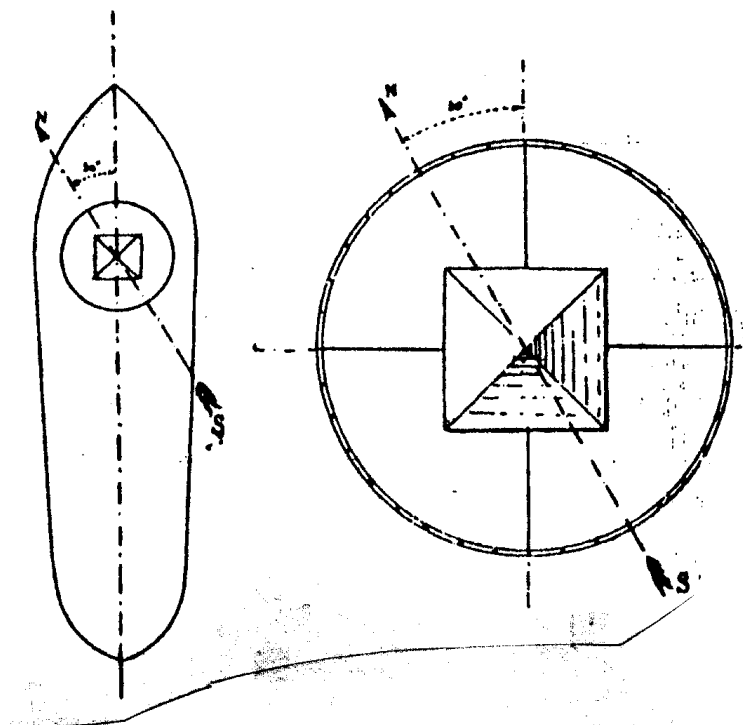

Figure 13. Radiesthetic solution for the compass

CHAPTER 4: RADIESTHESIA OF THE AMERICAN INDIANS

The Indian Conch.

The Indian Conch. Knowing that the Chinese and the Egyptians understood the secrets of radiesthesia at practically the same time, one ought not to ignore that such knowledge could exist at the same time on a completely different continent: America.

We owe this revelation to M. Turenne who cited in one of his books, an instrument of high value: the Indian conch shell.

This discovery suggested to us several reflections. Either the Indians found radiesthesia for themselves, or they got it from other people. In the latter case, it would be necessary to admit that their distant land was not always separate from the former continent.

It could also be, and it is nearly certain that, these men were the descendants of a very ancient race that kept, like all the previous races, the secrets of Sacred Science.

With regard to this issue, here is what Denis Saurat has written in his recent work, *L'Atlantide*:

Some three hundred thousand years ago, a well-developed civilization, very different from our own, was established in the Andes, at a height of three to four thousand meters above the level of the Pacific Ocean. However, at that time, the ocean rose to this altitude in the mountains, and the civilization of Tiahuanaco was situated on the edge of the sea. That is to say that the air was breathable there, while now there is almost not enough in these regions.

Why were water and air present at such height? It is because a satellite of the earth, of the kind of our actual moon, was at a distance of only five or six terrestrial radii from us. In place of a tide, comparable to what we have today, which rises and falls because our moon is about 60 terrestrial radii from us. The tide, due to the strong gravitational force of the moon, did not have enough time to go back down again: this powerful moon rotated too fast around the earth. In addition, all the waters of the world were crammed into a permanent tide that formed a fixed bulge around the earth. This bulge rose more than 3000 meters in the Andes region. This is

proven by a line of marine deposits that one can follow for 800 kilometers at these altitudes.

In this area of the civilization of Tiahuanaco, and of the region of Lake Titicaca in general, gigantic ruins remain. The oldest chroniclers of South America report to us that when the Incas reached these parts, they found the ruins there nearly in the state in which we find them today, making them immeasurably antique.

The carven stones show characters which one can find nowhere else until now. First, their dimension: one of these statues, of a single piece of stone, measures more than seven meters high and weighs ten tons. There are dozens of monolithic statues of this kind, all transported from far away.

This potent documentation from a reliable source goes to confirm the logical theory that a number of experts support. It gives a glimpse that man in his origins long ago possessed a superior science to that of the people who are his descendants.

During an entire period before the Egyptian and Chinese periods, humanity lost more than it gained, and the fragments of science that were saved in radiesthesia were the relics of a complete science.

It is important that we observe this phenomenon that we have discovered in the land of the Indians: a radiesthesia of shape such as we found in China and Egypt.

In the third part of this work we will give a complete study of the rays of the Indian conch whose form so strangely resembles that of the snail.

CHAPTER 5: EASTER ISLAND

Statues. Tablets.

We cannot terminate this historical section without addressing the enigma of Easter Island. Numerous missions have studied the island in minutest detail. Evangelized in the past by the congregation of the Fathers of Picupus, the natives of this land still maintain their church and continue to celebrate the festivals and Sundays. Lacking a priesthood, a secular person faithfully follows the divine offices and upholds the rudiments of the Catholic religion among the populace. The natives, few in number, ignore all that has happened on their island or describe fantastic stories that appear in legends that the scholars sent into the missions did not believe.

The mysterious coastline of Easter Island provides evidence of a great civilization long disappeared. Could its fate be related to that of Lake Titicaca to which we alluded in the last chapter? In spite of weather and prolonged systematic and indiscriminate destruction, the huge statues that were originally on the island are still there, standing or lying down, discreet guardians of their distant past.

Carved of volcanic rock found locally and planted in the soil along the coast on the *ahus* with which the island abounds, the dimensions of the statues are completely variable but always imposing. Certain ones reach a height of nearly 16 meters. The statues are menhirs featuring superhuman traits which, according to Pierre Loti “caused fear”. It is very difficult to locate the original sites of the fallen or broken ones. Very few remain standing intact and certain ones still lie on the slope of the volcanoes where they were sculpted. What sudden catastrophe came to wreak havoc on this busily working country, reducing its population to nothing?

If we refer again to *L’Atlantique* of Denis Saurat, we learn that the destruction of this high civilization must have developed in the tertiary era when the third satellite climbed up in this epoch around our planet. It disintegrated on the earth, provoking seismic cataclysms and movements of the oceans that shattered the continents and annihilated much of humanity. This was the golden age of good-humored giants, whose many fleets of ships sailed back and forth across all the seas of the globe, using the Andes for their base of departure.

Listen to Denis Saurat:

Extremely powerful reasons must have caused the erection of the stone giants of Easter Island. The state of civilization perfected in Tiahuanaco was reflected even in the faces of the colossi, inciting us to imagine one of the beginnings of humanity at this location. The huge sculptures were erected in the civilized communities where work was done communally and in harmony, between gigantic beneficent masters and crowds of grateful humans, in the same manner as our cathedrals were constructed. However, in these communities of Titicaca, the royalty were giants and actually seemed to have put hand to travail. We can even think that the Egyptians themselves, when constructing the colossi for their god-kings, remember the happy times when the giant Osiris taught them sculpture and thought that it was necessary to give to a dead god a statue in his size, so that he could return without difficulty or disruption.

A little further on: We can legitimately imagine that the humans of Tiahuanaco, a port on the sea, had boats that made the tour around the world on their bulging ocean. A culture covering all the inhabitable earth was unified by maritime traffic. How can we explain otherwise these startling similarities? The cromlechs of Morbihan and Malekula? The giants on Easter Island? The legends of Greece and Mexico? Degenerated fragments of a high civilization that can be set around three hundred thousand years ago.

Without taking a position, yet from the perspective of the radiesthesic plane, it seems to us that the huge statues play a considerable role in the life of the island and serve a very precise purpose. The natives, who have sculpted them and then placed them around their island, have not gone to such enormous trouble without important, major reasons, or just for the pleasure of decorating their territory with human masks. This done, they called on the services of the play of waves: this natural force was a necessary adjunct for all ancient peoples. Maybe this notion allows us to lift up a corner of the veil covering this mysterious event.

When examining the statues, what strikes one at first sight is their proportions: strange, horrifying, and superhuman, giving them the property of very powerful wave emission (See Figure 14.).

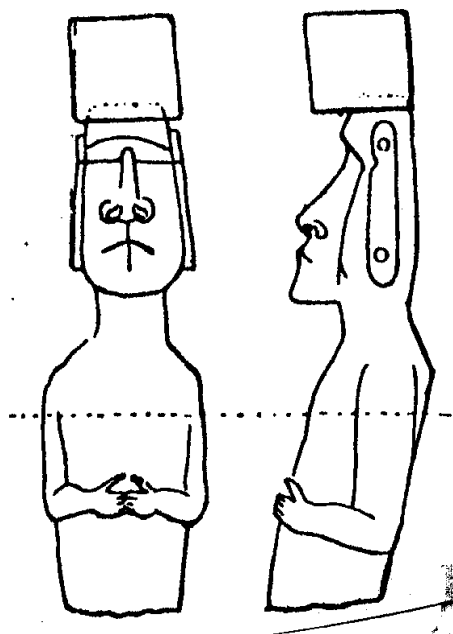

Figure 14. Front and profile of Easter Island statue.

To what can we attribute this trait? To the volcanic matter of which they are made? We think not; for us the material is a matter of indifference, but the shape is causal. How do we prove this? By making a like effigy in wood, as we have done. In making this model, we were able to notice that as the statue took form, the polarity moved, turning perpendicularly to the original polarity of the piece of wood. Strangely, it produced in front of the statue the plane of the waves of color, starting with negative green and continuing with white, ultraviolet, violet, etc.

Actually, these are not precisely planes. These zones of waves might rather be called “periods” because they have a variable density corresponding to the size of the statue.

In order to be certain that we were not victims of illusion and autosuggestion, we determined the exact placement of the zone of mummification, and there we placed a morsel of meat. After three days, it was perfectly mummified and reduced to one-fourth its original volume.

This test, compared to others, realized with our instruments, permits us to observe:

1. Shorter mummification time;
2. Greater reduction of volume;

so the waves have a greater intensity than our radiesthetic batteries.

We must deduce that the shape of the statues of Easter Island frees, volume per volume, the most powerful rays: they are even stronger than the emanation from the mummy statues.

That is not all. If, out of curiosity, one examines the map of the island, one finds along the entire shoreline a curtain or security grille of white vibration followed by another of ultraviolet, then violet, etc., while negative green almost completely covers the island. These different zones appear to be one kilometer wide.

One might object that these statues were not placed regularly along the coast. Indeed, it is impossible to find the color zones exactly, because the original positions can never be known. One detects their residual presence, however, very cleanly, and the action given by this phenomenon will truly continue a long time.

It is said in radiesthetic doctrine that an impregnation of the soil or a residue, produced by an ordinary body, lasts as long as the body that produced it was present on the earth; they claim that even one ray passing through the air leaves its trace in much the same way. If, then, these statues were fixed in the soil for millennia, the residue will endure much longer than our generation and the generations that follow.

Here is an experiment proving the residue effect: having closed our statue in a rectangular casket, generously sized so that we could put in a thick layer of well-packed sawdust, we concluded after several days that the casket was permeable to waves from the statue. (The packing of the sawdust was not as dense as that of oak; it would have required a larger cask to duplicate the virtual rectangular prism in this type of casting.)

After the statue was removed, the sawdust still emitted rays and toxic planes such that we were obliged to cast it to the winds in order to protect ourselves from the dangerous effects. Moreover, in order to protect against the effigy itself and to render it more inoffensive, we had to separate it at the level of the neck. The head still gave radiations, but of feeble intensity because of the diminution of the volume.

It is impossible to deny the massive action exercised by these statues, apparent at the coast and on the sea. It also affects the interior of the island, where one can detect zones of waves capable of bothering the inhabitants who are not wearing protective tablets. These tablets are without any doubt

the instruments of preservation and protection of the islanders against the toxic waves of their statues. (See Figure 15.)

According to R.P. Mouly, there were two systems of tablets called Keiti: some samples of large dimension placed in his showcases, and others of reduced volume, a specimen of which was offered to Mgr. Janssen, apostolic vicar of Tahiti. Several female human hairs entwined this tablet, a gift presented by the indigents. This engenders supposition that the Easter Islanders placed the Keiti in their hair, permitting free movement of their bodies while preserving health. They could thus brave the dangerous zones, whether on land or sea, without retaining toxic effects.

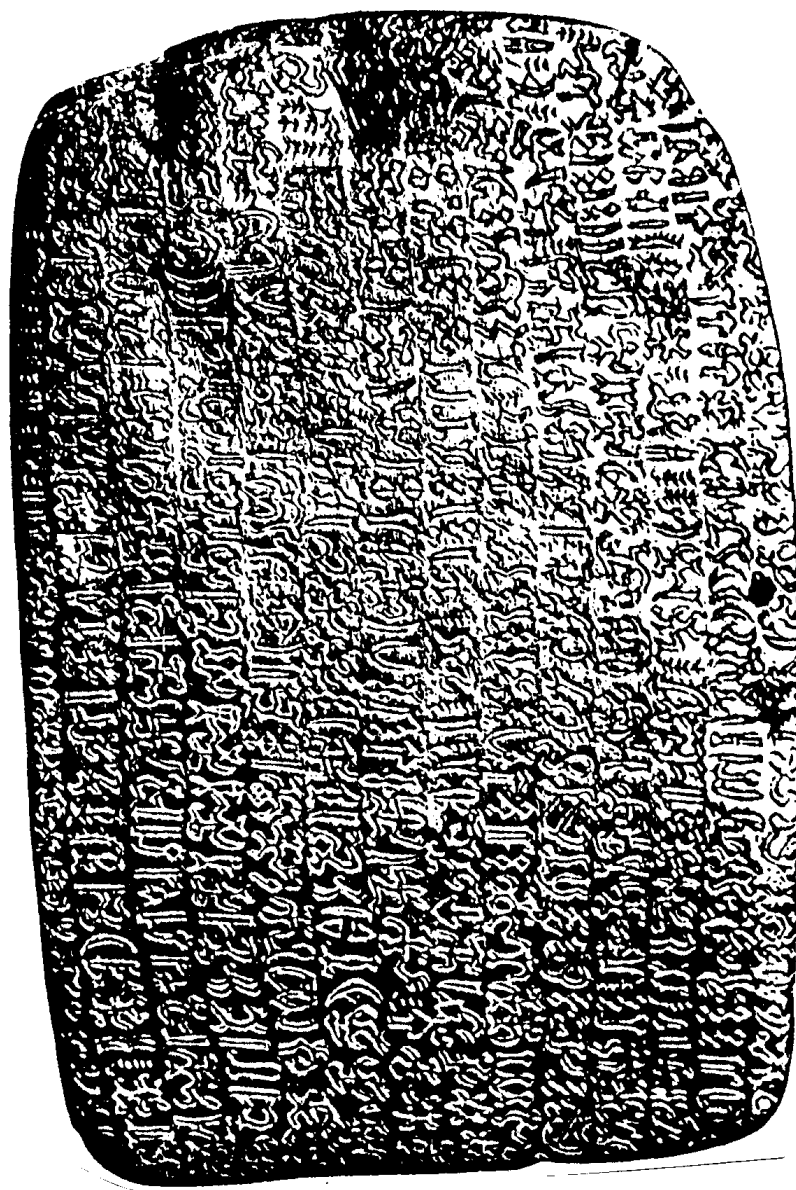

Figure 15. Engraved tablet from Easter Island.

A photograph of one of these tablets pinned to the ceiling of an apartment made noxious earth waves disappear. After a certain passing of time we noticed a decline in its power; this is no doubt due to the photographic print not being of the proper size. The tablets themselves are covered in carved characters in an unchanging form, retaining their properties indefinitely.

What practical use could these colossal statues serve? Against what were the natives of the island obliged to protect themselves?

Obviously, they served to preserve the inhabitants from invasions of looters, since the toxic radiations, which stretched more than ten miles to sea, could considerably diminish the vitality of intruders and perhaps force them to renounce their dread projects.

On the other hand, the ultraviolet zone was without a doubt the natural fishpond where the Easter Islanders were certain to have good fishing. In effect, the fish, bothered by the other rays emitted by the statues, had to take refuge in this limited area, bathed by a radioactive wave favorable to life.

PART II: RADIESTHESIC DETECTORS AND INSTRUMENTS

CHAPTER 1: THE SPHERE

Preamble. Radioactive planes. Color waves. Negative green.

In tackling the second part of this work, after having described certain manifestations of radiesthesia during prehistory and in ancient history, we come to the various techniques and instruments of detection that we use to allow separation of waves following our own personal method. By intense study of the sphere we discovered this new concept of radiesthesia. Here the reader should not expect to find learned theories, but simply certain deductions following logically from various experiments which have stimulated us to invent, then to modify, and finally to perfect our instruments.

We have stated that “natural magnetism” could, of itself, engender vibrations, and that we needed to clear up the mystery so that we could obtain an error-free method, especially for beginners.

Our concept of radiesthesia is not scholarly when compared only to ancient radiesthesia. Everyone will understand that an observed phenomenon, formerly without scientific basis, could also be understood today without recourse to the latest scientific deductions. Yet we would not completely neglect certain knowledge that, touching close to physics, enables us to advance our own research.

We have tried to limit our radiesthetic perceptions to those received impressions of a physical nature, and to separate and discard those that come usually in the purely mental modes. This is not because we wished to diminish the value of the mental modes, which have been shown to be successful, but we prefer to remain as much as possible in the domain of the physical. To us, this is more interesting.

We have been able to arrive at these results thanks to the invention of our Universal Pendulum, which possesses energy of its own, independent of all convention or mental influence. It stays rigorously neutral, not emitting the least preconceived thought-wave, since it does not use question format.

Before beginning the description of the detectors that we have developed, it seems necessary and even indispensable for the clarity of the subject to first proceed with a study of the sphere. This is indeed basic to

our method, and it is because we intercepted these particular secrets that we have a completely new and entirely personal conception of radiesthesia.

Study of the sphere. Imagine a sphere of some material that can be placed on a support, and such that we can explore all parts of its surface.

With the aid of a pendulum that discloses radioactivity, we find, like M. Turenne, three great circles cutting each other at right angles.

Through a complete, detailed examination using another pendulum not giving radioactivity, but the polarity, we notice that at the N and S points we have two opposite poles, evidenced by the clockwise and counterclockwise revolutions of our detector.

