EXAMPLE OF COMBINATION TREATMENT	33

INTRODUCTION

In the pages that follow, I do not pretend to resolve most of the questions that relate to the treatment of illnesses. It would be reckless to misread or to under-estimate the work and the doctrines that have given birth to contemporary medicine. However, while recognizing the value and the progress of official medicine in healing our diseases by rational means, it falls under criticism when its strictly materialistic point of view disturbs the human being. These unfortunate conceptions prevent, to my mind, proper progress.

Anatomy, the cornerstone of medicine, constitutes an exact science at its best; but it comprehends only the physical body, and the laws that it formulates are consequences of a purely objective test.

Yet, man does not comport merely a physical body. If this primordial question were examined from another angle, some observations that have given birth to these limited doctrines would have to be differently structured. Finally, causes of disease, whether near or far away from a certain affection, often could be cured outside of the bodily organs.

This seems to affirm that the concepts held by the medicine of antiquity were much closer to truth. Furthermore, the rules on which it rests are found to be in perfect harmony with the religious teaching from which it received its impetus.

My goal, by publishing this little work, is to outline to those who are interested in understanding therapy, a case employing "combination treatment", executed following the methods of hermetic teaching, and crowned with success.

The ideas that precede the description of this example cannot be considered as a complete exposé of any doctrine. It is hoped that their presentation will help the reader understand the use of certain procedures in the course of the treatment that is the object of this work.

CHAPTER 1

GENERAL DESCRIPTION

Modern science, of which medicine is but a branch, considers man to be a sort of perfect, complex machine. It seems to want to ignore the spiritual factor that differentiates the human being from the rest of creation.

This conception would be admissible if, by chemical combinations or by electrical or other intervention, one could assemble an entire organism from all the pieces. In a word, he could create. Unfortunately, all attempts on behalf of this project have never given and never will give the expected result.

Not by these manipulations will man succeed in creating his double, nor will he succeed with protoplasm or a seed, the simplest form of manifested life.

Man can realize with a certain precision the physical and chemical conditions of the late elements or the Periodic Table, but they are only dead things since he cannot breathe life into them.

We arrive at this observation that laboratory combinations only constitute a small, feeble attempt at duplicating the composition of a living phenomenon, even for the simplest forms. What to say, then, of man, this incarnate spirit, as implied in the Kabbalah?

In order to treat a malady, it is necessary above all to know the cause, and in order to discover the cause it is necessary to understand the constitution of the man.

A physician of our time, endowed with diplomas, studies the anatomy of the human body in medical school, so that he has thorough knowledge of the body like a mechanic knows the machine of which he is in charge. The physician believes that he has been trained in the interplay of the organs. He believes this . . . but here, science rests only on hypotheses, and if he formulates a diagnosis, it is only based on the experience and practice of his predecessors. As for the causes of our diverse ailments, can we say that the most skillful practitioner knows them? Sometimes, he squeezes it out intuitively, and yet . . . Here, medicine is groping in the dark, and most of the time, it is the nature of the patient that combats the illness, if he is not shackled in this process.

The preceding applies especially to allopathy, which treats a patient by introducing massive amounts of poison into his body. Sometimes these poisons, by acting upon the affected part, have a poisonous effect on the entire organism.

Homeopathy, born a century and a half ago, and up to recent times only evoked contemptuous smiles, has become developed in the last years to the point that it counts thousands of practitioners in the medical corps. (Footnote: Hahnemann began his observations and experiments toward the end of the 18th century. He is the father of this new doctrine.)

In England, America, and Germany they have created chairs for homeopathy in the universities, clinical services and specialized pharmacies.

Homeopathy is founded on the law, *similia similibus curantur*, meaning that in order to combat a malady, use a medication capable of provoking all the symptoms of the malady in a healthy subject.

Then, in lieu of using products in dangerous dosages, it divides them into minute amounts through a mechanical treatment, reducing the matter in some way to a primordial state. This addresses the illness, not by the substance of which medication it was made, but by its "spirit", if one can use such a term. The substance of the medication is reduced to a point such that chemical analysis cannot determine a trace. Nonetheless, the effectiveness of the treatment is incontestable, even from numerous conclusive experiments made on animals, experiments that eliminate by consequence the possibility of suggestion. Finally, homeopathy does not treat an illness, but it treats the patient. The choice of a remedy is for its function, not the diagnosed affliction, but more particularly according to the nature of the patient.

We can compare homeopathy to ancient medicine, which, before prescribing a treatment, established the horoscope of the subject in a way so that the distortions of the healthy equilibrium might be restored to health, by using substances in harmony with the nature of the subject.

In our day, there are other methods having some common points with the medicine of the ancients, for example: the medical zodiology of Dr. [M.] Duz [*Practical Treatment of Astral Medicine and Therapeutics*].

The doctrines of Hahnemann and Duz, while imitating the ancient concepts, remain nonetheless incomplete because their objective is the invisible man whose superior planes they totally ignore.

Antique medicine was oriented to religion. In this situation, man did not possess only systems relating to the domains of chemistry and electricity; they constituted merely his inferior parts. It is in these parts that manifestations appeared from different occult forces that formed the

infrastructure of his invisible bodies. The total composite was then penetrated by the Divine spark, the principle of sensible life.

It is difficult to reconstruct in all its beauty the edifice of ancient hermetic medicine, because we possess only disconnected fragments containing teachings of the Sages.

I am going to try hard to bring a bit of order into the elements that have been revealed up until now, and we will understand the differences that exist between the way the Hermeticists acted and the processes advocated by contemporary science.

I will begin by giving an idea of the constitution of man as he was perceived in the ancient Sanctuaries.

This subject is so vast and contains enough material for several books. Those who would wish to dig deeper into this question must consult certain works that I will mention in the references in the course of this book.

Then I will add the summary study of some treatments used by the ancients, treatments affecting the plane where the illness is located.

To end, I will cite as an example an observation relative to a medication according to esoteric teaching. It is a matter of a case where all the treatments of official medicine were ineffective.

Trustworthy witnesses have checked the facts as will be shown later.

CHAPTER II

MAN

According to the Christian religion, man is made of two parts: the soul and the body. (The Apostle Paul is the only one who recognized the three-part nature of man.) This point of view is not exact. It does not conform to ancient teaching, or to that of the Bible in Genesis.

What is the soul? Is it the vital principle that animates the physical body? If it did not exist, man would be no different from an animal, and we know man is at a more elevated level.

Genesis calls the animals “living beings”. Creation is not complete at the point of animal creation. The Scripture places man at a superior level clearly separated from the level of the animals. When God created man, he breathed Divine Breath in to him so he was different from any other “living soul”, because this breath is the vehicle of the Divine spark manifested in man by his reason and his free will.

And the first act of this free will was the glorification of the Creator, whom man saw around himself as the manifestation of the Almighty. This act of adoration is possible through Language, the mysterious expression and aspect of Reason.

From Genesis I, we know that man is formed of three distinct parts: Reason, or Divine Spirit; Soul or Individuality; and Body, or combination at the material level.

These three parts are named in the Hebrew Kabbalah (Note: Kabbalah means tradition. This name carries the complete elements of occult teaching that we are upstarts touching the creation of the world and of man.) : *Nechamah*, meaning spirit; *Rouach*, the soul; and *Nephesh*, instinctive forces governing the bodily functions. The totality, closely bound, constitutes man-unity.

Man, created in the image of God, exemplifies the Christian understanding of the Trinity, where One is Three at the same time that Three can only be One.

And, in the same way that God understands the Universe (Macrocosm) – His visible manifestation – man is the synthesis of the microcosm, where the components have been defined on high.

