PENDULUM DIAGNOSIS

(Radiesthesia)

By

Dr. C. Dietrich, M.D. (Berlin)

TRANSLATOR'S FOREWORD

This book by Dr. Dietrich was first written in 1936. Nevertheless, much of the methods outlined are true today and will be in the future. Dr. Dietrich wrote a number of works on the subject of Pendulum Diagnosis which are out of print.

Very few foreign works on Radiesthesia have been translated and published in English and I feel that this is a very good work that should not be missed. I append a series of notes to which I hope the reader will refer, since, in translating certain facts might appear inaccurate, also some references in the text, I feel, should be brought up-to-date with the present-day thinking.

1. The term "Radioactivity" throughout the book is synonymous with ordinary radiation, and might cover many varied things. The term should, therefore, refer to the normal radiation of things.
2. In the year 1936, such things to help the operator were not invented. We now have the Personal Body Polariser that ends pendulum "fatigue".
3. We must know that although these terms are correct, each person varies. My own movements are:— Male; a positive or clockwise gyration. Female; an anti-clockwise gyration (negative).
4. The polarities of all bodies (human) are relied upon by the forces of the body. Certain polarity changes might be due to the dual sexuality of the subject. Some diseases attack females more than males and vice-versa, and one should study the sexual balance problem with this in mind.
5. Nowadays, operators rarely use metal pendulums. It is much wiser to use a proper pendulum which is made from clear plastic or similar substance, being light to use and much more sensitive than metals.
6. The thread suspensions are given in millimetres, the best length being about 4–5 inches (10–12½ centimetres).
7. Modern pendulums and equipment do not lend themselves so much to outside influences; therefore, there is no need for such troubles as outlined in the section referred to.
8. Many operators state that WEST is the best way to face, but it is a matter for the individual, of course.

9. The reference "loading" is referred to in the original book. This is to be taken as a "witness" or a sample of, a representative piece of substance, etc.
10. This is an older method. We do not need to contact the pendulum with the object being examined.
11. There is no need to wait the full time stated in this paragraph. A magnet (bar) wiped across the item, will clear it enough to give a neutral surface.
12. This is now referred to as the "Ray of Union", first mentioned by Henry de France around 1930.
13. For a beginner, one hour per day is enough. After that time, he or she might extend the time, but not in such a manner as to get too tired. Modern instruments, of course, make the use of the pendulum much less fatiguing.
14. Not many operators examine patients in the Clinic now, since we use methods of Tele-radiesthesia to do this with a specimen, either with or without a diagnostic instrument.
15. The term "PENDELING" comes up several times in the text and I would like to clear this point up as the meanings might be mis-interpreted by some readers. The German term for Pendulum is Pendel. We cannot refer to this as "penduluming", but the original word "pendel" lends itself to express: "using the pendulum, i.e., pendeling". Also such words as Pendology, Pendolograms. Pendology would only be another name for the more familiar Radiesthesia.

It is hoped that these few notes will have clarified one or two older ideas and brought them up-to-date.

Sussex, England.
1975.

FOREWORD to the 7th Revised Edition

Since this work was originally published a great deal of research has gone into Radiesthesia, along with the mechanised section of the science called Radionics. The statements in this book are still as true today as when first written, but with the world gradually becoming more and more mechanised, it is interesting to note that Radiesthesia has gained much, and a great number of various books and study courses have been written which will cover the complete subject for the alert user of the pendulum, and/or instruments.

The science of Pendulum Detection is now used by many thousands of operators all over the world for a great multitude of things such as Geological Prospecting, Map Dowsing, Water and Mineral Dowsing, Agriculture, Horticulture, Animal Husbandry, Perfumery, selection of colours, scents, finding broken underground pipes and cables, research into health, etc. It is natural that the latter "research into Health and Healing" would be the most popular, since there is a great deal of illness around. In this field, diet selection, remedy selection, diagnosis, etc., are all a part, and Radiesthesia is a most valuable aid in this field.

It is hoped that the reader of this book will decide to go further into this interesting and rewarding field, and take the study into the future with the knowledge that you are working on the edge of the Unknown. There are a great number of books dealing with more up-to-date methods of using the pendulum, but the system outlined in this book will suffice to give the amateur user of the pendulum something to think about and experiment with until some experience is gained to follow on to the subject in more detail.

Prof. Bruce Copen, Ph.D., D.Litt.
Sussex, England. 1975.

PENDULUM DIAGNOSIS

(Radiesthesia)

By

Dr. C. Dietrich, M.D.

It redounds to my special honour that this book of mine has convinced many earlier sceptics of the significance of the rare material ray world and of Pendulum Research, and it brought them to us.

A Doctor, a Rhinelander, Dr. "P" says: "Your Publication has given me very valuable incentive to make my own studies of it. I have examined it thoroughly. Accept my thanks for this valuable book. For my own part, I would never want to be without it again".

Not only Physicians expressed themselves in this manner, but also well-known healing Practitioners, men and women of all callings, engineers, chemists, etc. For me, there is but one aim, and that is to bring to full recognition an earnest and scientifically conceived Pendulum Research, and I thank my friends at home and abroad in foreign lands who are of assistance to me in this matter. As honorary business manager of The Association for Scientific Pendulum Research, I point out here that all earnest investigators and friends should come together in this Association. Whoever does not want to stand alone, let him come to us. Naturally, we are only interested in those who are of a scientific frame of mind and do work in this frame of mind.

Pendulum Research is a Science. And now my book—written at Nurnberg in the height of May 1937 after the second German Assembly for Scientific Pendulum Research.

Concerning the driving force of radiation in all beings, the physical basis of "penduling" is the emanation, outward radiation of bodies.

1. Radioactivity exists in the organic and inorganic world and it is proven that all bodies and, without exception, absorb rays and send them out. We speak, therefore, of a universal radiation. Radiation or Radioactivity was first discovered by the great chemist, Dr. Karl Frieheer Von Reichenbach to whom we also owe other valuable discoveries. He brought forward 80 years ago the proof that everything radiates. The radioactivity in human beings, animal and plant, in metal, crystal and rock, in light—above all in sunlight—in every chemical process. Only Reichenbach was an outsider of school science and was ridiculed. Only in the year 1903 was the Reichenbach discovery re-discovered in Nancy by two famous French Professors, the Physicists Drs. Blondlot and Charpentier. Both of these servants worked independently and their service is not to be depreciated but that which they discovered was already known, only Reichenbach was simply born a half century too soon in order to recognise the magni-

tude of his genial discovery. While he had to work with very simple means, the two Frenchmen and their helpers had at their disposal the advanced scientific technique. The Reichenbach discovery for that reason, deserved our enhanced admiration.

There is then, as we have already said, a universal driving force of radiation. The origin of the All Creating Force in the Universe, is the continuous movement of the foundation substance commonly referred to as the luminiferous ether which we recognise (postulate or assume) in light. So says another unappreciated outsider, the engineer, Johannes Zacharias. All apparently different forces in the last analysis, have their origin in this single force of the self-moving foundation atoms. The infinitesimally minute, the foundation atom (foundation particle or proton) of light is the foundation stone of Nature, in fact, it is nature itself. Whoever, in experimenting only, fondly imagines the most apparent explanation to be the Truth, will forever be barred. For the researcher, as to the fundamental questions, theory ranks over practice, which in all our works has proved itself to be correct. The radioactivity which we speak of here, is indistinguishable in Nature. In this conformance to Law, lies the harmonious working of the smallest parts.

A genial Cosmology built upon a uniform foundation, we owe to a Zurichan, Dr. J. H. Zeigler, who already at the turn of the century pointed out that everything has its source in the eternally moving mass whose motion is the absolute fundamental force. The part has only significance in the whole. Bodily form and appertaining radiation are in direct proportion to each other, having a right swing in the internal and a left swing in external. The counter current furnishes everybody (substance) with as much of the incorporeal substance as is necessary for its existence, says Zacharias. The cycle of creation goes from light over sound, gas, vapour, liquids to solid bodies and vice-versa. It is possible for one substance to become every other substance as the emanation of a substance is not foreign to it, but belongs to its very nature. For all things there is one. The corporeal conditions form the bodies, the incorporeal emanation, the forces. Both are, therefore, inseparably combined with one another.

The establishment of the facts of radiation mechanics today, follows out of:—

- a) Through the exact sciences with very keenly thought out instruments which are continually being perfected towards which end all means at hand are pressed into service—and,
- b) With the scientific pendulum method of earnest pendulum research which is independent of ones' own thoughts, feelings and outside influences; to this purpose it utilizes the pendulum.

THE PENDULUM

Before we proceed, we would like to have an explanation of Physics in regard to this small instrument which hangs from a fine thread.

With a vertical or plumb pendulum, it is necessary to have a fixed point. There is involved, the attainment of a position of rest, caused by inertia and weight (in the direction of the centre of the earth). In order to cause an action in the pendulum, you need a power to cause it to swing (pendulum of a clock or magnetic pendulum, etc.). Without any such power, it will not swing long and will soon come to a rest because the surrounding air works as a brake. We differentiate between mathematical and physical pendulums. The former is an imagined mass (thought of as a point) of the pendulum's length, which is unstretchable and without weight. In all our observations and experiments, we naturally have to reckon only with the physical pendulum whose oscillation laws are identical with those of the mathematical pendulum. Galileo figured out and determined these laws.

With the pendulum, it is possible to determine important things. So, for the first time, the number $G-9.81$, the acceleration of gravity or the velocity of a falling body, at the end of the first falling second, etc. Furthermore, with the pendulum, the force of gravity was determined, then the density of the earth, and the flattening of the globe at the poles. The most important formula is this—the oscillation period of pendulums of unequal lengths is in direct proportion to the square root of the pendulum lengths or—the oscillation period is to the square root of the intensity of the weight in universe ratio, or the period of oscillations of unequally long different pendulums, stands in direct proportion to the square root of the pendulum lengths. That was the physical application of the pendulum in the exact sciences. But, to us, the important phase of the pendulum which swings from the hand, is its significance in the research of radioactive rays. We designate this research as Pendulum Science. Ludwig Straniak, whose scientific researches in this direction are so significant, declares—and with reason—that there is an eighth, hitherto unknown great force in nature.

Until recently, we accepted the idea that there were seven known universal forces as mechanical energy, energy of light, energy of sound, energy of heat, energy of magnetism, energy of electricity and chemical energy. Now we must add to these, this one force which entirely foreign to any of these other long recognised universal forces, is just as exact as the other known forces of the universe. The science of Physics has not, until now, engaged in the research of radioactivity. Today, electricity illuminates entire cities, carries the human voice over great distances, mountains, moves all kinds of vessels, aircraft, automobiles, etc., while at the time of Volts and Galvani, one, at the most was able to set in motion, only the hind legs of a small frog with this force.

Straniak bases his hypothesis on this, that the cause of the pendulum oscillations, is something which comes from the outside of the six cardinal points of space and which influences the object and causes the movement. Here we deal with a kind of radiation as the cause which seems to penetrate objects from without, because we find also that they can be shielded from the rays. The rays of this eighth universal force of nature must have always been present in the atmosphere as there have always been people who could operate the pendulum. The movement of the pendulum pre-supposes the idea that the objects which are being pendulled are actually penetrated by the hypothetical rays in the atmosphere.

HISTORY OF PENDULUM SCIENCE

The history of the pendulum which we wish to describe briefly can merely be touched upon in these pages. One often speaks about the **"sidereal pendulum"**, and derives the word "sidereal" from the Latin "sidus", meaning astral picture, sidereal meaning star; or one turns to the Greek word siderus, which means as much as; derived from iron. Perhaps as Sperlings at last assumes, one wished to take into consideration the influence which metals, that is all inorganic bodies, have upon Man so that he is able to feel metals and water under or below the earth. As far as can be learned, it seems as if the divining rod sprang from the pendulum. We know from pictures that twigs were held vertically with two fingers and were allowed to hang towards the earth. Like the sister of the pendulum, the well-known divining rod, the pendulum, according to old records, was used already in antiquity. We find it with almost all peoples of culture, in China, India, etc. We have clues which show that the pendulum was a subject taught in the clinical and medical schools of Aryan peoples. From India, the pendulum was brought to Europe, to the Greeks and Romans. At times, the use of it was much sought and it was greatly mis-used; as is often the case with the good and useful.

We come upon its use in all centuries. Frequently, we find it in connection with the divining rod. Only at the beginning of the 19th century, a Munich Professor, Dr. Ritter, occupied himself somewhat more earnestly with the study of the pendulum. We also know from Goethe's works and his tools which he left, how much the movements of the pendulum interested him. We have very distinct references to the pendulum in Goethe's "Elective Affinities". There we read, "She (Charlotte) took the thread in her hand and as she was perfectly serious, she held it steady and without any agitation, not the slightest movement could be detected. Otilie was then called upon to try. She held the pendulum still more quietly and unconsciously over the plate on the table. But in a moment the swinging piece of metal began to stir with a distinct rotary action and turned as they moved the position of the plate, first to one side and then to the other, now in circles, now

in ellipses, or else describing a series of straight lines, doing all that the Earl's friend could expect and far exceeding indeed, all his expectations".

For a long time, we did not hear anything more about the pendulum. It was entirely forgotten, due to the influence of a materialistic science and due to the fact that no one had any idea of radioactivity, although references to it were made by Hippocrates, Paracelsus von Hohenheun, but no significance was attached to them as no one could explain vibrations. It had been forgotten until the Professor from Dresden, Von Bahr, published his much discussed work "The Dynamic Circle" which moved along the lines of the first discoverer of radioactivity, Dr. Von Reichenbach. Neither Reichenbach nor Bahr were fully appreciated and one could almost think that both discoveries, the radioactivity and the movement of the pendulum which both were given significance, would again be forgotten. However, during the first decade of the 20th century, there appeared a Franconian private scientist, the explorer Frederick Kallenberg, who had already made several world trips. He made the discovery that rays escape, not only from organic and inorganic bodies, which as Bahr had already proven, put the pendulum in motion, but that also a process of loading or charging took place. Pictures and samples of writings (long hand) all objects which a person may carry about, breathed upon, or touched in some manner, left traces of a radioactivity common to him. Kallenberg proved that the transmission takes place with lightning rapidity.

For years he experimented and was assisted by a great many doctors physicists, etc. His work "Manifestations of the Sidereal Pendulum", published in 1912 gives us the first fruits of his experiments and in his further publications the statements made at first are still more enlarged upon. We owe to Kallenberg, the fundamentals for the foundation of the scientific doctrine of the pendulum. All other explorers of the pendulum took his studies for their starting point, and we too are glad to recognise in him our Master, whom the science of the pendulum solemnly pronounced to be the Past Master. For more than 25 years we owe to him our principal knowledge about the pendulum.

Far-seeing physicians and health practitioners, among them the gifted and efficient Dr. Vall, M.D., the old member of the Board of Health, Dr. Classen, Dr. Paul Wolf, member of the Board of Health, Dr. H. C. A. Mounlicher, M.D., Dr. Carl Erhard Weiss and further, the retired surgeon general, Dr. H. C. A. Heirman, M.D., Bruno von Willman, M.D., Dr. H. Reigler. In addition to whom, in the course of years a goodly number of others came, placed the pendulum immediately in the service of medical diagnosis. We had already written about this possibility in greater detail in our publication—"Healthy and Diseased Emanations of Human Beings", and now there have appeared in the course of the years, publications, to which we must accord greater value. The Circle of Natural Scientific and

Medical Researches, became greater and greater. Already there had joined us, several University Professors, though the "exact" ones continued to "ridicule". The discoveries which the serious pendulum research had brought forth and the experiences with the divining rod, contributed thereto that no one can pass up the now official confirmation of the scientific discovery of the radioactive or ray emanating human being and the conclusion to be drawn therefrom. The science of the pendulum had gained a victory. Its full significance, however, is yet to be accredited to it. For there is still very much to be discovered. We need gifted students and future Masters.

MOTIONS OF THE PENDULUM

We want to remember that the pendulum does not swing of itself, but the one capable of swinging it, furnishes the impulses. The nerve cords of our body are to be considered the conducting cables of the eighth universal force of nature, discovered by Stranick. Therefore, in judging the greater or lesser sensitivity of a pendler, one has to take into consideration the greater or lesser conducting resistance of one's nerve cords against the force. The pendulum is the indicator. It not only shows us its existence of nature's mighty universal force by its motions but by direction and polarity, it indicates the existence of eternal waves in the air. It proves to us direction, polarity and strength, and finally leading of the eighth universal force of nature upon matter. Also the correct power, potentiality, upon which very often, more depends than is generally assumed. Correctly used, the pendulum is a means of enriching our knowledge with insight in many new fields.

Because of the fact that one capable of handling a pendulum takes any kind of object in his hand, or more correctly worded, suspends it by a thread, this object becomes a pendulum and ceases to be this object at the moment when it is laid aside again. All material substances are to be considered more or less as catalysers. Catalysers are elements which, by their presence, cause the beginning or acceleration or delay of a chemical process, remain unchanged themselves because nothing can be noted of any possible increase or decrease, be it in regard to weight or in regard to measurement as Sperlings points out. A catalyser disseminates radiation easily. The opposite is the anti-catalyser, a substance which easily takes up radiation from ethers and causes them to throw it off. If we consider them from this point of view, many a problem will be easier with us. However, we continue with building our foundation.

The pendulum, during its functioning, must perform a certain measure of work and here electricity gives us the explanation of which we are in need. William Gradecke explains this to us so well that there is nothing to be added. A ball made of cork suspended by a thread, will be pulled towards a stick of ceiling-wax which has been rubbed before but again pushed off at once because at first their

existed an attraction (plus minus), then there followed a saturation with electricity of the same kind which in its turn caused a repulsion due to the sameness of the poles. And we know that in the case of the pendulum, similar proceedings manifest their influences; for when the pendulum rests, it is merely influenced by the uniform weight of the earth, or an iron weight would be pulled to the side by a magnet but could not swing freely to and fro constantly.

Only by the addition of changing potential (polarity), can a movement of the pendulum, an amplitude (oscillation), be effected without the acceptance of a mystic force. This amplitude finds its origin, its first cause in the human body in the radiation of man in "od" as Reichenbach designates the "unknown" radiation. Thereby the pendulum is bereft of all secrets, of all "occult" meanings once and for all. A serious pendulum research is therefore over entirely from a scientific point of view. The pendulum oscillations are under the influence of subconsciousness by the reciprocal exertion of the vibrations emanating from the object under examination as well as those from the individual using the pendulum. The subconscious has its seat in the voluminous system with the "solar plexus" located behind the stomach in the close neighbourhood of the heart, from which it is separated only by the diaphragm (Classen).