These two circles bisecting at N and S can then be considered meridians, and the third an equator. (See Figure 16.)

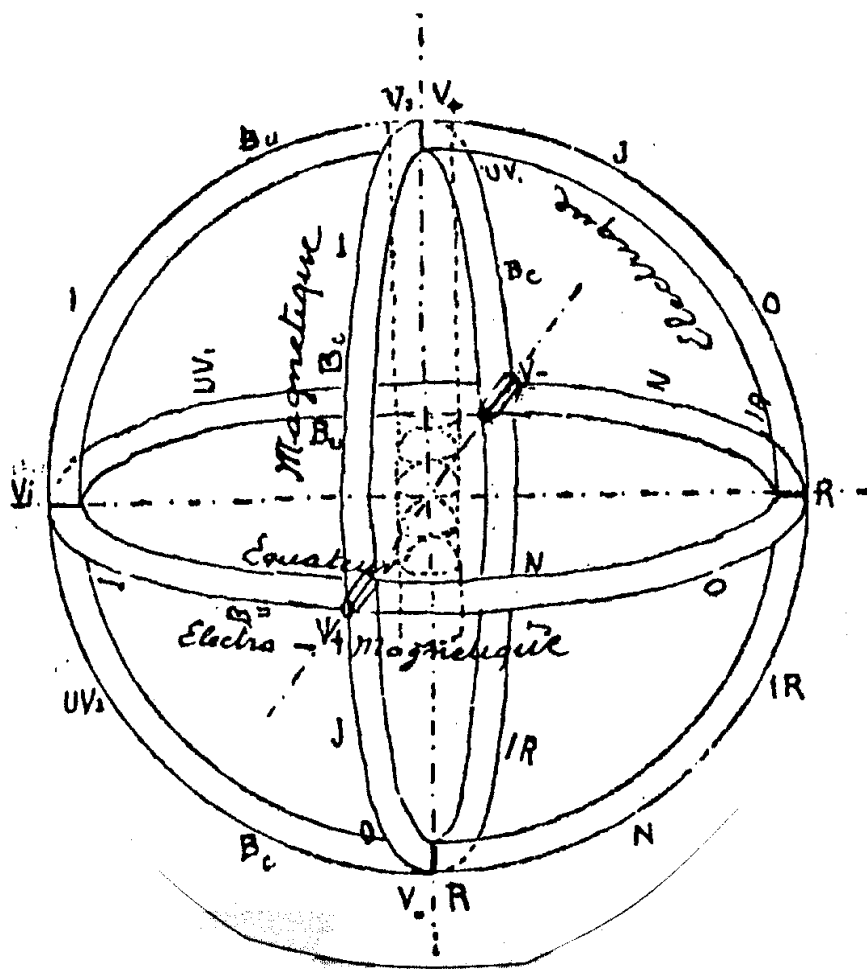

Figure 16. Schematic view of the two meridians and equator in the Universal Pendulum.

Study of the Meridians. Each of the two meridians possesses a separate and invariable functional energy:

- a) One emits electric vibrations.
- b) The other emits magnetic vibrations.

(See Figure 17.)

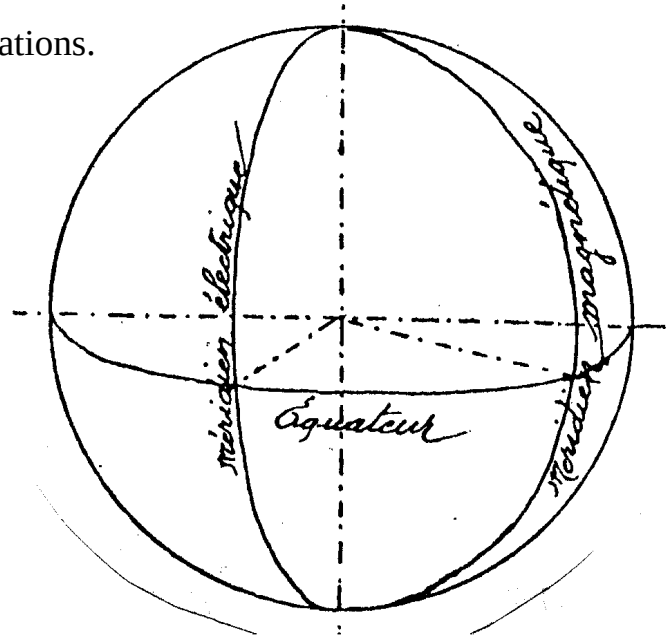

Figure 17. Electric meridian and magnetic meridian.

If we study the “electric” meridian, neutral pendulum in hand, taking successively for a witness the various colors of the spectrum (red, orange, yellow, green, blue, indigo, violet), we find that the superior part, that is, *above* the equator, will emit the seven color-vibrations, distributed regularly at $1/6$ intervals.

(See Figure 18.)

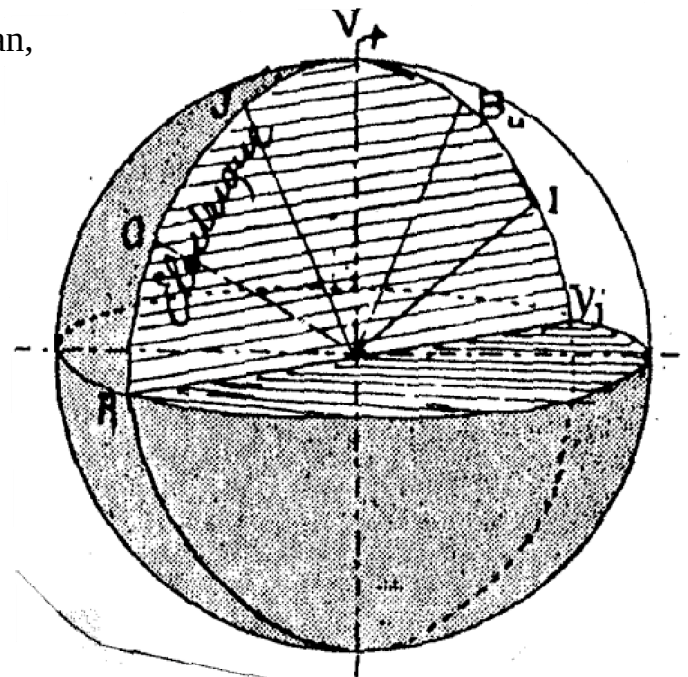

Figure 18. Separation of the “electric” meridian into ray-colors.

You will notice immediately that the color partitioning of the two meridians is not identical. On the magnetic meridian, we detect a portion of the invisible: ultraviolet, white, and negative green; while on the electric meridian we place only the color-rays of the visible spectrum.

a) Electric meridian: ultraviolet, white, negative green, black, infrared.

(See Figure 20.)

Negative green is a mysterious vibration, radiating between white and black, and having the property of making a neutral detector spin negatively when subdued by the action of the radiation. Since it arises at the opposite of green in the spectrum, opposite the North or positive pole of the sphere, we have baptized it negative green, or South Pole.

44

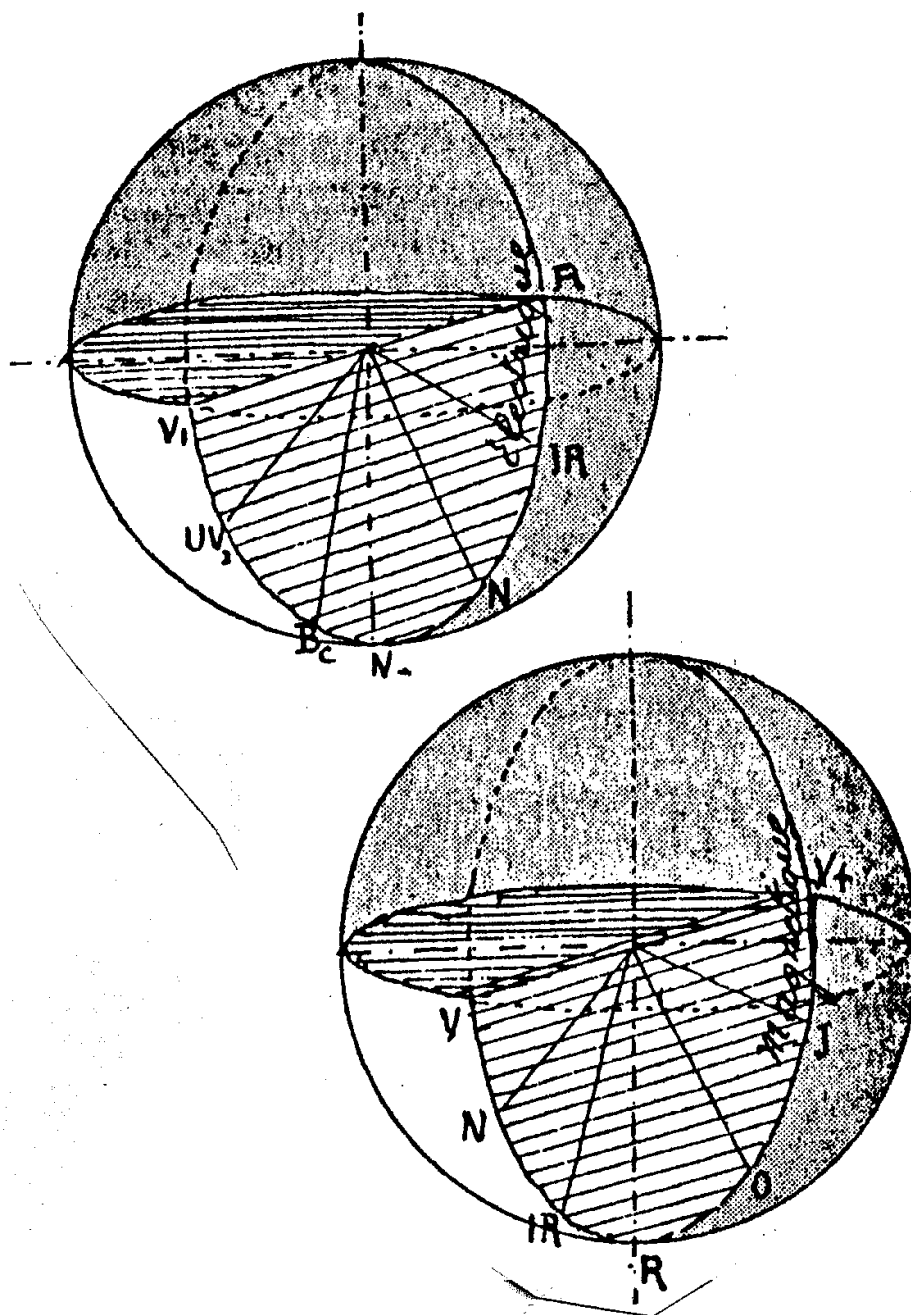

Figure 20. Partition of the two meridians into color-rays situated in the lower hemisphere.

Our discovery of negative green was made the subject of our 10 April 1936 patent that protects all our instruments and our method of "Separation of the Spectrum of the Sphere". We claim absolute paternity of it.

In the medical part of this book, we will show the prodigious properties of our negative green, which is not constituted of only one unique ray, but of a whole array of vibrations.

Important Notice. One could believe, after our having said in our study of the sphere, that the different spectral wavelengths are found uniquely on the three radioactive circles. If, however, one separates the spectra of the meridians with a neutral pendulum and one color X as a witness, one can describe, point by point, a spiral curve going one part to the North Pole, and the other part to the South Pole. Using one of the other colors, that is, another wavelength, it describes a new spiral not having the same profile as the first. It follows on the spherical surface a slower or faster path; there will even be crossing between colors. Out of curiosity, we have traced these curves on a sphere for study. (See Figure 22.)

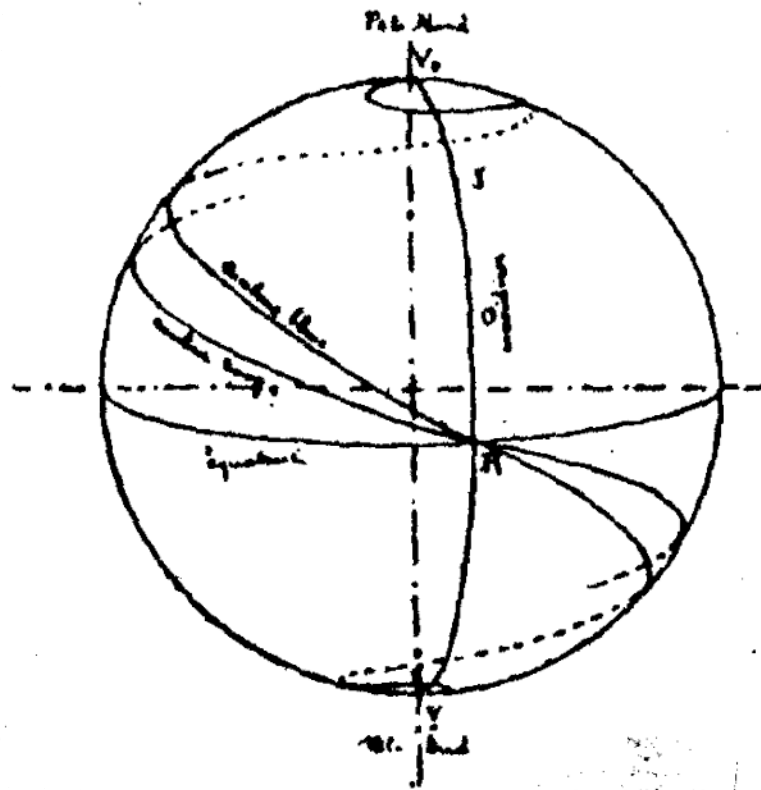

Figure 22. Movement of the rays on the surface of a sphere.

The figure shows the red and blue curves following the sphere in the manner of an orientable antenna. One could believe that at the point of crossing at R, the two colors could be identified on the meridian. There is none of that, however; only the red is perceived.

CHAPTER 2: THE UNIVERSAL PENDULUM

Receptor pendulum. Emitter pendulum.

Based on the study of the sphere, we have decided to use it as a sensitive detection pendulum tuned to the vibrations of the spectrum. But having calibrated a sphere posed on a support in this way, we noticed that at the end of several hours we could not find the color-vibrations at the points where we had previously marked them.

What had happened? Retaking our readings with the pendulum that senses radioactivity, we had been able to establish that the meridians moved with the location of the sun. They were not stable, and the calibration only corresponded at one instant within a day of 24 hours.

To resolve the problem, it was necessary to permanently fix the meridians and the equator in some way. In considering the sphere as a shape generated by a semicircle turning around its own diameter, we thought that it would perhaps be possible to disrupt the harmony of the figure by inserting two metallic masses at the intersection of the magnetic meridian and of the equator, these massive enough to definitely fix the radiating circles. (See Figure 23.)

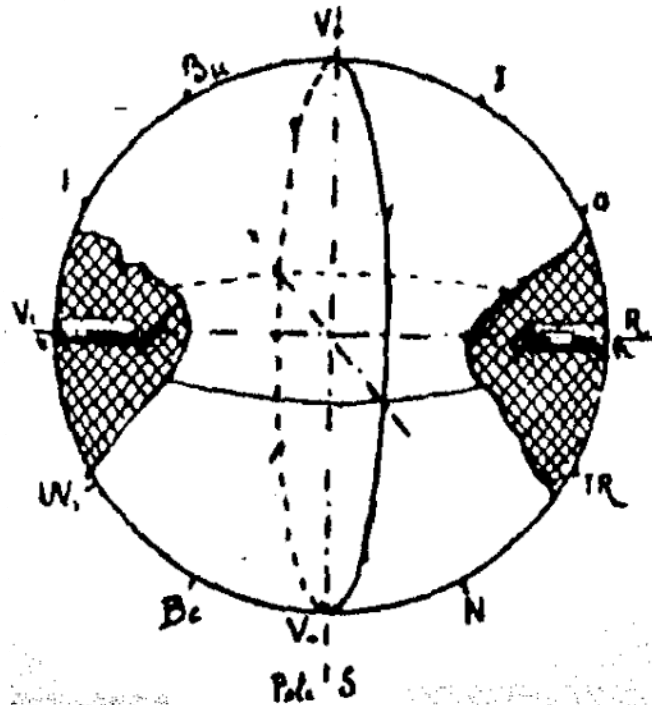

Figure 23. Stabilization of the radioactive planes in a sphere.

This done, everything happened as we had supposed it would. For the screws that we first used, we have substituted little copper cylinders that do not have the disadvantage of creating a secondary polarity harmful to the original natural polarity (especially by taking the precaution to oppose the polarity of these masses).

But how to make a spherical pendulum on which the attachment of the suspending cord could be adjusted to correspond to all the points on the surface of the ball? There was only one solution: add a non-magnetic metallic handle, articulated at two opposite points on which the cord could slide. (See Figure 24.)

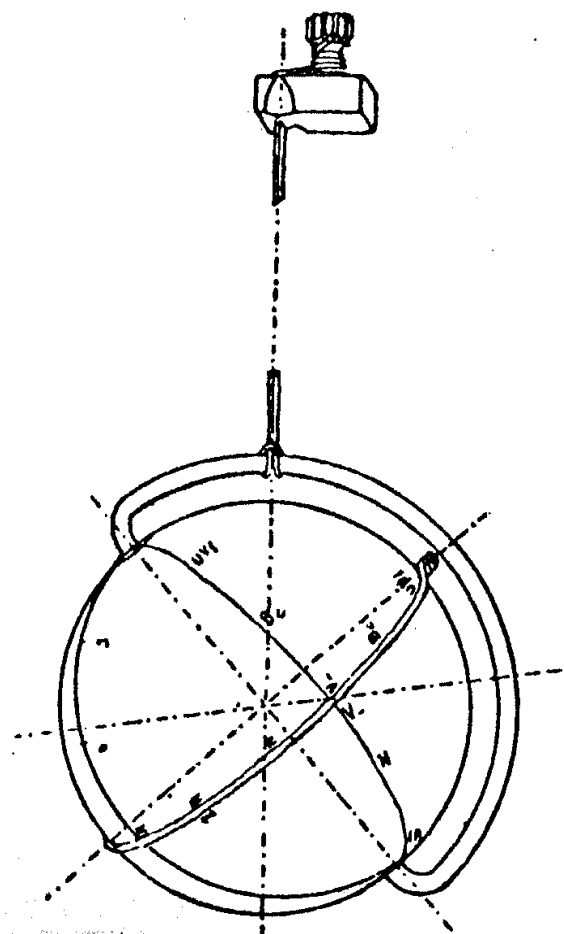

Figure 24. Placement on the Universal Pendulum of the non-magnetic metallic handle, permitting exploration of all the points on the sphere.