According to Egyptian teaching, the Divine Trinity is composed of thought-principle, which is God the Father, of Language-dynamism which

expresses the Son, and Life, which is the manifestation of intelligent Language. (see Hermes Trismegistus: *Pymander*.)

I insist that these correspondences must not be lost from view in resolution of certain problems related to the microcosm.

From this point of view, one clearly understands the truth of Astrology, which in the starry configurations find answers to questions that are posed by man. All has everything, all is in all, and what is above is as what is below.

According to the Kabbalah, man is a being belonging to three different planes. His highest part is bound to the spiritual plane, to Principle; his lower part, to the material plane, the one of manifestation realized by the plane of forces, or astral plane. The last is, consequently, doubly polarized between Spirit and Body.

But each of the parts in question does not represent an indivisible element, and according to the tradition, it is in its turn formed of three parts of which the superior is that of principle and the inferior that of realization, and the two latter bound intimately at the potentized center of the energies.

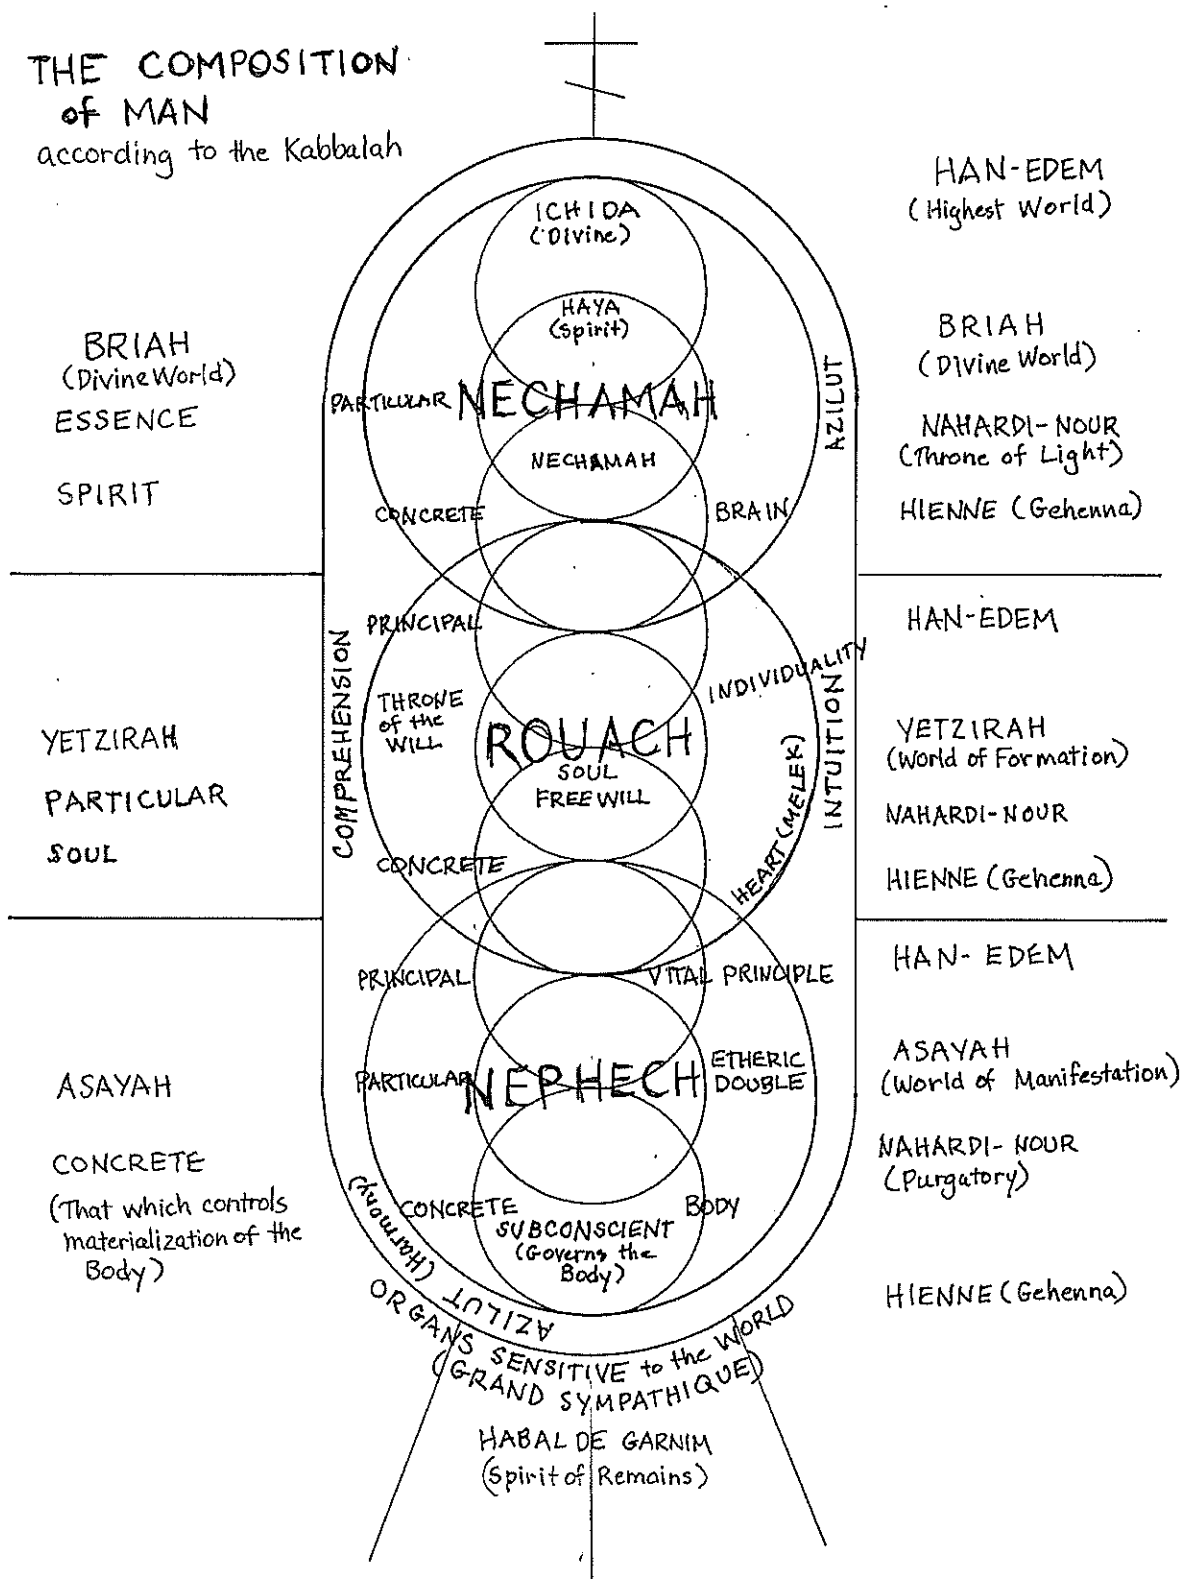

With this, we obtain nine divisions in the human being, which is demonstrated by the mysterious make-up of his name, Adam. Adam, the universal man, in the sacred language where letters have a numerical value in addition to their phonetic value, expresses the number nine.

The figure 9 is the last of the decimal numbers for calculation, after which comes the return of unity; ten is the unity of a superior order. Man, the ultimate term of creation, could not be represented by any other figure.