At this place, the significance of the subconsciousness for the pendulum can be discussed only briefly. However, we should not fail due to its great significance to repeat the best which we know about it in literature. So, I cite the explanations of G. Stutter: at first let us build a material foundation taken from nature's realm. Our body accomplishes a great number of activities apart from any consciousness that we possess concerning it. It works in life preserving functions apart from any influence we have upon it. The distribution of food-stuffs, the forming of our figure after a symmetrical or uniform plan, are such subconscious activities. Only when stricken by a disease do we pay any attention to the expansion and contraction of our chest when we breathe; only if taken by illness or if excited do we consider the heart, this perpetual motion, during our whole life. All these extraordinary and extremely fine physical and chemical performances take place in a very narrow space in the seclusion of the living body; only in exceptional cases are we aware of their activities. Especially important is the inhalation of the air visible to us. A healthy man of middle age receives thereof—according to Verhous calculations—a supply of 12,000 litres (1 litre equals 1.0567 United States quarts) in a period of 24 hours. The intake and outgo of the substance may not cease. Storerooms may not be drained of supplies entirely or else there follows a weakening of the whole structure which would lead to a collapse. This is a very crude comparison. And, why should it not be possible that activities of the Soul may be carried on without our knowledge and without our assistance; and, why should it not be possible that there are also stores laid up in store rooms for this pur-

pose. Yes, they are there!! And, this is the subconsciousness. In order to be able to understand even in a small degree, the processes carried on in our mental life, I see no other possibility but the assumption of a double consciousness. There is something which lives within us in seclusion, and works like the heart. Should our full attention be concentrated on it, then a jerk is needed; a lifting up of our consciousness like over a threshold. It is, therefore, named the **"subconsciousness"** to distinguish it from consciousness of the day. But it also absorbs everything, so to speak, like the lungs inhale air, and stores up the impressions which we receive by means of our senses; and it is very reasonable that no real impression is ever lost for us. There is no forgetting of such a one. All remains within us that ever made a real impression upon us. At a given moment, we may remember many impressions, but an endless number of them are dormant, within us; they sleep; they are not dead—but live. They may sleep for one year or fifty years without dying. An insignificant hint, a word, a gesture, a wink with the eye, the odour of some food, may awaken them. The most insignificant trifles like a flower, the colour of a dress, names long forgotten, the behaviour of a dog, are suddenly recalled and are vivid pictures before us. They are again submerged but live on, perhaps to be resurrected after years have passed, perhaps never. This is the storage room of the subconsciousness. The memory!! Suspended imagination!! Certainly, but more than that. A spiritual world in itself. Memories. Yes, memories!! That is to say, a reaching into the inner stores, boundless and much richer than day consciousness. The latter is the supporter of life, and the professional task, of great importance still with a limited capacity for power of recollection. It calculates, sorts out, ponders, studies, it gets tired, it slumbers. However, the activity of the spirit never ceases, not even during sleep. It works constantly and in two directions. The one arm of the scales is lowered and the other is raised. It is a pair of scales. The law of polarity encompasses all nature and the entire world of spirit. The one pole of the spirit grows fatigued, the other enters upon a period of activity. It is the spirit. The opposite to the pole of the day consciousness, is the subconsciousness, and the latter forms the wider sphere which includes the narrower one of the ordinary consciousness. Analysed, the mind about which innumerable people are so proud is but a servant for the motives of the thinking, of the will, and of the acting.

The subconsciousness is the realm of the feeling, of love, auto-suggestion, will, mass suggestion, love of one's own country, self-sacrifice. It is never the result of the calculating mind. Subconsciousness is the realm of fantasy, poetry, of the artistic and inner outlook, originality—it is the foundation of the temperaments, education, of the passions, of the whole personality, of the belief. Thinking done by the brain registers in a limited way, it obstructs, organises, but it does not create. The Creator in us is that unconscious pole of the spirit of our day consciousness. We possess a double consciousness. It is a

major error to believe that the activity of the spirit reaches only as far as the consciousness reaches. For instance, the latter is not also the source of art, but the secret deeply hidden subconsciousness which is highly productive, formative, creative. Often the poet and artist do not comprehend how their works have been created. He has the feeling then as if another stronger individual acted in him. This sort of transfusion (inspiration) from the depth, is an elementary process which is not being made available to the poet and artist through the channel of thinking consciousness. Its highest manifestation is a revelation of the genius given by God. In such a way, Phidias formed the marble; Raphael painted his Madonnas, Beethoven produced his Symphonies, Bach composed his Passions. Schiller gives the secret straight away (letter to Goethe of March 27, 1801): "The poet begins with the unconscious", or: "The picture is visible to the delighted eye as if it sprang from nowhere", or "Like the storm rushing through space, one does not know from where it comes and blows, like the source from the hidden depths, do the poets' songs spring from within".

Goethe and Helmholtz—these great giants of the intellect—have repeated again and again in their well-known writings with special emphasis that the substance and the originality of their ideas did not come through their thinking but "came to them ready made". Only their consciousness absorbed the substance given to them and worked it over again. Finally, we come to the conclusion: consciousness has a first step unknown to it. Yes, it is so. (A preparatory school unknown to it.)

It would have been impossible for us to have given this explanation in any other way. It is longer than we first thought to give within the framework of our book. However, we cited it, and went somewhat ahead of the subject which we expected to give later on, for in this place we already prepared the understanding for the suggestive method of the science of the pendulum. But enough of that. Back to the space within our framework.

LANGUAGE OF THE PENDULUM

The paths of the pendulum are exponents of a force which is inherent in an object of being, and the relative strength of them. This exponent will be different with different persons using the pendulum.

The signs of the pendulum have to be culled. They are not to be considered as being valid in every case, since every man speaks a special language, and in saying this, we mean that he possesses a special radio-activity, his own electricity, the currents and replenishments of which are different. In addition, there is a normal and an abnormal polarity which we have to take into consideration. The interpretation of the language of the pendulum, we owe first of all to

the Past Master Frederick Kellenberg whose merits in regard to the pendulum science cannot be valued too highly. This language expresses itself as follows: --

(a) In circles. (b) In ellipses. (c) In straight lines. (d) In action. and has many hundred variances. Thus we speak for instance of a male circle, a female ellipsis, the equalisation ellipses, the male circle with a female modification, the east/west line, the spiral, etc. The resulting motions of the pendulum depend upon the means (bodies used in examining other bodies). Several pendulum signs result in a pendulum picture; which, expressed in the language of the expert, is called a "pendulgraph". In the course of our study of the pendulum we shall discuss many more signs of the pendulum. The exploration of the language of the pendulum during the past decades led to conclusions of a far reaching influence; the language of the pendulum proved to be correct; the great experiences which have been gathered opened the way still further.

A possible aptitude and be it ever so little may be increased. Only one should not be rushed. One should take to heart what we have written in our preface. Even the divining rod which is still being laughed at by those who are injudicious and ignorant, is known not to react in everybody's hands. Its premise comprise certain definite tension of rays, of the human body, which is designated as sensitivity. The pendulum is only a somewhat more refined instrument than the divining rod and presupposes therefore, an increased sensitivity. What sensitivity is, we shall discuss in a few words.

The fundamental condition is therefore the existence of sensitivity. Since everyone is not sensitive and consequently can neither handle the divining rod nor the pendulum since they do not react to it, it is quite a short-sighted policy to take the pendulum for a fraud and swindle, no one has the right to do so, and a person thinking objectively will never do so since he knows quite well that human ability varies greatly.

Prerequisites for the Study of the Language of the Pendulum

We mentioned before that the prerequisite of sensitivity has nothing to do with anything shrouded in mystery. However, this does not mean that an easy study is given to us as a gift. To study the science of the pendulum, we must have solid expert knowledge, be this medical for the purpose of making a diagnosis of the condition of health, be it for the analysis of the character, or for utilisation in the criminal field, or for geological research, or for any other purpose. These are important prerequisites which under any circumstances must be taken into consideration. If these are met, if there exists an earnest desire for truly diligent and perseverance for indefatigable study, then there is just hope that toil will be rewarded and that our old and yet so young science will result in joy. However, an excellent state of health is an absolute necessity. For a really earnest pendulum research,

not only for an occasional hobby—only healthy people are suited; an earnest investigation is different from the layman's occupation with the pendulum possible in a playful manner. We have nothing to do with the latter, we refuse to do so.

Steady nerves are required or else it may easily happen, even if we think we are able to protect ourselves against foreign ray-forces, that disturbances come about in our bodies and set up causes which may continue to exist over a long period. Only the one who has undergone the experience knows in what manner these disorders may make themselves known; they will show themselves in one way in a particular instance and in another on a different occasion; it depends in what manner the object is constructed which is to be tested with the pendulum and in what way our bodies react to the experiment. We note that very often our bodies are penetrated by rays which are entirely foreign to them and which may leave behind some sediments. We shall discuss later what we can do against the absorption of harmful emanations. Especially the earnest and conscientious diagnosis of the state of the health and the much more strenuous character analysis so much more so if the latter is carried out in a psycho-analytical manner, consumes nerve energy.

2. Every study with the pendulum consumes considerable energy; demands are made on our bodies. In case the energies of a body are dissipated in additional ways, one failure follows after another. This must be considered. The investigator of the pendulum must remember this. Generally speaking he must get used to leading a moderate life, alcoholics, heavy smokers, hearty meat eaters and servants of Venus, will hardly be able to create much good and usefulness of permanent value with the pendulum. Yet, there are still more prerequisites—the art of relaxing entirely and at the same time to work in the highest concentration, in order to rivet one's full attention upon the pendulum. So, it follows that this earnest study is not quite simple, and if we emphasize this fact once more, we do so to have it stand out clearly and yet—the acquisition of this knowledge is easy for the one who is talented and who possesses the impetus of the research worker.

The Aptitude for the Pendulum

Everybody who is closely connected outwardly and inwardly with nature, is inclined to sensitivity. They are sensitive to the rays in the Universe, to the electric vibrations of their fellow-men. Among one hundred men, there are about thirty who are able to work with the divining rod and about twenty who have an aptitude for the pendulum. This ray detecting sense, or the rhabdometric sense as it is known by us, is present in every man, but in varying degrees. It is dormant in many men.

The Necessity of Sensitivity and of its Increase

Everybody if radioactive, receives rays, sends out rays, and is penetrated by rays. Radioactivity is one of the primary requisites of

all life. A person apt to be sensitive is one who possesses radioactivity to a greater degree. There are men whose sense of smell, of sight, and hearing, are above the average and thus it is in our case, therefore sensitivity is no great rarity. We know from experience that this holds also true of the aptitude for the pendulum. Our prejudice, our wrong education received in school, often destroys this aptitude as I have often noted when I meet Doctors, Physicists, etc. Therefore, it is advisable to approach the science of the pendulum without prejudice, and much is gained already by so doing. The most important point, however, is this: This quality not only can be improved but it must be awakened. A very inferior degree of sensitivity can only be improved by exercises, and the manner of living, by prolonged stays in the realms of nature especially in the forests by vigorous deep breathing. An advice fitting every situation cannot be given, for men are endowed with too many different qualities; only when a case has been clarified, can help be extended and we are always ready to do this.

The Aptitude Test

Experiments can be made by one's self if one is qualified for the work with the pendulum. Certainly, these are not always decisive because they do not always succeed, for in spite of failure, there may exist an aptitude. The aptitude test is generally made by experts familiar with the subject. Anyway, we shall describe here the manner in which these self-examinations may be carried out.

If there is no brass pendulum, a plastic or wooden one will suffice. At one end of the thread we tie a small loop so that we can better grasp the pendulum. Then, we take it between the thumb and index finger of the right hand. The other fingers we keep closed, forming them into a fist. Some metal, it does not matter if it is iron or copper, is laid on a table. We hold the pendulum $\frac{2}{3}$ cm. above the object to be investigated (pendulum object). Movements of the pendulum in accordance with our aptitude will result, that are in accord with our sensitivity. The pendulum will draw figures, usually circles, clockwise as this is the case with normally polarized individuals mostly.

Another experiment we mention, is to hold the pendulum over our own left hand. In this case the movements will be noted to be quicker and more distinct. The oscillations will result in clockwise circles with men of normal polarization. With women generally the opposite will be true.

The oscillations are brought about by the interplay of ourselves and the pendulum body, our pendulum object, and is nothing else but an induction process; depending upon the existing sensitivity and the condition of our body, weaker or stronger oscillations will result. It is only necessary to concentrate entirely upon the matter and to shut out every other thought. Above all, one should not anticipate the

pendulum with a thought about an expected or supposed oscillation (classen). If we do not shut out disturbing thoughts, the pendulum goes its own way without achieving any results.

The Law of Polarity

This very important law is to be strictly observed.

3. The male is usually positive, the oscillation of Figure 1 will result. The female is usually negative, therefore the oscillations of negative Figure 2 will show.

In addition, the currents of our bodies have to be taken into consideration. They vary in strength. In some, the positive current is more strongly developed, in others the negative one. There, is the solution to the question why men do not have the same pendulum symbols. Usually the right hand of the male is negative, the left hand positive. Of women, the opposite is true.

4. Currents in our bodies must be taken into consideration. Normally the left thumb of the male oscillates to the right and that of the female to the left. If the male is incorrectly polarized, his left thumb oscillates to the left, and the female to the right. Hence, in exactly an opposite fashion. Incorrect polarity has various effects in life. Later we shall discuss this aspect in detail.

Since, therefore, a person may be polarized in different ways, his polarity is to be fixed before further experiments can be made. Every observer has to weigh up personal characteristics which means that the science of the pendulum can never be generalised, but that it is an absolute personal matter, an art with a personal note. "Each to his own".

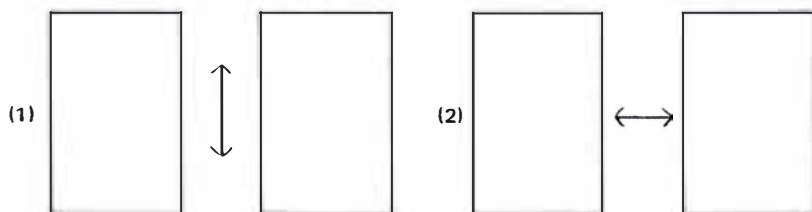

In observing the law of polarity we also know that it is advisable to test all fingers of each hand if the intention is to use other fingers in working the pendulum. Each finger has a positive or negative current, a fact we must consider when we hold the pendulum. The same fingers are always used, and best, in the manner as before described.

How we find our own Pendulum Language

Everyone must acquire his own pendulum symbols as they may show a different polarity and strength of the current. There is no vocabulary valid for the broad masses, and there never will be one. The symbols shown here, however, are to a great degree applicable to the polarized male. All have therefore to learn the symbols for the first time for positive and negative.

In order to discover our own pendulum oscillations and pendulum courses, we need two magnets. Most suitable for the purpose are small bar magnets. A single magnet is strong enough for the beginner. Each magnet bar must be examined to find out which end is positive

and which end is negative. A small compass can be used for this purpose. If one end of the bar is moved towards the tip of the compass (North being negative) and the compass needle is repulsed, this end is therefore negative and the other positive. The pendulum is then set in motion and held over the positive pole, resulting in a positive oscillation. The oscillation obtained over the negative pole indicates negative.

If the magnets with the same poles are placed side by side as shown in Fig. (1), the pendulum will swing in a straight line, a separating line, parallel to the magnets. If one of the magnets is turned around in such a manner that the different poles are facing one another Fig. (2), the pendulum also swings in a straight line but perpendicular to the magnets, the pendulum describing a connecting line. The connecting line and separating line will be the same with many working the pendulum. If we have these fundamental symbols, it will be easy to work. A connecting line indicates sympathy, a separating line antipathy.

There are other ways to arrive at the fundamental symbols. We allow experts—it must be carried out observing certain laws—to prepare prints of both our hands in such a manner that each finger shows distinctly. Each finger is then examined for polarity. In most cases there results an alternating of positive and negative fingers which are designed with plus and minus symbols. Taking these loadings as a basis, we examine with the pendulum a strongly positive finger and watch the oscillations, thus determining our symbol for positive. The same applies for the negative.

The Material for the Pendulum

5. We may use any material we like, but it is advisable to avoid such metals which are already magnetic, especially iron, pure nickel, etc. Erroneous oscillations may otherwise take place. The beginner should bear this in mind. The harder metals are the best. A very practical one proved to be of brass or one of some alloy of which my pendulum is composed; a material which can be used in almost every case. Suitable material can be had from professional establishments.

I repeat—In serving its purpose best, the pendulum is suspended from a smooth silken thread (it could also be twine) with a loop at the end for holding it. Sometimes this loop can serve us well if the pendulum swings wildly. It frequently happens, and in such a case the pendulum frees itself if too loosely tied or worn, thus flying off and describing a wide arc and becoming damaged.

6. According to whether we wish to sit or stand while working the pendulum at 20/40 cm. in length—20 cm. are sufficient if we are sitting and 30 cm. will suffice when standing, so that we do not become too cramped. The weight of the pendulum should be 15/25 grammes. Those with little sensitivity may either work with a brass pendulum or one specially made for them. Otherwise, the shape of this is of small importance. Some are ring-, conical- or globe-shaped. For finer work we use the well-known conical or special pendulum. In the course of our research work we shall learn to work with various pendulums.

The Pendulum Base

It is best to use the pendulum over a wooden table (drawers should be removed). **Metal objects** must also be removed. Only the bare table plate is used with white neutral paper kept in readiness, not yet touched by others, for our base. The simplest is ordinary writing paper so that the greatest possible surface is available. Should one sheet be insufficient, lay side by side further sheets (unused) and overlap to avoid any empty spaces. Do not use paper supports too often. It is best to use fresh paper for each experiment. Make every attempt to avoid loadings (transmissions), as other supports may divert.

Protection from Foreign Influences

Foreign rays which may influence us are warded off as far as possible by removing all metal objects like rings, keys, etc.