We spoke of the “magnetic” and “electric” meridians in the study of the sphere. One might wonder why we have attributed magnetic waves to one and electric to the other. We have found, as a result of diverse experiences in our tests, that an electric wave does not cross electric

insulators such as ebonite, Bakelite, porcelain, etc., but they do pass through an iron shield. On the other hand, a magnetic wave is stopped by the iron screen, and not by the electric insulator.

Furthering our study of the Universal Pendulum, we have found that it was sensitive enough to render the greatest service in identifying elements of the Periodic Table.

Finally, we point out another property of this detector, a property playing an important role in the future of radiesthesia, that of emitter, in which its power will vary according to its spherical mass. Whether they know it or not, radiesthesists operating on a map or on location to find an object for which they have a witness in hand, emit waves that distort their search. When using an ordinary pendulum, these emissions, deliberate or not, cannot happen without a witness except in the case of a very sensitive psychic. Their power, dependent on the magnetic force of the operator, suffers in the same way from his limitations. Moreover, with an ordinary pendulum, it is not possible to emit, at will, a specific wave calculated with precision.

The Universal Pendulum fills this requirement, since as receptor and emitter, it allows both reception and emission of all vibrations of the spectrum both visible and invisible. It is a receptor when the hand using it only registers its movement, but as soon as the radiesthesist purposefully impels the gyration, it becomes an emitter. Its action can then be compared to a dynamo producing a current.

Let us try to prove it: Take a sheet of clean paper, pendulum in hand, stylus in the other. With the detector set on a longer wave, red, for example, initiate a consciously willed movement of several circlings while the hand that holds the stylus traces an invisible line on the paper. This done, we have impregnated the paper with the wave for which the pendulum has been set, and this impregnation is so powerful that two or three months later, the pendulum still will detect it, thanks to the residue of this red wave.

In order to further augment the powerful emittance of this detector and to stabilize its polarity (which can reverse under the influence of a more powerful wave field), we have inserted a radiesthesic battery that reinforces its magnetic current, raising the voltage in the ratio of 1 to 4.

The radiesthesic battery such that we have made and tuned will be studied in one of the following chapters.

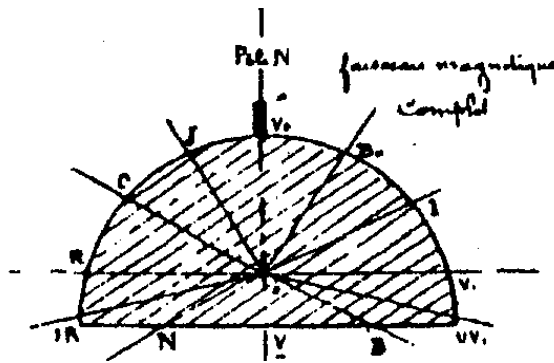

CHAPTER 3: THE HEMISPHERE

Distribution of waves. Prisms of radiesthesis radiations.

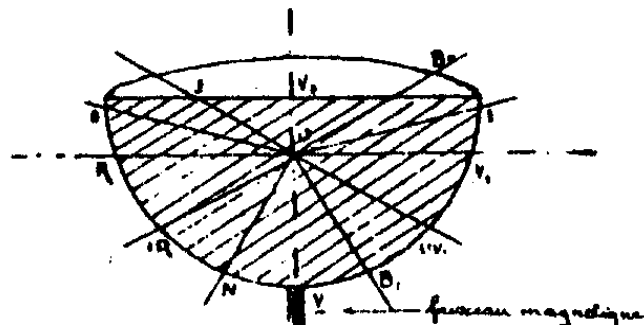

It was interesting, after analyzing the sphere and the resultant Universal Pendulum, that we came to discover the way in which a hemisphere behaves in connection with the decomposition of the spectrum.

The hemisphere also shows the three radioactive planes (meridians and equator) with this difference: in the sphere, the equatorial plane passes through the center of the figure and not through the great circle of the base (See Figure 25.).

Upper hemisphere

Lower hemisphere

Green prism

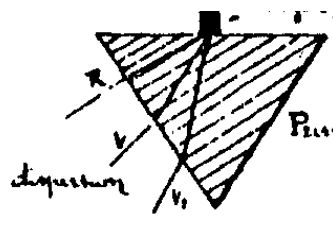

Figure 25. Comparison of the phenomena of separation of a light ray and a radiesthesis ray.

In the upper part we find the input of the complete array of visible and invisible spectral radiation at the vertical axis. Distribution of the decomposed spectrum to the edge of the hemisphere originates at point 0. Underneath this point we detect but a single pure ray, the ray we have already designated with the term *negative green*. The rays black and white, which generally follow in the wake of negative green, are here clearly separated, delivering a very pure negative green ray. This is a big advantage, as we will see, in studying the radiesthetic battery.

Notice. If we imagine the lower hemisphere, we find the inverse phenomenon: the rays of black and white are very close, while the yellow and blue are separated by the vertical. The positive green is pure, and the negative green is included in the complete array of the spectral waves. (See figure 26.)

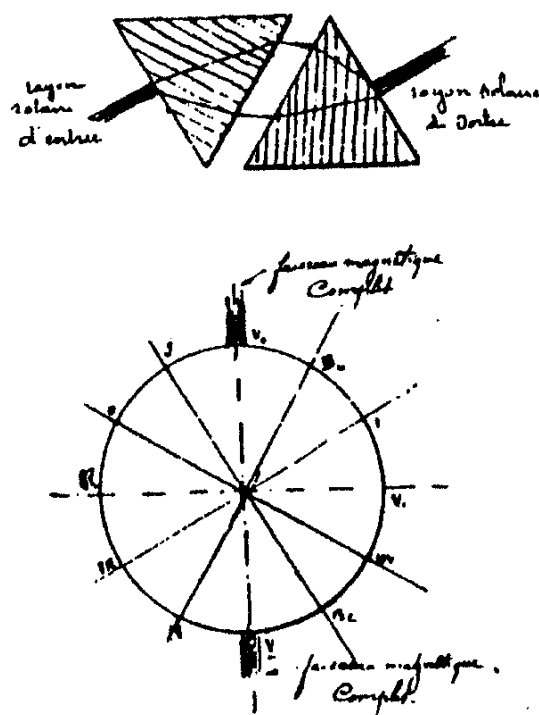

Figure 26. Comparison of the phenomena of separation and recomposition of a light ray and of a radiesthetic ray.

Does it not seem that the juxtaposition of the two hemispheres produces a certain analogy with the combination, known in physics as two crystal prisms, inverse and parallel? By that experiment we know that the light ray separates in the first prism in order to be reconstituted in the second, and finally, to come back out again in the form of white light, an identical ray to the one that entered the first prism.

CHAPTER 4: THE RADIESTHESIC BATTERY

The study of the hemisphere logically led us to the discovery of the Radiesthesic Battery, described below, and for which we took a patent in 1936. (See Figure 27.)

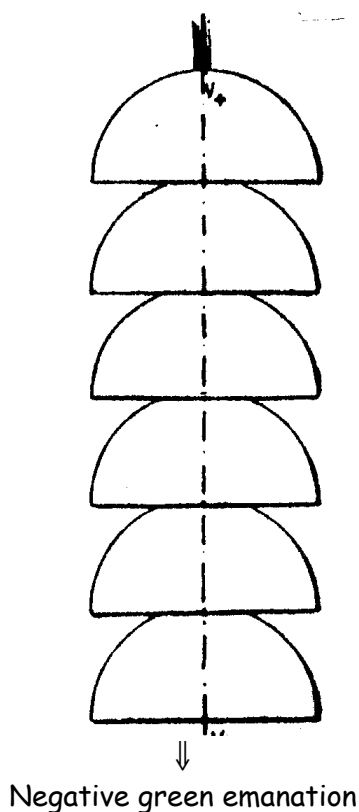

Figure 27. Battery composed of six hemispherical elements.

Regarding the use of the term “discovery”: after having perfected this battery, imagine our surprise to find that it already existed in Egypt more than four thousand years before the Christian Era.

The design of the pedestal table, reproduced in Figure 12, is certain proof, since it is an exact copy of an Egyptian piece of furniture. Here the pile is not hemispheric, but flat, and consists of four elements. Each contributes its power adding voltage like the battery of Volta; the negative green ray of the first, is added to that of the second and so on in succession. A radiesthesic battery of 100 elements, for example, projects an extremely powerful ray.

We then find in this battery, as in electricity, a “voltage” which is a function of the number of hemispheres, and an “amperage” which is relative to the diameter of the elements. By adopting techniques for electric batteries, it is possible to couple the radiesthesic batteries in series or parallel. With a pile of nine elements, it was possible for us to mummify (more often than we cared to) meat, eggs, fish, and flowers, submitting them to the negative green ray: the mummification ray *par excellence*. It destroys micro-organisms.

Moreover, here is the revelation of the marvelous beneficial power of our negative green ray. Since the experiment, it was recognized that it desiccates organic matter cells, living or dead. Why not attempt to experiment with it in a human organism threatened by a cancerous tumor? In 1937 a sick person was operated on for cancer of the stomach, and the surgeon advised his wife that he could only survive three months, so grave was his case.

After treatment with negative green rays, the roots of illness were entirely sterilized in the witness by our negative green. Ten years later the sick man still lived. He later died of a completely different cause.

The therapeutic properties of our negative green array will be shown in detail in the medical section.

In the Universal Pendulum, such a battery of four elements playing the role of stabilizer of the polarity, added a new property to the detector, since four elements represent the normal voltage of the human or animal cell in a state of perfect health. (See Figure 28.)

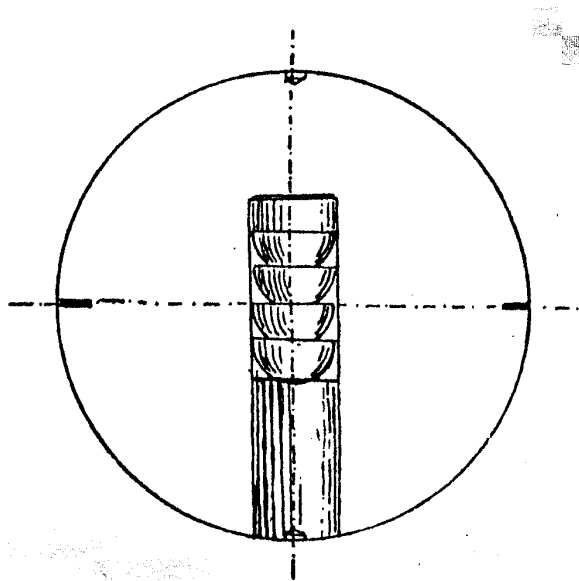

Figure 28. Cutaway view inside a pendulum stabilized by four elements.

CHAPTER 5: THE RADIESTHESIC ACCUMULATOR

It was logical, after stabilizing the radiesthesic battery to give a consistently identical natural ray (since emanation is a function of form), that we research the possibility of obtaining, as in electricity, a secondary battery or accumulator. This accumulator can store up and produce either a fixed wave of positive green or negative green, or an ordinary wave of the range of the spectrum produced by the Universal Pendulum.

We have already seen that rotating the detector calibrated to red, for example, while the other hand traces an invisible track or simply points a pen on a piece of paper, we obtain, at precisely the spot touched by the needle, an accumulation of the red wave. The detector behaves then like a dynamo and produces a wave in which the power is proportional to the number of turns it makes.

Let us suppose now that in this way, we have affected the edge of a disk made of as high a metallic content as possible. We obtain the red wave measured at the figure of 100 degrees as a result of the insertion into the Universal Pendulum of a battery of four elements (each element giving 25 degrees). (See Figure 29.)

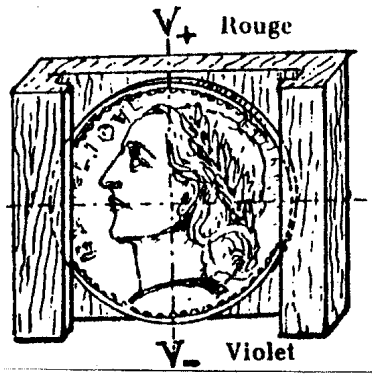

Figure 29. Accumulator of one element in which the intensity is carried to 100 by insertion into the Universal Pendulum of a radiesthesic battery of four hemispheres.

We have then charged this disk-accumulator with red, but if it gives this vibration in the direction of emission, it produces, in the other direction, the inverse wave, which for red, will be violet.

Important conclusion: an accumulator charged with an illness-ray automatically gives an opposite healing ray. This ray exposed to a witness of a sick person, liberates his beneficial energies for healing, and even at a great distance. This is how in Bretagne, Holland, we have been able to suppress simple-stem plantar warts.

CHAPTER 6: RADIESTHESIC RELAYS

The application of the accumulator has led us to a very curious solution that might encounter skepticism: the radiesthesic *relay*. Its reality, however, cannot be called into question, and its value exceeds any trouble spent explaining it. A plan or drawing connects with a ray to the object it represents on the condition that the plan is exact and oriented like the object. We will have the opportunity elsewhere, while discussing noxious waves, to prove once again the reality of this Law of Similars, one of the fundamental laws of radiesthesia.

We will procure: (1) Two identical and virgin accumulators, and, (2) the exact plan of a property or apartment. This done, we will charge, using the procedure previously indicated, one of the accumulators with a specific wave, and then place it on some part of the plan, oriented exactly to North magnetic.

Whatever the distance to the location of the experiment, we will detect at the location, at the precise spot printed in the plan, the wave with which the accumulator has been charged. What we find, however, in lieu of a single point of emission, is a beam. This beam can be understood as an augmentation of the emitted rays along the height of the ground or of the apartment in relation to the plan.

At this place where we detect the beam, if we put an exact copy of the first plan on which we placed the empty accumulator, we notice that the latter vibrates in resonance with the accumulator-emitter and gives, by the Law of Similars, a second beam identical to the first. This given accumulator could be placed on the plan so that it is within the boundaries of the beam from the emitter. It will act and relay the wave of the latter. (See Figure 30.)

Practical insight: a sick person can thus remain constantly under the direct action of the ray that is sent to him by his radiesthesic doctor. He can move around as he desires, and he can put the accumulator as needed on the different furniture pieces on his plan: bed, worktable, chaise-longue, etc...

If the healing wave needs modification in the course of treatment, which happens frequently as soon as the state of health improves, the radiesthesist, possessing a witness of the ill person, can change, without the knowledge of the patient, the wave of the accumulator-emitter so that the accumulator-receptor automatically receives and radiates it.

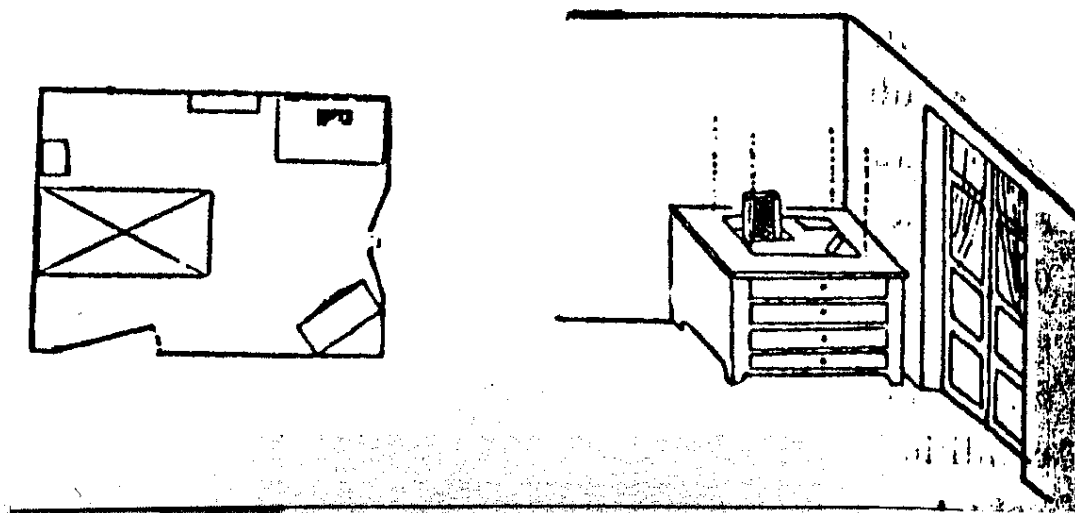

Figure 30.

(Left) Emission plan. The charged accumulator is positioned on a piece of furniture represented on the plan.

(Right) Reception. The augmented emission beam completely bathes the receiving plan. If the accumulator is positioned on the site of the bed on the plan, the bed, itself, will receive the emitted wave through the accumulator-receptor.

CHAPTER 7: SPECIAL PENDULUMS

Neutral Pendulum. Virtual cone. Easter Island Pendulum.

Before studying the sphere, we had already noticed that an ordinary pendulum carved of an equally ordinary piece of wood gives different reactions depending on the end from which it was suspended. One sees:

1. A positive circling or directly to a straight swing over an original source with negative circling over a drawing.
2. A negative circling over the original source and a positive over the drawing.

If the pendulum behaves differently depending on which end is uppermost, that is because polarity plays an important role in detection. The observed phenomena cannot be otherwise explained, nor surprise us, because we know that all bodies are crossed by one or several magnetic currents, the number being a function of the shape of the body.

In certain detections, it is helpful to use a polarized pendulum. In most other cases, the radiesthesist will be interested in possessing a rigorously neutral detector giving, as much as possible, the upright radiation with its figure for depth to the exclusion of all others. This is why we have attempted to establish the pendulum whose qualities are not merely residue or through willed mental orientation, but through a fabrication procedure assuring absolute neutrality.