The drawing below illustrates what was just stated: as one can see, the circles of this figure, which symbolize the different planes of man's being, are not separated, but they interpenetrate. We can understand from this that it is difficult to demarcate precisely where the higher plane that interacts with a lower plane ends, and where the domain of the lower plane begins. One could say that the principle of *Nephesch* takes birth in the manifestation of *Rouach*. In the same way the principle of the latter is intimately bound to the manifestation of *Nechamah*.

Outside the *Nechamah*, analogous to God in the universe, *Rouach* penetrates deeply into *Nephesch*. However, this involutive movement encounters an opposing evolutionary current. Indeed, *Nephesch*, by pushing its impressions in the material life, transmits them by *Rouach* to *Nechamah*. These principal currents are repeated in the same way between the subdivisions of the three planes, creating a constant exchange that is nothing other than the manifestation of the life of the complete man.

THE COMPOSITION OF MAN according to the Kabbalah

The exterior circle, the tenth, surrounding the figure, represents the complete human.

Thus, by going from above to below, we can decompose man as in the following:

A. Superior Plane, *Nechamah*

I. Principle: Divine, Reason

II. Power: Free Will

III. Manifestation: Life

B. Middle Plane, *Rouach*

I. Principle: Astral body, Seat of Life

II. Power: Center of ascendant and descendent, centrifugal and centripetal forces

III. Manifestation: Phantom or double that rules the subconscious, of which it is only a modality

C. Lower Plane: *Nephesh*

I. Principle: Subconscious

II. Power: Instinctive forces governing the vegetative and animal life

III. Manifestation: function of the organs, their contact with visible life.

This drawing shows that *Nechamah* constitutes the source of life and action according to free will, guided by man's reason; that *Rouach* and *Nephesh* are emanations of this source and do not possess on their own intelligent life.

Ancient teaching gave to *Nechamah*, the brain, like a throne, placed *Rouach* in the heart, and *Nephesh* in the liver.

It is clearly evident that these attributions are only symbolic because it is impossible to fix the spirit in an organ. We have seen that *Nechamah* penetrates the entire man, like *Rouach* and *Nephesh*, which form the fluid body, overflowing the frame of restraint that is the physical body. (See: experiments of Reichenbach and Colonel Rochas on the exteriorization of the vital force.)

The sacred alphabet, composed according to the laws of creation (See my *Essay on Kabbalistic Astrology*), is based on the three letters called the "mother" letters. These letters represent in the microcosm the head of man (*Shin*), his belly (*Mem*), and his heart (*Aleph*). (See my article in "The Veil of Isis", June, 1929.)

In the macrocosm, these same letters correspond: *Shin* to the active fire principle; *Mem*, to water, the passive principle; and *Aleph*, to the air, the

principle of balance, without which the fire could not burn nor the water experience existence.

For the Egyptians, God in his creative act divided successively in two (creating opposing forces, positive and negative, the foundation for all phenomena), then into four, and finally into eight. (This is inscribed on a sarcophagus of the Twenty-second Dynasty.) This definitive doubling created the "eight members of God" that accomplish all the work of creation. The manifestation of these eight divine members in the nine parts of man will give birth to the 72 parts of the universal man (8×9), which, in the macrocosm, correspond to the 72 divine manifestations, of which we indicate the names by the *Schemamphorasch*, a Kabbalistic table which allows one to reconstruct the 72 names. (See *Essay on Kabbalistic Astrology*.) It is curious to note that this number repeats in man as well as in the macrocosm. (Normal pulse is 72 beats per minute; 72 years during which the sun remains in one degree of the zodiacal circle, etc.)

The naming of these 72 parts of man known to ancient science is lost, but it is quite probable that they can be reconstituted by a method analogous to the use of the *Schemamphorasch*. Mathematically this number is composed of two figures of which the first is equal to the exponent of the second, and reciprocally ($72 = 2^3 \times 3^2$). This is a basic law of creation of the universe, a law that defines vibratory rhythm, necessary for the manifestation of the physical world.

A few pages are not enough to give a complete idea of this science, which has been consecrated for all time by distinguished spirits. I have written a brief introduction which is indispensable to what follows herein.

I refer the reader who is desirous of a deeper understanding of these questions to the works that discuss this ancient tradition: Charles Barlet, Frank Khunrath, Boehm, Raymond Lulle, Stanislas de Guaita, etc.

CHAPTER III

EQUILIBRIUM

The fundamental law that follows that of Unity is that of equilibrium. We find this law in all created forms and in man, the image of God. According to the tradition transmitted by the writings about creation, the first act of God was his doubling. This doubling represents, as we have said, the creation of opposing poles, of affirmation and negation, of attraction and repulsion, etc. All these forces, opposed to each other in order to help bring about universal harmony, must equilibrate with each other. This is how the trinity, a fundamental dogma of every religion, was born. It is composed of a positive principle, a negative principle, and the point of equilibrium. This law is expressed in the sacred alphabet by the three mother letters. The mechanism of the universe is based on this law. Without the equilibrium of the centrifugal and centripetal forces of our system, the stars of which it is composed, in place of making their orbits, would fall in the void or crash against the sun. The rhythm of life, such as we know it, is only the expression of different forms of the same equilibrium. Time, space, and weight are the cornerstones of these conceptions. Finally, all the branches of our knowledge, all that constitutes our progress, rests on this basic law. The enchainment of the causes and effects generating our existence represent the same equilibrium.

We have seen in the preceding chapter that man belongs to three different planes. The principal elements, the spirit and the body, are of an opposed and totally different nature. The middle plane, that of forces, the *astral* of the occultists and the *soul* of religionists, actualizes their union.

The involutive current, emanating from reason and energized by the will, forms a sensible current that is transformed by rational acts in the physical world. From another point of view, the impressions received by our bodily organs are transmitted to the center of the forces that transform them into analyzed emotions, examined by reason.

This transformation of the current can be compared to a phenomenon of the same genre that is produced in a dynamo or the primary current exciting induction causing a usable secondary current.

Man is in his normal state if the parts that compose him are in perfect equilibrium. We say he is "well-balanced". If one of the parts takes over, it is naturally to the detriment of the others. If it is the lower element that predominates, he is a beast, a man-animal; in the opposite case, it is the

spiritualist. Carried further, the disequilibrium may manifest as rubbish, or perhaps sainthood, or perhaps insanity . . .

If one understands the symbolism expressed by the three mother letters in the sacred language, one will get an allegorical but clear response. Remember that the letter *shin* represents the head (reason), the letter *mem*, the liver (abdomen, the animal part of man), and the letter *aleph*, the heart (and lungs, the principal organs of the life of living beings).

In order to realize a normal state it is necessary to balance the working of the two opposite parts that make up man. The physiologic functions must be orderly; thus he must eat in order to live and not live in order to eat. On the other hand, spiritual work or mental work prompts man to remember that he is not purely spirit, but that he must understand that the mission that is imposed upon him as he incarnated is the obligation to develop in parallel all his faculties in the different planes.

Jesus Christ is given as a model when he took human form and was subjected to the laws of the body. He lived like an ordinary man, in suffering and work. I am not speaking here of his martyrdom, but only of his daily troubles. For example: "He was hungry . . ." (Matthew 21:18), "My soul is very sorrowful" (Matthew 26:38).

Bodily ailments are trials designed to purify. It is not necessary to forget that the incarnated spirit must progress as a whole and not only in the spiritual domain.

Before the original sin, man was formed of spirit (divine breath) and of an etheric body issued from astral forces. His life unfolded in relation with its source – his creator, from whom he freely received directives. Original sin was a screen designed by the centrifugal force that led him far from the eternal center and threw him into the exterior sphere of passive substance and darkness. His *Neschamah* lost the possibility of direct communication with the Creator ("I was afraid", Genesis 3:10) and sank deeper and deeper into sin. The place between *Neschamah* and *Nephesch* became weaker and weaker, and the latter, which formerly constituted his luminous body, became our material body, exposed to all the misery inherent in matter.