7. As much as it is in our power to do so, we protect ourselves from the strong emanations of other bodies or objects in the room, e.g., we keep away from oven-screens and all other metal. The beginner may be disturbed by a gas pipe, electric wires, a radio or a massive nickel lamp. Of course, none of these articles are allowed to be placed on the wooden table, but notebook and pencil are kept within reach. The pendulum should be used in a closed room only for the time being to avoid atmospheric disturbances. To begin with and also later, if we wish to obtain results, we carry on our studies alone. We know that men are radioactive and that from them there may emanate rays which may deflect. Always use the pendulum in the shade—never in the rays of the sun, or allow the sun's rays to play on or near the object to be tested with the pendulum. Protection from moonlight, earth rays should be considered also. No disturbing music or radio should sound either in the same or adjoining rooms whilst carrying out studies. Everything should be excluded which might influence the object to be tested. No-one else must be

allowed to handle the pendulum. Do not stand upon iron plates. Wooden floors or those covered with linoleum are preferred—otherwise rubber plates are recommended.

To be Heeded in all Studies

8. We assume the magnetic position (this is not necessary for advanced students). We stand with our back towards the North, our face towards the South, as we know that the North Pole is positive—our back and also our head is negative. We are calmest in this position. Hands should be washed and thoroughly rinsed with pure water before every new experiment. By so doing, we free ourselves of foreign influences. We work entirely without inward sympathy and affection. When we are subject to disturbances of body or mind, we cease our investigations. If we have participated in an emotional affair, for instance one of love, it is very difficult to obtain an objective result. If we hate or lie; if we are adulterers, slanderers, thieves, embezzlers, murderers, etc., we can test only the one who has nothing to do with the case. This is one of the sources of errors which are often overlooked when character tests are made with the pendulum. Therefore, only a man of high moral principles can devote himself to pendulum science.

One point should never be forgotten—never make use of the pendulum until one has gained full confidence in this subject, and so avoid disappointment. Finally, one will soon realise that he is not always in the same favourable mood, and it is recommended that the pendulum may be used only when there is an inward inclination.

Important Laws

To avoid errors we must respect the laws which we have already pointed out to a great extent. It is not necessary to discuss once more the law of radioactivity (ray emanations).

9. But we would like to return to the loading capacity. We know that every material sends out rays and in addition gaseous emanations are thrown off. These emanations may cohere for hours, days, or even years. The law of polarity is sufficiently appreciated by us. We determined our own and found our own symbols of the pendulum. In certain instances, we consider the polarity of our pendulum object.

If we wish to follow our studies whilst sitting, we do so at the table in a comfortable position. The right arm is supported by our elbow which rests upon some insulating base—we need none ourselves. Hold the loop of the pendulum thread between the thumb and index finger.

10. The body of the pendulum is brought in connection with the object to be tested and for two or three minutes is laid beside it. If it is a picture or some handwritten material, the pendulum is placed upon it. If a human body, the pendulum is held over it, about 2 cm. from it. Then wait for the oscillations or signs.

Arm and hand are held absolutely still. According to the law of funnel-shaped emanations, which states objects throw off emanations, for instance on the table, the pendulum should always be held over the object and not used from the side as other oscillations, and weaker ones, could be received. The left hand should not be laid on the table, but be kept away from the object if possible. One can achieve this by allowing it to dangle alongside the body. The fingers should be spread slightly apart so that they can function as a conductor. The position of the left hand and fingers are **not** of **small** importance.

An arm rest facilitates the research whilst sitting and fatigue is thus prevented. Because the arm and hand are in a fixed position, it will avoid any reproach for causing the pendulum to oscillate himself. If standing a few centimetres away from the table, the posture should be erect and the pendulum held over the object as described before. The arm forms a right angle in this instance, the remaining fingers of the right hand being kept closed. The left hand should be held behind the back.

The First Experiment

Our first experiment must conform with the directions discussed. Experiment with metals, then stones and finally photographs and written manuscripts. Everything that has its origin in nature may be examined with the pendulum, i.e., those things which are loaded with radiation. The beginner should never forget this fact. The trained user may obtain many important conclusions very quickly. The examination of metals of our own or those loaned to us can be noted and the day and hour. The arcs of the oscillations will be small in some instances and large in others and should be minutely observed. Note if the pendulum floats, flies, dances vigorously or drags on sluggishly. Imprint these on your memory, record them in writing, get used to measuring them and so eventually evaluate them.

Preparations for the Treatment of Photographs, Manuscripts, etc.

11. Photographs or manuscripts usually surrounded by foreign emanations due to frequent handling, should be thoroughly aired for about 24 hours or more before examination. After this, fundamental emanations will again be present and we should not then be misled.

Some students successfully use the so-called magnetic strokes to do away with foreign emanations. This being the case, the right index finger is moved over the photograph or letter. Metal objects subject to other emanations are flushed with water, but generally airing will be sufficient. The same applies to stones, etc. Now for examination of colours, the kind of oscillations obtained from water colours. Naturally, no physical influence upon the pendulum must be tolerated otherwise wrong results will be obtained. Concentration in full must be made and there should be no interference by wishing for a certain result. Notes should be made. All this has to be learned.

Dr. Classen gives the advice for passive thinking: What is going to happen now? He writes: "If we do not succeed in excluding disturbing thoughts, the pendulum commits follies at once". The pendulum goes its own way. It must be held firmly in the hand. It may not begin its oscillations until we set it free. Therefore, it only works if our attitude is correct. This requires the user's watchfulness and only in this way will we gain results as Glahn has correctly said.

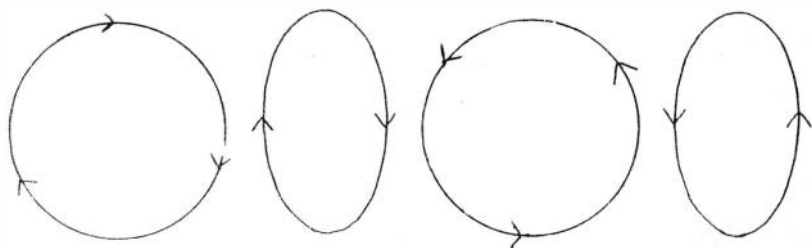

Further Experiments

We know that the male is usually positive. If we prove to be of normal polarity, we receive a right circle over male beings—man, animal or plant, certain metals, etc. Whether in the body or as a photograph—the circle is always positive—masculine. For a female, we usually obtain an ellipsis towards the right—negative. If it appears in an examination of men, disturbances will be present.

Illnesses change or neutralise polarity. By determining positive and negative rays, we may make further experiments. Take photographs and manuscripts of friends and acquaintances, male and female. One person only should be shown a photograph, and investigate their fundamental emanations and make a note of the signs thus obtained. After some time we can repeat these studies but at another time of the day, but using the same pendulum. Should different oscillations be obtained any time, if there are strokes or crosses:—

we record them exactly in a notebook set apart for such studies. Besides circles and ellipses to the right there will appear also circles and ellipses to the left as follows:—

The oscillations will not always be the same—sometimes more vigorous or slower and larger, and note of these should be carefully made. If the pendulum does not oscillate at all, we call this "rigidity"

and if it ceases during an experiment, a "pause". When pendulum graphs are built later, "rigidness" is indicated with a large point and a "pause" by a smaller point with larger point.

Soon we shall see how much time and close attention has to be given to research work, and day by day it will become more interesting as progress is made. But never attempt too much.

The Law of Attraction and Repulsion in Bodies

If two emanating bodies are laid side by side, on examination we can establish sympathy which is attraction or antipathy (repulsion) between them. This may be established also very quickly with the pendulum and deduced if their fundamental characteristics harmonise or if they differ from one another.

12. If two photographs are laid side by side, say two persons in love, and the pendulum is held between them to absorb emanations of the two pictures, we obtain a circle of great duration, indicating a harmony of the rays. They are sympathetic to one another and constitute a complete whole from the radioactive ray scientific point of view. If a pronounced stroke between them is obtained, the emanations disturb one another.

The Absorption of Foreign Rays

We are Inductors. Foreign rays pass through us and we have to remove them entirely from our bodies. After every examination of a body with the pendulum, especially that of a man, whether photograph, manuscript, or the man himself, we stretch our arms high above our head and exhale vigorously, do the well-known torso exercise and relax, at the same time almost touching the floor with the hands and thus fling off the absorbed rays consciously. This should be repeated several times. **Do not omit** to remove these foreign rays.

Naturally, an expert can attain similar results with magnetic strokes. Those who investigate emanations of patients afflicted with cancer, or those about to die, emanations in cemeteries, etc., know how to report the effects of such emanations.

The Charging of the One Using the Pendulum

If we have studied industriously, we will have noticed what effort the use of the pendulum exacts, especially when working on certain pictures, manuscripts, persons or objects. Just as important is the **law of charging** which the one using the pendulum must take into consideration. The human body is like an accumulator which is being fed and which maintains itself by radioactivity or other currents. Whilst using the pendulum, it gives off some current by this activity and must be fed again so as to replenish the forces which have been lost.

The Pendulum Researcher Acts Accordingly

The beginner must remember--never to use the pendulum too much, but slowly increase the time daily by five or ten minutes until he reaches the half-hour mark and later one hour, but he/she should take their time. The increase of **sensitivity** and **charging** are similar.

Daily walks, possibly always alone, through the forests (or fields) are suitable for this purpose, and whilst so doing, relax mentally and bodily, stretching the arms, spreading the fingers apart and so absorb consciously the healing emanations of the forest and radioactive currents of the trees. It stands to reason that the user of the pendulum does not wear gloves and still better, to exercise with naked arms. If no forests are in the neighbourhood, take exercise in the open, but avoid large human settlements and cemeteries. The air is fully charged with radioactive forces so deep breathing is essential. Weather permitting, lying on the grass, stretching the arms and hands is favourable. A quarter of an hour will accomplish much. More strengthening is the morning dew bath, laying the naked body upon the dew covered meadows. The same can be said of the air-bath with suitable gymnastic exercises, vocal breathing; which are very beneficial to the charging.

A correct charging demands care of the body and life, including careful tending of the skin and reasonable eating habits. Renewed charging is necessary to carry on the research work.

DISEASE DIAGNOSIS WITH THE PENDULUM

Foreword

This is devoted to disease diagnosis and belongs in the first place in the hands of biological Physicians and Health Practitioners. The literature concerning the use of the pendulum in medicine is extremely scarce and I realise that this work fills a long-felt want and will furnish stimulation and be able to help us further on.

Up to this time, few Physicians have had the courage to apply the pendulum to intercede in favour of its application for diagnostic purposes. Surgeon General Felix Buttersack, M.D., writes: "It is time that we thrust aside the microscope and chemical retort and appreciated other ways of research again as being valid. Naturally, the first ones who go these ways of research and therefore step out of line, will be looked upon without approval. But this will do no harm. But curve of historic development takes its course despite approval or refusal".

Another writes: "We people are finding ourselves continually on voyages of discovery. Of course, there are and there always have been people who foolishly imagine that they are in possession of a thorough insight into the whole universe. We pass over them lightly; we do not take them seriously. Before the discovery, we put ourselves in the same position as a ship on a many-branched large river proceeding

up stream with its sails all spread, squared. Occasionally, it reaches an impossible place. The searchers must disembark. They come across rapid currents, marshy country, liana (tropical climbing plants) thorns, poisonous plants, beasts, etc.—and strive hard—with a bound—yes, sometimes lose their lives to gain a clear track and free prospects. Meanwhile, not all of the exploration ship's crews are made partners therein. A certain number like it so exceedingly well in their floating domicile that they never feel the slightest inclination to exchange their comfort for those of the troublesome struggle surrounding new ways of making a living. The result of this struggle is very uncertain. There are no laurel wreaths in advance”.

Amongst the foremost Physicians of the 19th century, belong Imperial Railway Physician, Dr. Adam Voll, M.D., University Professor M. Benedict, M.D., Dr. Karl Erhard Weiss, M.D.; the latter became especially of great importance to the research of medical drugs. Thereupon I bestow second place to Medical Adviser, Dr. E. Classen, M.D., the outspoken supporter of the active suggestive method. As for myself I lay more emphasis on the application of the physical method of the pendulum. As far as Classen's health method is concerned, I have nothing to do with it. He has undoubtedly had good results with it, but it becomes evident that he might have had far better results if he had turned still more towards nature healing and to that of the finer material therapy.

Also the words of the deceased Director of the Medical Biological Society, retired District Medical Adviser, Dr. Frederick Bachmann are much too little known: “Pendulum diagnosis and especially its application to the penduling of suitable remedies, will get more and more adherents. Perhaps the proverb fits here: At first it is laughed at, then it is imitated; also of the treatment by which very many patients have gotten rid of great suffering. There are many people who are satisfied with their cure that they do not bother to ask whether their afflictions were freed by scientific or unscientific means. So here perhaps the occult will come to light. Everything remains occult just so long as until someone has found a scientific explanation for it and then its elucidation can be of service to the soul through the broadening of our horizon through the enrichment of our stock of knowledge”.

From another more distant place: “On behalf of pendulum diagnosis we physicians can go to the layman and the lay practitioners in the school—the pendulum and its application stems from the people and what had its origin there was always good, that we know precisely, no doubt, when we think of only a Priessnitz, Schroth, Rikli, Kneipp, etc.”.

Frederick Bachmann having come forth with Charles Strunkman as a leader for a biological healing method, expressed himself even more distinctly; his words should not be kept from us. In the year 1930, I cite literally, he wrote about the so-called sidereal pendulum

slandered by the official ones as quackery: "It seems the Materialistic Medical Science thus brought upon itself still greater guilt than it did through the misunderstanding of the Homeopathy of Hahnemann, likewise the discoveries of Mesmer, Reichenbach and others".

Special significance is attached to the pendulum at the sick bed. Inflamed places are all negatively ionized. This can be detected by the pendulum at once. It is not necessary to especially emphasize how important this is in regard to the cure. Medical Adviser, Dr. Alfred Maunlicher is an ardent defender of pendulum diagnosis, he acknowledges it: "With a great joy and an inner enthusiasm which is hardly reconcilable with my age". All one has to do is to read his animated explanations.

An older Surgeon, Medical Adviser, Dr. Paul Wolff, speaking from abundant experiences, says: "About the pendulum, there were made the most contradictory assertions; so to convince myself, I resolved to apply myself to it at all times". He then described a similar case from practice and decided upon his interesting demonstrations: "From the foregoing, there is quite enough so that I need no longer disbelieve the pendulum, I know that to those who understand it, it will reveal the truth".

The space arranged for present material was limited, which can be perceived now and then. However, there must follow some short restorations in order to impress oneself with its importance. Fundamental requirements for a successful pendulum diagnosis are a good knowledge of anatomy and physiology. The medical literature which I have made use of for years, I find generally listed among the auxiliaries, otherwise I refer to the literature listed in catalogues. I recommend as aids only those that have proven trustworthy to me. Many well-known old books are to be found: Pathological Anatomy plays a secondary part. Certainly the researcher will also be attracted to this field. Scientific pendulum researchers have united themselves into a society for this work. To it belongs many physicians and health practitioners. Many well-known German pendulum researchers and many from other countries are represented in it.

In the first session the society decided unanimously to pledge its members to always refer to the "pendel" in all publications. We trace the word back to its Latin derivation—"Pendulum".

HEALING WITH THE PENDULUM

There is no such thing as a healing science. In former times many could have made a living for themselves by telling people they could cure them. There is only a very limited knowledge of human life and as a deduction therefrom, only a very limited ability. Perhaps we perceive a trickle of scientific nature or character but it is still a long way from being science. So many things are called science, even by men whose thought is unbiological. The great Hippocrates, who a

short while back was the one held in contempt, the one laughed at, to whose doctrine they now return, speaks of the physician as a profession, the foremost among all of the professions. But the Hippocratic conception of medicine is today still valid, not to be treated alike. The great physician understood by that the real kingdom of the physician.

The medical man is by no means a physician. The knowledge will be found among the favoured few of the profession. The highest art is the art of healing, but they have little sympathy towards mechanistic ministrations, for instance with prescriptions, etc. The diseased body is biologically basically different from a healthy body in that it follows quite different biologically accurate lines. We know very little about diseased people. Hans Much said it rarely passes beyond symptomatology.

The art of diagnosis and the art of healing are two different conceptions but they belong closely together, they are inseparable. To perceive imperceptible disease from external visible phenomena, from interior symptoms, that is what we call the art of diagnosis. To find out, to learn from the invisible law of healing, from the external visible phenomena of disease, from symptoms to make it visible to the spiritual eye, in order to obtain therefrom the fundamental principle of healing, at the point of attack in the disease and remedy for the healing—that is what we call the healing art. The art of diagnosis is the art of sympathy, and this is everything. One must first know or understand what the disease is before he can cure it. He must understand the disturbance in order to eliminate it. But again, the art of diagnosis is still a long way from being a healing art.

In general, it is valid that the real point of attack and the remedy for healing the disease, can never be obtained solely and alone from the laws of healing. Never can the art of healing issue direct from the art of diagnosis. This way there could very early arise false points of attack. It is possible for a person to obtain an incurable disease from one still curable. Otherwise, the treatment is directed only against the symptoms but not against the primary cause and this, the real point of attack, will be misunderstood.

Felix Buttersack supplemented my precepts with marked distinction. Ordinarily it is much too late when the physician is called in, frequently the starting point of an ailment can rarely be discovered, no plan for the healing can therefore be established.

The pathological-anatomical diagnosis certainly shows us which cells, which tissues in the liver, kidney, heart and brain are deteriorated. But, that leaves us in the lurch. From its very nature it cannot do more! It produces only condition pictures. We make use of the direction of the currents of the *decursus morbi*. We do not want to know how the Rhine, Danube, Ganges, Mississippi became marshy or

boggy along their lower courses, that is, become powerless. Their upper course interests us as to how they breathe life into the entire land and how man can promote this life through buildings full of meaning.

The current of the life function flows, as it were, along mighty inclines as though this flowing lay just beneath the threshold of our observation post, as the rearing and crashing of the masses hurled down from the sun. From both processes, we are so far removed that we lull ourselves to peaceful rest in its presentation. And, this is what others say for exact consideration of the Constitution of Man. Under Constitution, we understand the entire Constitution, the condition and functional theory of all the constituents of the body, its organs, its cells, tissues, fluidity, etc., also the mental constitution, disposition, the psychical performances, the temperament, the configuration, the internal organisation, the course of the curve of development, heredity, the attitude towards sex, the capacity to defend, protect, and the reaction capacity of the tissues against the development of stimuli, the interior secretions, as well as all those properties through which the nature of the personality is determined.

Klemschiod writes: "The diagnosis belongs to the healing art as perhaps like the artist's brush to the art of painting, without the artist's brush one cannot paint, neither can he cure without a diagnosis. Only he can heal who knows what helps, and the diagnosis tells us in very few cases what helps. It only tells us what is wanting".