To create a neutral pendulum, simply saw through the center (See Figure 31.) along the length of the cylinder of wood destined to become the detector, invert one of the parts end to end, and connect one piece to the

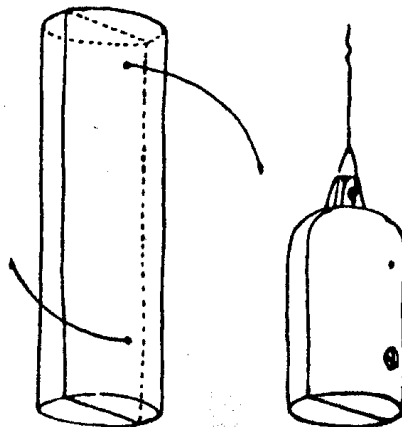

Figure 31. Fabrication of a neutral pendulum.

other with glue or two opposite screws. The cylinder being reformed, all it takes to make it a pendulum is to swing it. We thus obtain a rigorously neutral instrument since each end is half-negative and half-positive.

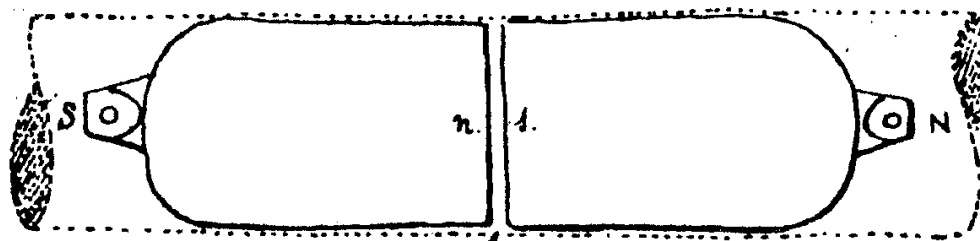

Figure 32. Method of obtaining two pendulums of different polarities.

This pendulum, however, carried the inconvenience of the necessity to mark it with figures, which are so often a source of error. We then found out how to determine them, and we created a serrated crown to encircle the base of the pendulum. (See Figure 33.) Carefully allowing for the thickness of the wood, serrations were made with saw marks as shown in the drawing. We have noticed that the first mark covers the figure closest to the vertical, then the second, and thus in succession, so that the crown shows all the increments marked, except that of depth.

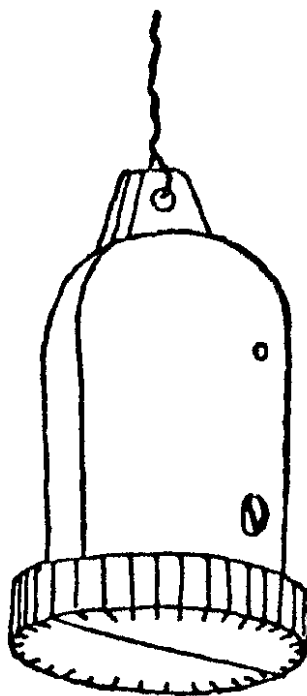

Figure 33. Neutral pendulum eliminating the figures.

The colorimetric disk with its axle fixed between the two halves of the neutral pendulum and its rotation around its axle permits identification of all the visible and invisible vibrations of the complete spectrum. (See Figure 34.)

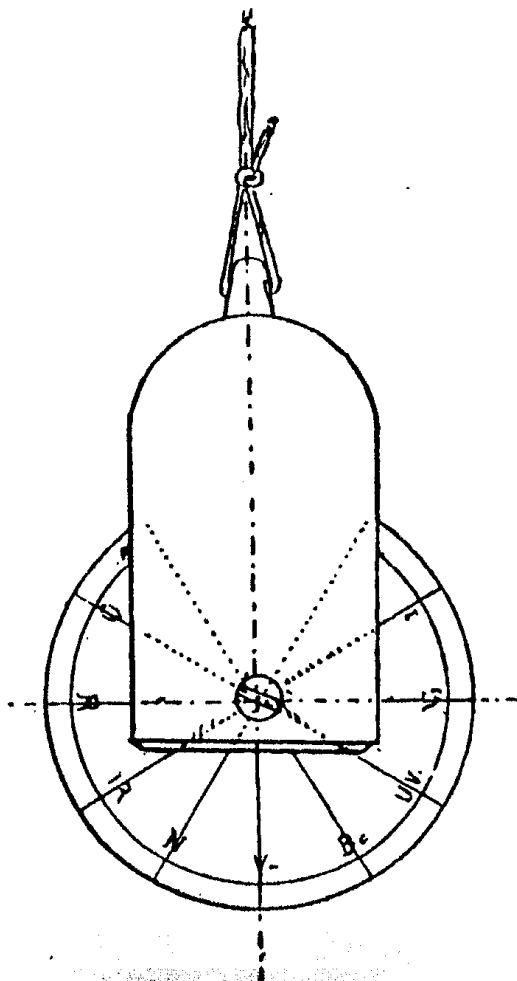

Figure 34. Pendulum with colorimetric disk, emitter-receptor.

Virtual cone pendulum. We have perfected another detector possessing universal properties since it is calibrated over the complete visible and invisible spectrum. We have named it “Pendulum of the virtual cone.

It consists of a rod of wood or metal along which the color-vibrations have been meticulously plotted, and on which slides a cylindrical piece. Measuring the length of the rod from the tip to the place where the sliding piece is fixed, one obtains a virtual cone of variable length. (See Figure 35.)

The value of the emitted vibration is instantaneously read on the graduated rod in wavelength. This little laboratory pendulum is most precious, and, personally, we use it for all our diagnostics on the anatomical chart.

It is possible to match this pendulum with the wave of a sick person. We would like to speak of the personal wave, an astral impregnation accompanying each human being since his birth until his death. In detecting with this color-matching pendulum, one has an infinitely larger chance of being accurate.

This pendulum is a sensitive detector and furthermore, possesses the properties of an emitter.

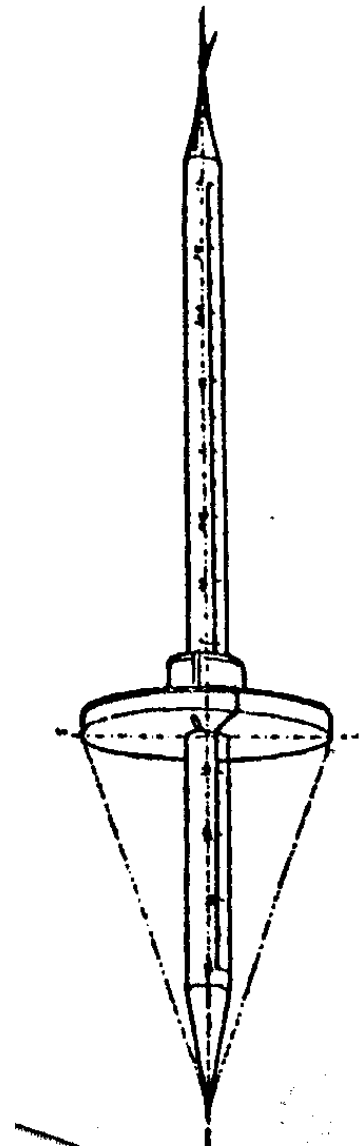

Figure 35. Virtual cone pendulum.

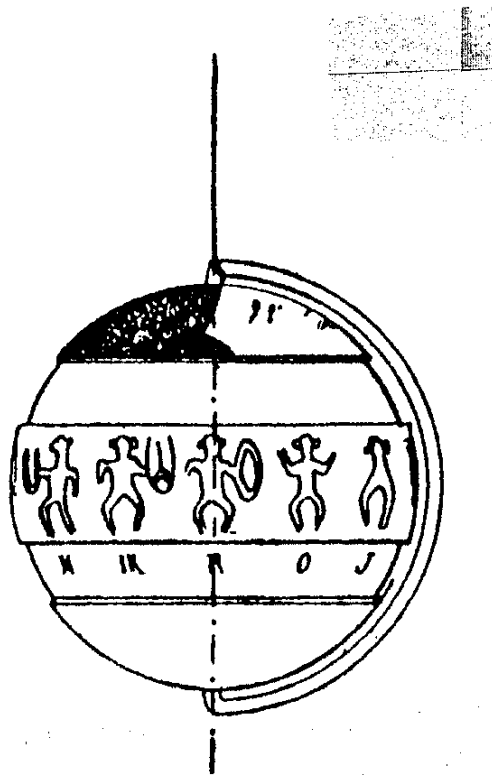

Figure 36. Pendulum of Easter Island figures.

Easter Island pendulum. Out of curiosity, we present a pendulum that, despite its strange appearance, has a real and strong action. The signs around the equator are selections from among the figurines on the carved tablets from Easter Island. (See Figure 36.) Our research revealed the figures that vibrate in accord with the twelve color-vibrations, and the reader can verify, on a drawing, the reality of these waves with the aid of a neutral pendulum and a chart of colorimetric witnesses.

PART III: FROM SHAPE-CAUSED WAVES TO ILLNESS WAVES. NOXIOUS WAVES. TELERADIESIA.

CHAPTER 1. PARTICLE WAVES. SHAPE-CAUSED WAVES.

Pyramid. Mummy. Easter Island statues. Sphinx. Radiesthetic battery.
Candelabrum with seven branches.

It is important to distinguish between the two types of vibration since the particle-wave is the best-known and the most studied. The lesser-known shape-caused wave is called, however, to take a grander and larger place in the vibrational radiesthesia of tomorrow. Furthermore, this wave frequently plays with the other waves without the knowledge of the operator. Ignorance as to how to protect against this effect will increase the already too-numerous errors.

We intercede on the part of radiesthesists who are baffled in spite of their best intentions. They struggle against unknowns, and their science is young and subject to precautions. It will, however, grow increasingly in truth, because those who incline toward truth give it all their best.

Besides the particle-wave, or fundamental or penetrating ray, there is another vibration. This vibration is generated by shapes and is engendered by the separation of natural magnetic current that exists in the essence of the shape of every object. We have already given a glimpse in the study of the sphere and the hemisphere; we are not returning. We have seen also that certain symbols give different vibrations in the scale of the spectrum, vibrations uniquely due to shape. These symbols are not the only ones which we have found; since then it has been possible for us to produce many others which, laid out in the required order, give the spectrum, and much better in its visible part than its invisible part. It is for this that we have been able to invent more precise pendulums using Roman numerals and the figures found in the tablets of Easter Island.

What we would like now is to bring out the evidence with regard to the radiations of pure shapes and their special characteristics such as the pyramid, mummy statuettes, sphinx, Easter Island statues, radiesthetic battery, etc. In all these forms used as examples, we find one or several separations of the magnetic spectrum. This separation is quite real and not due to a fantastic imagination; otherwise, one cannot explain that the mummy statuettes can make someone feel ill and even profoundly alter

health, or that the Easter Island statues can mummify meat or fish under certain conditions determined by the Universal Pendulum.

Evidence shows the cause of this to be powerful rays that can reverse the polarity of even a strengthened pendulum. They can contaminate a residence by their action. Contamination can also occur from the products covering the forms producing the waves such as venom, poisoned varnish, etc., because the form emits the penetrating wave that carries the vibration of the poison charged to disequilibrate the vibration of the living cell.

All natural magnetic beams leaving a body generate perpendicular planes that follow one another with a certain frequency depending on the mass of the emission; these planes are themselves cut by other planes. The surrounding space finds itself fractionated into cubical cells with harmonics tuned to the energetic source that generated them.

STUDY OF RAYS FROM A PYRAMID. If we place a pyramid facing North on a cardboard rose-compass graduated into 360 degrees (See Figure 37.), we detect, with the aid of a Universal Pendulum, two systems of wave-colors along the length of the suspending cord:

1. A complete invariable electromagnetic spectrum that follows the pyramid in its rotation around its center 0.
2. A natural spectrum, equally complete, of which the north-south axis coincides with the magnetic meridian of the point of observation.

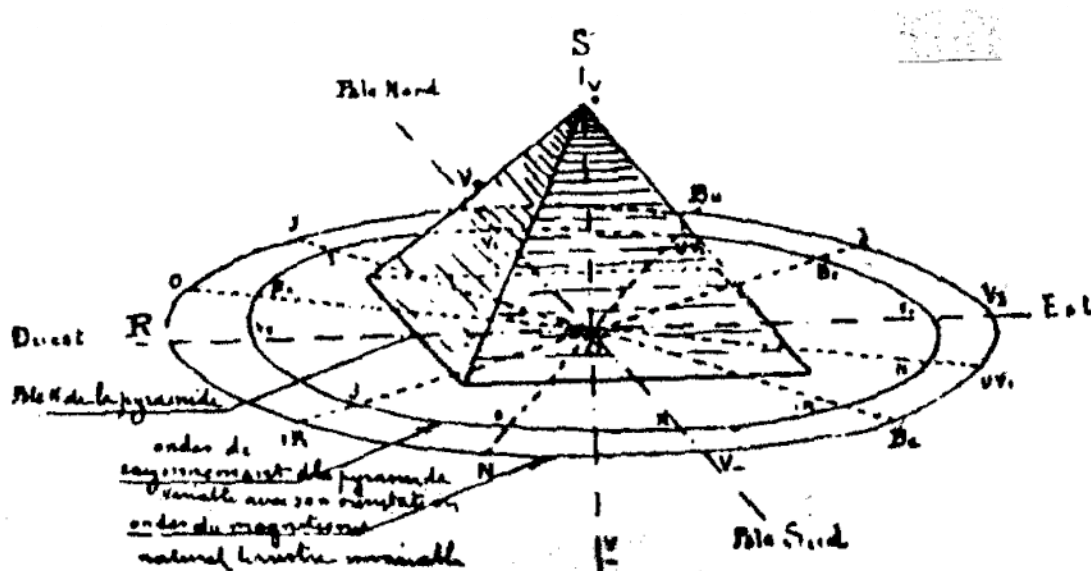

Figure 37. Breakdown of color-rays emitted by a pyramid positioned face North. The red emission to the left of the pyramid marks its North pole. The inner circle represents radiation of the pyramid varying according to its orientation. The outer circle indicates invariable natural terrestrial radiation.

By making the positive green electromagnetic waves coincide with the positive green shape-caused waves, the two systems superimpose color-for-color.

If, using as point of departure the *shape-caused* wave, we pivot the pyramid a quarter or some fraction of the circumference, then we displace the entire spectral system and its negative green / positive green axis. It no longer coincides with the axis of the north magnetic pole. The separation thus formed reads in degrees of the rose-compass and gives the angular measure.

This is, in our opinion, the explanation of the radiesthesic compass on the boat described in Part One. In the moment in which the shape-caused wave coincides with the longitudinal axis of the boat, one can, with a pendulum, determine the derived angle formed by this axis and the north-south line of the earth.

We put a pyramidal form on the axis of the boat because the pendulum gives the invariable north-south direction. Its movement is governed by a radio-active axis passing by the point 0 where there is truly a vertical antenna of the same style as the North-South antenna of the earth. (See Figure 38.)

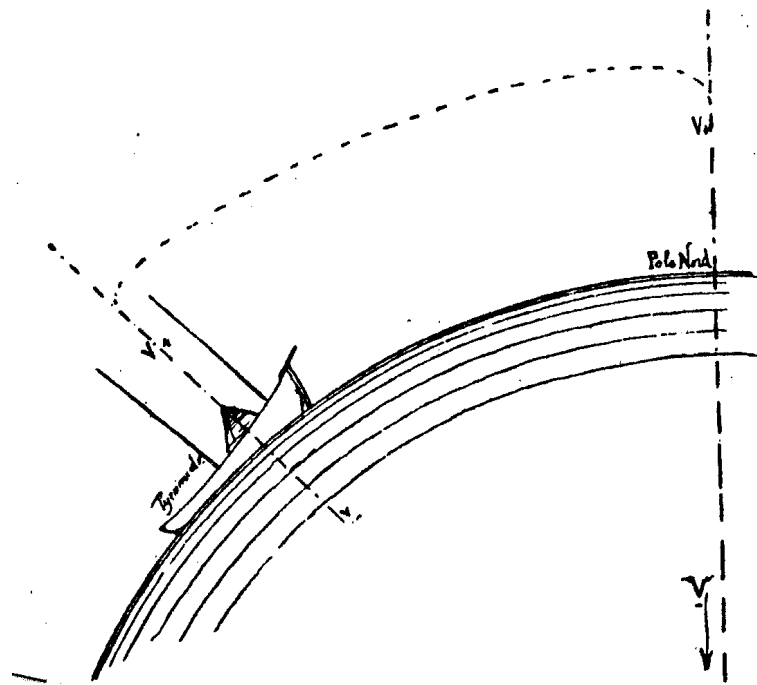

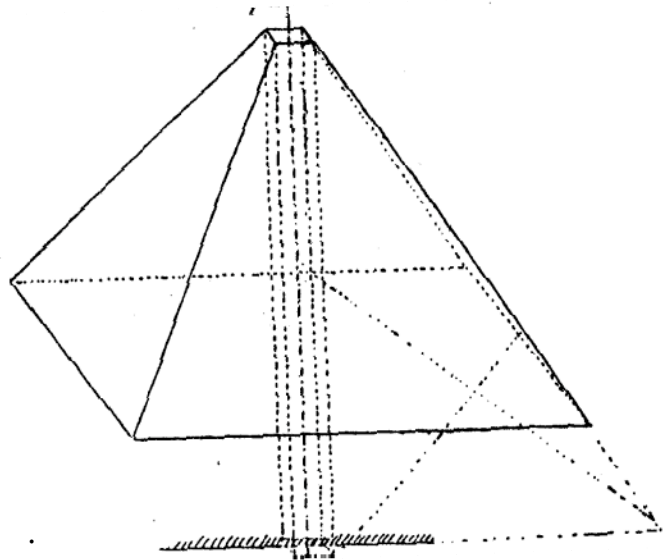

Figure 38. Place of union of the pyramid in the boat and the North pole of the earth.

Platform of the Great Pyramid. Its radiation. In the construction of the Great Pyramid, there is an oddity that has intrigued scholars and initiates who were inclined toward uncovering hermetic secrets. Why is the Great Pyramid without its apical point? In effect, its extreme point is constituted, not by four terminating angles, but by a platform 6 meters on a side, making 36 square meters.