The goal of real humans is to oppose the centripetal force to the centrifugal force, that is to say evolution to involution, in order to return to the luminous center. This is not to say that it must only bring back its *Neschamah* to the Source, because this would be physical death. No, the goal to attain is the resurrection, that is to say, the transformation of the physical body into the luminous body. And this result can only be attained by work coordinated by the three elements composing the human being.

Jesus Christ gave us the example of this resurrection, which can only be compared to rising after death.

Egyptian teaching was based on this belief. It envisaged a life after death, not like life only of the spirit, but a complete resurrection of man, dressed in a purified body.

The mysterious ceremony of Up-Ra "opening", conducted by the Egyptian Priest on the mortal remains of the dead, illustrates what I have just stated. The officiating priest wraps a mummy representing the dead Osiris, opens his eyes, breathes into his mouth, saying: "Get up, Osiris! I am Horus, your son, who has come to give you back your life, unite your bones, tie your muscles, join your membranes. Your flesh grows, your blood circulates in your veins and your limbs are healthy". . . And the dead man answers through the mouth of the Priest: "I am alive, I am alive!"

This ritual symbolizes the work of evolution in all parts of a man harmoniously bound in a perfect equilibrium.

The normal human personality must have its three parts in equilibrium: the evolution of *Nephesh* recognizes involution of *Neschamah* and is guided by the latter, that each in turn nourishes its smooth evolution.

CHAPTER IV

ILLNESS

We just saw that perfect equilibrium of the parts of man is at the basis of his health and returns it to normal. One could object that an animal can, from this point of view, be considered normal and enjoy perfect health, while a spiritually elevated being can have a fragile health and suffer bodily ailments. This is true, but it does not contradict what I have said. It is necessary, first of all, to envisage the degree of elevation of the subject in question, know if he is still found under the predominating influence of the centrifugal force, and by this fact, in a state of penetration into the material sphere, or if the evolutive movement has commenced to affect him and if he has managed to overcome matter. The creative act does not just stop after the initial creation of a certain number of individuals that actually are more or less upstarts to a same level of progress, because they will have nearly the same "age". I say more or less, because here enters the play of free will, which accelerates the evolutive movement for some and slows it for others. Creation continues, incessantly, and the projection of spiritual packets from its emanating Source is produced unceasingly.

The new sparks projected by the centrifugal force in the material sphere plunge deeper than this. Thus are born the new individuals in whom the instinctive part predominates, hiding the divine flame within their opaque envelope. Finally, in the course of these pilgrimages, the soul (We call this the Divine Spirit, enveloped by its astral body that remains with it through its incarnations.) of man accumulates good or bad deeds that form its destiny. This is what the Hindu call *Karma*. "The works of man follow him." During his earthly life, the memory of his mistakes is rather obscured and only shows in what we call conscience. His spirit conceives the cause of his earthly trials but his physical reason, if one might use this expression, understands the voice of this spirit only rarely. It is in the interval of successive lives that the veil falls before the spiritual eyes of the disincarnate and that he sees and understands the stream of causes and effects of his different existences. He sees clearly the situations and the circumstances in which he found himself in the course of his previous life, how he will have to act and what he lacked doing.

It is then that he increases his volitional forces in the cause of combating his flaws, and he prepares for the new challenges of the following existence, which he wants to conquer, but he can succumb once again. What

precedes permits comprehension of why a man can be born with such and such a flaw, this or that illness. This state of things does not constitute injustice, but an earned destiny that the reincarnate has chosen himself as an ordeal. It is still an equilibrium, not over just one destined lifetime, but over a cycle of existences, that must be stabilized. This is eternal justice.

For the present life, what we notice seems to be a disequilibrium since we see a creature suffering and there is no apparent cause. In order to discover it, the methods of official medicine are insufficient. It will be necessary in the end to resort to occult scientists.

The rupture of equilibrium can be produced to the detriment either of the body, the lower part of the spirit, or finally the binding of these two, the astral. Medications commonly used for the kind of case belonging to each plane are different. We show these in the following chapters.

But we agree from the beginning that in each of the cases that are presented, rarely is only a single plane affected. When one of his parts is affected, man being a complex creature, the others experience repercussion. What is important is to discover the cause of the illness and determine the center of the affection that has caused the disequilibrium.

This point being made, one must look to care for the patient and help him to combat his ailment. The methods used, one understands, are different according to the plane of the location of the cause of his difficulty.

Certain cases, incurable from the point of view of official medicine, seen from the hermetic perspective, can be eliminated without difficulty. But there are some medical situations where a medical intervention would be harmful to the subject. An error would be committed by trying to reestablish a vital equilibrium that has been broken, because one would be opposing the test that the patient has submitted to, and which is the condition of his progress. One opposes all sorts of cyclical processes of man and by diminishing a passing illness, retards his evolution. Many operations constitute the most deadly services that medicine of our time can render to humans.

A mythical example of the danger of submitting the body of a man to the blade is given us in the legend of Osiris, when Set-Typhon chops his body into pieces that he disperses in all directions. Isis takes great pains to reassemble the scattered pieces, and to reconstitute the body of her husband in order that he can be resuscitated. This appears to be the domain of legend, certainly, but within this child's story is hidden a clear truth. Before allowing an operation, the ill person should consider that he will cause himself to undergo a particular state that will follow him through the course of his future existences and increase the burden of his suffering.

The surgeon so often recommends the knife too casually because he does not know this. If he could consider for an instant that his unconsidered intervention creates misfortune that cannot be repaired without long centuries of effort, he would certainly be more prudent.

There are, understand, cases where surgical intervention, far from being opportune, must be recommended. For example: a limb, because of an accident, is torn off or crushed, the surgeon intervenes in order to stop the loss of blood and prevent gangrene. Consequently, all reconstitution resulting from a fracture is called for.

What must be considered dangerous are all the operations in the effective mode without due reason, like the operation for appendicitis practiced in America among all the children or the removal of certain glands recommended by the English doctors. Finally, all the operations deemed aesthetic that elegant people request. Thus a woman judging her calves too thick and unbeautiful reduces them and sometimes loses the leg, etc . . .

The conscientious and informed surgeon must reflect before proceeding with an operation and not lightly treat a question of this importance. Unfortunately few contemporary practitioners do this. In addition, the consequences of an operation cripple not only our present life. Be aware of the very long payback over time. Many are the births of disfigured children because of Karmic accident relating to a prior existence. The cripple that we see after an operation undergoes the consequences of this operation in one subsequent incarnation perhaps several centuries from now, but he will undergo them.

Why create misfortune if it can be avoided? Those who encounter their destiny suffer perhaps more in this life but their passing ailments can only favor their evolution.

Finally, one can affirm that actually, in many cases, systematic surgical intervention is but a failure disguised as the art of healing.

We know that for a long time after amputation of a limb, the patient retains the sensation of the amputated limb. He feels, for example, pain in the fingers of a hand when he no longer has the arm. These pains cannot be explained. They say that the severed nerves cannot adjust to the new situation. But if one examines the double, one sees that here it is not just a matter of nerves . . .

It is preferable to support the bodily sufferings, to submit, in a word to the challenge that must reestablish the cyclical equilibrium, rather than allowing an operation without absolute necessity.