It is not my task to go further into this here, for the true biologically engaged physician, thinking which takes place, before every disease, is the same as in a healing process, for in the disease there already lies the law, of the future healing art just as in the seed kernel there is already the law of the future plant. From this is deduced the principle and deduction—the treatment in its entirety by which the soul will never forget. Already Johannes Müller (1801–1858) says to us that there would have been no physiology without psychology.

The pendulum seeks construction of bridges across. It can just as well find employment for perception of disease as for curative purposes. It helps us or furnishes us with a well-adapted means to discover the remedy for effecting a cure. With the selection of a remedy, the pendulum therefore gives us objective solutions, whether the diseased body needs any and what kind of doses, whether they should really be continued with after that, or whether it is correct, how long it may be given to him, and finally whether other applications are necessary. The pendulum therein is far in advance of all other means of research, it is unique in itself.

In this book, we study the possibilities of perception of bodily disturbances by means of pendulum diagnosis; what is the reason generally for diagnosing disease with the pendulum. Pendulum diagnosis is a method of investigation dependent entirely on natural laws.

It is a biological diagnosis. The adaptability for it lies dormant more or less in every healthy professionally-trained person. It can be awakened and should then be put into practice. Pendulum diagnosis should never be an end in itself. At the same time, it will yield us valuable medical information.

In the history of medicine, we find a peculiar kind of accumulation of the lack of appreciation of great discoveries made by outsiders. Here are only a few cases:—

Only half a century after the discovery of the percussion method by the Viennese physician, Leopold Huenbrugger (1722–1809) it finally found admittance in the general set of the working outfit of physicians. Even the famous Holler in Gottingen still had the audacity to say in the year 1762: “All such propositions, of course, do not deserve to be accepted immediately, but are to be listened to with attention” Only no hurry! And quite similar still was that of the auscultation method of the French physician, Laennec (1781–1826). I recall further about Semmelweiss about whom even a Virchow avowed; in his 47th year, Semmelweiss died in a lunatic asylum from despair. After his death, they placed on his monument: “Saviour of Mothers”.

Worthy of note is the lack of appreciation of the discovery of local anæsthesia by Carl Ludwig Schleich. The German Congress of Surgeons, 1892 under Bardeleben (there were over 800 well-known men present), condemned the new discovery. After ten years the completely painless and non-injurious method was recognised; this brought them back to their senses.

In the new orientation of medicine, man will in this way turn around and go back to the “old as the hills” pendulum diagnosis, availing himself of it along with the other well-known school methods or with those of another outsider; for instance, eye diagnosis. Genuine biological thinking and the biological methods of healing corresponding thereto, make it possible. Bottenberg says very correctly: “The biological physician through his diagnostic efforts along with the condition diagnosis, aspires to a ‘performance diagnosis’, which gives him information as to the extent of the performance capacity of the organism and its reaction capacity to the natural stimuli of life, at the same time guarantees him that with perseverance, there will be, as soon as possible, an initiating entirely biological treatment”.

No doubt, the first visit of the patient can be made full use of curatively with pendulum diagnosis. The pendulum diagnosis is not only an entire research method, it is one which can be found very quickly in the condition of the body, along with the individual organs which can be accurately examined with it. The human body forms a unit. This unit is in regular motion through currents of a positive and negative kind. The individual parts of the body also in entire

organs, are very full of life; in others again, they are less lively. In the first volume we wrote how it consists of a process which is called forth by radiation. It comes into play under many kinds of conditions. The radiations of the human body are weaker or stronger depending on the condition of the body; it is also the same with the organs. If the organism, the organ, be weakened by disease, the currents are delayed, then the radiation is retarded. The sending out of the rays otherwise, cannot help but indicate those which are in the full height of their performance capacity. The interrupted radiation, also the complete cessation of the radiation force, indicate the condition of the body; this proves the value of pendulum diagnosis, since through it the currents and their radiations or emanations, become perceived. The interrupted radiation force of an organ operating upon the entire organism, shows in addition the general treatment of the diseased human body. Partial treatment is imperfect work—unbiological.

Dr. Alex Heerman, an old experienced pendulum diagnostician, says in addition: "Human beings as well as animals are at the same time radio receivers and senders and have the capacity to focus, to concentrate". Heerman differentiates growth rays (which promote the formation of cells) and arrestment of rays (which hinder the formation of cells). Dr. Heerman writes that life process produces both kinds of rays, growth and arrestment but in definite equilibrium.

Dr. Bruno von Willman's views as supplemental thereto: "We know from experience that the individual organs possess an overshadowing field of force, in their strong covering, in the positive as well as in the negative sense, so that one need not at the most, take into consideration the surrounding radiations as a source of error". He has a special method of investigation, he makes use of the mirror and the pendulum and has for over five years examined scrupulously, and compared the findings with the results of other methods and was convinced of the extraordinary advantages as well as with their certainty. He writes: "It is quite clear that here no man is born a master of his craft, that one must know how to find the topographically favourable point and how to eliminate the most possible sources of error. With these reservations in mind, the method is nevertheless learnable (by those who are adapted to the pendulum) and no doubt suffices to give quickly an approximate numerical general view of the internal organs. Its advantage must become clear to anyone who has had experience with it, what quickness and simplicity it is; for instance, it is possible to discover which one of the two kidneys is diseased, whether an adjoining thyroid gland has over-functioned or under-functioned, whether the stomach secretes too much or too little hydrochloric acid, how great the degree of weakness there is in the heart muscle, in order to demonstrate some few examples. Nevertheless, beyond this it is quite possible to discover the degree of growth in a tumour as well as to follow up a reaction to therapeutic remedies numerically".

At the conclusion of his demonstrations, Willman summarised in a few words the principles of the method: I give them below in the form of a summary:—

1. Everyone possesses a personal field of force. This is well-known already and has been proven scientifically.
2. In diseases, there appear alterations in this field of force which have become likewise scientifically known and proven as well through the diagnostic successes of Dr. Schreiber, M.D.
3. The divining rod and the pendulum in their reactions are dependent upon the same primary causes, these discoveries make it also valid for the latter. Owing to the pendulum diagnostic performances of a Dr. Abel Martin, M.D., they are recognised by the Paris Medical Faculty. It is also quite certain that we can also find diseased spots in the body with the pendulum, the advantage over the divining rod. It is also essentially more sensitive than the divining rod and for medical purposes is better suited.
4. That the back of a mirror radiates growth energies, the front side retardation of growth energy in any position, also at night in complete darkness, and the living cells in the positive as well as in the negative sense may be influenced, has been permanently established.
5. The accumulatory charging of the organs with their defective growth energies, or in other causes the opposite influencing by means of the mirror permits of their being temporarily measured by the pendulum.

Diagnosis by sensation of touch produces the magnetic healer. The word magnetic-healing, I view as an unfortunately chosen expression. When an organ is shattered in health, we therefore kindly say to the clear thinking diagnostic that there is a feeling of void in the finger tips. If it is festered then there is a dull feeling. With chronic inflammation of the bronchial tubes, there is a burning feeling. There are signs of a very poor flowing through or cessation of the currents.

Already more than 100 years ago, about 1810, Calimini found that the pendulum would not swing over patients who were ill with fever and that these were not even able to be penduled so long as the fever continued. According to that, the pendulum is a very accurate discoverer of the disturbances in the currents. It oscillates over organs that are sound and whose currents are flowing in order, in normal paths.

Over diseased organs the pendulum swings changing and becoming weaker or, in general, it does not move at all.

To be healthy is generally indicated by a movement in a clockwise direction, consequently by a circle to the right or an ellipse to the right with beautiful long oscillations which last a long time. In

the hand of an old experienced professional healer, who is intimately connected with nature, the pendulum proves to be fully up to the mark, not only occasionally but in many thousand ways. As Bachmann has already written before and since then, the history of the pendulum proves that it stems from the people. Everything really valuable came from the place and among the physicians. It has become for them an indispensable instrument in their biological thinking and working for amplifying and perfecting the diagnosis. In the hand of the qualified professionally-trained physician, the pendulum is absolutely reliable.

THE PENDULUM FOR THE DOCTOR

The pendulum not only indicated to us the location of disturbances, it shows not only the vital energy, but offers to us directly, early recognition and to the experienced diagnostician, sure prognosis. Very often the pendulum diagnosis shows functional disturbances which are neither to be found by our trustworthy clinical or by other outside clinical research methods. Frequently the pendulum has produced a better, also a more accurate disease picture than the x-ray photogram, and that is easily explainable, only the body and those organs of the same can in fact be really found that are in the line of a well-regulated positive and negative course. Still, any very slight disturbance of the current must make itself observable to us.

Consequently, the pendulum in the hand of the physician becomes a preventive aid. With reference to many lingering diseases with which we are surrounded such as cancer, tuberculosis, etc., this is of importance. The pendulum not only furnishes an essential enrichment supplementing the means of research, but we have experienced hundreds of times that when the physician has an interior liking for it, he will make diagnosis almost only with the pendulum. Very old experienced physicians have been the rule in this.

The employment possibilities of the pendulum in the healing art is manifold. It is not very just that the pendulum diagnostic method has not become recognised. Furthermore, the pendulum performs independently. Besides what has not been evaluated highly is the possibility of one occupying himself with it after the consultation hour, after the visit of the patient, also without the patient being near at hand, besides we must not exert ourselves too much. This has to do with chargings of prana at hand. In this way, it yields by itself, possibilities of supervision such as special regulations in office hours and other things besides.

Through the aid of medical atlases and other things we, for instance, can get near to such suffering which is not apparent, can find the location of a neuralgia, for instance such as is found in intercostal muscle pain, recognise deeply seated rheumatic places, determine tumours and their ramifications. We can direct the diet, supervise and test correctly the remedy, whether the body requires it, or whether it

is beneficial or not, and further how long it has to be given. Instruments are now being made to help pendulum diagnosis. There is in this immense possibilities, which may not be guaranteed by anything from any other side. Pendulum diagnosis is therefore, one of the working instructions of the physician in the future.

Not every physician is fitted for treating every sick person; so also every physician does not have success with all his patients. Here again the pendulum comes to the rescue, the physician will perceive quickly whether his own body emanations harmonize with those of the patient. He is able, out of pure inner honesty, to refuse to accept the patient for treatment or assign the patient over to one of his colleagues for treatment. If massage is necessary, or if the patient needs nursing then also the staff can be supervised. For a biological treatment, it is necessary that such kind of self-evidence be taken into consideration only once. The patient must not only have a healthy surrounding, but he must be treated by such men and be nursed, so that his health is not injured, that he eats and drinks nothing but what will rebuild him. The present-day medical doctrine has still found no value therein; it has to do with the future. This is important, as any practising physician can therefore supervise the treatment and be in a position at all times to give aid.

The Most Important Thing in Medical Pendulum Diagnosis

Pendulum diagnosis is an entirely individual art. With the pendulum problems there can be set up no generally valid pattern. Among all of the physicians and health practitioners who make use of the customary methods of diagnosis, there are among them who are adapted, some less adapted, so that it is conclusive that there is also a distinction to be made as to whether one is really a physician and a healer or merely a medical man. Pendulum diagnosis should only be made use of by those physicians who are sensitive to a high degree, then everything will lie or rest with them. The physician or health practitioner who leads a life close to nature, in his mode of living, is his own pattern—may very well incline towards the pendulum and be able to develop himself. He who obtains nothing with the pendulum should never assume to speak about the trustworthy pendulum diagnosis; he should also if he hasn't, leave the fingers alone and not become a quack; we do not need such in our ranks. The ability can be obtained from very many directions for articulation; what the one cannot accomplish, the other can.

Aids for Medical Pendulum Diagnosis

14. (i) A pendulum
- (ii) Anatomical Atlas
- (iii) Instruction book in Physiology
- (iv) Possibly an instrument as an aid.

The pendulum is naturally the most essential aid. To do justice to the law of radiation, the pendulum must be polarized correctly. There are many good pendulums that conform to these hypotheses for medical diagnosis. There is the normal clear plastic type which is always neutral. Some people will prefer a lighter or heavier type pendulum of approximately 30 grams (1 oz), but weights of 50 or even 150 grams are sometimes preferred.

PATIENTS' HISTORIES

Kallenberg demonstrated 25 years ago that the photograph was something more than a likeness of our exterior personality. He vouchsafed the information that not only is it alive, as it were, but it sends out definite rays, and he furnished the proof through exactly the same pendulum paths with the living persons as with their photographs. The evidence has been objectively proven and anyone today can be convinced by it.

We will let Kallenberg himself speak: "At the moment when the photographer (by opening the shutter) releases the track from the original of the person, for example with prepared bromo-gelatine negative plates the latter imbibes with lightening speed the radiations collected and concentrated by the most diminutive of lenses, of the person and absorbs them: their mental psychical and organic constituents also their consubstantiality. This process takes place with a veracity of which there is nothing to equal it. But whilst a person with insufficient understanding is here made to stop and sees that the impression or proof taken by the plate is only to be viewed as a dead copy, the original in reality has transferred one of the most essential fractions of an entire individuality or personality to the negative plate in layers by means of an outward emanation. Yes, even more; from this time on—there exists an imperishable, indestructable relationship between the person who was photographed and the photograph in question—imperishable and indestructable as long as the plate or the negative remains preserved." Kallenberg was not the first one to maintain this; on the contrary, Balzac was lost in meditation before the Daguerreotype likeness construing the wonder in the same sense and Albert de Rochas, as well as the chemist, Dr. Charles Buchner, asserted the same thing about the ways of these strictly scientific experiments. Surely the right belongs to them exclusively to doubly and trebly underscore these results, that is, from the assumptions conveyed by the evidence.

What applies to photographs is to be taken into consideration also for other load especially paper, breathed upon or written upon. A sheet of paper which has been breathed upon or written and preserved in an envelope gives to the physician the radiations of the hour and the day. Reichenbach previously referred to the extraordinarily strong negative radioactivity of the breath (in the year of 1851) and therefore the card which has been breathed upon proves to be very

good in the practice of the pendulum diagnostician. We call these cards, patient cards. They form a basis for diagnosis which stands forth unrivalled and unique of its kind for control. They can by proper preservation still be used after many years. It is best that we take a card the size of a postcard and allow the patient to breathe upon it three or four times vigorously and then put down in handwriting underneath the place breathed upon the personalities (the Christian and family name, date of birth, residence and street and the day of the examination). We put the card in an envelope and keep it separate alongside the other customary patients' cards in the filing cabinet. Upon the envelope we note down the name of the patient, etc., handling this one again exactly as was done the first time. We always diagnose only from the very newest loadings; whether we are able at any time to discover the present condition of a patient from an older loading depends upon our qualifications.

The course of a sickness permits of being very well supervised by means of the patients' card only that I censure one for the shutting off from strange rays, otherwise they are able to disclose the sources of error in our studies. In case of necessity we may also use hand impressions, that is, the hand may be laid upon pure white paper some few minutes, or warm linen for instance, also a menstruation band, blood, secretions, excretions. Loadings, cards breathed upon, etc., lose much of their value by unsuitable treatment. Should we examine from old letters then we must not forget that they have laid together with other loadings. We first have to isolate them, to ventilate them. Examination from letters with handwriting of several persons is difficult. Here the loading (strange) must be eliminated or removed.

The formation of patients' histories, through photographs or handwritings, etc., is not difficult: they can also be supplementary. Many a thing that was hitherto forgotten, or kept in secret comes into the light and will be verified by the patients or their relatives.

If we are permitted to demonstrate light medical poisoning through appropriate experiments by skilled pendulum diagnosticians then one can get behind this or that hereditary transmission. First the health condition, the degree of vitality, etc., as I have already pointed out before will be determined, also the physical condition will permit being established. First then we obtain the condition of the individual organs:

We were able to pursue our experiments years thus for instance by testing the photographs of the years 1920 - 1921 - 1922 - 1923 - 1924 - 1925, etc. We obtain from a photograph the development of a condition that can be important for the medical treatment. An advanced tumor, a tuberculosis, etc., are accurately considered. So may a diagnosis of a swelling, which the clinic would designate as mild proves to be with the pendulum a disastrous false conclusion. Through the arranging side by side of the patient's sheets we possess a living

patient's history, also a story of our treatment, always the occasional condition of the patient. Hardly any other method of examination can give us the satisfaction for subsequent researches permit being made after years. Only the patient's sheets must be carefully preserved. The sending away of a patient's card to a friendly pendulum diagnostician by appropriate dispatch who will examine the finding presents no difficulties. This proves still again the great importance of the pendulum in the hand of the physician. There is also the possibility of discovering the affliction after death. Objective experiments have proved this without any objection. To go further into these researches is the task of the science of heredity.

Every physician has so-called registry cards. We likewise need such cards for our pendulum researches, only we need them somewhat larger in size. The reason being that we have also to record sketches of pendulograms in certain circumstances with the size we are able to get along with nicely. The classification rests entirely on our discretion, it will become developed through the proxis. Classen took writing paper that was ruled crosswise—the so-called chequered paper with a distance between the individual lines of 5 mm. By a perpendicular line drawn or made with ink 7 cm. distance from the left margin the page will be divided into two columns, the space below being intended for the names of the disturbed organs with their pendulum oscillations in each case for which a perpendicular column of 5 cm. in breadth will be used each time so that one has space for almost ten researches.

In cases of necessity one can shift the perpendicular line somewhat further to the right; in the upper right angle of the wide half to the right is to be shown the names, age and dwelling place of the patients, and furnishes sufficient space for the patients' history (previous history), the appointments, etc., just like they are also now made on other registry cards. The pendulum diagnostician now has beside the important patients card with the loading of the patients also still the registry card.

Long Distance Diagnosis

Long distance diagnosis is not curiosity in the 20th century. The radio has been used for that purpose at thousands of kilometres distant already. Very soon we will have television and then the aeroplane will be employed to bring remedies. Diagnosing at a distance and treatment at a distance with utilization of the pendulum is possible to the physician. Different pendulum diagnosticians make use of it. A person should have new loadings to begin with, in case of need also at times secretions; when the previous history of the patient, his troubles are known then we can find out what are the suitable prescriptions to be given. Whether the beginner for safety sake goes back to still other research customs (for instance Wune Analysis) this matter must be left to his own discretion. Making

comparisons of diagnosis can never be injurious. Every diagnosis must be controlled through critical understanding. In regard to the possibilities of a case of illness being reviewed by other friendly medical pendulum diagnosticians I have referred to this already.