If the architects have purposely neglected to complete the pyramid, it is certainly for important reasons and a well-thought-out objective.

Would this platform constitute a vibratory virtual prism from which a wave descends vertically as far as the center of the base of the pyramid in order to play a precise and calculated role? (See Figure 39.)

Figure 39. Vibratory prism formed by the platform of the Great Pyramid, detected by pendulum

This vibration that we experience would even bathe the ceiling of the subterranean chamber beneath the pyramid. Its radiation follows a vertical situated between the peaks of the angles formed by the exterior casing and the ascending passage.

The King's Chamber, offset from the central stack of these vibrations, seems removed from this influence.

What was the practical use of this platform, which appears to be just an error of construction? Perhaps, and this is just a hypothesis, it allowed capturing of cosmic rays in order to impregnate the interior of the pyramid.

It is understood that we have not finished the complete study of the waves of the pyramid and the three radioactive perpendicular planes because it surpasses the parameters given by the popular nature of this book.

STUDY OF THE SEPARATION OF RAYS FROM A MUMMY

The art of Egyptian embalmment appears to coincide with the true art of radiesthesia. The position of the limbs of the mummy does not vary: the feet touch each other, the arms are folded above the height of the elbows; the hands are closed, each resting on opposite sides of the body. Is this by chance or for the convenience of placing the body in its enclosure? No, it is clear science, and science full of waves, because this form makes a radiation pass through the axis of the body and down two perpendicular planes. This radiation, while contributing to activate mummification, transforms the human body into a powerful emitter of waves.

We have reproduced below the passage of these magnetic rays, which in the horizontal and vertical planes form a separation spectrum sensed by the pendulum.

In the frontal and profile figures, it is intentional that we have not reproduced, at the level of the eyes, the third radioactive plane, which gives exactly the same color-separation, in order to leave the drawing clear. The schematic perspective view indicates this plane. (See Figure 40.)

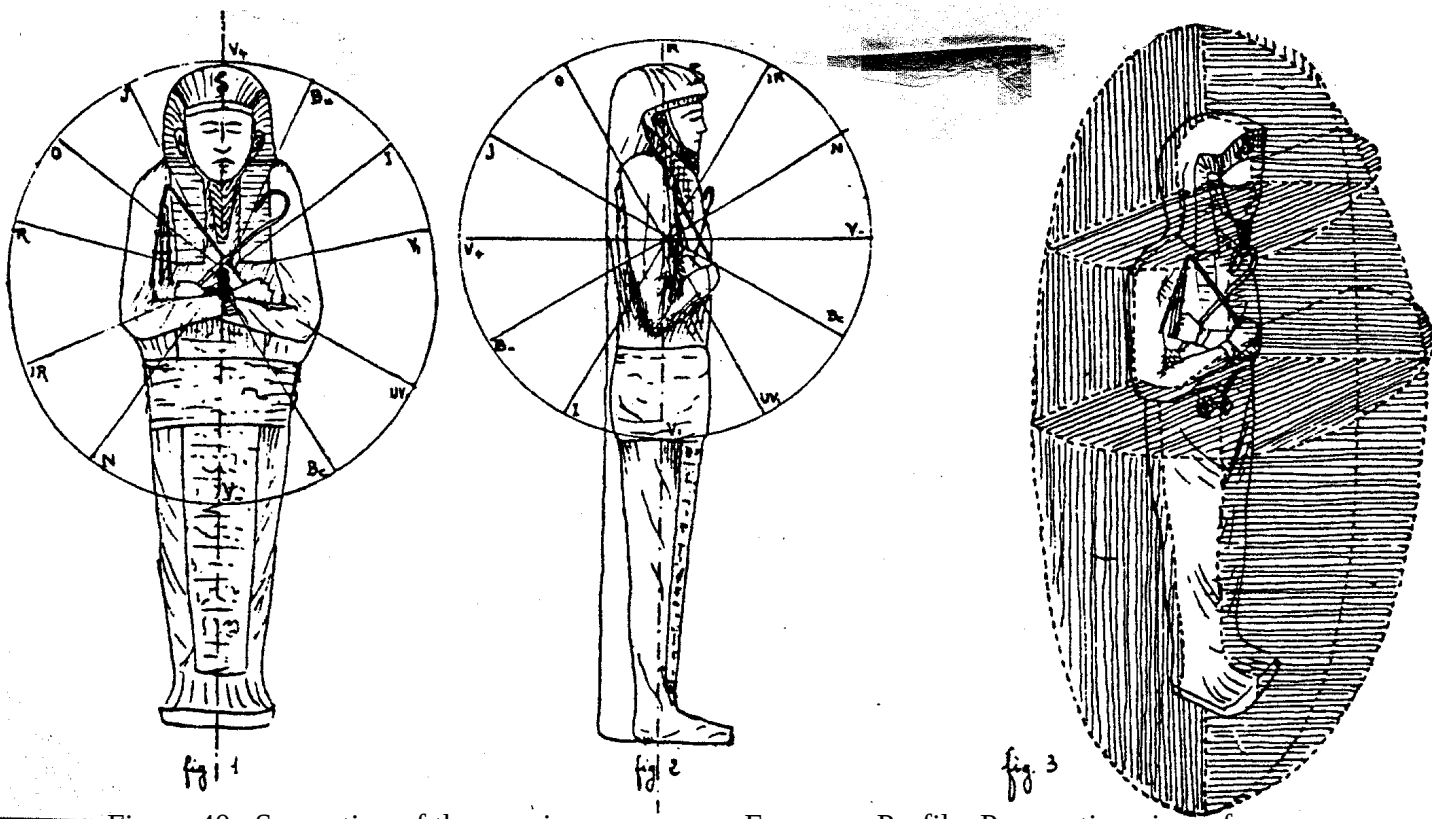

Figure 40. Separation of the rays in a mummy. Face on, Profile, Perspective view of the whole.

In an identical position, a living body is a powerful emitter of waves capable of reversing the polarity (spin-direction) of a detector, even one equipped with a stabilizing battery. This is why we always employ a procedure for rectifying our disordered pendulums for whatever cause.

This proves that the defense of the tombs was to be assured by the mummies themselves, by inserting poison or venom into the bodies at the time of the embalming, at a precise point situated in the area of the solar plexus, indicated in black on the diagram: the point of intersection of two arrays of magnetic forces.

Mummy, carrier wave; poison, wave carried; there is a perfect likeness with the natural toxic waves and the waves of sickness for which they are the medium. To this defense principle of the tombs were added the rays emitted by certain motifs of the frescoes such as the Uraeus (cobra) which, aligned in series, emits an extremely powerful and noxious wave.

Statues of Easter Island. The drawing of this statue (See Figure 41.) shows the separation of the rays by this shape used by the Easter Islanders in accomplishing their radiesthesic objectives.

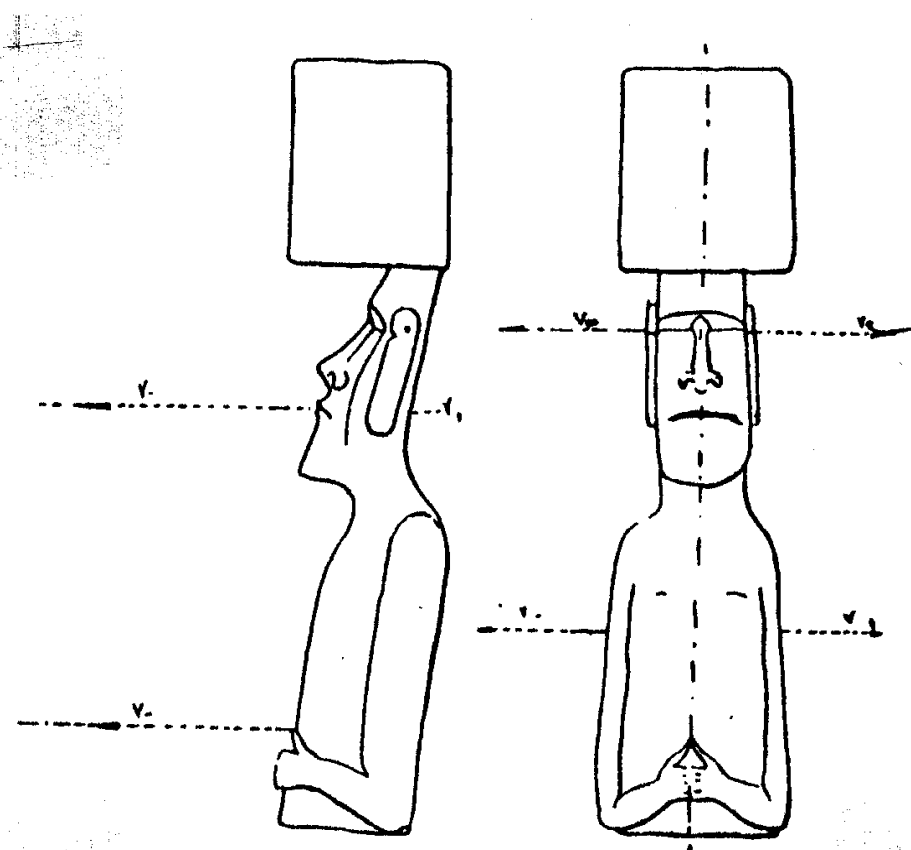

Figure 41. Distribution of the positive green and negative green rays in an Easter Island statue.

Sphinx. The Sphinx, like all Egyptian forms we have studied, emits radioactive planes. (See Figure 42.) We find these magnetic rays distributed as in the diagram below: 2 horizontal planes, one vertical plane passing through the longitudinal axis, and finally two transverse axes giving the intersection of three planes at the height of the head and the thorax.

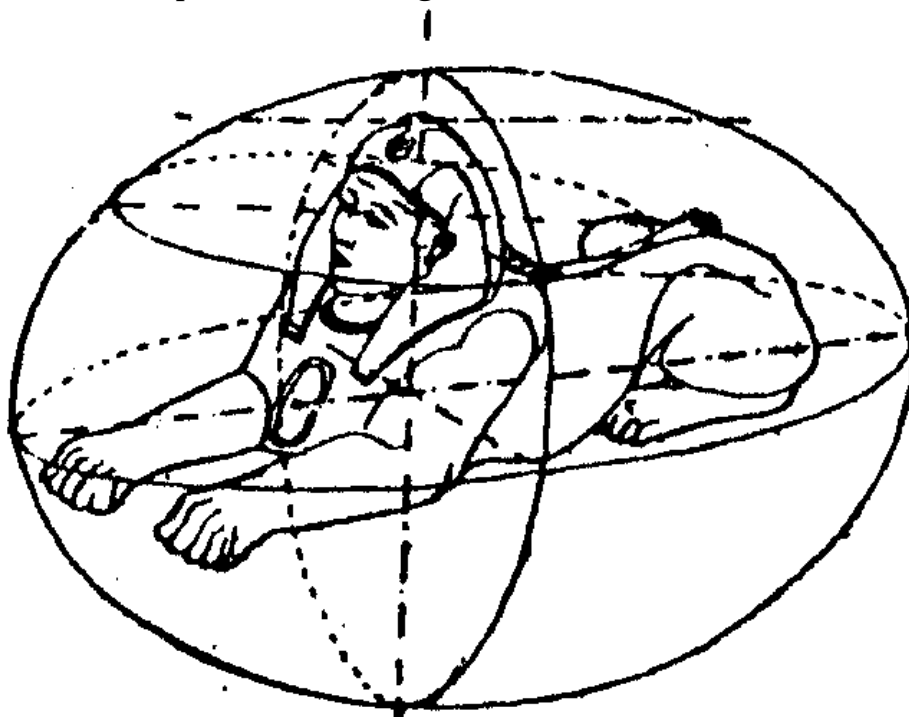

Figure 42. Planes and rays emitted by a sphinx.

RADIESTHESIC BATTERY. STUDY OF RAYS.

We will not return to the description of the classic radiesthesic hemispheric battery we invented at the beginning of our research and described earlier, but we are going to show that it is possible to change this form to obtain at will, in voltage and in intensity, the complete scale of the spectrum. In the hemisphere we examine only two rays: negative green and positive green. While retaining them as carrier waves, we can, in modifying the forms, create a double wave and balance it following the principle used also by the Chinese in the yin-yang in the Ba-Gua.

In order to calculate these profiles, we have perfected the virtual cone detector described in Chapter 7 in Part Two of this work. We remember that it consists of a shaft and a sliding disk on the shaft. The position of this disk in relation to the scale creates a virtual cone of which the diameter is fixed but the height is variable. The colorimetric value is read

instantaneously off the graduated shaft in scales for visible and invisible wavelengths. (See Figure 34.)

The principle of the balanced radiesthetic battery will be to juxtapose two angles at a base; and if one angle corresponds to red vibration, the other will be adjusted to violet vibration. (See Figure 43.) By combining multiple elements, it is possible to obtain extremely powerful rays. It is not necessary that such a battery be made of a solid, homogeneous material: the empty space can also form a battery, and it is thus that we interpret the four cells overhanging the King's chamber in the Great Pyramid.

Notice: We submit to the reader a reproduction of one of these batteries on which the surface has been entirely covered by gridwork. This gridwork has the property of making a screen or filter to the rays emitted by the battery. They can no longer be detected by the pendulum. (See Figure 44.)

In other batteries (See Figure 43.), the rays are very detectable. They have been set for the indicated length, and all radiesthesists equipped with a Universal Pendulum can detect them.

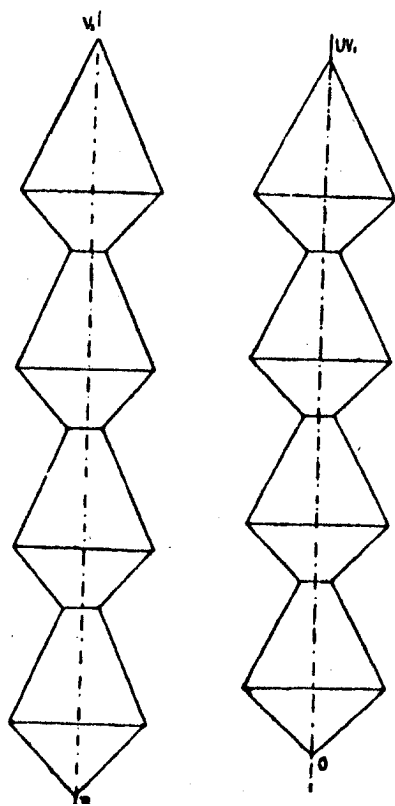

Figure 43. Example of two batteries with rays giving red or orange

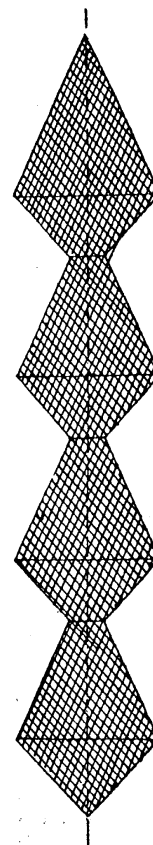

Figure 44. Use of checkerwork grid to neutralize rays of a battery.

THE SEVEN-BRANCHED CANDELABRUM

In antiquity, primarily in the Hebrew civilization, there existed a candelabrum of seven branches resting on a lozenge-shaped pedestal.

The peculiarity of this candelabrum was the emission, straight out of each candle, of a vertical colorimetrically-affiliated ray, from red to violet, with green found in the center. (See Figure 45.) Upon illuminating the seven candles, one obtained an intense radiation of the complete spectrum with this particularity, that the combustion and the heat engendered a disintegration adding to the power of the vibration.

If, in the place of the seven lights, there would be only one or two, one would obtain a fraction of the radiation, and limited to the color-waves emitted by the position of the lights in relation to the candelabrum.

It is the lozenge-shaped base that gives the property of diffusion of the radiations. This base is made of two truncated and superimposed parts of different proportions giving two unequal axes.

M. Bovis, perhaps without suspecting as much, was inspired by this emitting form for his well-known biometry, but without always producing radiation of the spectral separation that is very clear and represented in the drawing shown below. More than likely this candelabrum was used for religious rite.

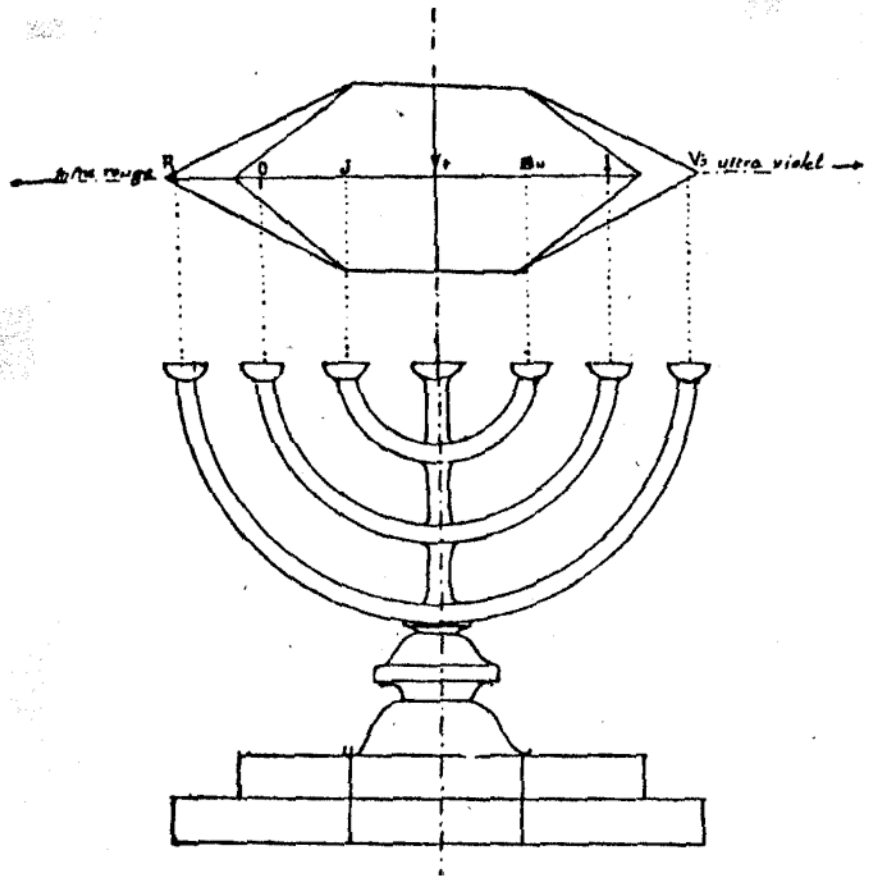

Figure 45. Candelabrum of seven branches, face on and in section. From infra-red to the left of the red candle, through the spectrum to the violet candle on the right, and ultra-violet beyond.