One might object that an operation assures survival of the patient. This allegation cannot be formulated except for someone who does not

believe in eternal life, who guesses that death is the end and that the only desirable things are those of the domain of material joys. He does not conceive that this present suffering fulfills perhaps the last step after which man rises one step toward the supreme goal. He does not see that death is a benefit, a deliverance, and that, by a brutal, blind intervention one risks annulling the spiritual labor of man, labor to which he will have to surrender to all over again with the pains that it includes, in order to redress the compromised equilibrium.

Surgery is a product of our materialist and atheistic century.

Life is only precious to the point of view of submitting to the challenge, with faith and resignation, in order to move up to a higher degree on the ladder of becoming.

So it is necessary, in order to return a being to a normal state, first to understand the cause of the disequilibrium, then to safeguard the ascension of the subject, to act on the forces that have provoked this condition and modify, if possible, their combined actions. In order to attain this end, it is necessary to possess knowledge and faith. Knowledge in order to act in the plane where the cause lies; faith in eternal life and the enchainment of accumulated causes and effects in the rest of existence.

A treatment not applied with this faith can only be harmful.

CHAPTER V

ASTROLOGY IN THE TREATMENT OF MALADIES

(Note: See my article "Medical Astrology" in *Hermétism*, May 1928.)

One of the branches of antique science, perhaps the most ancient, is Astrology, a way in which man, by studying the configurations of the stars, finds answers to questions concerning his own existence. All questions relative to human beings, in particular those regarding health issues that threaten him, can be resolved by Astrology.

The physician of antiquity, before undertaking this or that cure, carefully studied the horoscope of the patient and put into relief the dangerous influences that had caused the malady.

In order to be able to combat an ailment successfully, it was first necessary to pinpoint its origin, and here the astrological travails furnished the precious indications. To those who are interested, I recommend my book: *Essay on Kabbalistic Astrology*.

Here I will simply give an overview of the role of Astrology applied to treatment.

The horoscope chart separates the potentialities resulting from the configuration of the stars at the moment of the birth of the subject, or at the date and the hour of the beginning of the illness if one knows them. These givens characterize the subject in his existence here below. While we think we know causes, our knowledge is flawed with the possibility of pathology, and these causes are outside the domain of Astrology.

Astrology answers questions concerning the physical domain (manifestation) of man and his astral domain (combination of forces). The superior plane remains hidden and cannot be judged by interpretation of the natal chart. We already know that creation is manifest in the third, balanced by the three principle elements: water, fire and air, symbolized by the three mother letters of the sacred alphabet, *Mem*, *Shin*, and *Aleph*. But this threesome, coming from principle, is realized in the visible world by fours, of which different combinations with the triad principle will give birth to all the cosmic laws ($3 + 4 = 7$, $3 \times 4 = 12$, $3 + 7 + 12 = 22$). The fourth element of the quaternity of manifestation is called earth because it symbolizes the lower plane of solid matter. According to *Sepher Yetzirah* this element is derived from water ("The earth is made of water."), very clear symbolic expression, because here water, which represents passive substance,

sometimes the passive principle of matter, becomes the same matter – earth through the act of consolidation. These four elements form the four astrologic triangles connecting the twelve signs of the zodiac, three for each triangle.

These four trigons govern the vegetative (subconscious) life of man and all animals belonging to our world.

Each of the three signs of the zodiac found in the same trigon acts in the sphere of that trigon by promoting its influences. For example: Pisces, Scorpio, and Cancer have characteristics particular to them while representing characteristic manifestations of the water trigon. In a subject's life they strive to create sailors, or dangers of an aquatic nature: affections of the lymphatic system, dropsy, etc.

From this point of view, the illnesses could be divided into four principal groups: water, fire, air and earth or, according to the ancient appellation, moist, dry, hot, and cold. The treatment of these maladies can be drawn from two distinct and opposite systems: “*Similibus similia curantur*”, and “*Contraria contrariis curantur*”.

The first system carries the treatment from the first trigon, that is to say that in order to heal an individual facing toxic difficulties from Pisces, it is natural to resort to curative forces from Pisces, Cancer, or Scorpio.

The second system can be called treatment by opposites, that is to say, that for a subject affected by heat (fire trigon), it is necessary to oppose the cold. In ancient medicine the sign of the first group was a triangle and that of the second group a star with six points. In the latter case, it would be necessary to combine the forces of the opposite trigon from that of the location of the center of the illness. The physician must know how to harmonize the influences and to adapt them. For this, he must only act through cold, heat, moisture or dryness, but at the same time, choose certain plants marked by the zodiacal signs coming into play. This treatment, in terms of plant material, must unfold in the framework of the four trigons in question above.

But, as we know, the zodiacal circle is only the structure where the influences of the seven planets manifest. The seven letters of the sacred alphabet, the double letters, symbolize the planets. They are so-named because they carry in them both the presence and the lack of the quality (See *Sephir Yetzirah*), the + and the – and, from this point of view, they each present polar, binary, opposing influences. But, as we have said, two opposing forces acting at the same time must balance themselves, and consequently, each polarity expresses itself through a triple (positive, negative, equilibrium). So the complete number of planetary influences will

be 21 or 3×7 , the number of letters in the sacred alphabet. This is in the framework of the number that is going to transfer the seven planetary influences to man.

The action of the zodiacal signs on human beings is inescapable and cannot be neutralized by free will, because it affects his vegetative part, the subconscious, over which humans have no rational control.

The planetary influences are of a totally different order, because they act on the astral principle of man, which can be controlled by free will and reason. Such influences, while being the most pronounced, are however the most easily balanced by man, and here the rule to apply is: *similia similibus curantur*. In order to find the lost equilibrium, it would be necessary to use the strength of the same planet by attempting to paralyze its negative action and provoking its curative virtue. This equilibrium is reestablished by using correspondences taken from the material world. (See the table of planetary correspondences in my *Essay on Kabbalistic Astrology*.)

Finally, Astrology can even be utilized for illness on the spiritual plane, but its role is limited to addressing activities of invisible beings harmful to man. The cause of illness, which in cases of this nature is almost always of the Karmic order, escapes study, but one is always informed as to its effects.

CHAPTER VI

COMPLAINTS ON THE MATERIAL PLANE

We know that bodily illnesses relate to the region of the letter *Mem* and affect the *Nephesh* of man. Here, official medicine and especially homeopathy parallel the procedures of ancient science. The remedies used are borrowed from nature, and since it is the vegetative part of man that is affected, it is necessary to find medications in the same plane by using vital extracts coming from material forms (animals, plants, minerals). It is necessary also to take into consideration the nature of disequilibrium, that is to say, to see if the latter inclines to fire or water, to dry or moist. The heat treatments (steambaths, mud baths, etc.) like the thermal treatments (cold or hot baths (Kneip), or mineral waters, etc.) and the climatic cures can give results if the choice is judicious and repairs the observed disequilibrium. Likewise, this or that vegetative substance in harmony with the subject and the illness relieve or even heal the illness. All this is perfect if the ailment is of a purely physical nature. Unfortunately one can only classify in this domain the small affections of which the cause is due to poisoning of one type or another.

The cause of most serious maladies must be researched outside the material plane, and, for this reason, the restoration of equilibrium cannot be obtained by the correspondences related to the physical plane. Very often, healing that follows the physical treatment is not the result of the use of medication, but is due to the subconscious forces of the subject that concur with the reestablishment of the vanished equilibrium, or even to the will forces of the patient. Whichever it be, the conscientious physician knows that in a serious illness his role is limited to good hygiene for the patient and to place him in the best conditions to permit him to combat the illness through his own efforts and strengths.