The X-ray Photograph

If there are any X-ray photographs around we can also utilise them. The qualified and well trained pendulum diagnostician accomplishes his work by means of his aids, the utilization of the anatomical atlas, the medicinal model, very likely also with the X-ray photograph. So unlikely that it might be an outstanding fairy tale, he enters into competition with it, but there are not only many who have become convinced by it, but even those physicians who have just been converted to pendulum diagnosis avow that they prefer the latter to the X-ray photograph. There is only one thing to be considered about it here. He must protect himself against the influences of the radiations of the X-ray plate. If the pendulum diagnostician works accurately he will frequently make better diagnosis than will the X-ray physician.

The Physical Constitution of the Pendulum Diagnostician

We devote ourselves to the study of disease diagnosis only when we are in a good state of health, or frame of mind, when we feel that we are having a good day. The best time to make the diagnosis is therefore in the morning. Physical indisposition and ill-health can become quickly eliminated through studying. Great fatigue, over-exertion impairs the working and reduces the results.

In order to increase the sensitivity for pendulum researches we abstain from the use of alcohol, tobacco, etc., also no dissipating of sexual strength or forces, in a word living according to natural laws, also in close relationship with nature. Through this we increase our adaptability. Deep breathing exercises, mental concentrations and relaxation exercises advance us. We set to work with our diagnosing with a greater calm. The more we are withdrawn into ourselves, eliminate our individual thinking and wishing, the more we will obtain advancement and collection of evidence. The pendulum researcher will also work invariably by himself. But we must also have faith in ourselves in order to be able to make accurate diagnosis. We must believe in the good forces which lie dormant within us.

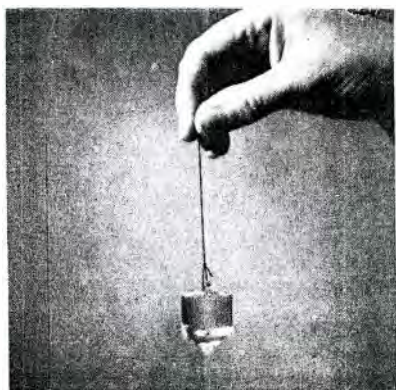

Freeing Oneself from Foreign Emanations

The emancipation of oneself from foreign emanations is very important in the medical diagnosis—this must never be forgotten. Before beginning we should not take anything strange into our hands, have no emanations clinging to us. If we wash our hands thoroughly

with soap and water and a hand brush this is sufficient. There is no need for further words about this. The emanations which we have to deal with we must obtain from the patients themselves or their loadings from anything which they have worn. After occupying ourselves with them we must rid ourselves of them very quickly and energetically. The well-known magnetic strokes along our body ought to be sufficient at the most, we swing with the hands in the downward strokes. This before we have anything to do with any new patients need not be emphasised. Whoever is not careful need have nothing to wonder at all, if once he gets violent headache or other complaints. The sensitive person must provide against such things in advance.

The Pendulum in the Hand

To obtain skill with the pendulum in the hand we must be very careful in doing it. This sounds very simple but nevertheless it is not so very easy and requires some training. We have observed how few of us will succeed with the pendulum from the beginning. It gambols, it produces voluntary movements, and from these we cannot obtain success. Before we do this we must be very careful and we must know what we are doing, and here again no doubt we enter the field of the subconscious. For training the oft-repeated recommended relaxation and concentration exercises are necessary. Since the entire natural forces within us are loose, we give our subconscious the command to show us the currents or emanations of a body (in our case now we have to do with human beings). Only the emanations, which we need for our researches in each case, nothing more. We must not expect too much in the beginning. The work of concentration will no doubt have to be strictly learned and practised. Therefore, I always advise to grow very slowly in our field as there will hardly ever be found a second one of greater importance to the physician.

Pendulum as held in the hand

The illustration shows the correct way to hold the clear plastic type of pendulum, but these can be of any colour, shape, or weight of bob to form the pendulum, it all depends on the use to which it is to be put. Many pendulists in the world today, myself included, have not one pendulum, but many, each for a special use.

If we are not entirely up to the point, if we are not able to eliminate ourselves, also to activate our subconscious and through it supervise our day consciousness, then it will be difficult to work with the pendulum otherwise we will

not pass over the definite cliffs. Briefly stated, our waking or day consciousness asks our subconscious. In any case our subconscious is of great importance. Every physician ought to occupy himself with this question.

The Reading of Pendolograms

The perception and reading of the pendulum oscillations, as signs, as pendolograms is a matter of practice. We familiarize ourselves at first with the simpler signs impressing them upon our mind; later on we add entire pictures. For reading complete attention is necessary and we have to be on the alert.

By means of oft-repeatedly made exercises this impression may be furthered. The student can test the findings in the beginning, however, by other methods of diagnosis.

In order to learn to diagnose we first of all must observe the different pendulum oscillations: viz: —

1. Circles turning round to the right.
 2. Circles turning round to the left.
 3. Cross lines from right to left.
 4. Cross lines from left to right.
 5. North-south lines.
 6. Horizontal ellipses around to the right.
 7. Horizontal ellipses around to the left.
 8. Perpendicular ellipses around to the right.
 9. Perpendicular ellipses around to the left.
 10. Diagonal ellipses around to the right.
 11. Diagonal lines from left to right.
 12. Diagonal lines from right to left.
- We observe further:
13. Pendulum rigidity or pendulum reaction.
 14. Pendulum pauses; if the pendulum ceases its activity in the middle of an experiment we speak of a pause.

The oscillations differentiate very accurately according to amplitude and strength. The strength can indicate to us the degree of the ailment. So far, some few signs, a circle to the right, a circle to the left, an ellipse to the right, an ellipse to the left, the short pause, the pendulum rigidity, all simple signs, show good possibilities for perception, permit us to recognise healthy and diseased currents, etc.

As I have written before, penduling is an individual art. It is quite possible, in fact often very probable, that we will come across other signs or pendolograms than those which are given here or in the

auxiliary tables for pendulum research, they will give better practice and furnish stimulations.

The left thumb of the male penduls normally to the right.

The left thumb of the female penduls normally to the left.

It is also correct to observe that among the present-day cultured people there is rarely to be found a fundamental and typical healthy state and function of the organs. In the strict biological sense with every one it is all but putrid, and that was said not only by our eminent specialists who were reprimanded nearly ten years ago for it, but among Eye-astro-face and pendulum diagnosis. I often say to myself it was done intentionally.

If we are confronted with an underfunction or an overfunction of an organ, a disarrangement, then we calmly say that the superstructure material, for instance, sends out rays which deviate from the normal. Then again the movement of the pendulum is dependent on the constitutional reaction of the diagnostician and that of the pendulum which he uses. For that reason it always requires at first either the adoption of pendulograms or signs for an accurate verification. It is then as the experiments clearly prove that we are confronted with a harmony of the loading. People are so differently polarized, charged, stronger or weaker, so we must study in order to obtain our individual signs. To those who are seriously willing and work industriously it will not be difficult. If a person has his own signs he keeps them near at hand. That which a person achieves by his own labour, that sticks. But I will also name a way in order to get at the bottom of the signs which are referred to in my book so that a person can utilize them. The experiment will repay him sure enough.

I myself pendul with the thumb and forefinger of the right hand, which may be concluded from the first part of my series. The fingers are polarized differently, the one positive and the other negative. My right thumb is strongly negative; with me, negative is indicated here by a circle to the left, the right finger (index finger) is strongly positive. Positive with me here is a circle towards the right. I even hold the left hand which is not without influence upon the right hand in the penduling, at the back downwards, the fingers slightly spread apart. For this purpose we have a photograph of the right hand made and have the plate or proof examined by a qualified pendulum researcher, or if we have to find our own signs we examine it ourselves in order to find which fingers of the right hand are positive and negative. If it is not possible to have a photograph taken then there is another way which everyone can make use of. We make a loading of ourselves by laying the right hand upon a new white sheet of paper, allowing the hand to lay upon it a few minutes and examine it after marking the position of the fingers with a lead pencil, to find out what kind of polarity each of the fingers of our right hand possesses.

In general for the penduling there is always needed two fingers, the one must be positive and the other negative, and now we will experiment to find out which fingers come the nearest to my classifications. We can also very well, for instance, take the thumb and the middle finger or the thumb and the right finger and others and obtain the same signs, as I named them. I have already experienced this quite often, but we must always take a positive and a negative finger to pendul with.

EXAMINATION OF GENERAL HEALTH CONDITIONS

For the examination of the health condition of human beings, seen as a whole, the pendulum is a good indicator. The health condition will be obtained by penduling over the middle part of the body. In this case we focus ourselves concentrating upon the entire condition of the health of the patient.

We study this from the healthy and healthy-looking persons, examining their pendulum oscillations. Then we study from persons who are slightly ill. Later on from persons who are seriously ill and such as those as a person sees with death staring them in the face. For in the estimation of people it can hardly become more than an aid to sufferers to put it mildly; here we meet very often with pendulum pauses or the pendulum swings to and fro as if it were moved by a slight breeze. It will not surprise us at all if hale and hearty-looking persons give disease oscillations. By more exact examination we find, for instance, considerable inaction of the liver, intestinal states, and so on.

Oscillations of the Healthy and of the Sick Person

The healthy person has healthy currents in his body. These will therefore give normal pendulum oscillations. Health is our positive sign. It will almost always be a right circle. It can also be a right ellipsis, become right triangular. Healthy oscillations are always clockwise in direction. There is one exception, however; persons who are polarised the wrong way; men the feminine way, women who are polarised the male way or like males, swing in the opposite direction. Then again there are still other exceptions. The law of polarity must never be overlooked.

15. The examination of healthy persons yield different organ oscillations. In the one they are more positive, the other more negative. The organs which come in pairs mostly have dissimilar polarity; for instance, the one kidney is positive, the other negative. The right ovary is mostly negative, the left one positive, and so on.

Diseased parts of the body are always negative, the polarity weakened owing to the disturbed currents; on the other hand, with a positive organ, it may show either weakening or negativity. The polarity proportion or condition can be different. With a healthy man the pendulum shows beautiful, long-lasting right circles. The pendulum picture always begins with circles, then follows a number of

ellipses. Only ellipses can show negative health conditions. But here we must take into consideration the constitution. The healthy woman has beautifully gracefully shaped long-lasting right ellipses. The pendulum picture of the woman always begins with ellipses which are followed by a number of circles. If with these the ellipses are very small or the oscillation be too protracted, they can be negative. Changing ellipses bespeak; sometimes healthy, sometimes out of sort (sick). If then, there are in sick people present disturbances in the currents it follows from that, that the pendulum must swing differently. If the pendulum stands over the object a short time, or during the swinging it suddenly changes the direction for instance, a right oscillation changes over to a left oscillation or turning, then there lies before us a definite disturbance of the currents. The weakened disturbances are easily indicated, the stronger ones by strongly coming out in bold relief, and then stopping.

Here is where earnest work has just begun. In general it can be valid and is described as:—

Healthy condition: Normal oscillations (only in few exceptions—strokes).

Diseased conditions: Changings—variations, pendulum rigidity over organs.

Cancer: The pendulum shows downward pendulum pauses (see also contribution about cancer).

Calcination: Larger and smaller circles to the left with cross lines or small quivering triangular figures, very frequently interruptions with pendulum inaction.

Inflammations: There appears trembling rosettes, turning to the left.

Wounds: The pendulum seeks to dodge, or will be pushed out of the way.

Diseased nerves: Life circles, left and right strokes.

Organ disorders: West-east lines.

Death: Pendulum pause and if continues always gives the same pattern. It is recommended here to check five or eight times at different times of the day in order to check the original finding.

There is nothing we cannot place in the right light with the pendulum. For instance, in the detection of a floating kidney, the ellipses will at first swing normal, then become smaller, again larger, again smaller, again larger, and so on. We will quickly discover the diseased place in the body. Only that a person must not be too over-hasty in the beginning, even making an accurate diagnosis.

The Life Force

The phenomena of the life, the functions of life, stem from the life force (vital forces). The life force is precisely the one thing, determinant of all life and is also a very comprehensive energy. Procreative power, nerve energy, blood energy, muscle energy and, among other things also, self, natural healing force (the healing power of nature) are only different forms of it. The life force is life procreative, life generating, life forming, life sustaining. It is important to recognise the life force. If the health condition of the patient looks ever so serious, if the condition looks ever so threatening, if when we find on discovery of the life force that we obtain good oscillations, then the body with our assistance will become self-steering, the diseased condition overcome. The life force will show itself to us in smaller, weaker or stronger large right circles.

Smooth, uniformly large circles are indicative of a good life force. If the life force is weakened, it manifests itself according to the health condition of the patients in either a smaller or much smaller circle, pendulum inaction, pendulum pause. From these we can make our deductions. In the beginning we study the life force only from healthy living people, later on from loadings.

The percentage determination of the health, the life force, the condition of an organ for the beginner is very hazardous and besides can only be obtained through rigorous self-control. The one diagnostician has very good success with it, while to another, success is denied where otherwise he can diagnose very well. It is dependent on many circumstances, upon our source of power. We are never so very equally charged that we can express ourselves in percentages, still we ought to occupy ourselves with it. If we are feeling quite fresh, then we make experiments. We take for that purpose the 360° diagram.

The utilization of the Graduated Circle

In consideration of what has just been said the 360° diagram can be used very extensively. Professor Bahr gave us in his "Dynamic Circle" an aid with which the advanced pendulum diagnostician can render valuable service. The Bahrsche circle is divided into degrees by which the oscillations can be measured. The circular diagram is divided into 360 degrees. We can make the best possible use of this diagram in connection with the insulated board. According to the assertions of Bahr the positive body lies from zero point up to 202½ degrees. The negative body lies from 92½ degrees to 360 degrees. Articles of food from 90 to 270 degrees. Nervous irritation material from 181 to 270 degrees. Real poison from 271 to 360 degrees.

Concerning the graduated circle we will let Glahn speak. The dynamic circle presents to us a wonderfully orderly superstructure with the individuality of a plant. The starting point is always "0" degrees. This gives us to understand when in organic life the germ capable of development of growth gets ready to come into life. Whatever it

needs for that purpose it finds successively. With 90 degrees the development is complete. It is the beginning of the working period of the activity, and again the necessary building material will be supplied for it. Then comes the "axe" antagonistic to the construction, the opposite pole of spring-time and autumn and with 270 degrees death begins, going always deeper into it until it becomes completely dis-integrated. Every graduated degree is accordingly full of meaning. Each polar and antagonistic relationship is demonstrative. As we lift our thoughts from the physical to the spiritual then we see the creation as it is foreshadowed in the Edda and Vedas.

It would fill a large book to record all of the relationships according to kind activity and degree, here the veil can only be lifted in order to make it possible to get the first glance at the truth. From the 360° polarity diagram through the discovery of the life force we have to take into consideration:

- 0° – 180° we designate as the rising tide of life.
 - 180° is the highest degree of life force.
- 180° – 360° is the descending tide of life force.
 - 360° is pendulum rigidity changing over to pendulum pause as with death.

For employment of the circular graduated diagram we lay the object (loading) on the insulated board and upon it the diagram which has a small circular opening in the centre of it. We now search for the life force according to what Barsch has to say and instead of 180° the normal healthy condition degree, we obtain 150 degrees and our measurement ascends to 210° then the life force decreases proportionately. If now fever supervenes then again we can obtain 50° and more with the presence of 42° fever (temperature measure by means of the quicksilver column) we can obtain an oscillation degree up to 269°. That is the highest crisis point of the life force. If the fever goes down then there will be shown immediately lower degrees. The person can recover his normal standard of living, but as it is always possible that if a debilitation appears, that the normal point will no longer be reached I also know many pendulum diagnosticians who do not use the Barsche diagram.

The Hereditary Factor

As the previous history of a patient and also the consideration of the constitution is important, so it is only fair that consideration be given to the hereditary tendencies as a cause of disease.

Inheritable diseases are either transmitted like any other disease or only as a reversion to a disease. In the latter case an environmental influence must break out with the disease due to the hereditary reversion. In this way we differentiate diseases which are throw-backs from those which are predominantly hereditary transmissions. If anybody is tainted with a hereditary disease we will readily recognise it over the Cerebrum and over the centre of the body. If, in the beginning of

the examination the pendulum describes only dashes breaks—diagonal line movements to the left, then we have an affliction with a hereditary taint before us. If for instance from the beginning, an organ gives us pictures quite different from the normal, like those shown on the previous page, then we can count upon it that from earliest childhood on, there is a tendency to diseases, a part of an inherited state lies before us.

The study of hereditary tendencies can be further extended by studies of racial mixtures. Racial mixtures in the end can finally bring about a tendency to diseases. In a few years it will be hard to understand how a person in the medical profession can overlook the racial relationships of the patients. Racial mixtures also are direct or indirect causes of disease and for the coming physician this must be a subject which he must thoroughly familiarise himself with. The pendulum thus is well adapted to show good results in racial mixtures.

The Prevention of Errors

To know the possibilities of error is a prerequisite in that they may be avoided. As in all investigation methods there is in pendulum diagnosis sources of error. I have given only a few suggestions here unarranged and I will repeat them again. We give in too easily to strange or curious suggestions, also we should never make investigations in front of large crowds. We should never lose sight of the possibility of being diverted by thinking about the patients. That can be met by focusing, by strong concentration. The elimination of all thoughts leading to imperfect diagnosis in other words, the only, the essential thing, the ability of the subconscious to permit it to become perceptible by us through the pendulum becoming now the one prerequisite in any pendulum diagnosis. The numerous experiments which I have made, also the experiences of many other pendulum researchers show that thinking or thoughts about the living objects, also of the patients or of another person can influence the student, with the experienced diagnoser this is no longer so easily done.

One person can be more susceptible, again another can be less susceptible to a direct thought transmission or a mental suggestion between living persons and the diagnoser, but this ought not to be. There exists always the possibilities that the pendulum can confuse or mix up material things with things imagined by the mind. When we make investigations we all make our minds become blank. We pay attention to correct inner focusing. The pendulum also must not become influenced, if it lingers then it gives to the pendulogram a false picture. It diverts the least when we are diagnosing in a standing position. The face faces south. The position of the left hand has an influence.

