## FOREWARD

The inexperienced reader may find it difficult to conceive of the possibility of diagnosing illness and conducting treatments from a distance, carried out by vibrations affecting the "witness" of the patient.

My research and experiments in this direction extending over numerous years seem to resonate among representatives of Official Medicine as well as among researchers of different countries. Here are several examples taken at random to show this.

Dr. Van der Sype (Belgium) ionizes the "par-soma" (part of the body, such as blood, hair, saliva, etc., what we usually call the *witness* of the patient) from a distance by appropriate medications that he projects via an electric instrument, the Hertzian waves serving as carrier waves. His preferred witness is a lock of hair, and he affirms having obtained appreciable success as a result of these treatments.

Dr. [Ruth] Drown of California (Rockefeller Prize) diagnoses from a distance using a drop of blood from the patient. She succeeds, according to her report, even in making radio-graphs (always at a distance) by introducing the drop of dried blood on a piece of blotting paper into an instrument at the same time as an unexposed film negative. The wavelength of the wave of the organ being photographed is sent into the circuit. She states that she obtains a photographic positive showing the position of a tumor, if there is one, as well as its exact contours.

Mr. And Mrs. De la Warr of England have constructed an instrument for diagnosing at a distance on a witness of dried blood. They also undertake cures and make radiographs, always at a distance and by using witnesses from the patient. Langson Day describes this process in his book, *New Worlds Beyond the Atom*.

I can give many more examples of the same kind, but it seems to me that I have sufficiently demonstrated that my idea of the possibility of diagnosing and treating at a distance by using the witness seems not only to be accepted but also practiced in many countries.

To my knowledge, the first to discover this possibility and use it with success was Paracelsus, Dr. Bombaste. He had, among other things,

compiled a "pleasant powder". When he treated a drop of pus from an abscess with the powder, the abscess was healed. I have succeeded in preparing this powder according to Paracelsus' recipe, and I am able to confirm its efficacy in a number of cases. In Egypt, for example, many suffer from what they call "the abscess of the Nile" during the floodstages of the Nile River. These abscesses are quite painful and form in groups of ten to twenty and more. Any treatment that one tries gives no results, and the patient suffers for two to three months during the flooding.

On many occasions I have tried Paracelsus' powder on these cases and each time experienced complete success. All that is required for prevention of formation of other abscesses and for a complete healing is to take a drop of pus from the first abscess and treat it with the powder,.

At the beginning of the century, I worked with de Rochas and I have been able to follow his experiments on exteriorization of "sensitivity" (an animal ability?) of a subject in a state of deep hypnosis. A glass of water soaked with the "sensitivity" of a subject was closely linked to him. The awakened subject quickly showed effects if a person touched the water thus charged. If he plunged his finger into it, the subject received a shock like an electric discharge.

These demonstrations by de Rochas as well as the formulae of Paracelsus inspire me to make known the principles of the method I developed during a half-century of my research and experimentation.

I can affirm with certitude the efficacy of treatment at a distance proven by thousands of cases. It is not a matter of suggestion, because the best results are obtained on animals and children, where the idea of suggestion is eliminated. In order to avoid any possibility of suggestion, I prefer to not be in direct contact with the patients, and often I have obtained healings without the knowledge of the patient.

In the second part of my book, *Radiation of Shapes and Cancer*, I explain the way in which I informed my work in order to detect and combat cancer. I have to add here several facts that are not included in the first edition and that show how official science approaches my ideas and confirms my discoveries.

In Chapter III of the Second Part of the same work I explain the role of the pyramid as an emitter of a beam having a wavelength shorter than Ultra-Violet, and its property of desiccation (often referred to as mummification) of organic cells.

From this wave I isolated a ray whose radiation destroys cancer cells. I have named it Pi because I obtained it from the pyramid, from which one can deduce the mathematical Pi (see Dr. A. Strauss, *Die Weltzahl Pi*).

Many experiments made with pyramids of different dimensions have demonstrated that a piece of meat or fish is desiccated (mummified) under the action of a ray emitted by the pyramid and remains in this state indefinitely. The mysterious ray was well-known by the ancient Egyptians who made great use of it. Egyptologues have long asked how the Egyptians could achieve such perfect preservation of their mummies and have made many hypotheses about this subject.

Here, for example, is what M. Warren R. Dawson in his book, *Magician and Leech*, p.50:

"It has not been long since I studied two well-preserved mummies from the Fourteenth Dynasty, although neither were their viscera removed nor had they been soaked in a salt-bath. Nonetheless, the two bodies were in a state of perfect preservation. The bodies had merely been desiccated and then covered with a resinous substance. The essential part of the mummification, the desiccation, is ignored by modern investigators.

In 1754, Roelle, after having examined a number of mummies, arrived at the conclusion that complete desiccation had been achieved (Roelle, *On the Embalming of Egyptian Mummies*).

In 1822 De Rougé said of desiccation: this operation about which historians never speak, was, without a doubt, the principal and most important process of the embalming (De Rougé, *Embalming Instructions*).

Dawson, in his book mentioned above, makes the supposition that the Egyptians had "an instrument which at the moment, we cannot possibly imagine".

If they would understand that it was use of the Negative Green beam, the question is resolved. Here is the writing of J.F. Balvanyi in an article that recently appeared in a Genevan journal under the title: "Unexpected Mummification.

*Five sarcophaguses placed in the chateau of Sommersdorf during the Thirty Years' War (1618-1848) recently have been the cause of a sensational discovery. The cadavers sealed in the enormous coffins were preserved nearly intact, without having been subjected to any mummification. . . The skin resembled Moroccan leather . . . They discovered strong radiations from the earth with a Geiger counter that happened to accompany an American officer inside the crypt. This new thesis about mummification gains strength from the dead animals found in the tomb: lizards, frogs, even a falcon, are all preserved in the same way as the human beings.*

This is an incontestable proof of the presence in the tomb of a telluric ray equivalent to the frequency of the pyramidal ray.

But we return to the question of cancer that was presented at the beginning of the main part of the work cited. Here is the position of the representatives of official science with regard to this question.

A German biologist, Gourevitch, had published results of some of his research concerning emanations of living cells. According to him in the human organism not all the cells emit radiations (I would have added: detectable by our physics instruments). He was able to observe, for example, that cells forming neoplasm (malignant tumors) radiate strongly, while those of benign tumors do not.

Concerning the physical nature of these mysterious radiations, the physicians Royter and Gabor have found their wavelengths to be around  $1/340$  millionths [?] of a millimeter. They have even been able to photograph these radiations.

Further, Dr. Mario Manzini, who rightly considers health as a state of cellular equilibrium, affirms that the normal neutron is negatively charged, and that in the case of cancerous proliferation, the charge of the neutron, for some unknown reason, changes its polarity and becomes positive. This accords with my discovery of the PI ray that is found precisely in the positive sector of the invisible spectrum.

Here is then where official science resides, and it seems to me that we can give each other a hand across the gulf that separates us, for we arrive at the same observations by following different paths.

I do not pretend to be able to heal every illness and especially all cancers, but I am sure of the right road, and I hope that others better qualified than myself will be successful at last in finding an effective way to master this terrible curse that seems to grow with the progress of civilization.

## INTRODUCTION

Several years have passed since the publication of my little book, *Radiations of Shapes and Cancer*. Since then, I have continued my research, and I have tried to clarify certain points that were not crystal clear during the publication of the book.

In addition, I have made a number of new observations and invented new instruments. These observations have permitted me to correct certain errors and to be more precise in my practice.

In the end it is for the reader interested in my work to clarify and to inform himself of the results of my latest discoveries that I have decided to make public in this book.

I do not pretend to possess a panacea for healing every ailment without exception, but I allow myself to believe that the numerous observations made in the course of long years of research could be used by physicians that are interested in the questions of the life of the human being as well as the life of the Universe.

For the ancient Egyptians, the Grand Architect – the god Tem, creator of the Universe – had as an epithet, “Everything,” and also “Mother-Father” of all manifest life. His first act to begin creation was dualizing into two opposing parts, of which one carried the name of “Great by his Unity” and the other “Great by his Multiplicity”. This act of dualization of the Creator is rigorously repeated in cell division in the living organism, a continuous process in the life of every being.

In the Middle Ages man was designated the Microcosm and the Universe the Macrocosm, the same laws regulating one just as the other, the large Universe the same as the small Universe. They said: *as above, so below*.

The working methodology that I present is in accord with this principle, which, besides, as I will demonstrate, preceded the Middle Ages. Based on the laws that regulate the perfect equilibrium established by Nature, I have looked for basic healing methods for human ailments that are different types of disequilibrium, in order to re-establish the equilibrium.

The fundamental law of the Universe is movement, or more precisely, vibration, in infinite variety. Sound is one vibration, light is another, but different; and matter itself, seemingly dense, is only another form of vibration caused by the eternal dance of innumerable electrons, neutrons,

etc. . . , each distinct form of matter having its own characteristic vibration. So one could say that the Periodic Table of Mendeleev presents a particular, complicated, yet precise, arrangement, choreographed where each element is represented by numbers according to the rhythm and the cadence that characterize it. From this point of view, one can understand what Dr. d'Arsonval meant: "Medicine of the future will not use drugs nor injections of any sort. The old therapeutic arsenal will be replaced by new radiations of which we are just beginning to discover." From this point of view, one can deduce that the efficacy of a medication comes not from its chemical composition, but more from the radiations that emit its composition and which aid in the re-establishment of the equilibrium of vibrations of the cells affected by the illness. Homeopathy seems to have understood this fundamental principle by "potentizing" medications in dilutions of greater and greater power. Chemical analysis shows no trace of the original medication submitted to numerous dilutions. And yet, the more dilutions, the more potent the remedy. We are still unable to determine with precision what happens, but one might suppose that it is a matter of a process similar to that of the disintegration of matter which provokes atomic radiation and eventually, explosion. The latest experiments with disintegration of the different elements, such as, for example, that of hydrogen, seem to confirm that hypothesis. Any chemical element in its normal state of inertia cannot show what it shows in its potentized state. The reader must not conclude that I have identified homeopathic dilution with atomic bombardment, which, itself, causes the disintegration of matter. What I point out is the effect of pulverization, or as the homeopaths say, the "dynamization" of the remedy, which, by diminishing its materiality (chemical) makes it emit a more considerable force that it does in its original state, just like disintegration of the atom releases a powerful energy that does not appear in the original state of the element. I simply want to draw the attention of the reader to the similarity and differences of these two principles.