CHAPTER 2: MEDICAL RADIESTHESIA

Wave-sickness. Noxious planes. Radiesthetic touches. Medicinal plants.
Wave-selection instruments: the Snail and the Yin-yang ruler.

Medical radiesthesists encounter a limited purview because the art of healing must be exercised only by licensed doctors. There is no argument against this fact. It is dangerous for others to compete with Esculape without having made the necessary studies; so many anatomical concerns for which the remedies are so numerous, and for which chemistry plays such a large role.

Is ours not the century of specialization? And yet these specialties from the pharmacist, given prescription methods, come from the shelf to be put into any Tom, Dick, or Harry. These ready-made formulas are so perfectly convenient at first sight. Frequently, it is even unnecessary to have a prescription or a medical consultation. Every fourth page of the magazines shows you marvelous cures to improve your state or heal you in one fell swoop, as if thousands of sick people had testified for your own situation. The magazines no longer accept this hyped-up advertising, but the radio meddles with it and holds to the disposition of these fabrications for health.

Can all these medications be taken innocently? We do not believe so, and many medicines appearing inoffensive more often damage health than re-establish it. A remedy, in order to fulfill its role, cannot and must not be an “omnibus” powerful enough to deal with all problems at once. Each illness has a personally individualized action that arises from the wavelength of the sickness-wave, the temperament of the patient, and the state of vulnerability or deficiency at that moment in time. In order for a medication to act, it must be measured out and calculated according to the personal wavelength of the patient. On the other hand, certain diagnostics are often in error, but not through the fault of the doctor. Often the patient claims an organ is injured because it is painful, while this pain might be, in certain cases, the reflex of the neighboring organ, which effectively is ill itself.

In order to avoid these errors, certain radiesthetic doctors, exercise a more wholistic way of prescribing. They are morally within their rights whether they succeed or do not succeed. With conscience they apply new processes that can expand their medical skills. But while these doctors orient themselves toward this new branch of medicine, many others

energetically fight and stand in opposition to a science about which they are ignorant of even the very first word.

It is necessary to listen and understand. Is this radiesthetic medicine true or false? If it is true, it must be given the publicity it deserves. It must even be taught at medical schools. If it is false, it must be pursued, condemned, and annihilated. Public health requires such an effort. But supposing that it were false, the proof remains hard to come by. Several failures or setbacks do not justify a rejection, *a priori*, of a method rich in promise. Setbacks are normal; radiesthesia is a young science where unknowns abound. If official medicine were infallible, there would not be any more disease to contract, and everyone would die of old age.

Is official medicine without dispute? Some are for allopathy, others for homeopathy. Some are going to go so far as to say needles and vaccines are always dangerous, not only for those who are vaccinated, but dangerous for the future of the race,

For all this one fact remains: only the doctor is authorized to care. The radiesthesist, capable or not, cannot act if he is not under the control of the system. He can only make diagnosis according to his procedure; then doctor must verify and prescribe the remedy. The doctor can, however, be further advised by the pendulum as treatment progresses in order to assure that the remedy vibrates well in accord with the deficient organ.

It is along these lines that we would like to give our personal opinion on the actual state of radiesthetic medicine. A disease is registered by the pendulum as a disorder in the vibratory state of the patient: the wave of a person in perfect health (a rare find) does not resemble that of a diminished person.

Where is the affliction localized? Is it microbial or does it result from a passing or chronic indisposition? The answers appear by a scale of wavelengths that locate the gravity of the malaise. Certain dowsers equip themselves with an illness-witness, a drop of blood, hair, or trace of crayon to use as a witness, and drawings of organs on an anatomical chart explored with the aid of a stylus.

The detector, then, reveals the diseased region. Success is often affected by the fact that the radiesthesist, thanks to the witness, vibrates in resonance with the weakened organ; however, numerous errors can occur if the operator has not taken certain necessary precautions:

- a) No other person may touch the witness.
- b) Detection must be done in a neutral place.

Noxious waves can oppose the effect of the pendulum. Likewise, radiesthetic ray-emitting instruments, certain forms of statuettes, or persons

present at the moment of detection can hinder the operation and induce error.

Moreover, a sick person can be influenced by an impregnating noxious wave during his nightly rest or at his place of work. In this case one can easily follow the course of the incriminated wave across his body, and all the organs it touches are more or less weakened.

This noxious wave in combination with a weakened central nervous system puts the organism in deficiency, preparing a propitious terrain for illness. Often, at the beginning of the troubles, all that is required is to move the bed in order to see the rapid disappearance of the maladies, and we have been able to thus reestablish the health of many persons without the use of conventional medicine.

But as we said above, the noxious waves only render one ill if the central nervous system withholds its cooperation to defend the organism. This is why vigorous people resist and tolerate with ease. Others may experience a small aching or stiffness; headaches are quickly attributed to a meal, sleeplessness, or to a chill. Often a simple moving of the bed puts all in order.

When a person is depressed or weak, the noxious wave can act. Having lost its reserves, the organism is no longer in a state of struggle; its dynamism is not strong enough. It is vanquished in advance, especially if the illness is caused by those waves the Chinese call “veins of the dragon”. Any medications that could ameliorate its state cannot produce their effects since the noxious vibrations oppose them.

In the chapter on telluric waves, we will give our theory of the “Rupture of the Compensating Forces” which is at the origin of most of our ailments.

In order to actually heal, the evidence shows that it is necessary to remove this mode of toxic influence that annuls the beneficial effect of medications. These, whether internal or external, always act by their vibrations. This is our point of view; it seems proven by the facts and the numerous experiments we have been researching for twenty years.

Certain that it is surely the wave that is causal, we have pushed our tests farther in substituting curative harmonizing and balancing rays in place of medication. The illnesses submit to the influence of these rays and improvement occurs, often immediately.

INJECTIONS OR RADIESTHESIC TOUCHES

Since vibration acts by itself, we have thought it certainly possible to use our Universal Pendulum-Emitter to affect the central nervous system energy and to charge it with a measured, balanced healing-wave. This wave is delivered by means of the intermediary of a probe placed on very precise points of the body indicated by the detector.

We have noticed that on the human body, a number of important points are sensitive to the pendulum, and at which the circling direction is reversed.

Just touching these exact points with the probe, and leaving it as long as necessary, changes the negative turning to positive. After a certain number of turns there is saturation, the Universal Pendulum slows down its movement, and then it swings in the directions N-S and E-W before it stops completely.

One can thus treat several sensitive points, one after the other. In a case of rheumatism, for example, at the end of a dozen touches, a patient felt an intense tingling sensation in the treated part, and the pain disappeared in two or three hours. We note that in addition to the vibration emitted by the detector, the radiesthesist sends the patient his own vital fluid, further reinforcing the healing ray and giving a transfusion of vitality.

The mechanism of radiesthetic touch cannot be explained by an excitation of the central nervous system energy on these precise points because the latter is deficient (reverse circling). It is thanks to the harmonizing wave projected by the intermediary of the Universal Pendulum. This method thus parallels with *sympathicothérapie* and Chinese acupuncture.

MEDICINAL PLANTS

People who treat empirically with plants know the proper timing for gathering herbs so that their curative properties are enhanced: for example, some must be picked at the exact moment of the full moon. Do not laugh at these old customs; these secrets of the past, transmitted orally from father to son, continue ancient traditions bursting with truth.

One often hears talk of the influence of the moon on our planet. It has obvious effect on the oceans and the periodicity of women. Certain phases of the moon influence the growth of vegetation, and planting seeds in a given lunar period promotes growth. Trees for industry, in order to

remain sound, are cut during precise lunar phases. There must be in all this at least some part of the truth. The bigger picture shows the moon to exercise its influence concurrently with the sun, the several planets, the zodiacal periods based on the fluid action of the “fixed” stars, and finally, all the cosmos. Errors can occur when influence is attributed only to the moon.

In order to prove the astral influx on all that lives, we made the two following experiments:

1. We picked at the same moment two different plants which, checked by the pendulum, have given us each two vibrations:
 - a. One vibration of its own, due to its species;
 - b. One vibration in common, resulting from the astral influences impregnating these two plants at the moment when they were cut.
2. We have picked two similar plants but at two different intervals of time. We have then noticed:
 - a. One characteristic wave common to both plants;
 - b. Two distinct waves that logically must be attributed to the sending of astral rays at the moment of cutting.

If the plants submit to these mysterious influences, it must be the same for humans. Does not astrology inform us that the infant, upon birth, receives an astral impression that he will retain for his lifetime?

This impression will give him a sort of tendency, a particular character made up of other astral influences in proportion as he progresses in life. This does not extend, however, to deny the arbitrary freedom of will for each individual or the possible range of his own reaction to the best or the worst. The Creator intended this liberty.

It is the same for the plant as for man. At the instant the plant is separated from its stem, waves impregnate it, but with this difference: the plant can no longer react. It is immobile and frozen in this radiation now part of its make-up.

The secret of medication by plants is to cut them at the moment when they are impregnated with the largest astral radioactivity.

Before giving or prescribing a remedy, remember that the biggest obstacle to healing is the permanent action of noxious waves. The potential of supposedly efficacious remedies is partially destroyed by these contrary waves that harm the healthy equilibrium of the human cell. Deprived of its beneficial action, the medication retains by its composition the possibility of damaging or irritating certain organs: liver, stomach, intestine, etc., and

its useful role is converted into a harmful one. The noxious vibrations absorb its healing vibration.

Is protection from noxious waves possible? Such protection would necessarily be a) present at all times and places, and b) opposing the noxious wave by detaching its radioactivity. This prevents the carried wave from vibrating and escaping into the atmosphere.

We think it essential that one carry on his person an emitter producing a shape-generated wave designed to suppress this dangerous radioactivity. Here is the origin of amulets, lucky charms, and talismans operating in ways unknown to those who carry them. The charms bear figures and designs having radiesthesic ability only the pendulum can reveal. These objects, beneficial for certain people, are sometimes, however, harmful for others because the capacity for absorption and diffusion is not the same in every individual. This is why some people are “empty” in a crowd, and so are moved unconsciously to search for isolation. Others, of inverse constitution, have a tendency to mingle with their fellow creatures, and to their homes they draw the vitality that their being lacks.

The handled cross of the Egyptians, once utilized for protecting oneself against noxious waves in temples, tombs, etc., was of massive and powerful form. It was not used except at the desired moment for crossing a contaminated zone or staying in one for brief periods. On the other hand, there were rings, of which we possess a specimen, calibrated to human voltage, and which would have been worn continuously.

WAVE-SELECTING INSTRUMENTS: 1. SNAIL. 2. YIN-YANG RULER

We have previously seen that disease-vibration is detectable along the spectral cycle by the Universal Pendulum. We have developed two little instruments permitting instantaneous location of these illness-waves so that the healing ray can be utilized.

The Snail. The form of this instrument recalls the Indian Conch, and we have named it the Snail. (See Figure 46.)

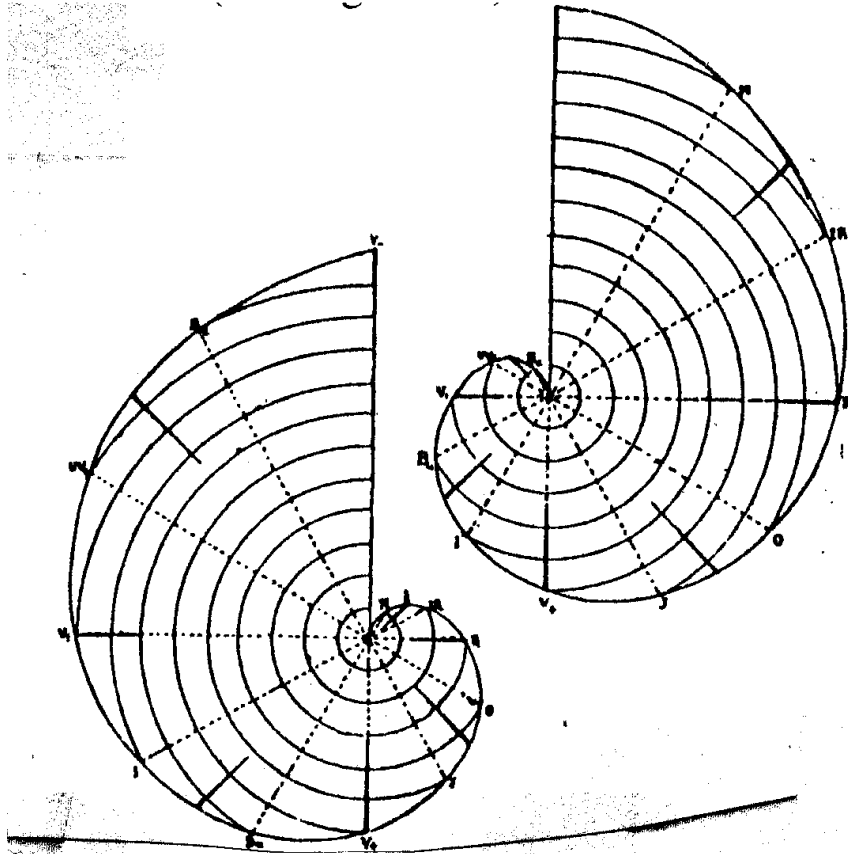

Figure 46. Board snail showing the separation of the color-rays on its two faces.

It can be made of plywood, *fibrine*, or metal; the material is not so important because it is the form that produces the effects. The illness-source is placed on the center and its wave is carried by the color-waves of the instrument, which is radioactive due to its shape. On the drawing that we have added to this description of the snail are represented all the color-vibrations on the exact points where they are situated. Each appropriate remedy, placed in the extension of the illness-ray and outside the snail, annuls the turning of the detector. The same medication at the location of

the witness gives the pendulum a reverse turning from the illness-wave. This one was annulled by the remedy with the aid of the search-pointer fastened at the center of the instrument, looking for the positive turning of the pendulum on the circumference. (See Figure 47.)

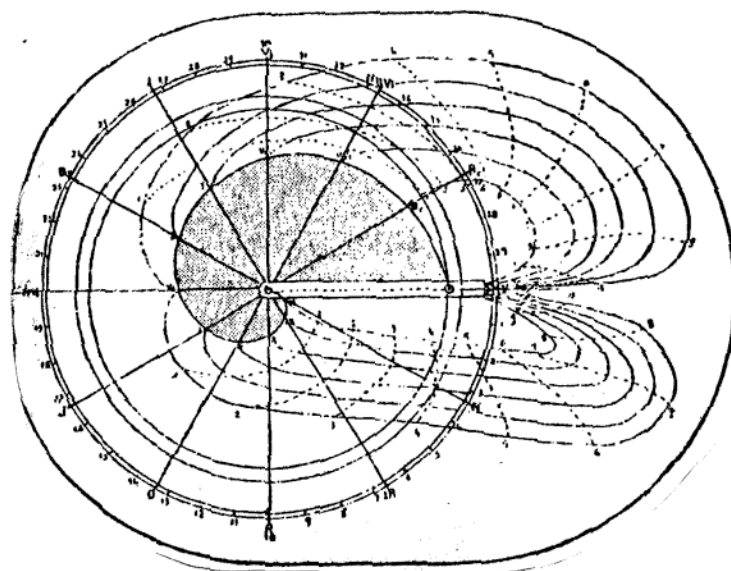

Figure 47. Perfected snail-disk.

The Yin-Yang Ruler. This instrument, perhaps more complete than the previous one, is made of a ruler that is graduated in 100 divisions and also in wavelength. One end carries a movable metallic disk with marks for all the vibrations of the spectrum.

In the positive green position, it informs the detector of the energy or the state of deficiency of a sick person. Place the witness in the center of the disk and with the aid of a virtual cone detector search for the breaking point on the scale. Example: 85/100. This instrument is based on the principle of the yin-yang, and we consider it very precious. (See Figure 48.)

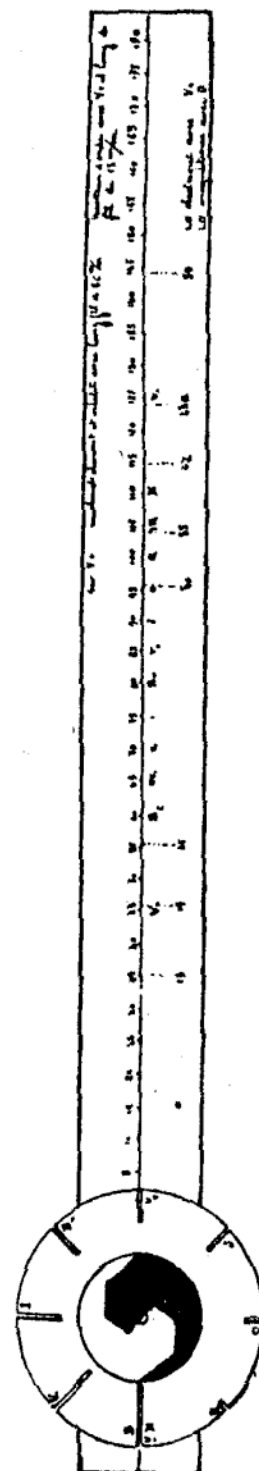

Figure 48. The Yin-yang Ruler

Remarks. The violet ray holds the indication of a good health and equilibrium in the human cell. In order to place the violet ray conspicuously we have established a very precise graphic (See Figure 49.), and the accompanying legend explains the mechanism. If the healing-ray is well-tuned, we always find violet. Conversely, if we know the sickness-ray, then we obtain automatically the healing or opposite ray to be administered to the patient under different forms: plants, allopathic remedies, homeopathic remedies, and even radiesthetic rays in place or at a distance.