The left hand is outstretched slightly trailing in the back, the fingers spread apart, not directed towards masses of metal, electric light conductors, or radio apparatus. Through a closed left hand

another kind of oscillation can arise. We always take the same pendulum, not, one time this one, then again another. Also the thread may not be longer one time, and then again be shorter. We protect ourselves against foreign emanations. We keep our investigation room free from unfavourable earth rays. If we examine the patients themselves we take care that they are stripped of all metals, for instance, take keys, etc., out of the pockets. We practise in the beginning only from undressed patients. We insulate the examination bed. It ought to be made of wood, if possible covered with oil cloth upon which a fresh linen cloth is laid. If the person lays his hand on the table that also has to be taken into consideration. That way a patient gives his loading to others from which there can arise two or even several mixed emanations of persons and the investigation becomes distorted. Here it is called Isolating and rendering non-injurious taking proper measures. For diagnosis we always require only the pure emanations of the patients. Loadings always must be handled properly, they must not be allowed to lie together with others. Otherwise there is only one remedy, they should be thoroughly aired, they should be wiped off. We take into consideration the polarisation of the patients. Penduling of women during periods ordinarily differ from what they are at other times.

Organs which no longer exist, the pendulum shows that up by not swinging. When patients visit us at first we pay attention to terrestrial rays. Shifting the resting place or the insulated boards furnishes a quick remedy. We observe whether the person lies with the head towards the North or the West. That he becomes free from other radiations and other influences which are deleterious to him is self-understood. That we do not overlook his physical condition is to be understood as a matter of course. We make our investigation only on the general assumption that it is for a diagnosis and treatment to be given at the bedside.

What ought to Precede the Diagnosis

In contrast with other ways of diagnosing, for instance, the clinical, we do not interrogate the patients when they visit us in our office or when we call upon them at the sick bed; we do not wish to know anything about their complaints before making our pendulum examination.

We must not allow ourselves to become prejudiced by outside things. We take their comings to see us, or our visits to them, as proper and an obligation. If the patient begins to relate any symptoms we ask him to do so later on. We favour making notes from the beginning. We occupy ourselves first of all only with the life force and take the individual organs before the general health condition; that way we obtain a picture. We note especially conspicuous disturbances in case of need and in fulfilment of duty, we write them down. If later on we are able to talk to the patients we would therefore briefly tell

them what we have found and in doing so obtain quickly his confidence. We very soon find his previous history, he will now readily tell us everything—even about the soul. It is important to know how he was treated formerly. The taking of strong medicines in former times leaves a sediment in the body and is indicated by the corresponding pendulum oscillations. There is never any imbiological treatment which does not leave its results. There are also to be found physically dependent diseases. The beginner may however (I discussed this only recently) keep up his former research methods reassured, if he wishes. Then he will be convinced how much easier is the accuracy of pendulum diagnosis.

If for instance, one is a skilled wine analyst, then he can continue with his researches; if he is an experienced eye diagnoser, he works similarly. All these methods of research permit us to recapitulate, to exclude all except the best one.

There are in Germany and in other foreign countries many physicians and health practitioners who in former times have applied it correctly, in later years they have investigated or made examinations only with the pendulum. Their numerous experiences teach that the pendulum diagnosis belongs to the best research methods.

METHODS OF PENDULUM DIAGNOSIS

For the utilisation of the pendulum, we differentiate two methods of investigation:—

1. The active or suggestive method.
2. The passive, physical, or the method which is independent of ourselves of foreign influences.

The Active Method

The active method is the suggestive method, its operation depends upon physical-physiological-psychological laws. The consciousness of the day, also called the higher consciousness, concentrates upon a question focusing entirely upon it, asks the subconscious about it. This questioning is no curiosity with us for it is the usual thing in daily life. At anytime when we are perplexed over a difficult question “we sleep on it over-night” and we become better able to decide it. Here we are in contact with the subconsciousness. I refer again to Jung and Stutzer.

Dr. Classen, member of the Board of Health, is the medical representative of the method. Among the medically trained lay practitioners, there is still today the remarkable Catholic clergyman, Dean Alfred Pientka, Ph.D., of whom we shall speak later about his method. In the methods of investigation, we give first consideration to the active method as has just been said, when we ask our subconscious, for instance: how does the disease swing?; where is the place of the disease?—among other things.

The Passive Method

The passive method is the physico-physiological kind of investigation. The passive method is the one method which will be most generally practised and comes into consideration first in every respect for the physician and health practitioner. The physical method, as we have just called it, is passive because it is independent of us, of our thinking, feeling, also of foreign influences.

We rely on the passive method, for instance : —

- (a) for diagnosing with the pendulum from the patient himself, when we examine his organs;
- (b) for investigation by means of a loading in connection with the aid of an anatomical atlas, or the diagnosing instrument.

The boundary line between the active and the passive method cannot always be drawn so very sharply, both methods work harmoniously together with qualified advanced pendulum diagnosticians.

I recommend at first to always practice with the passive method. This applies also at least in the beginning.

A few ways of applying the Active Method and their Application

I repeat once more that the essential difference between the active and passive method lies therein that the active method is a conscious questioning of the subconsciousness, while in the passive method a person in this respect maintains a neutral or passive attitude.

Since in the active method there are different ways of application, I will name here only a few of them : —

- (a) The patient sits in front of us, his right hand resting on the table, our left hand touching it. The pendulum is in our right hand. We observe the swinging of the pendulum over a white neutral paper placed underneath it.
- (b) We pendulum over the hand. The pendulum swings over this. the left hand is in the well-known position as described earlier in the book.
- (c) We diagnose from a loading without his even being present.
- (d) The patient sits in front of us; we diagnose in his presence from a loading without even touching him.
- (e) We diagnose the present condition from an older loading at hand.
- (f) We diagnose the absentee party through a third party.
- (g) We diagnose without any loading, without the patients, from a distance.

For that reason I have quoted several in order to show the different possibilities, but I also expressed my own opinions. The application of the active method without the aids of the passive method by right belongs only to the best qualified diagnostisers. That this does not

equally always permit of a strict counter check and the self-control to be found in all investigations and in any scientific work, must never be forgotten. There is no doubt that when we are a little out of sorts there can be produced by those who have had little practice a considerable impairment of the investigation. It must always be observed that the pendulum swingings can be influenced by all kinds of things, radio waves, etc. It will do no harm if we inform our patients that along with other methods of investigation we use that of pendulum diagnosis. I will elaborate on only a few of the above methods of application since they are all similar to one another.

The patient sitting in front of us (see reference (a) on previous page) we first must get in rapport with him. That is the case when the pendulum begins to swing. At first we will let the pendulum give us only the sex, the polarity, etc. Then we will examine the vitality, the general health condition to see whether there are signs of a special disease, pendulogram for instance of cancer, which by the way is not locally limited, as was formerly erroneously taken for granted but likewise operates throughout the entire body.

Finally we are able to determine equally whether hereditary transmissions or after-effects of a disease, for instance syphilis, medicinal poisoning play a part. If we want to do this systematically then we have to examine the entire body approximately in the following order. We will also be able to deal with this from the significance of the activity of the glands, especially the so-called secretory glands. There are indeed all kinds of assumptions of which I need not enter into here.

We now take them in rotation—for instance, the cerebrum, the cerebellum, the pineal gland, the right eye, the left eye, the eye-ball, the optic nerves, the nerves of the head, the right ear, the left ear, the drum of the ear, the archways, the root of the nose, the nose, the upper jaw, the lower jaw, the mouth, the teeth, the neck, the bronchial tubes, the oesophagus, the throat, the tonsils, right and left thyroid glands, the larynx, the right and left lobes of the lungs, the right and left lung tips, the right and left lung vein, the central lobes of the lungs, the right and left lower lung lobes, the blood vessels of the lungs, the heart, the individual parts so well known to us (secluded spots, cardiac cavity, veins, etc.) all of the blood vessels, the blood pressure, the blood vessels of the body, the female breasts, the stomach, the spleen, the liver, gall and gall bladder (the same examination to be made for gall stones—and with the bladder for stones in the bladder), right and left kidneys (the supra), the renal gland, the diaphragm, the pancreatic gland, the bladder, the spinal marrow or cord, the spine, the coccyx (the tail-end of the spine), the right and left inguinal gland (groin), the appendix, the blind gut, the duodenum, the small intestine, the transverse intestine, the large intestine, the rectum, the sphincter muscles (a muscle that surrounds an opening or tube and serves to close it).

With older people the well-known special examinations— bladder, urethra and prostate glands. With women, the germ glands.

Now come the turn of the joints, the muscles, the arteries, the veins, the nerves. The sex organs can be accurately examined. The question of maternity is to be taken into consideration, whether it carries bacillus, etc. From the condition of the disease a person considers the function of the individual organs. Should a patient complain to us about pains, then we look into the organ concerned. We of course take notes for ourselves. The beginner perhaps will take somewhat longer, but the skilled pendulum diagnoser knows very well that the time which he spends on the pendulum examination will be of slight importance, the same as it is with many other research methods.

With reference to (b) see previous page— this is quite similar to what has been portrayed under section (a).

With reference to (c) on previous page—here the left hand lies upon the loading, the pendulum swings over white paper, or if we pendul directly over the loading the pendulum swings also over the latter.

Reference (d) same as for (c).

The other well-known ways of application (also e-f-g) are less adapted for the proxis, they are in general rarely to be met with. I mention them only because they are being applied and many times give good results. For general use or application they should be eliminated, but they could be used for superficial research work. I recommend very strong supervision with them.

Dr. Pientka's method of application

Alfred Pientka, Ph.D., has a special method, that is to say, it belongs no doubt to the active method (to (a) and (c)), but he searches for the diseased nerves in the organism :— "Everything has its origin in the nerves". He goes over the entire nerve centres in thought; when he has found the diseased nerve then he makes his diagnosis, and in fact with a bewildering accuracy.

It proceeds from the supposition that every ailment stands in relationship with the nerves, and this must be the first thing to discover. Here then is where the medical treatment comes in which has become such a great blessing to thousands, limited only by our fundamental knowledge of the human nervous systems, on the other hand in the extraordinary miraculous development of the nucleus paraventricularis. Pientka compares the nerves to the receiving apparatus that reacts upon the rays of the universe, which are not always allowed to pass through the human body but also become reflected upon it. How Pientka made his examinations, Lederer describes this briefly to us as follows :— The father of the patient brought the fingerprint of the patient with him. Pientka leaned back in his chair and grasped his whole instrumentarium (the pendulum) and let it suspend

over the fingerprint from the index finger. This simple method, which by penduling here and there the innermost things about the character and the disease will be given. Pientka told us about his little short motto, which consists of anatomical conceptions through which the pendulum comes to a standstill—see this organ is diseased. Each finger contains the intelligence about the condition of the health of the other organs. One finger by way of example is competent for the lung. Pientka says: “left lung lobe” and the monotonous little motto “cells — protoplasm — hernel — central corpuscles — over-stimulated — under-excited — odic rays — radio-active rays — heat rays — electric radiation — magnetic radiations — ultra-violet rays”.

Dr. Pientka is most kindly disposed towards those with broken-down nerves. He is a specialist therein. Well-known cases of which very many of us know anything about, and where we, with our ability and knowledge would very often be at the end. For example, if Pientka finds ultra-violet rays, then within a few days he has to reckon with death. In such cases he will be able to predict with accuracy the day of the death.

Although I have not yet gone into the application of the pendulum for the selection of healing materials, it is still to be noticed here with Pientka, that the crowning feature of his blessings consist of his unselfish activity in the healing of all sufferers when people follow the cures given by him. He selects his remedies with the pendulum. But that may be worthy of notice by us: according to the theory and the experiences of Pientka, the heart is not the life preserving organ in the human body, but the motors of the heart are the nerves. Everything permits being traced back to the nerves and around that place the treatment must be centred. The healing consists fundamentally in the suppression of the over-excited nerves.

The number of his successes is endless. Many physicians come to him for treatment. There is as it were, no ailment which he could not accurately diagnose, and could not have healed, provided that the organism is not weakened through some kind of fake treatment or through a too far advanced disease so that recovery is no longer possible. Pientka has nothing to do with witchcraft. But if it lies only halfway within the range of human power, his intervention is successful. His contention—that every disease is curable in the acute stages—has been realised without exception. That it would be strange if he were not revered as a benefactor of humanity, goes without saying. His remarkable modesty, his reality attracts us to him. With this, we will conclude our demonstrations about the active method.

Some Ways of Using the Passive Method

As I have already written before, we work only with physical laws, whilst with the active method we must focus our thoughts completely on some one thing, for instance, an organ, whilst with the passive method we investigate with the mind blank: we perceive only

the swingings. I repeat again the methods often work harmoniously together. Let us take up the easiest methods first. If we were to use at first the purely passive method of investigation, we would make fewer erroneous diagnosis than if in the exercise of our calling, we started out immediately with the active method.

Of the passive methods of investigation, I will mention only:

- (a) we examine from the persons themselves who are undressed;
- (b) we examine from persons who are dressed;
- (c) we examine them by using either an anatomical atlas or a medical model;
- (d) we examine from a loading at hand (photograph, handwriting impression of the hand) utilizing for that purpose the atlas or the model.

In regard to (a): I wish to emphasize here that we can indeed get very far with a very few simple signs, we are easily able to make good diagnosis without special efforts. Good study material will be furnished from that. We start at first with living persons, later on with their loadings. We proceed with the examination of the vitality. A child lays upon our examination bed undressed.

As said before, the pendulum should be held over the middle part of the body. We concentrate on our investigation—giving the command—the silent command to the inner perceptive faculty within us—to give us the swingings of the vitality, and to eliminate ourselves entirely; at first when we set the pendulum free it begins to move as soon as it gets connected up with the body. We soon have the feeling when it will cease oscillating and so we order it to stop, since otherwise it will continue, and we don't want this. Let us return to the child. The pendulum exhibited beautiful large circles. The swingings continued for the 30th time and then they underwent a slight change. The pendulum stood still for a short time and then it went over into a circle to the left. A proof that in the body lying before us there was some kind of disturbance. With my many long years' experiences, I recommended to make a preliminary short diagnosis in order to find the focus or centre of the disturbance. We pendled the head, the upper part of the body, at times the abdomen as a unit seeking to discover whether perhaps the disturbance was located in one of these parts, and as I have often said before we can accomplish this with quite simple signs. We found with the child that the swingings over the head were not normal, circles to the left, the upper part of the body likewise showed no orderly pendulum swinging, on the other hand the abdomen distinctly, the pendulum began to swing like mad, in several circles indicative of sensitive forebodings. We then examined the entire abdomen holding the pendulum over the place of each organ. It showed us a disturbance in the large intestine. The mother confirmed this—the child had catarrh of the intestine. For the pendulum investigation a very good knowledge of anatomy is necessary, we

must know just what a cross-section is, where the individual organs lie, what the nature of the organs are and how they function. The short diagnosis saves us a lot of time. But if we are unable to work it out, it must be learned, and one must take time to learn it. The complete diagnosis is more important, indeed more valuable.

First we examine the vitality, the condition of the health, then immediately we take up the investigation of the individual organs, beginning with the cerebellum, etc. For each individual organ the advanced pendulologist has its own sign, also its own swingings. We impress this upon our mind and then we perceive that our "field of force" at first gives these swingings correctly always with the normal body. A proof that we have found the right organ. We know how the pendulum oscillations should be with healthy people. If we wish to prove this, then we focus our mind on the occasional organ; if we were to hold the pendulum, for instance, over the liver, over the stomach, and then get our sign it is not always to be said that everybody may deviate from the old empiric signs that I have mentioned. In the first place we can pendulum over the entire body without taking into consideration particular organs, by doing it as if the body were only a unit and in this way also find the places where the disturbances lie and then go on with the examination which is indicated to be necessary here.

In the healthy condition there will be no variation in the pendulum swinging whilst indeed with the very slightest indisposition the circles are perceived to be smaller or the swinging is obstructed. There can be circles to the left, ellipses to the left, shorter or longer pendulum inaction. If the pendulum stands still a long time over a part of the body, we will stay a whole minute and even more than we have to do with a very serious ailment. With cancer patients, I observed the interruption to last for five minutes and still longer, the pendulum swung to and fro as if it were only moved by a light puff of wind. Since we have always focused ourselves upon the whole person, we know that besides the most principal organs which we have to do with, there are also other organs which have become attacked, which are heavier or lighter burdened, which show the way to help. General treatment in addition to treatment of organs.

Deep lying organs such as those which overlap or intersect we pendulum not only from one side, but from two, better even from three sides; we take the average. This is correct. We can also counter check them in many ways. One of our best qualified diagnosticians of disease in Germany, Ernest Schradin, works very similarly to the way I do. He speaks of two projections: one, the depth projection; the other, surface projection. If he is in doubt which organ is concerned, it happens that, if at the point where the pendulum stands still or moves only a little, imaginary lines are drawn through the body which intersect each other, the ailing organ lies there. And the re-checking

by other clinical methods of research or examinations proved its accuracy.

Practise makes the master. With our practises with people who are undressed, we have little need to reckon with foreign emanations. We have trained ourselves for that. I again refer to the prevention of errors and delusions. As I already wrote, I will say here also; if we at any time take up the study of pendulum diagnosis with great love and desire it will bring us great happiness and we will make noteworthy advancement and have success.

With reference to (b) see page 54. If we were to practice any length of time over undressed persons then we would gradually pass over to the other ordinarily used way of investigation with the pendulum with persons who are dressed. But there is no rule without exception. The special radiations or irradiations with the characteristics of the wearer make their way through the clothes of the person. People are continually being surrounded by aureole; naturally this is according to their state of health.

16. In order to familiarize ourselves with this method of employment we examine persons; first of all those, for instance, who are attired only in their night attire; we proceed then as previously described.

If we are very sure of ourselves, we examine patients who are fully dressed, the only requirement is that they wear their own clothing. We ask them also to take all objects of metal out of their pockets, otherwise if we were to pendulum over organs in the vicinity of which there were metallic objects—for instance, nail scissors, pocket knives, etc., in that way we would obtain a muddled picture, if not entirely a false picture.

17. In the course of time we will almost make all examinations from persons who are dressed. The pendulum diagnosis, therefore, works sympathetically with many patients. The pendulum (in regard to (c)) investigation with the aid of an anatomical atlas is simple. We allow the patient to sit beside us or in front of us. His right hand can lay upon an insulated board, our left hand resting upon his right hand. We always have the pendulum in the right hand; holding it over the anatomical illustration, for instance, the head, focusing ourselves again accordingly. Shutting out our sense organs from outside impressions and the pendulum will soon begin to move, we will obtain the same signs as when penduled over the person's body.