Medical radiations projected onto a patient act directly on the complex of vibrations of an organ, and these radiations, if they are correctly chosen, re-establish its equilibrium more rapidly than medication alone.

The ancients were perhaps more advanced than we in this practice. Here is what Plato said on the topic of vibrations: "You must suppose that among the impressions continually received by our bodies, certain ones are absorbed by the body before arriving at the conscious mind and therefore do not register, but others traverse the body and mind by establishing a type of

vibration. Some of these vibrations are specific to the body or to the mind, others are common to both.” (Plato: *Phaedrus*)

But in addition to the chemical substances and the known modes of energy that penetrate the body for which they provide the material structure, man is the carrier of a force of life superior to known forces, superior given his activity, his intelligence. It is in harmonious exchange with the vital force that maintains and intercedes in the construction of our organic and fluid bodies; it is the human soul, the “*spiritus vitae*” of Paracelsus, says Dr. Baraduc in his work, *The Vital Force*.

Man is a complex being: in his body with all the complicated functions of endocrine glands, circulations of blood and lymph, nervous vibrations with the chemical laboratories of the kidneys, liver, and spleen, etc. . .

Man is not a perfectly evolved animal. And it is for this reason that Moses in the first chapter of Genesis describing the progressive creation of the individual beings calls the animal a “living soul” (*Nephesh Haia*). When Moses speaks of the primitive creation of man, fashioned of clay, he said, “and man became a living soul”. By this Moses accepted evolution of the creatures and placed man at the ultimate step of the creation of individualized lives among mammals, but as such, the more evolved, the final manifestation. Adam is not a proper name, as they say in translations of the Bible, but signifies literally “universal man” or in other terms, “humanity”. The particularity of the Hebrew language, where each letter, in addition to its phonetic property, corresponds to a number, means that each word represents a mathematical formula. And yet, the name Adam, written in Hebrew, ADM, transcribed in numbers: 1, 4, 40, which, reduced according to the numerical system of the Kabbalah, gives  $1 + 4 + 4 = 9$ . The 9 is the last figure of unity because 10 is already united to a higher echelon. Thus, judged numerically, the name Adam represents the end of a manifestation, its apogee, after which begins a new cycle. Only in the following chapter in Genesis is the distinction made between man and the other animals and this distinction is accomplished when God breathes his breath, the Divine Spirit, the *Nechamah*, according to the Hebrew. The Divine Breath, this *Nechamah*, is precisely Ten, the unity of a superior order that introduced man into the higher cycle by making him the carrier of the primordial Unity of the Creator. Thus man becomes the only terrestrial being gifted with three distinct elements: one part instinctive (*Nefesh*), one part animal (*Rouach*), and one part spiritual (*Nechamah*). The last act of the Creator places the human completely apart from the rest of Creation. He

becomes a unique three-part being "created in the image of God". Even the most evolved animals are only two-part, only possessing the instinctive part and the animal or emotional part.

I made this little incursion into the domain of ancient knowledge in order to explain the different methods that one must apply in order to understand the different parts of the complex human. Understandably, it is much easier to treat an animal than a human being precisely because the animal usually only presents physical disturbances. For each physical affliction of man, on the contrary, there are more or less strong repercussions in the superior parts of his being. Also, during a diagnosis, outside the direct action of the malady on a sick organ, it is necessary to research the effects that it exerts on the mental parts and the higher order that forms the whole human being. Both the ancient Egyptians and the Hebrew Kabbalists divided the three principle elements constituting the human into nine subdivisions of which each one constituted a definite region corresponding to the functions of the higher being of man. Complaints said to be of the mental order have their center determined in this nomenclature. But on the outside, even certain troubles that seem to be purely physical promote a repercussion in one of the higher centers, and it is by acting on the appropriate center that one effects the return of the equilibrium of the affected organ.

De Rochas, Reichenbach, and certain other researchers, were well aware of the possibilities of action in the etheric parts of the human complex producing reactions on the physical body. A renowned radiesthesist, Mme. Jacqueline Chantereine, drew concentric circles on the floor of her reception room, the largest having a diameter of 8 meters. She placed the patient in the center of the circle and walked her rods in the other circles by moving closer to or farther from the subject. The movements of the rods in one or other of the circles indicated to her which kind of complaint she was encountering. If it was a physical problem, the rod acted in the circle closest to the subject, but depending on the behavior of the rod in circles further from the subject, it would be an emotional, mental, or spiritual matter.

At the end of this book, I will give a more precise opinion on this kind of work and on the enormous possibilities this research can uncover.

I am going to stop this introduction here in order to begin presenting the details of my method. But before finishing, I must mention the words of my teacher, Colonel de Rochas: "One must never play with unknown forces." The danger is greater than one would think and the damages that

can be caused are sometimes irreparable. I must give this warning to everyone who attempts to apply the science of radiesthesia carelessly without sufficient preparation by serious study. Further, and this is of major importance, it is necessary to carry out work of this kind for the good, in order to lighten the physical and moral suffering of humanity. It is necessary, as is said in the Gospel of John, to be ready to sacrifice for one's fellow man.

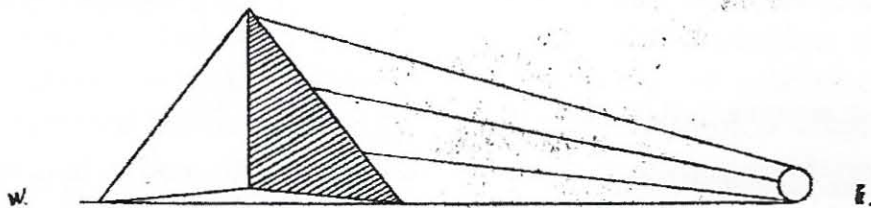

## CHAPTER I

### THE PRINCIPLES

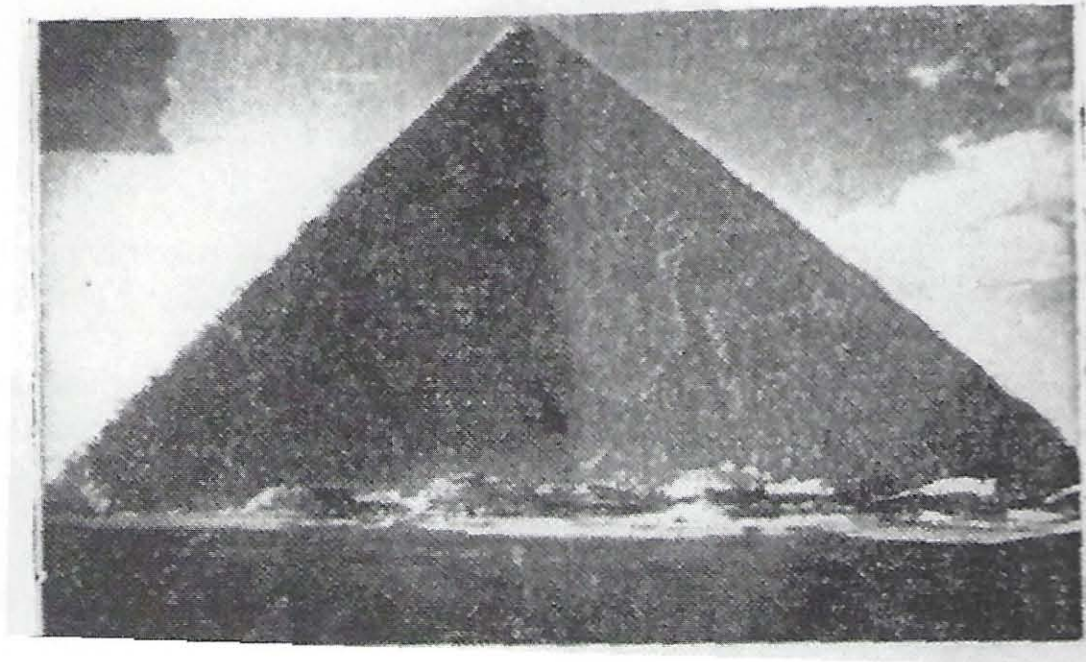

The fundamental principle on which my method is based is purely geometric. It uses angles and all the instruments described in these chapters are based entirely on this principle.

The terrestrial meridian serves as the basis; the worktable and the instruments must be strictly oriented on the North-South line. The operator stands in front of the table facing West, and having North on his right.

Most of the instruments that I use are made of wood, but it is very important to observe the way in which one cuts the piece of wood. Each object, even if it is not of steel, must be considered to be a magnet having its North and South poles. In a board, it is in length, that is to say, parallel to the grain of the wood, that we find the meridian of the wood, and North corresponds to Positive Green, and South to Negative Green. Before making a device (biometer, Naret board, etc.), one must, before everything else, recognize and observe the meridian line of the wood, and position the instrument in such a way that the North part corresponds to natural North of the piece of wood. The precision of the instrument depends largely on this condition. The ancients knew perfectly well the importance of exact orientation for everything. The Great Pyramid, for example, is oriented according to the cardinal directions. The proof of the precisions of this orientation is that at the equinoxes, when the sun rises precisely in the east, at the moment of the sun's rising and for several minutes afterward, the South face of the pyramid is divided vertically into two clearly delineated triangles, one illuminated and the other in shadow.

This phenomenon proves the fact that the south face of the Great Pyramid is slightly concave, and the rays of the sun coming from the east first illuminate the triangle to the west while the eastern triangle is still in shadow. At sunset, the effect is reversed.