For 30 or 40 years (This book first appeared in 1928.), physicians considered an elevated temperature as a dangerous manifestation that had to be conquered at any price. Today, this way of seeing has been totally abandoned. We know that the temperature is essentially a red flag, a signal of danger, but that its cause can be pulmonary congestion as easily as typhoid fever or blood poisoning.

Indeed, temperature rises in the course of combat, freed by the positive forces of heat of the organism against negative and deadly forces of

cold. One must not forget that heat is a manifestation of life, while cold is a sign of death.

But, I repeat, most illnesses that appear to be purely physical are caused on a higher plane, and because of this fact, the effort of the physician must be applied to the discovery and elimination of this cause in order to re-establish equilibrium.

Numerous affections thought to be incurable are only so because of erroneous diagnosis. The ignorant physician tries to combat not the cause, but the effect (symptom medicine).

Finally, certain illnesses and anatomical malformations are not rightable by any treatment. Their cause resides in a former lifetime of the subject, and the illness that manifests in the present life is only a stage in the return to equilibrium.

These Karmic maladies can be considered incurable. It would be an error to try to heal them; any intervention would only result in hindering the reestablishment of cyclical equilibrium and evolution of the subject.

CHAPTER VII

COMPLAINTS ON THE ASTRAL PLANE

We remember that the astral plane in man represents the balancing part in which the forces of the will emitted by his reason are transformed dynamically, and are called to manifest in the material sphere by an action. On the other hand, the impressions received by man through contact with the exterior world get modified in the balancing part by nourishing fluid from the superior plane. From this point of view, one understands the importance of the median plane serving to tie together the two poles of the human being.

In the sacred alphabet, this plane is represented by the letter *Aleph*, which holds in equilibrium the active principle of fire and the passive principle of water. In the physical body of man, this same letter symbolizes the heart home of the soul, and the lungs, the respiratory machine without which physical life is not possible.

This does not lead us to conclude that the illness of the heart and lungs are of the astral order. These organs are linked to *Aleph* in order to emphasize the importance of the balancing plane in physical life. The absence of cardiac and respiratory movements means death.

What is the astral world in the macrocosm? It is the world of forces or formations. Nothing can exist in a physical state before its formation by constructive forces in the astral. (See my article "Astral Cliché", *Annales de l'Hermétisme*, June 1929.)

It is the same for man. All his acts must, before their realization, form their movement in his astral part.

In these conditions, an illness or unfortunate event, before reaching a given person, are first in power in the microcosmic astral, and only affect the material part of man through his astral part.

It is for this reason that homeopathy, by potentizing a remedy rendering it to its astral state, possesses *a priori* more chance of success than allopathy, since the power of the product employed acts on the astral level and not on the physical only.

In addition to the curative forces extracted from the astral of certain material forms, there exist other genres of treatment that relate directly to the plane of *Rouach*.

Once can cite as examples: magnetic massage, hypnosis beyond most profound phrases, treatments of the aura, etc. The sometimes-bizarre

treatments indicated in the grimoires, which were and are used by the sorcerers in the country are of the same order.

Note: I have seen plantar warts treated by the method of tying a thread with three knots around the excrescence without squeezing them. One then throws this thread under a gutter, and its destruction is followed by the disappearance of the wart. In the same way one could transfer jaundice onto a living pike (fish) that the patient had focused on for a half-hour. The pike became yellow and died at the same time that the patient was cured. I could cite many examples of this kind of bizarre treatment.

Purely astral-order maladies most often manifest as cerebral troubles, nervous affections, certain affections of the skin: erysipelas, jaundice, etc. A sensitive observing the luminous aura of the patient can discover there the more or less shadowy areas that indicate nests of astral "microbes". Submitted to a special treatment, these spots clear and at the same time as the stigmas of illness on the physical body of the subject.

I have had occasion to notice miraculous healings of affections known to be incurable, obtained by magnetic procedures or by suggestion. One arouses subconscious forces of the subject which, having been augmented, overcome the harmful forces of the malady.

One can return the treatment to the same plane by transferring an ailment to a plant or an animal, or even onto an inanimate object.

If the attack is from the outside, one can substitute for the patient another subject who acts as a sort of lightning rod and, in this case, the equilibrium will be saved. In the countryside one finds several witchcraft recipes of this genre that arouse smiles but which, in reality, often give results. I have verified certain of them with, from the start, an opinion of disbelief. The results obtained have caused me to change my opinion. These recipes are often written in incomprehensible form. They seem to constitute a string of unintelligible sounds. I was stupefied when studying one of them in which I discovered a slightly deformed Sanskrit text.

I will return to these questions in the following chapter, because these processes bring magic again, and act particularly on the superior plane.

CHAPTER VIII

MALADIES OF THE SPIRIT

This domain is the most important of the human being, because it is that of Principle, the Divine spark, that places man above every other creature. At the same time it is the least known because all investigations are without result. In acting on one of the inferior planes, the action of the physician reflects the purity of his intentions, his sympathy for the subject and his ardent desire to heal. These beneficial emanations will be agreeable to the sufferer's spirit, but they cannot destroy the illness because they do not attack its cause. For this it is necessary to act through the superior plane.

Maladies that have their cause in this plane present different forms of which one is called insanity. However, this word carries too many diverse meanings, and the origin is often lost in the darkneses of the cyclic equilibrium. Certain meanings are not known to ancient wisdom, and contemporary medicine does not understand, either.

What is a fool? Official medicine will tell you that a fool is an abnormal man whose words and actions do not follow conventional logic. Certain of these poor demented persons present a danger to those around them, and it is necessary to commit them. Others are affected by sheer madness or melancholy. No serious treatment exists. Here, more than with the other kinds of ailments, contemporary medicine is plunged into darkness.

Ancient medicine knew the causes of several particular cases of insanity and could thus act against them.

We remember the gospel where Christ had cast out from someone possessed, a legion of spirits that then entered a herd of pigs. The Christian church has retained a special rite for exorcising one possessed and forcing the spirit to leave him. This rite is taken from hermetic teaching. We examine this genre of madness that is called possession.

The case can occur from birth, when, along with the spirit that just incarnated in the infant, a demon enters, which, being stronger, torments the spirit and the soul. The subject is reasonable and good, and in his moments of lucidity, complains of his sufferings. But should a crisis arise, it is no longer a Divine Spark that speaks and acts, but a harmful entity from the invisible world. The voice changes, as does the physiognomy. A terrible and diabolical laugh can be heard, and the soul suffers.

Possession can occur later, in middle age. At the moment of an astral journey, voluntary or not, a larva can return to the body at the same time as

the soul or even take its place, and prevent its reintegration into its home. It is for this reason that incursions into the astral are very dangerous. Those who operate with a subject must take all precautions in order to protect the body from any undesirable intrusion. Possession can be provoked not only by a demon, evil spirit, but also by an elemental or even a larva. In each of these cases the manifestations are different.

Finally, there exist partial possessions when the subject, bound with an entity in the course of his former existences undergoes the consequences of the past. (For example: the case described by Goethe in *Faust*.)

He who, practicing black magic, utilizes these inferior entities for personal gain creates a liason with this genre. In order to recover his lost equilibrium he must undergo, during one or several existences to come, the influence of this entity who will torment him and from whom he must be liberated.

Finally, the different forms of vampirism, the succubi and incubi often the subject of writings from the middle ages, are affections of the same genre, giving birth to different forms of dementia.

These maladies present variable objective signs but, as I have already said, our methods of investigation do not allow us to penetrate in the plane closed to us, and consequently any classification is impossible.