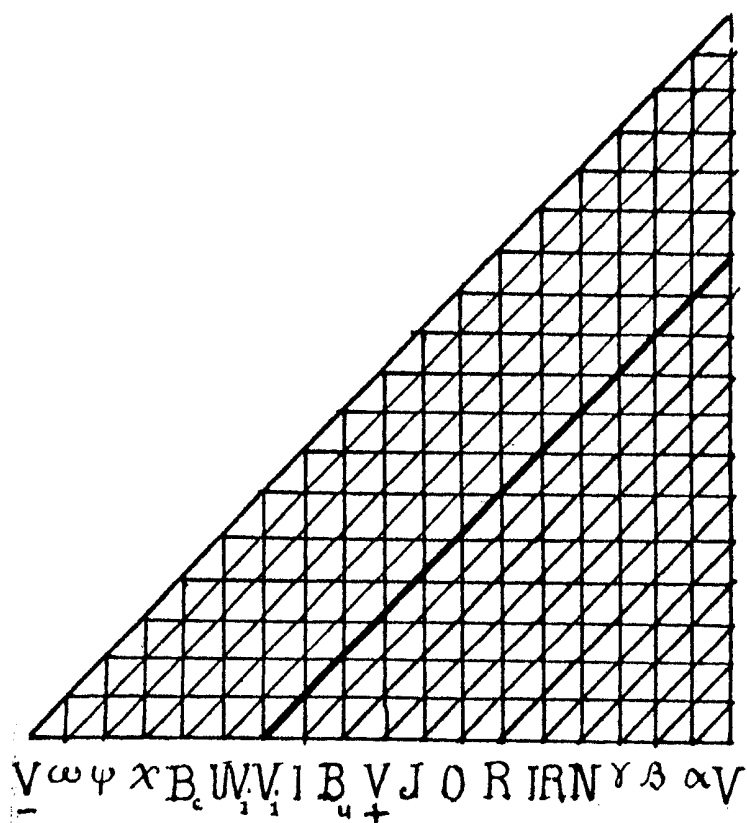

Figure 49. Color array: Negative Green, ω , ψ , χ , White, Ultra-violet, Violet, Indigo, Blue, Positive Green, Yellow, Orange, Red, Infra-red, Black, γ , β , α , and Negative Green.

The graphic demonstrates the relationships of the healthy violet wave. To obtain violet, notice that the two vibrations, yellow (sickness wave) and white (healing wave) are opposite on the universal Pendulum. Counting horizontally from the origin at the left, the ordinate of white (4) subtracted from that of yellow (10) ends up on the thick line, violet, the line of health. Another example: indigo, sickness wave, infrared, healing wave: $13 - 7 = 6$. Indigo's vibration meets the hypotenuse of the triangle, the line at 90 degrees that automatically conducts to the thick line: violet, wave of good health.

CHAPTER 3: THE BEAM. NEGATIVE GREEN.

We devote a special chapter to our negative green because we are aware of the capital importance of our twenty-year-old discovery, and we hope it will soon be used in official medicine. This mysterious radiation of surprising power is not a single pure vibration, but actually a beam of intense radioactive rays extending from infrared to ultraviolet.

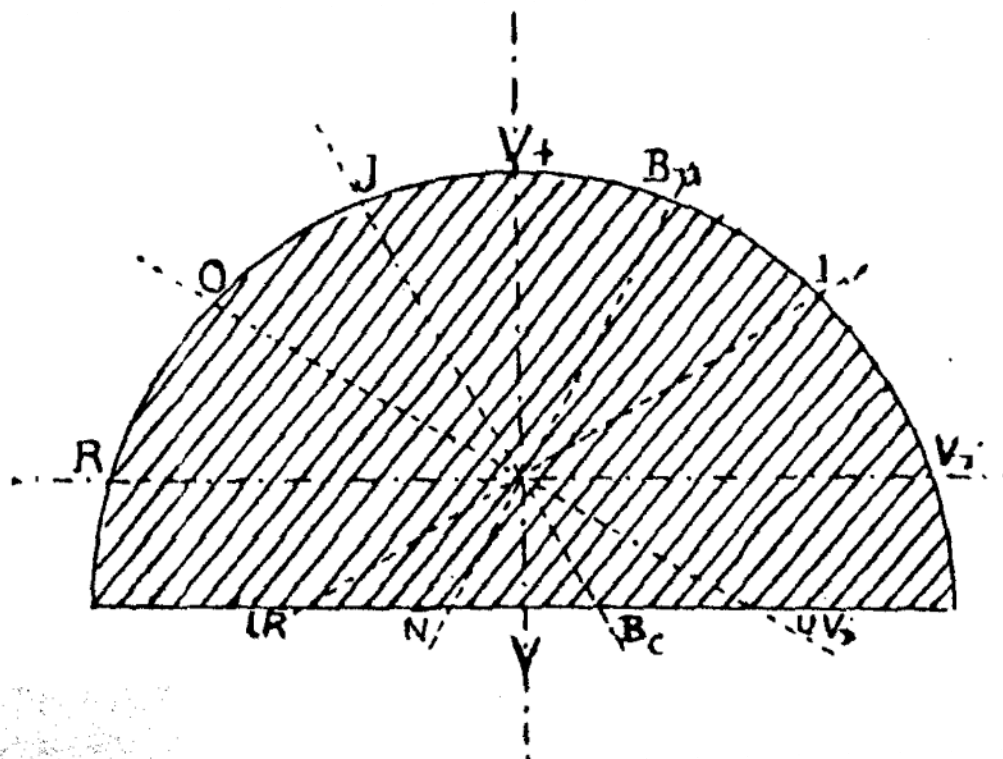

Figure 50. Complete array of the negative green as it escapes from the flat edge of the hemisphere. (From 12:00, top, going clockwise: Positive Green, Blue, Indigo, Violet, Ultra-violet, White, Negative Green, Black, Infra-red, Red, Orange Yellow.)

Figure 50 graphically shows these principle vibrations to be infrared, black, pure negative green, white, ultraviolet. Outside of these we have isolated other secondary rays designated by Greek letters: (See Figure 51.)

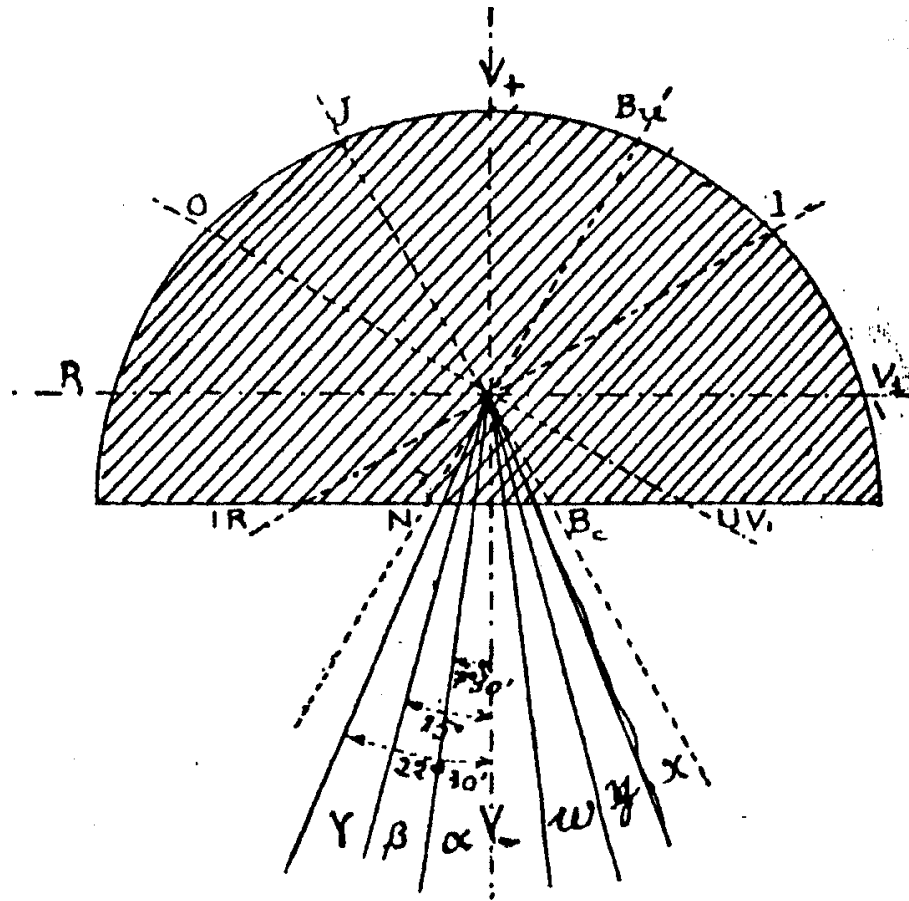

Figure 51. Radiation of negative green beam uniquely included between white and black. Between pure negative green and black: alpha, beta, and gamma. Between pure negative green and white: chi, psi, and omega.

An infinity of other vibrations exists between and among these designated bands, but we content ourselves with those named herein. For in these we recognize extraordinary curative abilities, particularly in the case of cancer.

Pure negative green mummifies with a prodigious power: meat, fish, eggs, flowers, etc. This makes it sterilize and destroy micro-organisms and agents of putrefaction.

It is not necessary that the action be limited to operation only in its own location. Take a bit of meat and place it in another place where negative green can be directed. Even at a considerable distance, sterilization will take place. In this way, we were able to mummify a piece of meat from Paris using a witness we took in Brittany.

Since it is possible to sterilize a piece of meat even at a distance, it is equally possible to mummify a cancerous tumor.

And if, in place of using negative green, we emit alpha rays, we obtain a curative vibration for tumors. In proportion as the illness progresses toward healing, this beneficial vibration tends to digress from pure negative green and to approach black. The mummification ray is passed by and we find ourselves in the invisible sector whose effects, although powerful, are entirely curative.

Since we touch here on the question of cancer, we point out that the healing of cancer remains problematic, especially if the illness has invaded the organism forming metastases. If the radiation is received at the beginning, there is hope, and even later, it can be possible to bombard the illness with pure negative green, mummifying all the cancerous tissues and central nerves, to suppress suffering and extend life for several months.

This pure negative green vibration is the shortest but the most penetrating wave of the universe. Its power is infinitely superior to that of X-rays. It is possible, if one does not take the proper precautions, to get burns from it like those from overdose of radioactivity.

New Discovery concerning Negative Green

In 1968, eleven years after the death of my collaborator, Léon Chaumery, I resumed study of this enormous subject of negative green, its discovery having been made with my great friend around 1932. Here is what I have been thinking since having more experience with this mysterious vibration. I have been able to observe that it is comprised of two different components or frequencies:

- a) A purely magnetic frequency that is a beneficial vibration *par excellence*. This is the vibration of GOOD, on the philosophical plane, which re-establishes a deficient health to a good condition when rigorously dosed.
- b) A pure electric frequency, a noxious vibration, and on the philosophic plane the vibration of HARM. This is what destroys health and brings about death by unbalancing the vibration of the cell.

By way of example: it is possible for me to kill an adult tree in one week by submitting the tree to the action of electric [vertical] negative green.

In the laboratory, Czech and Russian physicians actually kill flies, spiders, mosquitoes, etc. at will, by submitting them to the action of electric negative green.

In 1974, having reconstructed my laboratory with large cosmic and magnetic batteries emitting electric [vertical] negative green via the intermediary of the emitter of shock waves, and having exposed gamma-sensitive film to these rays, the film showed *complete darkness*. Time of exposure was 88 hours. The emissions of Roentgen rays were infinitely more intense than with the classic procedures. They have baptized this radiation a Belizalogramme.

Reproduced no more on the laboratory plane, but on the industrial plane, with a radar emitting a great intensity of an electrically pure negative green over a large field of action, it was possible to suppress all life by dehydration in an entire sector swept by this vibration of death.

—A. de Belizal

CHAPTER 4: NOXIOUS WAVES

Carrier waves, carried waves. Rupture of the Compensating Forces.
Physics apparatus, stabilizer of the Balancing of Forces. Kaolin,
impermeable screen to noxious waves. The Reequilibrator.

This naturally-occurring phenomenon of noxious waves is more than ever the order of the day. Denied by some, recognized by others, it is a subject of many discussions and exchanges of opposing views between radiesthesists.

What is a noxious wave? What is the mechanism impelling it to vibrate? How do we recognize it? We will answer as many of these questions as we can in these pages to shed a bit of logical light on this ancient knowledge.

Our lengthy experience has taught us that a noxious vibration is formed of two completely independent elements:

1. A carrier wave, an aspect of negative green, which is to the radiesthesic wave carried as the Hertzian wave is to the modulating wave.
2. A wave carried vibrating on this carrier wave, conveyed by it, and having its own wavelength synchronized on the complete scale of the spectrum. It is comparable to the modulating wave of radio, but is in fact an illness wave.

This negative green vibration, if not accompanied by the modulating wave, is dangerous to the health because the rays deeply penetrate whatever they strike. When it is accompanied by a modulating wave, which is generally the case, the toxicity is augmented since this vibration can create, in a prepared and deficient terrain, a climate favorable to the development and growth of an intense microbial flora. Over time, health can be irreparably devastated.

It is not even necessary to place oneself directly in the path of these vibrations in order to undergo their misdeeds. Since we know these waves emit harmonics in three dimensions, the action, although less virulent, is enough to enfeeble the central nervous system.

If the modulating wave can thus attack the organisms of living beings, it must take on the radioactivity of the carrier wave of negative green. But negative green escapes from the soil and rises in the atmosphere only on the condition of the “rupture of the compensating forces”.

We now introduce this theory, apologizing for the repetition that we think necessary for clarity. The following has already been the subject of a report to the International Congress of Radiesthesia at Paris, May 1954.

We understand a noxious wave to be a telluric non-compensated, or non-counterbalanced, vibration that spreads in the soil in the form of a carrier wave. It serves to support a modulating wave that might be either a vibration from dirty water, microbes, emanation from a graveyard, a sewer, a subterranean poorly draining river, or a dry radioactive fault, forming a radioactive battery by virtue of the different layers of minerals in the soil.

All over the earth are formations whose magnetic fields can destroy the state of equilibrium in the living cell. In order for this toxicity to act, it is essential that these disequilibrating vibrations find a support, a carrier wave permitting them to escape into the atmosphere. This carrier wave is the negative green wave, and it plays the same role in the soil as the Hertzian wave in the ether by linking with a modulating wave. It attracts to it all the disequilibrating radiations that, without its cooperation and assistance, could not escape into the stratosphere.

Some may think that these waves must then be everywhere. Fortunately they are not everywhere because in order for a toxic emission to happen, it is necessary that there be a *rupture of the compensating* [or counterbalancing] *forces*.

Without alluding to illnesses originating from epidemics, heredity, or from secondary accidental causes, but instead to neoplasm, certain forms of tuberculosis, mental illnesses, nervous depressions, rheumatism, liver or cardiac deficiencies, etc., most of these maladies have their origin in natural noxious vibrations.

For thousands of years in China, for example, no one would ever conceive of constructing a building on a site without first appealing to a qualified specialist to determine the nature of the vibrations of the location and if the site was located on a “Dragon Vein” (as the Chinese named these noxious waves).

In our time in Europe, who is anxious about these invisible yet fearsome contingencies? Fearsome, because the human, animal, and plant cell, in order to grow, develop normally, ripen and mature, age, and finally to die of old age not from disease but from wearing out, must be obliged during the length of its existence, to vibrate in balance with two forces:

1. The Telluric Force which comes from the center of the earth;
2. The Cosmic Force which comes from the Cosmos, our galaxy, and solar system.

Most human, animal, and plant cells find themselves in the balance of these two Forces unless affected by other secondary or accidental causes. They are safe from the evils that ravage humanity. But if, for whatever reason, one of these two Forces comes to be lacking, (it is always the Cosmic Force), very rapidly the disequilibrium engenders malady in its diverse forms because the spinal energies have broken down and the spinal cord can no more fulfill its role as defender of the organism.

The state of illness proceeds then to a vibratory imbalance caused by a “rupture of the compensated forces”. These sole telluric waves are precisely those noxious zones determined by all competent and serious radiesthesists. They constitute injurious vibrations that we find in all the houses where cancer or diseases are found.

These lines of force, when it is not a question of subterranean currents of water, sit noticeably on North-South or East-West lines, but it is sometimes possible to detect them also in the form of a sort of sketch, where the ascending verticals are clearly shown.

We know of three procedures for neutralizing noxious waves:

1. A psychic procedure. This procedure is based on the call to the Superior Forces, a call always heard when executing it with perfect consciousness of one’s own nothingness, and put in a state of love necessary to the success of such an operation. This makes it touch the failing Cosmic Forces and permits, by its intervention, the return to balance with the compensated forces.

This invisible action by the invisible forces can be ignored by the superficial types who only count concrete facts and solve problems mathematically or from the perspective of physics, chemistry, or biology; and yet the proofs are there, convincing and irrefutable. Everywhere that the balance of the forces has been reestablished, there has been a clear amelioration of health; moreover, this affects humans as well as animals. In cases of advanced cancer, the patient ceases to suffer and passes on peacefully.

As proof of this physical action, the detector, which had detected the wave through a violent negative turning, remains inert after the use of this procedure.

According to the measurements made in each precise case, it is possible for us to affirm that the protection of a building given by this procedure extends in the form of an ellipse having these dimensions: 70 meters in the N-S direction, and 45 meters in the E-W direction.

2. A physical procedure. Since it has been recognized that a toxic vibration stems from a rupture of the compensated forces, it was logical to try to develop an instrument with which, by its power as emitter-receiver, we could both reestablish the balance of the forces and suppress the radioactivity. This radioactivity neutralized, the modulating wave finds no support for its transportation across soil and space.

This instrument is simply constructed of two identical shapes in wood or metal, sliding one on the other, and of which the relative travel annuls the radioactivity of the telluric wave, even if the neutralizer is not placed at the vertical to the noxious emission. Its field of action is of sufficient extent in order to protect the surface of a medium-sized building. (See Figure 52.)