# INFRA-RED PHOTOGRAPH OF THE SOUTH FACE OF THE GREAT PYRAMID AT SUNSET

The shadow clearly contrasts the two parts of the south face that it appears to have a ridge down the center.

This effect is sufficiently clear even today when the surfaces of the sides of the pyramid are rough and bumpy and not smooth. It is easy to imagine the clarity of this shadow when the pyramid was covered with its polished white limestone. The covering stones were removed in the ninth century under the orders of the Caliph Ma-mun, son of Harun al-Rashid.

The large triangles that form the faces of the pyramid seem to fall from the sky like rays of the sun, when, veiled by clouds, the sun slips through for a moment, showing its beams.

— A. Moret

We draw the sun emitting its light like a spray of rays. — A. Moret

The triangle is the symbol of zodiacal light. — H. Brugsch.

The pyramid-shaped point of an obelisk symbolizes the rays of the sun in stone.

— Obelisco vocantes

Solis numini sacratos, Radiorum ejus argumentum est in effigie. — Pliny the Elder

Further, three thousand years before our era the Chinese performed astronomical research and found divinatory predictions by means of an instrument having at its center a yin-yang, and later, a compass, which are for them equivalent. This mysterious figure, the yin-yang, symbolized the two opposing principles on which Creation is based.

*Considering that the Yin and the Yang fill up the heavens and the earth, that all shape births shapelessness, that the heavens and the earth are harmonious responses, the ancient sages (ChenJen) said: there is a great transformation (t'ai yi), there is a great origin (t'ai-tchou), there is a great beginning (t'ai chen), and there is a great unwinding of the things (t'ai son).*

Lao Tse

*These are the two activities, which, by combining in diverse proportions, constitute the basis of all that exists in Nature.*

Dr. Vergues: *Chinese Medicine*

While the two principles are in correct proportion and while they are not changed in their rhythm, the being plays in perfect health and vice versa.

The Yin-Yang equilibrium is perfect when the line passing by the two centers (that of the black part and that of the white part) corresponds exactly to the terrestrial meridian; black to the North and white to the South. This equilibrium holds true for the macrocosm and the microcosm, notably when concerning human health.

All deviations of the line joining the centers of the Yin-Yang from the meridian, thus forming an angle with it, constitute disequilibrium. This rule applies to all my instruments described in the following chapters.

Dr. Abrams made the following observation: While examining a patient, he had discovered an affection of the organs, which, according to his method, were treated with success by electronic irradiation of a certain order. Wanting to make a demonstration of a typical case to confirm his theory, he invited his students to assist him at an irradiation session. But he was surprised when, in reproducing the same experiment on the same subject, he did not observe the same effects. After having long reflection upon the reasons for his failure, he suddenly remembered that during the demonstration, the patient had been placed differently, at another angle to the North-South meridian than he had been during his previous treatment. By placing the patient at the first orientation, he reproduced the prior effects. This experiment proved the wisdom of the correct orientation.

The principle of a diagnosis according to my method consists of establishing, for a particular organ, the angle that it forms with respect to the meridian, the angle indicated by the instrument. The larger this angle, the more important is the seriousness of the disequilibrium. Once the disequilibrium is detected, the treatment consists of finding whatever medication reestablishes the equilibrium, or even to project this medication with another of my instruments to the deficient organ, at a different angle, always with relation to the meridian. This is that angle which, by irradiation, reestablishes the equilibrium. In the following chapters, I will explain in detail how this can be effected with the aid of the instruments that I describe.

Finally, since all life on the earth comes from the sun, it is important to take into account that the principle angle that one has just established is in harmony with solar movement.

The spectroscope reveals to us that light rays seem to be, so to speak, uncolored, but are in reality composed of seven principal colors that we call the solar spectrum. But are the different colors of the spectrum not the result of various angles formed by the refraction of the solar rays?

Everyone knows that when a prism is placed in a light ray penetrating through a narrow slit, the prism will decompose the light ray into seven colors: red, orange, yellow, green, blue, indigo, and violet. But what is less well-known, is that the intensity of the spectral radiation is not uniform, but changes from hour to hour. That is to say that at a certain moment, the maximum intensity is that of red, while after a certain amount of time, it passes to orange, then to yellow, and so forth, until violet, returning again to red and following the same rhythm through the entire spectrum. These variations of intensity of the different colors of the spectrum show precisely the changes of the angle that the sun forms with the terrestrial meridian in the course of the daily rotation around the earth. The time during which a color predominates is always the same in the same day, but changes from day to day and also according to the different seasons of the year.

In the chapter treating the question of the solar clock I will explain in detail how one can take into account the intensity of a color of the spectrum in any given moment.

The ancient Egyptians already knew the phenomenon and had adapted all their religious ritual and other functions constituting the framework of their life to vibrations characterizing the different hours.

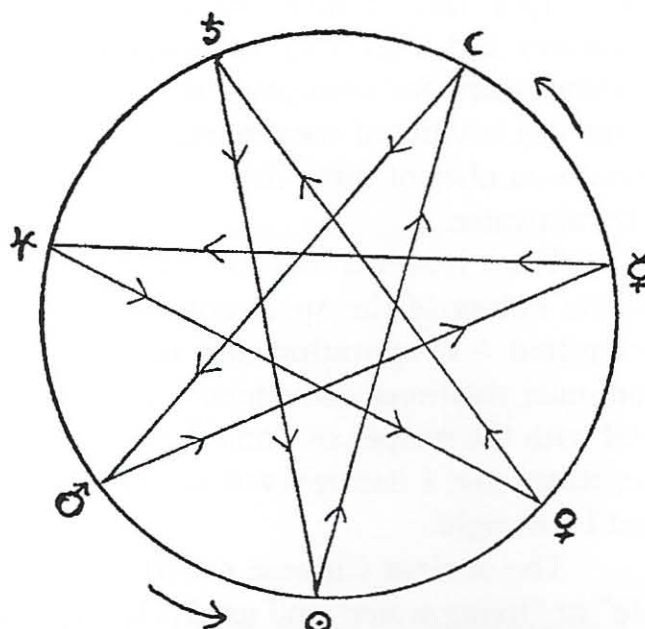

They divided the 24 hours of the day into two distinct parts: the daytime hours and the nighttime hours, "day" beginning at sunrise and terminating at sunset, and night beginning at sunset and ending with the

following sunrise. The day as well as the night are divided into twelve parts called "hours", but it is evident that the length of the daily hours were different than those of the night and varied according to the seasons, the hours of the day not being equal to those of the night except at the time of the equinoxes.

To measure time, the Egyptians used sundials during the day and during the night *clepsydras* — instruments measuring the time by the volume of water running from one basin to another.

Keeping track of the time based on the solar radiation, which differed from the official time, is discussed in the hermetic works of the Middle Ages under the name "magical hours". Each of these hours was ruled by one of the seven planets (which correspond to the seven colors of the spectrum). The order of the planetary influences for the hours of the day is the following: (according to the medieval grimoires): Mars, Sun, Venus, Mercury, Moon, Saturn, Jupiter, of which the whole cycle, once ended, repeats always in the same order forming thus a continuous chain of planetary influences (or of colors) throughout the 24 hours of the day. Each day of the week in its turn was ruled by a specific planet, but the order of the planets for the days of the week was different. Sunday was the Sun; Monday, the Moon; Tuesday, Mars; Wednesday, Mercury; Thursday, Jupiter; Friday, Venus; and Saturday, Saturn. The cycle of

the hours achieved one daily round every 24 hours making a perfect continuity through the week, each planet rising heliacally corresponding automatically to its ruling day. To facilitate their research the sages of the past times imagined a star with seven points such that they could predict what day or hour a planet was dominant. We will return to the question in the chapter on the solar clock.

So the first principle at the basis of my method is the angle formed by an element with the meridian. The second principle is that of continuous movement, which rules the celestial bodies, the atoms of the macrocosm, like those of the microcosm.

As one can understand, these two principles are in strict combination because, on the one hand, it is movement that creates the angle, and on the other, the angle orients the movement. By describing my instruments, I will attempt to demonstrate the action of the principles that I here advance.

Concerning the second principle, that of movement, here is an example to illustrate my thoughts.

In my preceding book, *Radiations from Shapes and Cancer*, I have mentioned that the fact that giving water a rotating movement changed its spectral constitution. Let me explain.

In radiesthesia, rainwater responds simultaneously to all the colors of the spectrum, except to the “dark” colors infrared, black, ultra-violet, etc., while water from a river, a spring, or a tap only responds respectively to one single color. In cities, in order to sanitize water and to destroy microbes, they put chemicals like chlorine into the reservoirs. Due to this interference, the color radiated by the water varies from infra-red to black. This water becomes, then, so to speak, dead — neutral.

The ancient Chinese well knew these properties of water, and it is for this reason that they used for curative purposes only rainwater or water from glaciers that they saved in jade vases. All the recipes of Paracelsus specify that rainwater must be used or the medication will be ineffective.

I have reproduced certain recipes of Paracelsus and I am sure that this was important. I then researched the reason for this particularity of rainwater and after long experimentation, I observed that if one uses any random water, for example from a tap, which radiates some color, and if one gives it a rotational movement in a clockwise direction, this water after a certain number of turns begins to radiate all the colors of the spectrum just like rainwater.

Thus, it seems logical to me to deduce that rainwater is charged with all the colors of the spectrum as a result of the movement to which it is submitted — evaporation and return to the earth in the form of rain — continual rotational movement. In order to check my deductions, I made a trial with the recipes of Paracelsus, this time by replacing the rainwater with the water that I had revived artificially by rotations and the result showed that I was right.

The ancient Chinese called the rainwater in the jade vases “water of life” or “living water” and used it to treat various maladies.

I have noticed that water revived by hand rotation had effectively curative faculties, notably in that its regular use returned digestive organs to a perfect state, notably that it re-established the normal functioning of the

intestines in cases of persistent constipation without which it would have been necessary to use a laxative.