A person can work very well with portable tables. Since the illustrations are only of a superficial kind, a person can examine the organs in question still by another transverse measurement and works the same as before. In this case, we work better when there is a model

at hand. It has always held good in examining the component parts of the brain, the lungs, the liver, the sex organs, etc. A person takes the parts apart, holds the pendulum over them and very soon will have the places of disturbance. These diagnoses can hardly be outdone in reliability and exactness; all this has been confirmed by those who work with the models, especially by the aforementioned Ernest Schradin, one of the oldest professionally active pendulum diagnosticians in Germany. He says that a person with the help of the plastic model can determine accurately the places where the functions are disturbed from the height, breadth and depth. The advice of the pendulum diagnosticians will very often be asked for when a person stands diagnostically before borderline cases.

The pendulum still has this one great advantage, it sees mostly more than all other methods of diagnosis—it has shown that it is so far the least hardly perceptible, also all of the slightest disturbances which medical teaching still will accept as being sound.

With reference to (d)—the loading will, in the same case, be laid to the left of us, we assume that it is a photograph, our hand is laid on top of it and now we pendul just the same as before. In this case, the patient is not present. It is not necessary.

With long-distance diagnosis it is recommendable that we secure two quite recent photographic likenesses taken in bathing suits, or if possible one taken with the front view, the other with the back view. If need be also with the side views, we pendul then as before. We can utilise the model here. The left hand rests upon the model or the organ in question taken apart from it, the pendul is over the pendul that is, over the loading. We will very soon come to know that it brings out the swingings of the organ which we have just touched, the individual part that we touched or held in the hand. There are variations however, a person penduls over the anatomical figure, over the organ to be examined first and obtains the pendulum beats for the normal organ. Then he touches the loading with the left hand. If there is now given a different swinging then there is an ailment in the case lying before us. Or a person penduls "blank"—over a white sheet of paper or free—and touches the place of the organ to be searched into on the anatomical illustration with the left hand. One obtains the swingings of the healthy organs. He then places the loading under the pendulum and again touches the place of the organs with the left hand; with variations of the swingings there lies before us disease. The last-named methods of employment are very simple and are unique for short diagnoses.

Whether we pendul over the body or touch the model or the sheets, or whether we pendul over the sheets or the model, or touch the body or parts thereof with our left hand, it is all the same. One person will like to investigate with this method, another will select the other methods of investigating. We use all of them in our proxis. The

This "exact" doing away with, by no means, appears sporadically only just within our ruling schools of medicine, it is one of frequent appearance. We can only call to mind one case, that of George Florschütz, the well-known advocate of medical life insurance which was looked upon as unscientific because he advocated the "unheard of" opinion that in tuberculosis, the constitution, the predisposition to disease plays the principal role. And oh, how the tunes change; today the views advocated by Florschütz concerning the constitution and hereditary, form a focussing point in scientific research. Only a conception of Hippocrates absorbed in the mind in the spirit of a Paracelsus von Hohenheim preserves us against the torpidity in dogmatic tradition. The law of hindrance permits being used extensively in pendulum research. I must fully agree with Weiss when he says: "The law of hindrance is far more accurate than that of the comparison of the pendulum swingings according to the kind and intensity and doubtless will become the basis for further discoveries".

The Practical Evaluation of the Law of Pendulum Hindrance

We repeat again it is a fact that is not only obvious that our pendulum in its movements not only will become weakened and retarded, but will also come to a standstill when the pendulogist holds in the left hand the same object radiations (also the instance such as human blood, sputum, etc., loadings on paper, photographs and other things of a like kind). But this stoppage or the standing still never appears when the pendulum diagnostician takes hold of something or touches something which belongs to a third person. Here the law operates in our case the same, that like poles, always repulse the same kind of odic emanations from one another. Only a few fixed points in order to make special experiments. As with all experiments we must donate time here and have patience. We take the sputum expectorated by a patient. We have not as yet examined the patient—we do not know what ails him, there appears to be nothing the matter with him at all. The sputum we stroke on a glass plate. We lay the plate upon our insulated bed, and now we begin, as mentioned in the beginning of this book, to focus ourselves, and the pendulum will show us by extremely short or long beats what kind of disease predominates here and how it is to be indicated.

We now take the sputum of a patient with tuberculosis of the lungs which we have in our possession and take it exactly just as we did in the first case—we obtained the same swingings—but that does not satisfy us. We lay both glass plates abreast of one another at a distance of 25 cm. apart. The plate of the first patient is to the right, the plate of the tubercular patient is to the left. We hold the pendulum over the plate to the right and almost touch, or we know what is best for our purpose, the sputum on the plate to the left with the left hand, we examine for tuberculosis and will discover therefore by the conformity of the tubercular bacillus that the pendulum immediately becomes stopped. In this case, whilst we examine from the conformity

the pendulum will almost have entirely ceased to swing, it swings to and fro as if it were only lightly blown with the breath.

We will make a simpler experiment. We will examine only blood samples, observing how the pendulum will behave with them. We take blood from four patients, let it be spread by a neutral person upon eight glass plates, so that for each patient there are two strokes. The plates were marked with a secret sign and then laid in a row--free from objection in making an objective examination.

We find that when the blood from "A" and "B" is examined with the pendulum when we are working according to the law of pendulum interference there appears no interference of the pendulum, but that it furthermore swings in the same manner as it did before. But if we take plates of the same block, for instance, belonging to either "A" or "B" then there appears immediately after touching the interception just described, the pendulum coming to a complete standstill.

This pendulum experiment, namely the one with blood, can also be of forensic value in medicine especially in that a person must be able to differentiate with a positive sensitivity and training through interception. (A phial with animal blood of the kind referred to or with human blood, for which a very small quantity suffices.) Whether it has to do with human blood or animal blood, and with animal blood, what kind of animal--with human blood, whether it is of male or female essence. Pendulum science for us is not only theory but good practical knowledge.

The Law of Similar Reproduction

This law, the name of which stems from me is also of great importance in pendulum research. Everything is in a precipitate in our subconsciousness. If we build up our study seriously then we will also run into the accuracy of the law of similar reproduction: It reads as follows:--

(1) We react definitely to fine substance rays of the same kind, trivial errors are insignificant, they are bound up together with our personal physical condition, over certain substances, etc., they always give us the same swingings, with variations, the causes are to be found in other combinations, disturbances, etc.

For instance, over a healthy person we always have our circle. It changes when a disturbance is present. Our study from living subjects gave us special swingings for certain physical disturbances, for diseases (for instance, carcinoma) a special pendulogram. If the signs found by us are seen to be free from objection, then there remains in our subconsciousness precipitates and we see their latest emergency for instance, in other patients, hence the reproduction in the same form when these same disturbances are caused by the same disease; they may appear stronger or weaker.

This separate reproduction is a part of the natural sensing that has been lost by most people through modes of living contrary to nature. The ray perceiving sense. The sense of radiation perception.

(2) Pendulum diagnostors who are similarly polarised can work approximately in the same "field of force" under similar conditions, that is they obtain the same pendulograms and they are mutually able to employ and make full use of the signs, pendulograms, which are found by themselves. The law of similar reproduction is no hypothesis. It is also of practical experience in medical pendulum diagnosis.

General Supervision of our Diagnosis

The attentive student will have learned through experience himself that both the methods, the active and the passive, can often pass over into one another whereby its border line many times can hardly be drawn, however we are inclined more to the passive method. A control, yes, even in manifold relationships is given on the following page either according to a method of the active or the passive or according to two methods of the passive from loading at hand, through employment or application of the pendulum hindrance laws, etc. We urgently recommend to make supervisions quite often. In that way the accuracy will be essentially enhanced.

DIAGNOSIS OF THE SECRETORY GLANDS

This investigation can be made to serve likewise for comparison, to examine the most important secretory glands, to scrutinize their activity, can hardly be looked upon as unessential any more. I would like very much to impress this upon every pendulum diagnostor. This special investigation can also be considered for the supervision of diagnostors.

These are to be taken into consideration : —

The male germ gland	(the testicle)
The female germ gland	(the ovary)
The pituitary gland	(hypophysis cerebri)
The pineal gland	(epiphysis cerebri)
The thymus gland	
The (supra) renal gland	
The thyroid gland	
The supra-thyroid	(epithelium cells)
The pancreatic glands	(pancreas)

We must recollect that these are the most important physiological functions.

The Male Germ (The Testicles)

The male glands—fructification of the organism, development of the secondary male sex characteristic, arousing fiery passion.

The Female Germ Gland (The Ovary)

(a) Intermediate cells (egg cells which have not yet reached the fructifying stage (follicles)), fructification of the organism, formation of the secondary female sex characteristic, blushing, monthly occurrences with women, making arrangements for the reception of the ovum. In pregnancy further development of fructescence. Enlargement of the muscular mass of the womb. Loosening of the connecting tissues between the pelvic bones for the set purpose of enlarging the bony pelvic rings. Activity of the mammary or lactiferous glands.

(b) Yellow substances; settling down of the ovum in the mucous membrane of the womb. Prevention of haemorrhages of the womb; prevention of further fructification during pregnancy.

The Pituitary Glands

(a) **Anterior Lobes:** activate the sex functions and the working material of the testicles. Formation of semen. Fructifying the ovum, yellow substance forming.

Influencing the combustion of food and, at the same time, of the fatty appendages, direction of longitudinal growth of the body.

(b) **Middle Lobes:** we know almost nothing at all about these.

(c) **Posterior Lobes:** increasing the blood pressure, stimulation of peristaltic motion. Stoppage of water excretion stimulating the contraction of the womb during the birth travail.

The Pineal Gland

Retarding the development of the germ glands preventing them from fructification.

The Thymus Gland

Influencing of the growth and limestone deposits in the bones.

The (Supra) Renal Glands

(a) Maintenance of the capacity of the muscle performance through elimination of exhaustion material formed by the muscular exertion.

Prevention of abnormal pigmentation—fortifies ourselves against the strange, off, sexual hormones.

(b) The pith—pulp—stimulation of the heart. Acceleration of the pulse. Contraction of the blood vessels thereby increasing the blood pressure. paralysation of intestinal activity. Effeminacy of the muscular system of smaller air tubes, air vessels, increasing of the sugar content in the blood through opening up of the sugar sluices of the liver.

The Thyroid Gland

Advancement or promotion of the growing organism activation and regulation of the assimilation, metabolism stirring up the combustion processes, increasing the capacity for stimulation of the voluntary muscular system.

The Supra-Thyroid Glands

Regulating heat or warmth. Detoxication of the decomposed poisonous elements of the muscular substance. Influencing the counteraction of calcium-sodium and through that of the capacity for stimulation of the voluntary muscular system.

The Pancreatic Glands

Storing up the dextrose (grape sugar) formed by the carbohydrates, also the starch sugar or the glycogen in the liver. Stimulation of the combustion of the sugar in the muscles.

Enlargement of the smaller blood vessels (capillaries) the membrane and the muscular system of the heart, the lungs and the brain, and through that the lowering of the general blood pressure.

What we have laid down as a principle for the investigation of the deeper lying organs; what should be done in the diagnosis of the glands of secretion is to examine thoroughly from two sides (bilaterally).

Objection to the difficult time consuming Pendulum Diagnosis

The objection that the pendulum diagnosis is difficult and requires much time is not sound, that may only be found with beginners. We demand of our young students that they meet the highest requirements, that they be quite up to the mark in order that they may become very good pendulum diagnosticians. There is no doubt that the beginner can do practical work with it, it is also true if he carefully considers the suggestions which I gave. The beginner examines the vitality during office hours, determines the disease signs, then makes use of the short hours and spends no time whatever on many of the organs which are not affected or only with such organs as are affected by others. An immediate discussion with the patient after the diagnosis quickly furnishes further suggestions. The skilled, talented pendulogist works quicker, surer and more reliably than those who use very many other methods.

How are we to Obtain Disease Signs?

If there is no occasion to examine direct, for instance, typical cancer patients, consumptives, for the characteristic sign peculiar to these diseases (pendulogram) then perhaps we may have the opportunity of obtaining good photographs, quite often photographs will be proffered us by our professional magazines which we may utilise for study.

We hold the pendulum over the representation which lies before us, concentrating upon it, proceed to the well-known barrenness of mind and observe the pendulum. When we get the sign we make a note of it and check it frequently, also on the next day. If, however, we have a photograph of a patient with a likely disease then we also use it for research. If it appears to us to be just like it was before, we may rest assured that it is correct. We impress it upon our mind firmly. It would certainly be good if we were able to examine thoroughly also from living persons and not alone from loadings so that we may be able to say something about transmissions. We will observe later when after the examinations we ask questions about the disease and the patient is surprised, that it happens through the signs which we found.

If at the moment the disease is the result of a contributory disease, then we will get the pendulogram of the original contributory disease, for instance diseases of the spine and such like, the pendulogram of syphilis.

Disease diagnosis has given me very rich experiences otherwise I would not be writing this, besides I speak from many long years researches of my own. Thus we get pendulum pictures (disease signs) not only from the examination of patients, but also from their photographs, X-ray pictures, microscopic slides. This is just the thing needed for acute and chronic diseases. If we wish to do special work as for instance with social diseases, all we need is to procure a good book on the subject with abundant photographic material in it. These suggestions ought to suffice.

Redintegration of X-ray Plate

When we differentiate between a picture of the human body taken with a Rontgen tube and one taken with a box camera containing a photographic plate then the denser bones show up clearer than the surrounding softer parts, accordingly by the plate making a positive picture of them in the dark, the surrounding softer parts showing up more or less clear. The Rontgen ray photograph was formerly once very simple, in the course of the years it has become rather bulky. The highly artistic expensive instruments demand an expert to handle them, which requires a very special kind of training. Good photographs are only to be had which are made with more perfect technique and better apparatus. But the interpretation of the photograph on the one hand requires a good knowledge of the methods of production in order to obtain by much practise, understanding of the shadows, darkness—on the other hand a fixed supervision and redintegration through the other clinical methods. Without good training, without strong criticism, the X-ray method can become the source of great errors and illusions. This construction was upheld, among others, by a University Professor of Medicine, Dr. Klempere.

Dr. Paul Wolf, member of the Board of Health, furnishes us with a typical example. In his contribution: *Physician and Pendulum* in the publication of the society for pendulum research (the truth about the pendulum, 25 years' experience) he writes: "Not long ago there came to me a patient whom I had treated some time ago for several ailments who had a very bad accident. As he was entering a house a piece of stonework broke loose and struck him in the back in such a way that it knocked him down. Since I had his handwriting I penduled the vertebral column and found a fracture in the lumbar vertebrae. On my first visit to the hospital I immediately asked the surgeon if he would confirm my pendulum diagnosis, and told him about my discoveries. The surgeon gave me to understand that it was only a fake, but I stuck to my diagnosis. On visiting the hospital again I was still informed that my findings were a fake as an X-ray for fracture had been taken and nothing on the plate could be seen. As to that I told him as is always the case with unclear X-ray pictures, there has never been anything written in regard to what the shadows on the plate indicate, and I, of course, stuck to my diagnosis. As the pain became worse with the patient in the place where the fracture was, another X-ray plate was taken. On my next visit the surgeon told me that "we have deluded ourselves, it is a fracture"; thereupon I remarked: "I beg your pardon, it is not I but you that has been deluded". Naturally, neither my pendulum nor myself has to take a back seat.

If an X-ray picture any time is unclear, then we take the pendulum and explore the place of the disturbance in it.

I have made numerous researches in that way. It seems to me we ought to make provisions now and at all times to get the older and modern X-ray pictures, also those which are quite recent for purposes of study, and I speak here from experiences. Most of the physicians and health practitioners manage to get along without X-ray pictures since they often have to do so for economical reasons. The really good pendulum diagnoser needs no X-ray photographs, his inexpensive pendulum tells him exactly what to do. And when in doubtful cases he uses the pendulum for supervision—pendulum diagnosis—he becomes more certainly sure.

SWINGINGS OF THE PENDULUM

Some suggestions for the advanced diagnoser. First a few words relative to the symbolism of the signs. A circle, an ellipsis indicates something unbroken, a thing complete in itself; they are frequently so deviated from the normal and indicate a deficiency in the harmony of the laws of nature; when the direction is reversed they indicate a disturbance. A stroke—line—in general signifies a condition outside the normal which may become serious. A healthy cell, an organ or a body when it functions, normally shows us a circle. As just stated, the circle indicates to us an undisturbed interplay of all the separate forces into an unbroken entirety.

An ellipse which is inclined to the vertical indicates a very narrowly confined condition, a restriction or curtailment of the special activity of a cell or an organ. It is indicative of a reduced ray force. Certainly psychic inhibition likewise can have something to do with this matter. It happened with me and it has been confirmed by other diagnosticians that the pendulum swinging ellipsis forming from the left downwards and upwards towards the right is indicative of a more or less strong one-sidedness of the distribution of the humors of the body (disorders of the blood). As a result of that I would infer that instead of a greater combustion process, there will be found the albumen would not be completely utilized; there will be too little acidity found in the stomach and formation of pepsin present on the sides of the pancreas. A further examination will show the incomplete development of the hormones of the supra-renal glands.

If the course of the swinging is only in the form of a line springing lively, then it indicates the predominance of vegetables, bitters---again I mostly run into this in liver disturbances, disturbances of the functions of the pancreatic glands, as regards to the secretion of the steapsin and in the effect of a disturbance in the formation of the fruit sugars; of a lower quality of the cells which bring about hormones of the supra-renal gland, such as indications of jaundice, early hardening of the arteries generally with predisposition to neurasthenia. We have before us still further researches.

The swingings in ellipsis form going upwards from the right towards the left permits to conclude or imply disturbances in the hormone formation of the thyroid glands, the pancreatic gland, the supra-renal glands. If only lines in the same direction as just mentioned, so we have along with the deficient secretion in the thyroid glands, with women atrophy of the ovaries. Inclination or disposition to myoma (a muscular humor) by increasings not at all rare of hysteria, with men impotence. The cross line is an indication of the vegetative life. It is an indication of a condition of exhaustion, weakening of the entire glands of inner secretion. As I have previously demonstrated strong trembling of the pendulum indicates likewise of inflammation, pains. It is of the greater significance to me when the pendulum instead of swinging from left to right, also swings anti-clockwise from right to left produces very excited trembling movements. The significance here is one of the process of dissolution decomposition.

In conclusion the swingings of a pendulogram indicate to me efforts to renew the vitality. If these start out with circles the body will know how to steer with medical aid, if the pattern is one-sided, unilateral, it should not be denied anything, so we must give our entire attention to the patient. There is much still to be explored here.