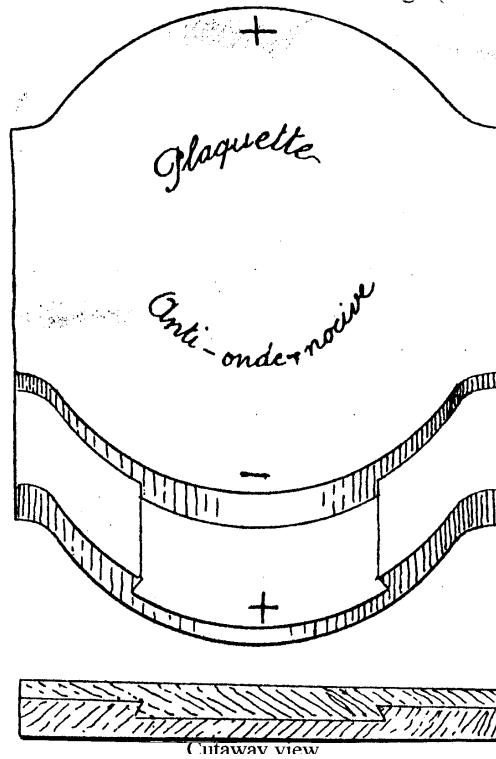

Figure 52. Stabilizing plaque for balancing the Forces: noxious anti-waves.

3. A natural procedure: Kaolin, protective screen. We have noticed that a clayey subsoil of a certain density forms a protective and stable screen against the disequilibrating noxious wave. When the bed of clay is neither constant nor sufficient, however, the

radioactive vibration still passes, and that explains certain localized rising of waves.

After many experiences, we have the certitude that a contaminated house can be rendered healthy through a well-packed covering of the soil of the cellar, of a bed of kaolin around 20 cm thick. After this is put in place, it is no longer possible to find a trace of the noxious vibration except in the walls. Interiorly the protection is absolute. With radioactivity suppressed, the cosmic wave can again freely bathe the contaminated zone with its beneficial radiations.

Such is our opinion on the noxious natural waves. As for others that qualify as artificial because they are fabricated and calculated, their action may be more veiled. But they are not less dangerous and their degree of toxicity is a function of their form, mass, and material. It is also a product of the venomous products that enter, by design, the composition of these wave emitters. The activity of these statuettes, Buddha, sphinx, etc., is variable because they act either in a neutral terrain or in a noxious zone. In the latter case, induction reinforces their actions. It is thus we noticed that a reproduction of an Easter Island statue (35 cm) in only three days caused a surgical scar dating back 17 years to become painful and intolerably itchy. These symptoms disappeared in one night after the statue was removed from the house. Its action was a ray of around 4 meters in length. At the same time that it disturbed the person subject to these troubles, it mummified a piece of meat perfectly.

A new instrument, invented in 1966, has the property of reestablishing the balance of forces in a house suspected of “ruptures”. This is why it was named “Reequilibrator”.

Using principles of physics, it reestablishes shape-caused waves. It has the ability to attract positive cosmic waves so that these come again to bombard the negative telluric waves, reestablishing a balance in the compensated forces.

This magical shape-caused wave had been discovered in a sarcophagus in the Valley of the Kings, during the excavations made in Egypt 150 years ago. Well-placed in the magnetic field, its efficacy is positive to 100%. Wherever the instrument is in action, in a contaminated house suspected of a rupture of force, health is reestablished and the joy of living is reborn.

CHAPTER 5: THEORY OF THE GREAT MAGNETIC CURRENTS, RESEARCH ON LIVING WATER

The problem of water:

If there is a really burning problem, it is certainly that of water. Water is the essential element. It is indispensable to life, and without it our planet would be only an immense desert like the Gobi or the Sahara or the moon. The human body itself contains 80% water: brutal and rapid dehydration is a common cause of death, especially in depleted infants.

At this moment, with a worrisome logarithmically galloping population in a society focused on consumption of comforts always more sophisticated and more demanding, the need for water is becoming a premiere problem that completely overwhelms governments and municipalities.

In order to satisfy these most urgent immediate needs, they drain the surface waters, the streams, the polluted rivers, even the irrigation flows to the big towns, for which the waters cart off the detritus and waste of the cities and their sewers. Chemical products from industries pollute downstream.

Obviously these soiled, contaminated, microbe-polluted waters are not available for consumption. It is necessary in the first place to construct dams to hold them back and “water chateau” factories for purification in order to obtain a neutral water termed “potable”, meaning chlorinated, pasteurized, but dead forever, and of a taste more or less dubious, not to say loathsome. This water is only good for cooking food and watering livestock, but not for table drinking water.

In addition, companies exploiting mineral waters (which are not surface waters, but waters of the depths) have themselves a good time developing their industry. Bottled water sells now for a low price not only in the supermarkets but also even in the smallest village grocery. This is a triumph over table water by the plastic bottle because it is not noticed by whomever refreshes himself with tapwater that the service is assured by the *Compagnie Generale des Eaux* which holds a veritable monopoly in France in the same way as gas and electricity are monopolized.

If these “mineral” waters are biologically healthy, in theory, they are not suitable yet for all organisms because they contain excessive mineral salts in suspension that can injure certain temperaments.

Professor Louis-Claude Vincent, following very careful bioelectronic analyses, informs us of the mineral salt contents of certain spa waters:

Vichy (bicarb, soda)	4 g salt/liter
Badoit (bicarb, soda)	2 g salt/liter
Contrex (calcium sulfate), water for plaster	1.7 g salt/liter
Vittel G.S. (calcium sulfate)	1 g salt/liter
Perrier (calcium carbonate)	0.6 g salt/liter
Evian (calcium carbonate)	0.5 g salt/liter

Consequence for the organism: these waters are tartar-forming (forming mineral deposits in the tissues, joints, and arteries in phase with oxidized blood) and thus thrombosis-forming and carcinogenic.

The only mineral salts assimilable by the human body are those of organic origin from vegetables or animals or their by-products (eggs, milk, butter, etc.).

In the case of ingestion of non-organic mineral salts, the blood thickens and becomes alkaline rather than remaining acid. This opens the door to all those thromboses and arterioscleroses stopping up the arteries. The organism cannot utilize minerals that have not already been metabolized by vegetable life. All the calcareous waters we reject as harmful, while the waters from granite or volcanic sources (Volvic, from Auvergne; Katell-Roc and Lisio, from Brittany) are highly recommended because they are chemically pure and without any medical contraindication.

Upon learning the above, the reader will perhaps be tempted to think: earth will soon lack potable water because polluted waters must be avoided and the waters of the distribution companies, although regenerated in purification plants, are dead chlorinated waters inappropriate for table water.

Besides, mineral waters, as indicated above, should be used only with the greatest reservation, in order to avoid the tartarization of the organism. So far, planning for actual and future water needs of the world has been concerned with desalinization. Desalinization of ocean water into sweet water is, however, prohibitively costly. Furthermore, this desalinized water becomes dead water. It is neutral, certainly, but does not possess the energetic value of untreated living ocean water.

The great magnetic currents Fortunately, a capital discovery has been made and tested several years ago in France, Belgium, Italy, Malta, Pantellaria, Baleares, and Spain, always with success. This discovery shelters our planet from all water problems, especially from the lack of pure water and living water, and here is the fundamental law: The earth is a

living being in the same way as is a human being. We have arteries, arterioles, veins, capillaries, and blood necessary for life. They are all pulsed by a motor, the heart, for returning the blood to the same motor after having been purified and oxygenated in the lungs. It is the same for the earth, but in place of the medium of blood, its medium is water. Like man, earth has its arteries, veins, and capillaries, and all living water pulses from two hearts, returning to these two hearts after having been purified in the lungs of the cosmos. As in man, it is a closed circuit.

What are the two hearts pumping this living water? The two hearts of the earth are the two poles – arctic and Antarctic – North and South.

From the two poles go the large magnetic arteries of living water until they reach the bulge of the equator. There they feed the tropical rivers. Then this water, pumped partly by the sun, goes to be purified by the lungs of the Cosmos, falling down again as living water at the two poles in the form of ice and snow. It is a closed circuit, inexhaustible, of pure and living water (I repeat it) because it is charged with cosmic rays.

In the same way that the human body cannot live without blood, the earth cannot be without water. Just bore into these magnetic arteries and they gush. They encircle the planet like a net around a ball, and it is very possible to establish on a map the tracks of these arteries over the entire surface of the globe. They follow about 20 km from each other, and it is on this network that we find the branching veins and capillaries that feed our nations and carry life to them.

The arteries cannot vary their paths because they are made of sheaths of invisible radiations subject to the terrestrial magnetic field serving to convey the underground flows to the bulge of the equator. They can, however, vary in depth, according to the nature and profile of the terrain under which they flow.

All hills, especially the wooded ones, and all mountains contribute, for the magnetic artery flows deep under their profile, a veritable pump breathing in the water of the artery through the capillary, and often rising at least 50 meters to ground level.

These natural pumps serve to feed water to all the veins of our countryside. Here there is no more magnetic field, and the pumped water in the arteries follows the profile of the terrain and the gradients in all directions. They are the wells we find in the villages in which the water is always proving the origin of the magnetic arteries.

At what average depth in the earth do these arteries flow? Experiments show between 180 and 250 meters under terrain of normal

altitude. On the high plateaus the depth of the arteries can attain 350 meters.

The flow is extremely important and varies according to the nature of the drilling, whether it is in the very center of the artery or on the edges. This change of flow varies on the order of 60,000 to 80,000 liters per hour to 250,000 liters per hour, and that without the level of the water dropping in the well.

This water is of extraordinary purity, and the pressure coming from the poles is such that it comes up in the well at some 50 meters at ground level and maintains the quantity drawn.

When the artery finds a geologic fault on its route, a shaft in which the water can come back up through natural pressure, it sometimes springs up to the surface making a natural artesian well.

In the Mediterranean basin the ancients knew perfectly well the existence of all these currents of water and the smallest subterranean streams. But perhaps they ignored the fact that these currents are magnetic arteries taking birth at the North and South poles, truly pulsing hearts of LIVING water in all directions, that is to say, LIFE.

In order to signal the presence of the subterranean water, they had the habit of placing three stones on the dry stone walls around the fields, the two extremes indicating the width of the current and the one in the middle, the center. This middle angular stone represents the passing of the water.

Yes, in the entire Mediterranean basin, the stones thus posed on the stone walls speak of this intelligence, and one is tempted to say, "When these stones speak, the streams sing". Confirmation requires only holding a dowsing rod between the fingers.

SOME RESEARCH EXPERIMENTS

Certain readers will be without a doubt interested in knowing exactly the procedures of detection of the Grand Magnetic Currents. We have traveled all of Italy from north to south and everywhere we have crossed the arteries of living water coming from the Adriatic. They are generally of little depth and the subsoil is constituted of impermeable clay under which the arteries circulate. Returning back to the north, one finds these in Dalmatia, Yugoslavia, Austria, Poland, Siberia, Lithuania, and the Polar Circle. These arteries cross Italy here and there in the north-east/south-west direction. Those passing through the Isle of Capri (understand that this

island is made of two mountains emerging from the sea, separated by a hill) flow at 750 meters under the hill and about 450 meters under sea level.

While to find the arteries of inexhaustible living water is one thing, to drill a well on one of these arteries is another thing, because one collides with powerful private interests impossible to defy. On Capri, for example, the island is provided with fresh potable water by cistern-boats that transport the precious liquid from the continent three times per week. This water is stocked in enormous reservoirs and then forced through pressure to the cities of Capri and Ana-Capri. It is a real monopoly that no one can touch. If a well assures the island's independence with potable water, that would be the end of the benefits accruing to the *Compagnie* that has been providing fresh water to this pearl of the Bay of Naples. In a word, it would be bankruptcy.

The artery that passes under Capri has been found also in Sicily. It proceeds on to Malta before reaching the coast of Africa near Tripoli.

The island of Malta is not well provided with potable water because the arteries in all the west of the island are sulfurous and brackish, inappropriate for consumption. The recent government of this island was put under the protection of UNESCO in order that no one can touch the wells without its authorization. There again, as always, monopolies . . .

At Baleares there exists a marvelous island: Ibiza, a true little paradise possessing five arteries for an area of 48 km in length and 25 in width. There it is possible to drill, and water gushes inexhaustibly. It lives, to the great comfort of the population and their summer visitors.

One case in a thousand: a farmette of six hectares, Can-Toni, near Santa-Eulalia featuring an abandoned house and three unsuccessfully excavated wells at 80 meters outside the boundaries of the arteries. On a hunch, we designated a precise point at a distance of 20 meters to where there is a large vein of the artery in the west. We indicated a depth of 140 meters, and a column of water stabilized at 50 meters from the surface.

The well made, at 147 meters water is met and rises to stabilize at 47 meters from the surface with a volume of more than 100 meters high. Equipped with a 35 HP motor and a pump immersed 80 meters deep, the well has since 1967 given about 40,000 liters per hour twenty-four hours a day without the level dropping in the well.

This well has been made, not on an artery, but on a large vein (the artery passes to the west), in a property belonging to the Mme. Martell. The volume of water is so important that the proprietor sells all the excess to tourist hotels in the region of Portinaz where the magnetic artery passes.

In Spain in the north of Valencia, in the home of a grand family of royalty possessing a plantation of some 200,000 orange trees, a well on an artery resolved the problem of irrigation with an output of 240,000 liters per hour without depressing the level in the well. These examples are the miracles of the big magnetic currents.

In Belgium to the south of Brussels, at the boundary between Wallnoie and Flanders, the proprietor of a piece of land wanted to create an artificial pond. Heaven was with him since his property is situated on an artesian artery of the sort that gushes water. By the lay of the slopes, the pond was able to be fed directly without pumping and is inexhaustible. Again the miracle of the great magnetic currents.

In France in Aveyron, on the plateau of Larzac, on a property of 300 hectares crossed by a magnetic artery 250 miles wide, we found a point for drilling giving at 315 meters an output of 300 cubic meters per hour.

Comparable results have been recently obtained in South Africa and in Japan.

When one realizes that there are arteries of living water every 10 to 20 kilometers, that the poles come down to the bulge of the equator, one remains confounded to understand that soon the earth will lack water. To think that this water, indispensable to life, is only available in polluted surface waters, is to ignore that it circulates everywhere in the entrails of the earth in living form.

CHAPTER 6: TELERADIESTHESIA

Teleradiesthesia is a rather controversial question, in spite of the successful impressions of certain radiesthesists. Complete negation of this possibility is heard more and more rarely. At first sight, it does appear incomprehensible: how can a drawing, even rigorously accurate and oriented identically with its subject, vibrate in unison with the latter? When it is a matter of a photograph, the mind can again conceive that it was an exact identity and that the lens could let pass the lights and shadows that are radiations of the object that it will transmit to the plate. In a drawing, however, one cannot seize a transmission of waves by the play of light. Here it is a question of geometry. The compass, the ruler, and the square have only traced landmarks to the observed dimensions; even the eye of the radiesthesist acts in two ways. It is difficult to represent the radiations of a terrain registered in the eye of the draftsman and reported later on a piece of paper. This is why few people believe in a radiesthesic connection no matter however absolutely it exists between a geometric design and reality. For those who admit the possibility of the phenomenon, the image or plan is only one sort of screen through which the teleradiesthesist actually sees the object as if he had it before his eyes. This can be true when it is a matter of the mental method. The brain is so powerful that it can interpret its imaginative faculties and fix their vibrations on a piece of paper.

In our method where we have arbitrarily eliminated psychic action, we will try to show that a real radiesthesic link unites plan and terrain. If, after multiple experiments, this conclusion is recognized as true, the reality of teleradiesthesia will have proven the mechanism.

It will not be necessary to believe in the infallibility of teleradiesthesia, for there are and always will be a percentage of errors due to exterior unknown causes, as are always found in a newly-born science. Here, there will be detection on a plan presenting noxious waves that by the composition of the waves gives a false solution. There, a void or an emitting form situated in the fragment can distract the detector. This is why, before commencing a study on a plan, we look to neutralize, as much as possible, the interfering influences which trouble detection.

The certitude of teleradiesthesia came when we discovered the relay: an accumulator charged with a remedy-wave and placed on the plan of an apartment of a patient, at a specific place. We have been able to control the emission of this curative ray from one place so that it is detected in the other place in spite of the distance. The wave vibrated in a beam and was

not simply a point or a line. This projection seems larger in reality by being linked to a plan. The person affected, not having instruction in the details of our experiment, but who had in hand a detector tuned to the emitted ray, eliminated the always-possible autosuggestion. After multiple experiments in this domain, we affirm the reality of radiesthetic relays.

Another proof of radiesthesia: From 45 km away, we have impregnated the garden of M. Lacriox a L'Henri with a silver wave which was detected in the exact placement by his friend, M. Chalançon, who did not know about the course of our experiment.

More recently we have sterilized a piece of meat from Brittany at Sucy-en-Brie, near Paris. A witness-piece was sent to us by mail. It was immediately bombarded by shock waves of large intensity, and less than 8 hours later the piece of meat from which the parceled-witness was taken had been treated was completely mummified and rendered imputrescible.

We introduce all this evidence to conclude an absolute identity between the plan and the actual terrain, but also between two elements stemming from the same root. They are two equals acting reciprocally one on the other by pulsations of continuous waves between them. We leave the perception of teleradiesthesia to the sensing of our detectors, these perceptions being difficult to detect with ordinary or less gifted pendulums.

For the moment, outside of the Law of Similars that we advocate, we do not wish to take the position about the mysterious mechanism of detection on the plan, we simply notice a relation of cause to effect; the explanation will come later when the science of waves will be more sure of itself.

Radiesthetic diagnosis on anatomical charts has already surprised many people, including physicians. It is the most fascinating branch of radiesthesia.

In conclusion: We hereby submit to the reader the fruit of our observations. We have tried to classify our work in a rational way so that the lessons might be easier and more attractive. It would not be necessary to believe that we have said everything in these several pages, for this book is rather a plan for research in a new way for radiesthesia. We have only made a few feeble breaches into this invisible domain of waves, saving for tomorrow its biggest discoveries. What we have done is absolutely unselfish. Our work had but one goal: to make radiesthesia progress to the level of a science. It can be that in our work there will be some errors. This is not surprising; we would be surprised were it to be otherwise.

Man is not universal, like the pendulum. Therefore, we ask indulgence of those who judge our pages.