Whatever the case, possession, in a general manner of speaking, can be healed by the transfer of the force possessing the subject either to an animal, or to a plant in harmony with the patient. This genre of "para-lightning" is indispensable for retaining the equilibrium of the subject and so that the harmful force cannot provoke its death. We remember that Jesus Christ himself in delivering the possessed of their demons, allowed them to enter the bodies of pigs.

The teaching of ancient Egypt and of India contained a special rite that gave the possibility for transferring harmful influences onto a certain object but always in harmonic correspondence with the possessed.

The experiments of Colonel de Rochas have demonstrated how one can bind a subject to an object saturated with his sensibility. His process has points in common with the one in question.

As we have seen, the treatment of maladies on this elevated plane consist of special prayers known to all the religions, or in magical rites. But in order to be assured of success, it is necessary that the operator be qualified by the purity of his intentions and armed with an unshakeable faith in the effectiveness of his action. He does not act on natural forces, but addresses the superior plane and implores the grace of God in order to be able to care for his brother.

CHAPTER IX

EXAMPLE OF COMBINATION TREATMENT

The short theoretical exposé from preceding chapters is indispensable to the information that follows.

I am going to cite now a combination treatment that is completely foreign to official concepts. This treatment has been checked by trustworthy persons.

A subject of around 30 years, of fairly robust constitution, of apparently normal health, complains of feeling worries and sudden frights that often made it impossible for him to work. He said he had bouts of this kind since his infancy and lived in constant fear of these crises.

He tried hard to describe these sensations but his explanations were rather vague. He would suddenly see a light that would fill him with a feeling of terror.

From this light came a sort of spear of fire crossing a dark space and approaching him with some type of vibration.

He felt that he was going to be carried away along the luminous trace and finally engulfed in the blazing fire. The sensation of shock and total collapse translated into a cardiac worries, and his entire body began to tremble. The attack, which lasted about an hour, was always followed by complete prostration.

In his childhood, these crises were rather rare, but with age they became more frequent. Medicines aimed at calming his nerves and heart gave no relief. The patient lived in an incessant anxiety and slipped little by little towards melancholy.

It is interesting to note that during the 1914-18 war, the subject had been injured by a bullet in the heart area. This bullet had punctured the pericardium and exited by the back without causing mortal bleeding. As you can see, this case presented a very particular interest. In order to be able to act with complete knowledge of cause, of first importance is to address the horoscope chart of the subject.

Astrological study: Ascendent: Libra with Sun, conjunction Mars, quadrature Moon in Capricorn and quadrature Saturn in Cancer. I only mention the configurations that might provoke the pathological state of the subject that interests us.

Judged according to the scientific method, these givens lead to the following indications: 1. Sun – setting, in conjunction with Mars – danger

of injury by iron and fire; 2. Quadrature of Mars with the Moon and Saturn: aggravation of predicted dangers. 3. Quadrature of Sun with the same planets: nervous maladies.

Examined in the light of Kabbalistic astrology, the same indications furnish the following additions:

The birth sign, Libra, corresponds to the letter *Lamed* and as the sign is occupied by Sun and Mars (ascendant planets), we obtain two roots for the first House: *Lamed-Kaph* which establishes that the subject is found bound by another and the root *Lamed-Tau* which expresses a binding. The Moon, found in Capricorn gives the root *Beth-Ain* that means "a burden". But as this malefic combination of birth by quadrature, one obtains a new root *Beth-Ain-Lamed* that specifies an idea of completing possession of the prediction obtained by the scientific method: "nervous malady". The Moon being only a receptor element and acting by reflection (this is the character of the letter that corresponds to it), it is necessary then to look besides at the source of emanation. We discover it in Saturn in Cancer in semi-quadrature to the Ascendant, which, itself, receives ill regard (quadrature) from the Moon.

The root disengaged from the combination Saturn-Cancer is *Heth-Resh* of which the literal significance is "*hearth from which ardor escapes by radiation*".

Thus the seat of the harmful force is placed in this Saturn and Cancer combination. In taking the root of this combined sign with that of the Ascendant upon which it acts by giving troubles, one obtains thus a new root *Beth-Lamed* that again emphasizes what we have promoted because it means: "*a force that breaks the bonds of the body by relaxing them to excess*". And has as a material sign: "*an opening or a wound*".

Finally the key obtained by the reduction of the name of the subject that is located at the Ascendant gives the letter *Tzade* which, with the letter of birth, forms the root *Tzade-Lamed* and expresses: "*an effect that extends far into time and space*". Thus the complete prediction obtained by the chart studied Kabbalistically can be formulated as follows:

"The subject is found troubled by an entity that possesses him. This tie weighs like a heavy burden. This unknown force having its source in Saturn in the sign of Cancer provokes by its rays an injury in the astral body of the subject. This effect is not the result of a recent attack, but happened rather a long time ago.

An important question arises: how to find the zone of attack on the body of the subject? If one takes the letter *Lamed* in its direct correspondence to with the microcosm, one is oriented on the bile, according

to *Sepher Yetzirah*, and the kidneys after the Kabbalistic tradition of the Middle Ages. It has seemed reasonable to take *Lamed* in its macrocosmic correspondence and not microcosmic.

What does the sign of Libra represent? It is the equilibrium point of the zodiac, the pattern of the macrocosm, that is revealed to us by the six *Sephiroths* of construction as well as through the combinations of the sacred name. (See my *The Trilogy of the Rota*.)

So *Lamed* symbolizes in our case the equilibrium mortar which, in the body is the domain of the letter *Aleph*: the chest (lung, heart). The word heart, king of the body, *Malek*, confirms one more time that we are advancing because in the word (*Mem-Lamed-Kaph*), the *Lamed* is the point of equilibrium placed between the two letters and by this fact represents the same essence of the word heart. Kabbalistic study reveals to us an attack emanating from Saturn and that is manifest by a wound to the heart.

The result from the preceding is that the heart of the subject, from birth, had its *locus minoris resistenciae*, and it is precisely in this organ that it must have to receive the physical wound predicted by the configuration of the stars. These Kabbalistic-order deductions will be confirmed by the study of the aura of the subject, made by a clairvoyant who observes its presence from an obscure stain corresponding to the region of the heart provoked, according to him, by a shadowy ray hitting the patient.

The same sensitive, put into a deep hypnotic state revealed that the harmful bond had a karmic origin and referred to one of the prior existences of the patient. This confirmed, as we have seen, the Kabbalistic predictions.

Proceeding to examine the aura of the subject, and noticing its rather feeble nature and rather troubled aspect, it presented an obvious spot on the left side, around the region of the heart. This spot, at the moment of the crises, grew larger, and darkened, becoming more visible.

Magnetic treatment: Magnetic treatment was applied from the start. It consisted of magnetic massages leading to restoration of order in the centripetal and centrifugal currents. These normal currents were troubled by the oppression felt by the subject. These practices were accompanied by suggestions acting on the subconscious forces of the patient in view of raising in him the defensive action of *Nephesch* against the attacks from outside and to prevent the subject from falling into apathy.

This treatment will give a positive result rather quickly, raising the instinctive forces, which were noticed in the clarification of the aura. The subject felt calm and reached a certain point within normal life. However, the dark stain persisted and the access, somewhat less frequent, was still in

place. Marked amelioration during the first weeks of the treatment, stopped and the condition of the subject remained stationary.

This is then how one judges the appropriateness of a change of method. We decide to effect the transfer of the illness onto a plant, a transfer that is mentioned by several authors from the sixteenth century and is currently employed in the Orient.