On the other hand, if one gives water a counterclockwise movement, it becomes noxious, as if it were poisoned. One of my physician-friends wanted to test the effect produced by a water turned inversely, and swallowed a large gulp of it. He felt a burning in the esophagus and for two days a certain sensitivity of the intestines.

It seems to me then that one can conclude the existence of an ordinary beneficial creative movement for all manifestation of life as well as a destructive, noxious movement that acts against the laws of nature.

This appears to be confirmed by what happens in the macrocosm. Astrologers, since the most ancient times, for example, have noticed "retrograde" movement of a planet, even if its nature is beneficial, changes it to maleficent. Further explanations are too lengthy for present purposes.

In the following chapters, you will see how to apply the principles of movement that are more constructive than destructive. Constructive movement reinstates the equilibrium of the forces of the organism. Destructive movement can be used to paralyze the vibration that provokes disequilibrium or, in other terms, the vibration that characterizes illness.

The two principles on which my method are based being established, we proceed to the detailed description of the instruments, how they detect a disequilibrium, and how they re-establish it.

## CHAPTER II

### THE INSTRUMENTS

In my preceding books, *First Steps in Therapeutic Radiesthesia* and *Radiations from Shapes and Cancer*, I have described certain instruments that I used for my research: the Biometer, the Naret board, the Escargot, the Universal Pendulum. I have also described the projectors of curative vibrations, once the vibrations have been determined by the aforementioned instruments. They are: cylinders, the arrow, the Lakhovsky oscillator, the hemisphere, and the pyramid.

I will not resubmit their description. Instead, I will describe the new instruments that I have invented since then.

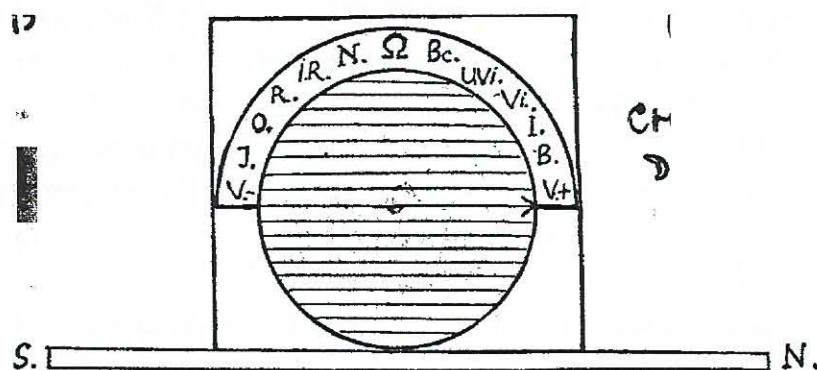

#### 1. THE WAVE FINDER

The reader will remember (see *Radiations from Shapes*, p. 80) that I used projectors in the shape of cylinders on the surface of which were drawn helicoids at different angles of inclination. These cylinders are effective and have rendered many uses in non-serious afflictions. Their only faults lies in the fact that at first their fabrication presents difficulties in obtaining the exact angle of the radiation of a precise color. In other words, it was necessary to have a large quantity of cylinders on hand. And finally, they did not always project only pure colors. Very often the color re-establishing the equilibrium was found between two colors, for example, between red and orange, or between yellow and green, etc. This required the making of a variety of cylinders and it became even more difficult to make them in such a way that the angle of inclination was precisely the angle of the intermediary colors.

So I looked for a simpler way to resolve the problem and that would give in addition greater amplitude from the whole group of colors by permitting me to use intermediary colors.

From research with the aid of my collaborator and friend, the late Mr. Capes, electrical engineer, we were able to observe that a simple line drawn exactly parallel to the meridian with which another line formed an angle gives a weak radiation and that by modifying this angle, one could change at the same moment the color or vibration emitted.

This observation permitted us to invent the instrument that I call the Wave Finder, which consists of a ruler oriented North-South and that serves as a base. At each end of the ruler is a small platform on which the witnesses are placed. A disk of around ten to fifteen centimeters of

diameter is mounted above the ruler and at the same level. The disk turns on a pivot at its center. Parallel lines are drawn (or cut) on the disk at a distance of one-half centimeter from each other, the middle line representing the diameter of the disk. This central line is marked at one of the ends with an arrow that constitutes the indicator of the instrument. The correct placement of the indicator is of prime importance, because upon this depends the precision. If the arrow is not placed in the correct spot, all the indications of the instrument are false.

At the beginning of this book, I indicated the proper way to cut an instrument from wood. I have insisted on the importance of observing above all the natural polarity of the wood in which the grain constitutes the meridian, to the extremities of which are found its North and South poles. I have also explained that the North corresponds to Positive Green and the South to Negative Green, which causes the pendulum to gyrate counterclockwise [*sinistrogyre*]. In order that the instrument function with precision it is necessary that the middle line, otherwise called the diametral line of the disk, correspond exactly to the North-South polarity of the piece of wood and be parallel to the base ruler. Once the diametral line is oriented North-South, the arrow is placed at its Northern-most point. This arrow indicates the colors as the disk is rotated. The disk is fixed on a square platform by means of a central pivot on which it may freely turn. The different colors are marked on a semicircle drawn from the west side on the platform supporting the disk (the west side placed with regard to the base ruler). The colors are spaced 15° apart with subdivisions of 5° to indicate the intermediary colors. If the disk is big enough, subdivisions of 1° can be

given for even more precision. The colors are given in the following order from the North: + Green, Blue, Indigo, Violet, Ultra-Violet, White, Omega, Black, Infra-Red, Red, Orange Yellow, Negative Green.

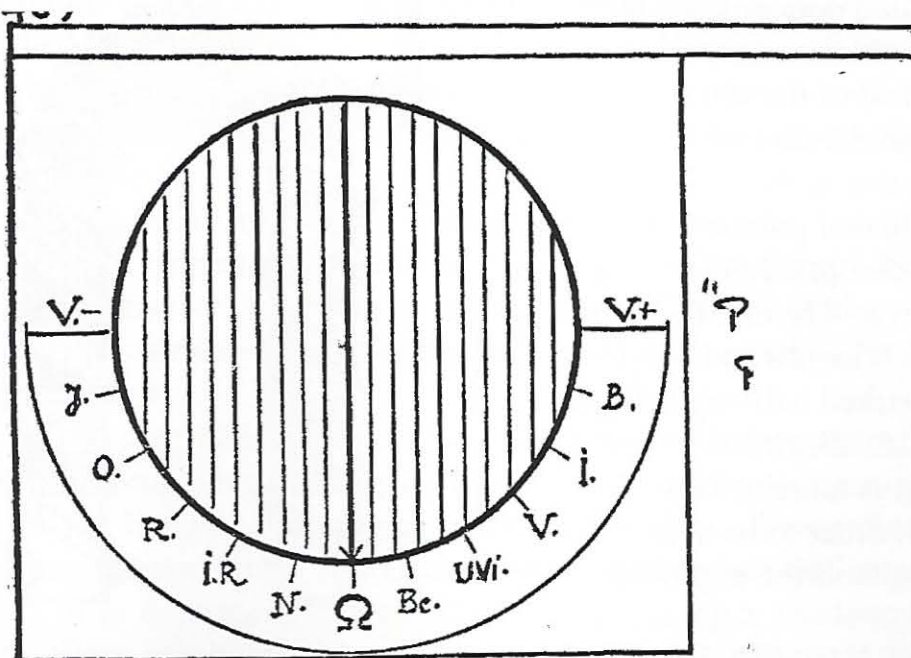

If the indicator on the diametral line of the disk is correctly placed, that is to say toward the natural North of the wood, when the arrow points towards one of the colors inscribed on the semicircle, the parallel lines form an angle with the line of the base ruler that emits the color. But if the indicator is not correctly placed, the instrument is rendered completely false.

This "wave detector" is extremely sensitive, and the least discrepancy of the angle indicating the color instantly stops the Universal Pendulum adjusted to this same color.

This instrument can be compared to the tuner of a radio, with which, by manipulating a dial, one obtains the desired wavelength. The difference consists in that the radio tuner is activated by electric current, while the wave finder functions in an autonomous way, simply by the change in the angle formed by the parallel lines and the line of the base ruler.

It is possible to amplify this instrument by joining it to a wall with a wire, which, I have mentioned before, conducts telluric waves.

In place of using the cylinders, this instrument can be used like a projector of waves with a little modification. Placed vertically on a support, the ruler now above it, forms a projector through its north end, the other end being cut even with the square platform. I call this projector "little pistol" [*pistolet*] because its shape resembles a pistol.

## 2. MAGNETIC PROJECTOR

I have used magnets for many years to reinforce the colors or to project an ionized medication. Over the course of my experiments, I have noticed how the magnetic meridian plays an important role in the effectiveness of a projection. I have observed that the projection of all the "positive" colors (after de Rochas), that is to say, red, orange, yellow, infra-red, and black must be oriented to the South, while the projection of all the "negative" colors, blue, indigo, violet, ultra-violet, and white must be oriented to the North.

For many years I was happy with these two orientations, but with some recent experiments, I noticed that the way in which a magnet is oriented plays an important role.

I experimented by turning the magnet in various ways so that it made an angle with the meridian and I noticed that this way different vibratory effects could be obtained that did not correspond to the colors, but to different vibrations that were nonetheless based on the law of the angles. Many illnesses that did not respond to treatment by colors — which responded to no color — are influenced by being exposed to a magnet oriented to a particular angle. I then constructed an instrument using an iron horseshoe magnet or a bar magnet, wound and amplified by a spiral of isolated copper wire, is suspended by a sleeve of wood in a box. The end of the sleeve goes out through the lid and carries an indicator in the form of a needle that points to figures on a dial placed around the sleeve. The dial is calibrated from 0 to 120 and by subdivisions marked halfway between the figures: 5, 15, 25, etc. This calibration is more or less arbitrary, but in order to be able to compare results, if the exposition

THE MAGNETIC PROJECTOR

of the elements is correct, the numerical nomenclature of the instruments used must be the same. In this way, my students that use these instruments can always ask me to check their use of therapeutic elements by indicating the figure from the dial of which they were made.