Special Fields

For the early diagnosis of the carcinomas. Long before cancer becomes perceptible or visible, there is no doubt one can infer this

from the diagnosis. There is scarcely a single neglected case of cancer in which constipation was not only present, but no doubt existed for a considerable space of time before the disease was noticed. The retention of waste matter in the body which still carries a poisonous character will mostly be made too light of, and can still become the cause of the poisoning and may make its influence felt now in one place and then again in another place. And from this we may well draw the conclusion that we have the prevention of cancer more in our power than we believe. Ever since the time of Hippocrates (a Greek physician, 467–557 B.C.) named the Father of Medicine, there were physicians who were opposed to operations. But again a long time ago—180 years A.D.—Leonides of Alexandria operated for cancerous ulcers and said that one must cut away as deep as possible. Nowadays, exactly the same thing will be recommended and we see the longer it is put off the more interference will the cure meet with from operations, therefore it is best to cut away deep as early as possible. There is scarcely any field of medical science in which the skill and proficiency rises so high as in that of surgery. But whether the ability ought always be applied where it would do most good, I venture to question and, of course, on the grounds of my own experience and the experiences of others.

There was a time in the past when very many cases of appendicitis were treated by operations just as is done at present. There was even, in Switzerland, a well-known University Professor who slit the little abdomen of every one of his children just after they were born and took out the vermiform appendix in order to prevent possible inflammation. That was at a time when people knew very little about the functions of the appendix. I now believe that the various kinds of cancer operations have crossed their highest point, and that we will have recourse more to other methods. Schwenninger has said before that the knife can operate as an irritant to proud flesh. If it is true that tuberculosis frequently recurs in the cancer patient in the genealogical tree, in which tuberculosis occurs, and if a person also takes the best preventative measures against the tuberculosis line, then it is high time that these preventative measures be taken against cancer.

To humanity it has fallen the sad lot of being at the most, creatures inclined towards the forming of tumors partly owing to our having reached the highest pinnacle of our deviation from the primitive, natural mode of life. In the course of the years to come it may be that we will return to a mode of life more in accord with the laws of nature and in that way the value of the biological production of our nutrition and of its use for human nutrition will be taken into full consideration.

“Everything begins in the Physiological” said Nietzsche. The well-known present-day Bireber Brenner, who was born in Switzerland, wrote previously in the year 1903: “The prevention of cancer is a question of nutrition”. For over thirty years we have laughed this

off. Medical adviser, Dr. Alfred Mairnlicher, occupied himself entirely with biological questions and was likewise thoroughly convinced that every living being possesses a "polarity" just like a charged accumulator. Also the human body is arranged or disposed so as to take advantage of such a polarity. "The latter can, under circumstances, become lost so that the body conducts itself like a discharged or short-circuited accumulator. With every reliable cancer case, there is to be found a normal loss of polarity. Still, however, cancer is mostly indicated by the deficiency of the polarity without any localised cancer suffering. However, in the early stages, in the phase of the general ailing of the body, it is also well indicated first of all in the blood. Besides there is no other ailment which we have to do with in which it shows up so distinctly as in cancer. On the other hand, also that which after a thorough anti-carcinoma treatment for the complete cure brings back the polarity. From my hitherto earlier and rather large experiences only negatively polarized persons may arrange for cancer ailments".

Ordinarily, when the cancer becomes perceptible, it frequently has reached the third, that is mostly incurable stage. The struggle against the cancer must indeed begin much earlier and directed in order that very few patients will ever reach this third stage, as this is also excellent for tuberculosis up to a certain height.

Early detection is, therefore, the only demand. There is no doubt that we have some methods which are very noteworthy, even though they are not yet recognised by the medical schools. This does not make any difference at all. I refer to the method of the much-reviled outsider, Dr. Von Brehmer, who still today is very much misunderstood. I call to mind only one instance, Florschütz. Further, in the future, there will be more interest taken in eye diagnosis such as Kotschau wished for. Along with this, cancer diagnosis with the pendulum is still very much unknown. Still the pendulum diagnosing physician has here an instrument that will be exceedingly valuable. We have before rich experiences from approximately 36 biological physicians and 29 biological health practitioners, and also non-medical scientific pendulum researchers who have had many long years' study behind them. Doing pioneer work, as is often done by laymen—Kosmos Huber. Acting co-jointly with physicians who themselves are not occupied with the pendulum, but who have confidence in pendulum research, because they have been convinced by experiment, he discovered the pendulograms of cancer.

Kosmos Huber was the first pendulum researcher who obtained a cancer pendulogram after an hour's work with a breast operative at a distance. He was not aware of the conveyance of the objects of what it was about, he concentrated only upon the radiations, upon the swingings of the pendulum. After many tiresome examinations of patients who likewise were unknown to him, from whom the same pendulum swingings were obtained—they were suffering from cancer

of the breast—he was told by the doctors that they had carcinomas. The layman, Kosmos Huber, showed the cancer research the method for early detection.

Dr. John Faust, M.D., confirmed it once again when he says: "All medical science stems from the people's medicine with the further development to its subsequent heights, naturally it became more and more removed from its old home source. Correspondingly to the height of their rank there developed also a legitimate measure of pride, but with the remoteness from the source they also suffered considerable loss of fortune. Many advocates of our grand science have very frequently outlawed the old native soil and willingly shut their eyes to further suggestions which now and then suddenly pop up in front of them. But still, up to our time every native soil has proved fertile and it will always remain so. It will always produce men who are born physicians. Interior talents coupled with lucky breaks will always present us with valuables in given cases. Lucky then is the physician to whom a gift or donation has been presented. It shows that he has rendered a valuable service to humanity and science. Just like the endowed layman can render a valuable service with this special science to the physician so also under favourable circumstances he can do the same for one who is not a professional physician. I myself, have been occupied likewise with several hundred cancer cases. At my request, well-known older physicians worked with me jointly on this pendulum problem and our experiences deviated in nothing. I have, in former times, frequently written about carcinomas — I repeat: — There is furnished an early possibility of detection of cancer through the pendulum diagnosis. If we will consider what has been said before about pendulum signs then we will find the cancer pendulograms plainly typical of it.

In this part I have given only the signs for cancer of the breast and cancer of the bladder. Further carcinoma pendulograms are included in the tables for pendulum research, first published by Kosmos Huber, with whom we worked up to the time of his death.

There is no more remunerative field than assisting in the work of cancer prevention and setting ourselves against its advance. For practise work, I suggest now making individual studies of cancer according to the instructions given. Then, when we progress further and examine patients who exteriorly seem to have nothing that looks like cancer, who even have no kind of ailment whatever; if we find they have cancer, and by supervision and using other methods this is confirmed, then we are advancing in a field which gives us pleasure because we will rescue so many victims from this disease.

PREGNANCY AND PENDULUM DIAGNOSIS

I have repeatedly said that "penduling is an individual art". This will be shown here: —

I will write later about the discovery of the conception. In order to recognise a pregnancy with certainty we make our first study only from a patient who is pregnant. I recommend to make the first investigation from the patient in the last month of pregnancy. We ask the pregnant woman (as we do also with all our patients) to remain quite unconcerned, in order not to be worried over our investigations.

We hold the pendulum over the pregnant woman's body and impress on our mind the correct sign for pregnancy. It will at the most be simply a circle to the right. If we have already examined the womb or the female sex organs accurately in order to obtain a sign for the womb then probably at first the swinging for the normal womb will set in, to be followed immediately afterwards by the sign of pregnancy. As with all new oscillations or signs which we study we re-check these. Also quite often, later with a second, third and even many women who are in this stage of pregnancy. When these examinations are ended then we take such women as are in all the possible stages of pregnancy, in the third, the fifth month, when the first movements of the child begin, etc. When we are further advanced, we have the patients examined—give us also loading or chargings at the different stages. If it were possible under the circumstances, I advise also the taking of a photograph (if possible) of the naked body—about the size 13 x 18 c.m. From this we make our supervisions. When these experiments are done, we take the patients dressed, examine them again over the body, subsequently over the body as a whole or over parts of the body, over the hand, and much later whenever possible, from loadings, from photographs in smaller formats or from handwriting.

The general condition of the woman will give us the swingings of the pregnancy. It is then very valuable to make studies from confinements. I, myself, was only able to occupy myself with loadings that I obtained during the birth in the beginning of the setting in of the child labour throes. I have studied changes that were made after the birth, before the expulsion of the afterbirth (secundine). These working materials, collected from everyone, are the foundation for accurate diagnosing of pregnancy. If things as we need from or through friendly physicians or midwives, I can only give suggestions. We have abnormal and normal cases to study. If there appears to be anything abnormal then we use the anatomical atlas—Schaffer Atlas and Compendium prove to be serviceable—also the one by Bumm is to be recommended. It will be very interesting to us when we notice disturbances that were not felt by the woman who is pregnant. This indicates under the circumstances, the course of the pregnancy which must be watched over very carefully. Pendulum diagnosis in the higher grades is therefore equal to prognosis. Miscarriages, abortions, permit of their being examined. This will be made full use of in the future. If an abortion has taken place, then the adhesions remain, that is, the womb or uterus will always show indications of it. All

organs which have undergone a change or an irregularity are stamped or marked in some way known to ourselves. Very often the pendulum also furnishes answers to questions which the patient herself cannot answer.

I had the occasion to work with an experienced lady doctor and a midwife and very frequently I confirmed things that were of great value to the physician. Today they are all taking up pendulum diagnosis. Pregnancy, with its many attendant phenomena, offers great material, like many other special fields of medicine. The question of conception has been left until the end because I know from my own experience that it is better to practise with the easier than to rush at first into the more difficult things.

DISCOVERY OF CONCEPTION

The pendulum diagnoser builds up organically, with all the scientific adjustments, he must never forget his biological position, he must always remain an observer or, better still, a follower of Hippocrates.

A little while ago we were practising and intentionally at first with the discovery of a far advanced type of pregnancy, also with a condition which always excites strong suspicion of pregnancy, so now we will occupy ourselves with the somewhat more difficult perception of conception by itself. There lies before us her, much experimental material. There are of course many who will shake their heads at pendulum diagnosis, but we erect no hypothesis.

There are all kinds of "extraordinary things" between heaven and earth. An "out of the ordinary thing" is however, the one in which a physician or a practitioner who uses the urine of a pregnant woman in order to manufacture therefrom a remedy and his success was unquestionable in spite of that. Naturally the high esteem in which orthodox medicine was held would be immediately reduced to nought. As with Carl Ludwig Schleich it lasted ten years, only the highly sensitive persons, those who are really advanced, should occupy themselves with the establishment of conception. The human being is propagated through sexual intercourse since the ovium (cell formed in the ovary) supplied by the female unites with the spermule derived from the man and develops into a new individual. The semen is a viscous feminine thick looking peculiar smelling neutral or alkali reacting fluid in which are suspended the spermatozoon (the essential male fertilising element of an animal). The spermatozoon move through wriggling movements of the tail. The swiftness of the movement comes to perhaps 0.1 m.m. in a second. The movement of the seminal threads is most vigorous just after the ejection of the semen. They will be favoured by weak alkaline reactions. Strong alkaline as well as acid reactions hinder the movement. In the prostatic secretions, the semen threads are kept in motion very long. With one ejection there will be 105 c.m. cement ejected. The spermatozoon which are emptied into the vagina by the act of copulation wander around

through the uterus and the oviduct into the ureter ducts. The fertilising takes place after the loosing of ovum. Whilst unfertilised eggs immediately go to the bottom, the fertilised egg, which perhaps reaches its destination in the uterus through the tubes in eight days are held there. They settle in a groove of the mucous membrane of the uterus which is very thick. The walls of the groove become overgrown with the membrane of the egg and over-run the egg. This place in the uterus mucous membrane with the overgrowth of egg membrane later forms the placenta which is the organ that nourishes the young in the womb. It is quite proper to believe that the moment of copulation is not always the moment of conception. It can well take place immediately, but it can also take place days after.

It has been said that the spermatozoa do not remain longer than two days in the genitals of the woman in the condition required to fertilise an egg. Pryll Duhrssen said in regard to that, that semen cells can be well preserved in that place longer than a week. Only for living bodies and not just from new loadings do we make our studies here. Former women patients and their husbands will help us, the men must, under all circumstances be healthy, and be at our beck and call for supervision.

I take it for granted naturally that if the examination of the female ovaries and the sex organs show nothing then a fertilisation has not taken place. I also recommend here to examine at first over the undressed body. If we have the opportunity to diagnose after the day that copulation takes place, it is advisable. It is quite rarely a curiosity that we still find no conception but for instance in the vagina besides the normal swinging there still will be registered on the other hand a secondary swinging will be recorded days before the conception is perceptible. To some extent the sure establishment of conception is approximately eight days after the copulation takes place.

Then again if there is always the same swinging we will have them take a photograph of themselves or have them give us another loading—we again note all observations. An earnest study of this is useful to students, particularly so if they have established several cases of pregnancy by means of loadings and get a new one each week.

We work either by having recourse to the signs of pregnancy which have been firmly impressed on our mind and have been described in an earlier paragraph. The pendulum will be held over the uterus if a conception has taken place, there will appear at the outlet according to the instructions given for the normal healthy organs a very tiny circle or ellipse (male or female fertilisation) or when the pendulogram of the woman in question in the normal condition is known to us, we will be able to recognise the new thing, the embryonic, in the body of the woman after the pendulogram is completed. This is the method that Mrs. Julis Kniese thoroughly put to the test for over 20 years.

The healthy woman will have in her pendulogram 90 to 120 North-South ellipses; with a very healthy female constitution there will be wide ellipses and from 20 to 30 circles. As a universal thing to depend on a fixed number is hazard. If we obtain, after copulation has taken place other oscillations than this of the first pendulogram of the patient, which in the subsequent pendulogram otherwise begins with ellipses, circles, perhaps smaller than in the former, then we may, and with good reason, have a suspicion of a change in the body of the woman, of conception.

A new being begins to grow in the body of another person. Then again if at first the number of the circles appearing are taken daily, with the normal development of the child in the mother's womb they will become increased. The basic swingings of a normally healthy man's fertilised egg is a circle from left to right as we have already perceived those of the female egg (fertilised) is a North-South ellipse, which likewise goes from left to right.

NEW ADVANCES IN RADIESTHESIA — THE USE OF THE PENDULUM

In later years a great deal more research has been undertaken by many operators of the pendulum around the world with radionic instruments, charts and rules, etc. The advantage of using an instrument allied to the pendulum has been appreciated by many practitioners as being far more accurate and simple than some of the methods without an instrument, but the guidelines given within this book should prove an interesting beginner's method of learning what the pendulum can do, and should we then be interested in continuing our work, be it with animals, plants, or human beings, then no doubt you will graduate to the radiesthetic and radionic instruments which are in the hands of every successful operator of the science today.

CONCLUSION

To conclude this book, it is our understanding that we have obtained knowledge which no matter in which way and in what manner it was obtained, may not be kept to ourselves, but must be made accessible for utilisation universally. With that complete understanding the publication of the work which lies before us was made. I have condensed everything that is necessary for one to know in order to be able to use the pendulum for diagnosis of disease. The one who qualifies himself, who quickly familiarises himself with its contents will in a relatively short time no doubt, be able to make good diagnosis; any other person will take longer to advance, but the pendulum will also prove to be of valuable service to him.

"Therefore, because such pendulum experiments are not successful with everybody is no reason to give up, rather one should investigate only the more earnestly and fundamentally" wrote Goethe.

To us a very familiar expression of Professor Tromp of Munich, has much value which I borrow from the foreword of a very remarkable work: "delicate sensitive crystallisations processes as proof for the formation of forces in the blood" (Honorable Fred Pfeiffer, Weise, Dresden). This book is by an outsider (unorthodox) medical man. He acknowledges that "we orthodox medical men particularly in modern times must recognise a great many times things as valid that heretofore we have derided as nonsensical".

We must involuntarily admit again, thinking of Schopenhauer, "every single problem has to run through three stages before it receives honourable mention. In the first it is apparently laughed at, in the second it will be opposed, in the third it will be accepted as valid as a matter of course. The world is just full of numberless possibilities which still have never been made manifest".

Pendulum diagnosis has a future: I acclaim to all biological physicians and healers the words of the Brambacher advanced medical course (1933) Let us be only good physicians supporting together the self-healing processes of nature and not be like the bad physician who imagines himself to be a wiseacre and retards the self-healing process with intellectual electuaries and medicines and forms or shapes the painful spots. We want our people and our empire to be trained to rise to a natural and efficient position and to increase our share in the general welfare and the peace of the world.

No doubt, after having studied this most interesting work you will want to research further. The secret of success in this method is to use the "intuition" not the will power, by using intuition you will discover a new world, and whether you continue just to use the Pendulum, or decide to take up work with instrumental Radiesthesia, the time spent will be well worth it.

About the Translator

BRUCE COPEN commenced his writing career at an early age, and by the time he was 21 had written 15 stage plays, numerous books of poetry, and Belles Lettres. His original method of writing was discovered and cultivated for the more popular style of works, of which this book is one.

He has studied a great deal and researched many diverse subjects, and his versatile talents have been recognised all over the world—awards have been bestowed upon him during the past 20 years, some of which include Doctor of Philosophy, Doctor of Literature, etc., etc. His outstanding contribution to adult education was rewarded by him being installed as Knight of the Sovereign Order of St. John of Jerusalem (Danish Sector) in 1970.

During World War II, he was serving in ENSA, as Stage Manager, and ultimately Stage Director whilst serving in Germany. On returning to England after the War began his most prolific writing career, but always in the vein of the Teacher. To date 52 books, 9 study courses and hundreds of articles have been published, some of which have been translated into French, German and Swedish. The book you are about to read is yet another of his essentially practical works, which are timeless in their content.

Past President/Founder of the British Radiesthesia Association 1953/69. Editor "*British Journal of Radiesthesia*" 1954/60. Editor "*Natural Therapeutics Journal*" 1965/71. Editor of the *Seeker Magazine* for 11 years. He is a member of the Society of Authors and other literary bodies. Currently he is President/Founder of "International College of Radionics".

Hobbies include organ playing, reading, motor cars and anything inventive and scientific.

Consultant to a number of Overseas Universities and Educational bodies in Adult Education.

In Radiesthesia, Radionics and Adult Education in Natural Therapeutics his name is known all over the world as a leading authority. Inventions include numerous Radiesthesia and Radionic Devices, Radionic Computers, and Therapeutic aids.

He is still a hive of industry, pouring forth knowledge of his very specialised nature, for which his advice is constantly sought.

THIS BOOK is a practical one—offering simple, non-technical knowledge and style which will enable readers who have only a minimal knowledge of the English Language to understand, and utilise its contents.