CHOICE AND PREPARATION OF THE PLANT DESTINED TO RECEIVE THE TRANSFER OF THE HARMFUL INFLUENCE

In order to make a judicious choice of the plant that corresponds well with the subject, it is important to understand the following: this plant must be in rapport with the sign of Libra, relate to the dominant planet of the horoscope chart, and will initiate the symptoms according to the rule, “*similia similibus curantur*”. In other terms it will be necessary to operate with the curative forces from the malefic planet itself. As we saw in the chart, the only planet likely to influence the sign of the ascendant (Libra), the place of its rising, was Saturn. The other planets, setting or in exile, by this fact are under the influence of Saturn.

Other considerations of the second order, from nature to specifying the work, can resume like the following: 1. Choice of a plant native to Europe, 2. Plant with a rather rapid growth habit in order to be able to attain its entire development in several weeks (a herbaceous plant). We have thus chosen *Datura foetida*, originally from the Indies, but acclimated in Europe and corresponding closely enough to the subject as to the nature of the illness. A certain number of seeds are planted in order to study the conditions of germination. The average time of sprouting ascertained, these conditions can be adapted to the horoscope chart of the patient.

We know that it is impossible to find a sky that is identical to the natal sky. The Moon alone returns within a short enough time to the place it occupied at the subject's birth. It is necessary then, to base the plan on artificial light in order to make one of the seeds sprout at the moment closest to the one when the moon was found at the same point that it occupied at the birth. The other planetary influences must be realized by replacing the planets by their correspondences drawn from the mineral, vegetable, and animal worlds (example: for Saturn, lead, camphor, goat bone, bat bone, dryness, etc. . . .). These materials for replacement are placed in a pot full of purified earth (in which the seeds are planted), in lieu of the exact matter

from the corresponding planets (the pot having been oriented according to the cardinal points).

This done, one sows seeds successively at different times over several days which, after the preliminary study, must on average sprout at the opportune hour (Moon in Capricorn).

The first harvest was not satisfactory, the seed having germinated with too large a deviation from the desired moment. The operation had to be repeated during the following lunation to get the seeds closer together. This time, the result was obtained and two young shoots born at the opportune moment were saved and the others were eliminated. The two young plants were raised in the best conditions and when they had taken a certain vigor, one of them was dug up and the other watered regularly with water magnetized by the subject, in order to give it maximum intimacy with him.

During the two months necessary for the growth of the plant, magnetic treatment was continued and the results can be translated as follows: the subject became more calm, the episodes occurred at longer and longer intervals, the aura became clearer, but the spot persisted and seemed even to take on a sharper relief. One could compare it to a radiography of an opaque and foreign body incorporated into the body of the patient. The sensitive had the impression that a strange influence had penetrated into the aura of the subject. It seemed to him that he saw something like a dark ray coming to strike the subject and of which the source was lost in the distance.

A study of the cycles of lives of the subject oriented to this aspect revealed a karmic liaison with an entity that began to influence him in his present life. This influence was innate and constituted one of the elements of his real life. The study concluded: the harmful influence that the subject felt could be curbed with certain magical operations, but in order that these operations be effective, the influence must be transferred onto another subject. In order to not damage the equilibrium, it was necessary to replace the harmful influence with an equivalent beneficial one.

Parallel to the development of the plant of which we have spoken, one must, knowing the nature of the harmful entity, prepare a sort of impenetrable "shield" against this entity (a sort of pentacle), in order to block up the hole, if one can use this ordinary term, created by it in the aura.

In order to establish equilibrium that was lost at the moment of the suppression of the ray, it was necessary to discover an entity of the same order, but of beneficial influence, and to attract it to the subject.

HOW TO LIBERATE ONE POSSESSED

To free one possessed of a force or harmful entity that has gained possession over him is a most delicate operation. There is little written on the subject and most of the authors make only vague allusions. Note, however, that in most religions there exists an appropriate rite for these sorts of cases, but rare are the priests who know the process and who will consent to practice it should the need arise.

These rites consist of evocative orations for beneficial forces and in exorcisms of the possessing entity. The officiant, after having evoked the forces for the good on all sides of the subject, binds the demon that torments the subject with formulas obliging him to show himself and to leave his host. Here, the Christian religion takes the example of Jesus Christ who, having spoken to the demon, ordered him to immediately leave the possessed. But in the same way that Jesus permitted the demons to enter into the herd of pigs, the operator must, in driving out the entity, designate a place where it can transport its influence. This condition is essential in order to obtain a cure because such a dangerous force, left to error, could either return or attack another person. The disequilibrium created by an error risks causing unexpected nasty consequences. Here is why, before proceeding with an operation, it is necessary to have carefully prepared a sort of lightning rod-conductor that will attract the harmful influence. It is all-important that this conductor be in perfect correspondence with the subject and the malefic entity.

The grimoires that describe the process, the rites of liberation of a possessed person, and even the texts used by the church present a huge danger because the exorcisms that are pronounced there, even without a subject, are capable of evoking supra-natural forces from space. I have been able to verify this several times and I advise no one to attempt the experiment.

Briefly, in the case with which we are concerned, after three months of work we had successfully obtained the desired elements of cure: 1. a plant grown in closely related conditions to those of the horoscope of the subject, and closely bound to him since it was impregnated with his vital fluid; 2. a pentacle corresponding to the intended entity, having required long study and adaptations; 3. a way to attract a beneficial entity had been set in motion, promising success.

All was ready for operation on the astrologically designated day.

In order to understand the effectiveness of the shield, we resolved to stop the action of the harmful ray by blocking the way with the prepared

pentacle. How astonished we were when the pentacle, placed in the path of the ray, burned up before our eyes. This was for us a proof of its partial effectiveness since it provoked an effect that was never before witnessed, not on the skin, nor on the clothes of the possessed. On the other hand, this state of things showed us that an error had been committed in the composition of the pentacle, because in evoking the reaction of the entity in question, it was nevertheless not impenetrable.

More verifications were undertaken and new research was done permitting the correction of the error and of constituting a second pentacle, this time effective.

Finally the designated moment arrived and here is how it went:

All the details regarding the propitious moment, the necessary correspondences, the appropriate fumigations, were strictly observed. The subject was placed in a circle, lying on a cot. Inside the circle was placed the potted plant, which was in full vigor.

The subject was under the control of a sensitive who observed the modifications of his aura and noted the quality of the dark spot. In another circle was the assistant whose role consisted of supervising the fumigations.

After an appropriate ritual, the operator approached the patient and, having exorcised the entity, uprooted the malefic ray, which he transported to the plant, the wound in the aura covered at the same time by the pentacle-shield. Then, by the operations designated in advance, he evoked the beneficial ray of an opposite entity and had it penetrate by the forehead of the patient. All these operations were controlled by the sensitive who affirmed their success. Finally, all the assistants shifted the appearance of the evoked forms taking part in the magical work.

The sensations of the patient were the following: 1. The uprooting of the ray produced no impression; 2. By contrast, the moment of the entrance of the beneficial ray was strongly felt. He felt something like a nervous shock that made him start and cry out. Then he felt a burning on the forehead. The operation was immediately followed by a magnetic massage in order to reestablish the normal regime for the disrupted currents in the aura.

The plant receiving the transfer was in full bloom. The transference caused it to blacken and wither. In several minutes its leaves fell, and as the assistants watched, it was consumed, leaving only cinders as remains. The sensitive clearly saw the astral flame that incinerated it.

This treatment was crowned with success. The subject was freed from the nasty influence and from his physiologic symptoms. He could enjoy life, full of cheer and gaiety.

This case allows us to conclude that the application of the ancient hermetic method to the superior planes produces a decisive effect on the three planes constituting the human.