The calibration of the magnetic projector must also be made along the direction of the meridian, so it is necessary to find the exact position of the magnet which, confirmed by the pendulum, responds to Positive Green. This position indicates the North pole of the apparatus and must be distinctly marked on the dial, because everything depends on the correct orientation of the instrument. The north point is marked "zero" on the dial; from this point the divisions are 10, 20, 30 and so on in a counterclockwise direction. In the bottom of the box that holds the magnet, there is an opening for the placement of a witness that can be submitted to the radiation of the magnet.

I have observed that the instrument with the magnet is especially useful for cases of nervous afflictions and cases that do not respond to treatments by colors and also in cases of certain afflictions of the endocrine glands, the brain, and spinal cord tissues.

### 3. THE YIN-YANG

In ancient times, in place of saying "north" or "south" they said: "midnight" and "noon". The latter expression remains today: in French, we say "le Midi" for the South. The Chinese at the time of LaoTzu used the same expression and this inspired them with the coloration of the Yin-Yang: black for the dark, night, the North, and white for light, daytime, the sun at its height, the South.

In order to remain in perfect equilibrium, the Yin-Yang must be oriented black part to the North and white part to the South. I have said in a preceding chapter that the Yin-Yang for the Chinese is the symbol of the equilibrium as much as for the human, the Microcosm, and for the Universe, the Macrocosm.

One can then say, based on this Chinese information, that the two elements composing this mysterious figure represent opposing forces that must be in balance in order to maintain stability. These elements can be considered respectively as positive and negative, masculine and feminine, etc. Yin is dampness, the rarifying force having a tendency to descend; while Yang symbolizes inner heat, its nature is dilutive; it is always in movement. In relation to man, Yin governs the heart and lungs, in general

the thorax, and the Yang the intestines. From this fact, one could say in reference to the Hebrew Kabballah that the Yin is from the domain of *alpha* and the Yin is the domain of *mem* (For details, see my *Trilogy of the Rota.*). According to the Chinese there are twelve principle meridians (King) through which flow vibrations according to their positions, either Yin or Yang, along the meridian and which determine the shape of a particular equilibrium of a given manifestation.

The Chinese diagnosed illness by pulse examination, taking into account the predominance of either Yin or Yang. They judged the state of the lungs by observing the nose; the liver's condition by the eyes; the cheeks and tongue correspond to the heart. The end of the nose to the stomach; the shoulders to the kidneys. They also took into consideration the gait and handwriting in order to draw conclusions that gave them precise information about the general state of the illness.

Chinese acupuncture, the efficacy of which has been proven by numerous European physicians (see, for example, *Astrology and Acupuncture*, by Dr. Emerit), is based on the Yin-Yang principle. Dr. Ferreyrolle has made successful acupuncture demonstrations at L'Hôtel Dieu against Parkinson's disease, paralysis, and asthma.

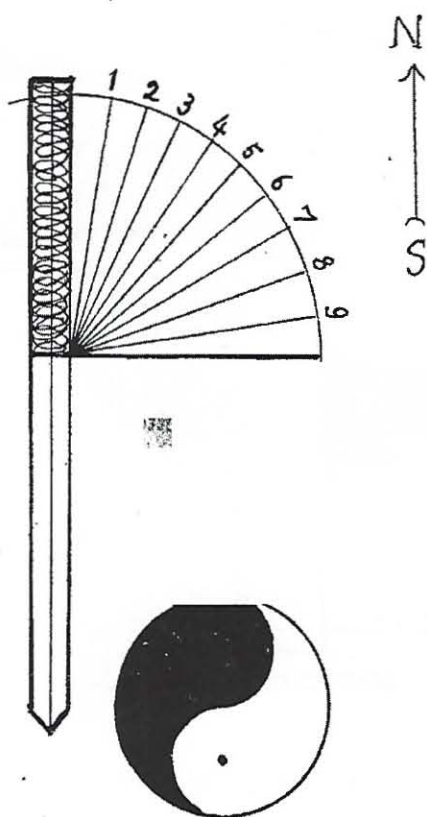

The two opposing principles that the Yin-Yang symbolizes recall the two colors, one positive, the other negative, that de Rochas used for treatment in establishing natural equilibrium. At that time, at the beginning of the [20<sup>th</sup>] century, radiesthetic usage of the complete color spectrum had not yet been discovered; it only became known after the useful discoveries in radio were made. De Rochas only used Red for positive and Blue for a negative color. If he detected a state of disequilibrium in the home of a patient, he looked for the positive or negative cause of the failure. Then having established the origin of the ailment, he treated it with vibrations of the opposite order and I must say that in certain cases, he obtained very interesting results.

I carefully keep a sketch of the human body that I made in 1904 when I worked under de Rochas' direction. On this sketch, the fluid vibrations are marked in red lines for the left side and blue lines for the right side of the body. We are reminded of the Yin-Yang.

In order to equalize the emanations of Yin and Yang, I have imagined a small board at one end of which a Yin-Yang is placed, with a line calibrated in degrees at the other. To amplify the vibration of the Yin-Yang, a spiral of copper wire is inset into the wood along the North-South line drawn on the board. Like all the other instruments, the board must be oriented parallel to the North-South meridian and the Yin-Yang turned so

that the line crossing the centers of the black part (oriented toward the North) and the white part coincide with the meridian. This position presents the perfect equilibrium of the two opposing forces. In order to determine the state of health of a person, place his witness in front of the Yin-Yang on the board and swing the pendulum above the numbered wedge related to the color of the patient, above the copper spiral. If the person is in good health, meaning in perfect equilibrium, the pendulum will swing along the North-South line. If, on the contrary, it shows some failure in his health, the pendulum will swing along the line and begin to describe an angle with it by swinging above the segment. The larger the angle opens up, the more serious is the condition.

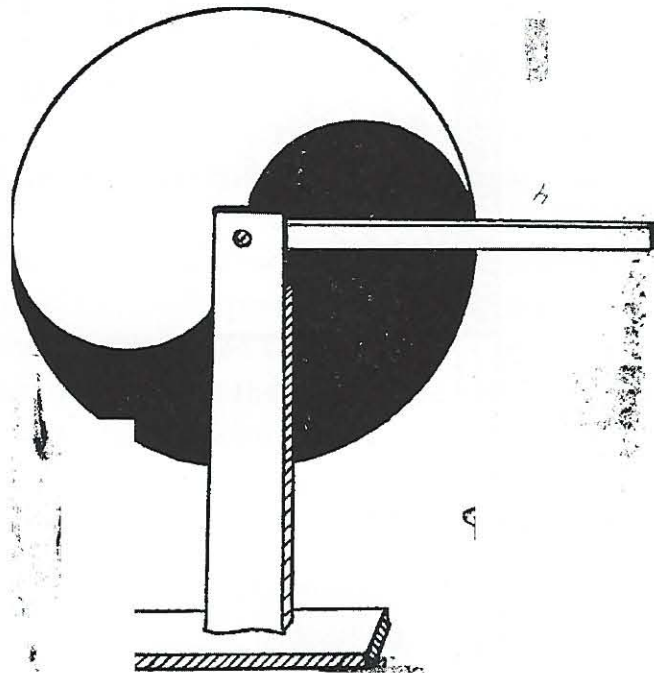

THE YIN-YANG  
BOARD

In order to determine the Yin or Yang nature of the illness, the Yin-Yang can be slowly turned on its pivot while continuing observation of the movement of the pendulum. At the moment when the pendulum is seen to slowly return to the North-South base and when it truly swings along this line, the position of the Yin-Yang will indicate if it is necessary to increase the positive or the negative radiation in order to re-establish the equilibrium of health.

In order to measure the variations of the different positions of the Yin-Yang, I have marked twelve points around it corresponding to the twelve meridians. The board described above, complete with the Wave Finder, described earlier, serve to find the combinations that will establish the equilibrium of the individual.

Based on this same principle, I have made Yin-Yang projectors, marked exactly like the Yin-Yang on the board. After having found which of the meridians will re-establish equilibrium in a given case, I set the angle on the projector to the same angle and expose the affected organ to its radiation, or even more, if it is a general affliction, I simply expose the witness of the patient to the radiation.

THE YIN-YANG PROJECTOR

I use the radiations of the Yin-Yang in cases where the patient responds neither to the colors or the magnet.

Finally, there is one other application possible with the Yin-Yang, but this time in combination with the Ba-Gua. As the name signifies in Chinese, eight principal trigrams made of long lines and lines cut in the middle are used in combination to form the sixty-four hexagrams. It would require a long explanation in detail to describe the functioning of the Ba-Gua, of which I possess an authentic ancient example. Those who would study this

question can find the details of this system in the *I-Ching, The Book of Changes*.

I have made several applications of this instrument with a certain success in cases of mental derangement, notably in the case of schizophrenia. But I must add that I have been unable as yet to pursue this research sufficiently since I have not treated enough cases to be able to establish the laws. I simply mention these possibilities in the hope to one day return to this subject and to give it more precision.

## CHAPTER III

### THE SOLAR CLOCK

In the first chapter I mentioned the fact that in the course of the day the intensity of the vibrations of the different colors of the spectrum emitted by the sun changes from hour to hour, or more exactly at equal intervals that were formerly called "magical hours", which do not correspond exactly to the official hourly divisions.

In order to establish the length of a magical hour in a given day, it is necessary to use an astronomical ephemeris. Let us use, for example, 10 June, 1957.

According to the ephemeris for Central Europe, the sun rises at 4:34 AM and sets at 8:24 PM. The duration of this day is then 15 hours and 50 minutes. Division of this figure by 12 gives approximately 79 minutes, representing the length of the magic hour for this day.

The length of the nighttime magical hours is calculated using the time from the setting of the sun to its rising the following day. Sunset being at 8:24 PM [20:24], this figure is subtracted from 24 hours, which gives 3 hours and 36 minutes, to which is added 4 hours 34 minutes being the time until the following sunrise. This makes a total of 8 hours 10 minutes for the length of the magical hours of the night. By dividing this time by 12 the duration of one nighttime magical hour is obtained, which is 48 minutes 3 seconds. This length is only valid for 10 June.

Let us take another example: 10 December, 1957. Sunrise is at 8:03 AM and sunset at 4:40 PM. The length of the day is then 8 hours 37 minutes and the duration of the night is 15 hours 23 minutes. Proceeding in the same fashion as before, we arrive at 43 minutes for each hour of the day and 1 hour 24 1/4 minutes for each hour of the night.

To calculate the beginning of a certain hour on a given day, for instance, the fourth magical hour of 10 December, add 3 magical hours to the time of sunrise: (8:03) plus (3 x 43) 2 hours 9 minutes. Thus the fourth magical hour of 10 December begins at 10:12 AM official time and lasts until 10:55 AM.

As I have said already, the ancients assigned one of the seven known planets to each magical hour: the sun, Venus, Mercury, the Moon, Saturn,

Jupiter, Mars, and they always follow the same order. But what interests us is not the planets, but the colors of the spectrum that correspond to the planets. Thus, since 10 December 1957 is a Tuesday, the first hour of the day will be governed by Mars, and therefore, by its spectral color, red. The second is governed by the Sun, orange, the third by Venus, yellow, and the fourth by Mercury, green.

I had to explain these things before describing the solar clock because it is based precisely on these calculations.

Nevertheless, in order to establish the dominant color of the spectrum at a given moment, one can also proceed in another fashion. Taking a neutral pendulum in the right hand, make the left hand an antenna by pointing it toward the sun. An assistant slides bits of fabric in the different colors of the spectrum under the pendulum, in turn. As soon as the piece thus presented matches the color emitted at that moment by the sun, the pendulum begins to gyrate.

Many times we have verified this process by working as described above, and each time the results were identical. The information determined by the pendulum conformed to that obtained by the calculations made for the given moment.

After many experiments we developed the solar clock. A wooden sphere turning on a pivot is oriented according to the meridian in such a way that natural North of the wood corresponding to +Green is oriented to the north of the meridian. An arrow pointing north is attached to the pedestal by a support bringing it to the level of the equator of the sphere without ever touching it. The exact orientation must be established at the moment at which the sun emits the +Green of the spectrum. This point is marked on the equator of the sphere. Then, setting the Universal Pendulum at Blue, search for this color in the extension of the ray at a distance to the right of +Green and mark it on the equator. The distance between Green and Blue will indicate the distance between each pair of colors. The same distance as Blue from Green separates Indigo from Violet, and on the other side of +Green to the west, Yellow, Orange, and Red. The entire range of the spectrum occupies a small section of the equator of the sphere. (See p. 40.)

Since only one color is dominant during the course of one corresponding magical hour, the Universal Pendulum set for this color turns as soon as it is presented before the arrow oriented North-South along the meridian. As soon as the magical hour arrives at its end, the pendulum slows its movement and stops completely. Then the sphere is turned so that the following color is placed opposite the arrow pointing North, and the Universal Pendulum set for this new color will begin turning strongly.

If one has enough patience, he can observe the changes of color that represent precisely each magical hour.

As soon as the end of the spectrum is reached, that is to say, the color Violet, it is necessary to turn the sphere in order to see the beginning of the spectrum from Red.

This clock can have diverse applications. For example if one has a need to calculate the color (planetary) of a planet or some other object, it suffices to orient the sphere on the color of the hour and then to present the object that one wishes to examine successively in the extension of the rays of the different colors, and as soon as the object is in the corresponding color ray, the neutral pendulum begins to gyrate. This can be used, for example, in order to know the color of a plant, because to maximize its potential, it is necessary to plant it precisely at the hour that corresponds to its nature. Anyone who wants to try this experiment could determine at what point the plant develops best in these conditions. Likewise, a sick plant exposed to spectral radiation that is natural to it will quickly regain its health.

These experiments with plants gave me the idea to do some trials with humans, and I have noticed that the radiation emitted by the solar clock is superior to that from any other instrument. I think that this proves the fact that with this instrument one can capture natural spectral radiations directly emanated by the sun, which is, as we know, the distributor of all life in our system.

In order to effectively use this kind of treatment, it is first necessary to find, using the instruments described in the preceding chapter, the color that re-establishes the equilibrium of the patient, and then expose his witness to the action of this color. The exposure must be made at the hour when this color is dominant, because it is at this time that its radiation is the strongest. The witness is exposed before the arrow pointing to the north.

The difficulty with this treatment resides in the fact that the exposure only lasts around one hour, the duration of the magical hour, and must be stopped exactly at the end of the magical hour.

If one pays no attention and does not meticulously follow this rule, all the effectiveness of the treatment is annulled.

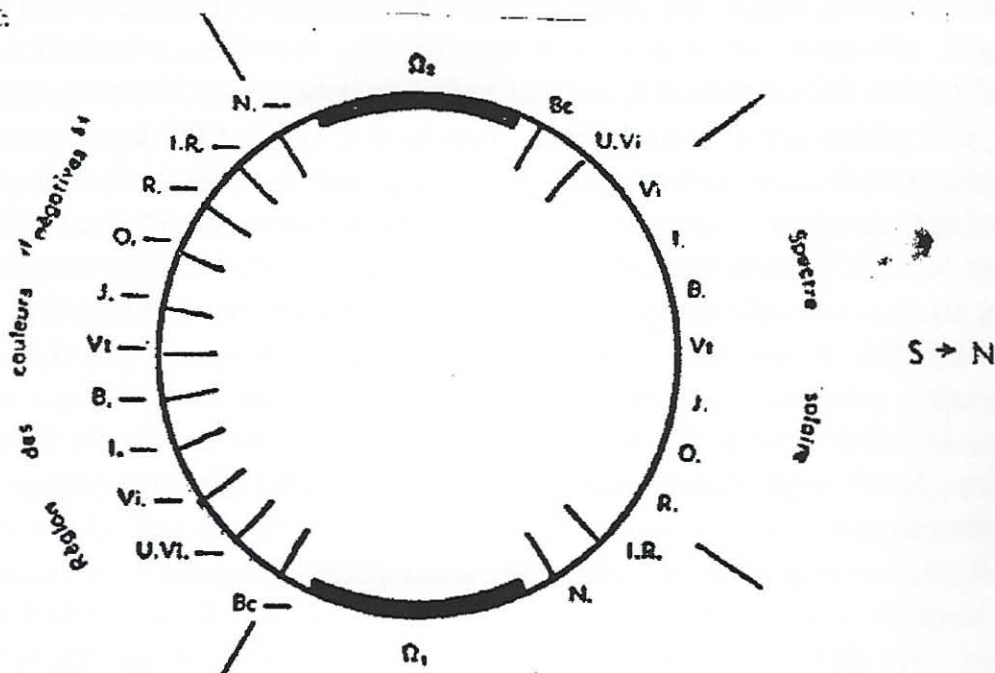

This type of treatment requiring repetition at the corresponding magical hours demands attention and constant working on the part of the operator.

There remain only a few words to say about the vibrations that are emitted by the largest part of the sphere found on the opposite side from the part that emits the spectrum. The vibrations diametrically opposite to those of the spectrum represent the negative colors. Each color of the spectrum has its negative color. There is then a negative red, a negative blue, and naturally a negative green. I confess having made a mistake in accepting the name proposed by Messers Chaumery and de Belizal, "Negative Green", as the most powerful wave of unknown nature, which is found in the Pyramid. On the sphere of their Universal Pendulum, it is placed between black and white. It has nothing in common with the negative green of the spectrum because, for example, on a dial it is not found opposite, but at a right angle to +Green. This fact, that on the pendulum of M. Chaumery, this mysterious color is found opposite +Green and coincides with the negative green must be because in the sphere that constitutes the Universal Pendulum, the constructor has artificially arrested the natural movement of the colors of the spectrum by breaking the symmetry of the figure in introducing the two nails at the intersections of the meridian with the equator. This unfortunate coincidence caused the inventor to think that the mysterious vibration of the pyramid was that of Negative Green. Green, as I stated above, is found to the south as much on the Wave Finder as on the magnet, but this is not what M. Chaumery thought; it is certainly not the vibration found in the Pyramid. I beg my readers to excuse me this error in my earlier book. The Pyramid emits a band of rays from which I have succeeded in isolating the Pi ray. The band of radiations from the Pyramid contains both beneficial and noxious vibrations that relate to the higher being of man. The principal vibration from the Pyramid is totally different from any other known wave, and while it causes the pendulum to oscillate, it is not a part of the makeup of the spectrum.

At the end of this book I will say several words about this vibration perhaps on the astral realm or even the spiritual? In any case, a deceased person, once liberated from his terrestrial body, responds to this mysterious vibration, and it is in this fashion that one can, as much as possible, understand the state of the soul of the disincarnate.

As for the negative colors, they are all harmful, representing the destructive movement, the same order as the counterclockwise (sinister) gyration. All the negative colors are unstable, they continually change place with the positive colors, according to the magical hours. This is why at one

In summation, here are the positions on the circumference of the solar clock of the characteristic vibrations that I have discovered up until the present:

In conclusion, I advise not exploring in daylight in any case involving the south side of the sphere of the solar clock, because this can have unpredictable consequences. Even I, myself, as well as my assistants, have paid dearly for having attempted investigations from this side without having taken sufficient precautions to protect ourselves.

It would be erroneous to consider that Omega signifies a definite end. This is only the end of a cycle, of a certain manifestation after which begins the following cycle, a new manifestation. Life is eternal; it is only conditions that change. In an Egyptian papyrus from the twelfth century before our era, it is said: "Eternity, having no end or beginning, is a circle." (Anana Papyrus). On the other hand, is it not said in John the Evangelist that it is necessary that the seed die and be buried in order that it manifest the life of the plant (John 12:24)? This accords perfectly with the Egyptian idea that explains morning (the rising-birth of the sun) by the word BKA; but the same word with another determinant would mean: to be pregnant.

One can conclude from all of what was just said that the state that we call Omega is that of the formation of life, the grand mystery that causes the germinating of a seed buried in the darkness of the earth, expels the chick that forms inside the envelope of the egg, and finally births man out of the uterus of its mother.

Returning again to the Egyptian teaching, we see that the sun Ra represented the visible manifestation (incarnate life) while Osiris was the vital force working under the veil (of apparent death) but who constitutes the principle permitting the radiation of the sun. This is how we understand the *Kabbalah*: "the lamp that nourishes the flame". Without oil the lamp would have no flame.

This is then what the vibration that I have named Omega represents:  
IT IS THE ETERNAL VITAL FORCE RADIATING FROM THE  
ENDLESS SOURCE OF LIFE.

## CHAPTER IV

### DIAGNOSIS AND TREATMENT

In this chapter I will give some examples of my diagnostic method and the way to apply the different projectors to the various treatments.

When I receive a patient's witness, I first of all establish "his color", that is to say, the vibration that characterizes the individuality of the patient. I use the adjustable [virtual] cone pendulum for this; the changes of position of the sliding disk on the shank change the color to which the pendulum responds. The colors of the spectrum are marked on the shank in graduations; Infrared and Black are found at the bottom, while Ultraviolet and White are at the top. The Omega of the lower range is below Black, and above White is the Omega of the remaining range.

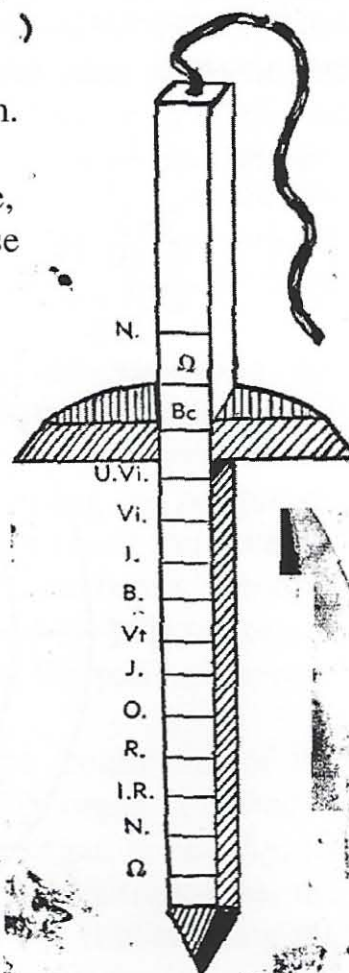

The invisible colors are marked on the shaft for other research that can be done with the same pendulum.

Six colors of the visible spectrum characterize the human being: Violet, Indigo, Blue, Yellow, Orange, and Red. As you can see, I have omitted Green, because in all my long practice, I have never met a human being responding to this color.

The individual color now established, the pendulum set at this color gyrates clockwise above the witness.

Then I put the witness on the southern extremity of the biometer and slowly I move the pendulum along the ruler, which is marked in figures from 0 to 200. I take note of the figure above which the pendulum swings back and forth. This figure will be the indicator of the vitality of the patient. As a general rule, it varies between 90 and 100 for an adult. For a child, it can exceed 100 and go to 103 or even 105. For an elderly person it can be a bit below 90. A middle-aged person normally shows around 95. The vitality figure is noted on the patient's personal record.

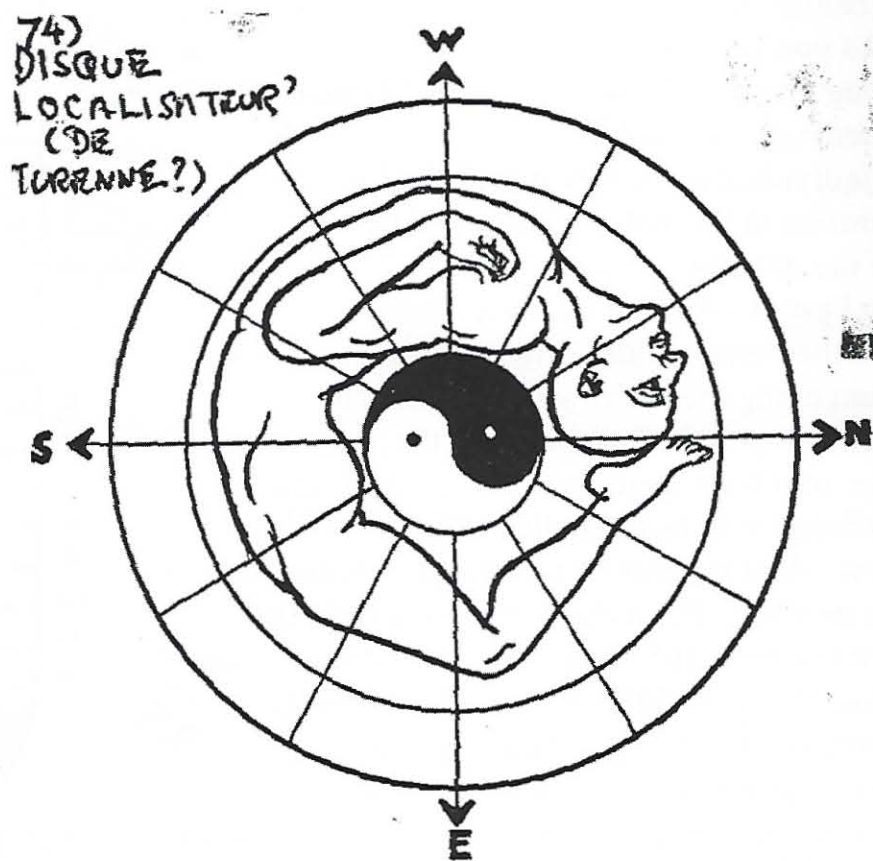

The second operation consists of checking whether the patient's general state of health is good or bad. In order to do this, place the witness at

the center of the Escargot, which is oriented so that Violet points to the North. The pendulum, always set for the color of the patient, is moved in along the extension of the Violet line toward the North, and its responses are observed. If it gyrates counterclockwise in complete circles, the general state is good. If it describes ovals, it indicates a light derangement of health. If in place of gyrating, it swings, it indicates a more serious derangement. But if it gyrates clockwise, this is an indication that the disturbance is very serious.

After observing the general state of health, we find the affected organ.

In order to locate the affection, I use a little device invented by an Italian physician whose name I have, unfortunately, forgotten. This instrument represents the body of a man in the form of a circle, the sole of the foot touching the head. Two lines crossing at a right angle indicate the cardinal points. The instrument must be oriented before using. Place the witness at the center and place the pendulum above it. In cases of derangement, after several gyrations the pendulum begins to swing across the part of the body that is in disequilibrium. Swinging, for example, across the middle of the body can indicate that it is the liver, stomach, pancreas, or even the kidneys that are affected.

After this preliminary evaluation, it is necessary to have access to anatomical charts that are as detailed as possible. To use the chart, take the witness in the left hand along with a rather long pointer (a knitting needle, for example). In the right hand, hold the pendulum, set on the personal color of the patient. Slowly walk the needle over the organs that you wish to examine, observing the movement of the pendulum. As long as the organ touched by the needle is in perfect health, the pendulum will gyrate counterclockwise, but as soon as it touches a diseased organ, the pendulum begins to swing or even reverse the direction of the gyration. With sufficient experience, one can in the same way not only detect the sick organ, but, for example, in the case of a tumor, find its exact location and follow its contours. When examining an organ such as the liver, when the needle touches it, the pendulum begins to swing, it is an indication that it is deranged, but if in pursuing the examination on the anatomical drawing of the anterior and posterior surfaces, and, if possible, cross-sections of this organ, one notices suddenly that the pendulum stops and gyrates clockwise, this indicates that at this location there is something very serious, for example, a tumor.

By moving the needle back and forth from side to side, one will understand by the changes of the movements of the pendulum where the tumor begins and where it ends. The complete and exact form can be determined. In a number of cases, x-rays have confirmed these determinations by pendulum.

The step following the examination consists of evaluating the intensity of the condition of the organ. To obtain this with precision, use the Naret board. Place the witness on the designated South position, and the drawing of the affected organ on the North position. Bring the pendulum, always set on the color of the patient, to the center of the board and give it a slight swing along the East/West line (perpendicular) on the board. Observe the pendulum's change of direction and swinging toward the affected organ. Note the angle of inclination and write the number on the patient's record (the larger the angle, the graver the patient's affliction).

To check this result, place the witness on the South end of the Biometer on which is placed the drawing of the identified organ. Proceed in the same way as to find the figure of vitality. If the organ is healthy, its figure will correspond to that of general vitality. In the contrary case, the pendulum will indicate a lower number, for example, the vitality being 90, the disequibrated organ will be 70. This difference shows the intensity of the illness; the greater the difference from the initial number of vitality, the more serious the ailment.

Here is an example of a patient's record:

Vitality: 90

General state (swinging of the pendulum; the circle is the sign of counterclockwise gyration).

Liver < 5 70/90

Proceed in the same way for examination of other organs and in cases of other affections, note the results in the same manner.

Often diseased endocrine glands are the cause of an organic malady. In this case, in order to determine which gland is responsible for the trouble, it is necessary to closely examine the glands (pituitary, anterior and posterior; pineal; thyroid; parathyroid; adrenals and adrenal cortex; pancreas; and in the case of a child, thymus). The cause can also be found in the spinal vertebrae, but the most difficult case to detect is that of a cerebral affection that manifests, for example, by total or partial paralysis. I cannot give a course in anatomy here, and I advise those interested in my method to procure good, highly-detailed anatomy books showing mutual relationships of the organs and cross-sections at different levels that will promote exact location of the affection.

The diagnosis thus established, we proceed to how to re-establish the equilibrium of the diseased organs. This return to health can be obtained in various ways.

## 1. TREATMENT BY MEDICATION

In order to know if a medication fits the patient, use the Naret board and the Escargot. To obtain an indication on the Naret board, place the witness at the South and the organ to the North, as for the examination, and the pendulum swings at the angle determined earlier. Then place a medication on the witness for verification. If it is effective, the pendulum returns toward the vertical line. For the medication to be totally effective, the pendulum must return exactly over the line at 45° in the Southwest sector of the board. If the pendulum does not arrive at this line, that is an indication that the medication, while it may be perfectly good, does not suffice for healing the patient. If, on the contrary, the pendulum remains at the same angle that it had indicated for the illness, it means the medication is without effect. But if the opening of the angle initially indicated during the

examination increases, and the pendulum inclines towards North, the medication is detrimental to the patient.

Results from the test on the Naret board should be checked on the Escargot. Place the witness and the drawing of the organ at the center of the Escargot; then place the medication on top of them. If the medication is good, the pendulum will gyrate counterclockwise along the Violet line. If the medication is not appropriate, the pendulum will swing back and forth instead.

The Escargot is also used to determine the correct dosage of a medication. If the medication is in tablet form, put it on the witness, at the center of the Escargot, first one, then two, and so on, observing the reaction of the pendulum. As soon as the dose is correct, the pendulum gyrates counterclockwise, but when the dose becomes too strong, the pendulum will begin to swing back and forth.

Remove the tablets one by one until the movement of the pendulum indicates the maximum suitable dose. For medication in the form of drops, place a small liqueur glass on the witness (still posed on the Escargot) and pour the medication into it, counting drop by drop, stopping as soon as the pendulum begins to swing. This change of movement indicates that one drop too many has been poured.

## 2. TREATMENT BY IRRADIATION

As has been said in an earlier chapter, the effect of a medication often results not from its chemical composition, but from the radiations that it emits. Naturally this is not the case for medication used to destroy microbes or any other form of parasite like penicillin, for example, or sulfamides, mercury, etc. But most of the other medications can successfully be replaced by appropriate radiations. The advantage of irradiation is that the radiation can be directed solely to the affected organ and have no influence whatsoever on any other organ. While many medications, however effective against illness, are hard on the digestive organs, in the case of medication taken by mouth, or subcutaneous or intravenous injection, they can tire the heart, create inflammatory states, etc.

This is why I often prefer replacing medication with appropriate irradiation. In order to find the radiation that will re-establish the equilibrium of a deranged organ, use the Wave Detector (See p. 26) and proceed in this way. Adjust the Detector to the color of the patient and place the witness on the South platform of the instrument. The pendulum being

set for the color of the patient, hold it above the North platform. As long as the platform is empty, the pendulum turns the way it did directly above the witness itself, but as soon as the drawing of the afflicted organ is placed on the platform, the pendulum begins to swing. At this point, begin to turn the disk of the wave detector very slowly, thus changing the angle formed by the parallel lines with the ruler at the base, until the exact moment when the pendulum begins to gyrate clockwise. Note the color indicated by the pointer, whether it is pure or intermediate, between two colors. Set the Pistolet to exactly the same angle as the Wave Detector, and expose the drawing of the organ with the witness of the patient behind it to the radiation.

After this exposure with the device, it is necessary to verify the efficacy of the treatment on the Naret board, the Biometer, and the Escargot in exactly the same way as was done for the examination. If the exposure was correct, on the Naret board the pendulum will swing at  $45^{\circ}$  to the Southwest from the vertical; on the Biometer the figures of general vitality and those for the organ will be identical, and on the Escargot, the pendulum will gyrate along the Violet line. But there are some cases in which one cannot find the healing angle on the Wave Detector. Then one must have recourse to other instruments.

Before explaining how I proceed in these cases, I must repeat that often one can successfully combine treatment by medication with treatment by irradiation. This is done by ionization of the medication found to be effective and projected onto the witness with the Pistolet set for the curative color.

In many cases I have been able to obtain much faster results by combining the two methods of treatment. For example, in the case of cardiac failure, one can ionize the camphor administered by fixing an ampoule at the end of the Pistolet, which is set for the curative color. I have been successful with ionization of penicillin, sulfamides, and many other medications. But the most spectacular effects are produced by the ionization of morphine in cases of post-operative pain. Without any injections, I have succeeded in stopping the pain by ionizing the witness of the patient with a narcotic. This carries great advantage, because the patient is not disturbed by an injection, and the effect of the ionization is longer-lasting than that of an injection. Further, it produces no disagreeable reaction such as nausea, headache, etc.

If the correct healing color to re-establish equilibrium is not found on the wave detector, there are other instruments that project waves. First, one should try the Magnetic Projector [See p. 28]. Proceed thus: with the

witness and the afflicted organ placed on the Naret board with the witness at the South and the organ at the North, put a drawing of the organ with an attached witness on the base of the magnetic projector and turn the handle slowly while observing the pendulum over the Naret board. At a certain moment the pendulum will begin to return to the Southwest line, then pass it. When it arrives at  $45^{\circ}$  in the Southwest sector, stop turning and note the figure indicated by the arrow on the dial. It is necessary each day to verify that this figure has not changed. If by observing the Naret board you find that it does change, the position of the magnet must be corrected.

Finally, if the Magnetic Projector does not give the desired indication, one has recourse to the Yin-Yang. In order to know if the Yin-Yang re-establishes equilibrium, there is a special board described earlier [See p. 31]. Place the witness, or the witness with the drawing of the organ, at North on the Yin-Yang, and launch the pendulum along the spiral. If it makes an angle with the North-South line, turn the Yin-Yang slowly until the angle is straight again and the pendulum swings on the line of the spiral. Then expose the witness to the Yin-Yang Projector, set at the same angle that was found on the board. Then verify the effectiveness of the exposure by the processes described, that is to say, with the Naret board and the Escargot.

## CHAPTER V

### SOME OBSERVATIONS

In this chapter, I will give some observations of encouraging results from treatments applied according to my methods, drawn from my long years of practice.

#### 1. ASTHMA

Based on the cases of this ailment that I have been able to observe, I estimate that it results from a derangement of the vagus nerve (pneumo-gastric). While different manifestations of asthma could lead one to suppose that their causes are different, I have noticed that it is always the vagus nerve that is the origin of this affliction. The therapeutic methods applied depend on the part of the nerve that is attacked and that one must find.

An anatomical drawing clearly shows the parting two vagus (pneumo-gastric) nerves at each side of the medulla oblongata. The first branches go toward the throat and the thyroid, then a bit lower form the cardiac plexus; following the esophagus, they go around the stomach. The left nerve ends but the right descends into the intestines near the appendix. In order to establish the exact location of the nerve necessary for re-establishment of equilibrium, use the anatomical chart in the way already described by using the witness and needle held in the left hand and the pendulum in the right. The movements of the pendulum indicate the diseased section. Proceed then in the finding of the color, or curative vibration. All cases that I have observed could be cured by projecting the color through the Pistolet.

It goes without saying that children suffering from asthma are much more easily treatable than older people. The longer a person has suffered from this malady, the more it hangs on and requires a longer time for healing. In any case, my treatment is a proven therapy and absolutely effective, except for long-standing cases, and it can provide some relief even for an aged person.

## 2. PARATHYROID

It is very fashionable now to remove the tonsils as soon as they present an inflamed condition. This operation is sometimes dangerous and can cause unexpected complications. As long as the tonsils are not decayed or chronically infected, it is not necessary to deprive a human being of the natural protection that these little organs offer by intercepting certain microbes.

I have noticed in a number of cases that the ailment that visibly manifests in the tonsils causing a large inflammation of the throat is the result of a disturbance of the parathyroid. The four little lobes of the gland are lodged in the body of the thyroid on its posterior; there are two on each side of the trachea. The function of these glands is little understood, but their experimental removal in animals causes complete metabolic trouble and leads quickly to death. This is why, in operating on the thyroid, strict attention must always be paid that the parathyroid is not touched.

I have had truly spectacular results in several cases of children suffering sore throat and very high temperature.

After exposing the parathyroid for one single night, the temperature comes back down to normal.

In order to act effectively on the parathyroid, one must first determine which of the four lobes is affected. It is rare to find the four glands simultaneously afflicted. Ordinarily only one side is affected, or more likely only one substance that needs to be treated by the appropriate vibrations. To determine which one is in disequilibrium, use the needle and the witness and observe the movement of the pendulum to indicate the location of the ailment. Then look on the Wave Detector for the color that re-establishes equilibrium, and project this curative color with the Pistolet.

## 3. CANCER

Since the publication of my last book on the treatment of cancer, I have had the occasion to observe some cases. I have noticed that it is an error to think that one can treat all cases of cancer in the same fashion. That is to say, by the Pi ray. As I have already mentioned, there are a great number of afflictions that are classified as cancer, but they are in reality very different from each other. I will say the same again: there are forms of cancer that are exactly opposite from each other. It seems to me now that we can classify cases of cancer into two categories: those that are favorably

influenced by Pi radiation, and those that the Pi ray activates. For certain people this vibration can even cause cancer. The latter cases, which I call "inverted cancers," had to be treated by radiations diametrically opposed to those that healed the first cases.

An explanation is required. The cancer that I considered as direct and for which I described the treatment in *Radiations of Shapes and Cancer*, lent itself to treatment by Pi radiation. Pi, as I have already said, was found in the beam that I erroneously called Negative Green, but which shall henceforth be named *Omega*. After the book mentioning it was published, I noticed that for cancer and certain other serious maladies, *two* examinations were required: 1) Find the curative ray that reestablishes the counterclockwise movement of the pendulum by using the Wave Detector as has been explained, and 2) Find the radiation characterizing the ailment itself.

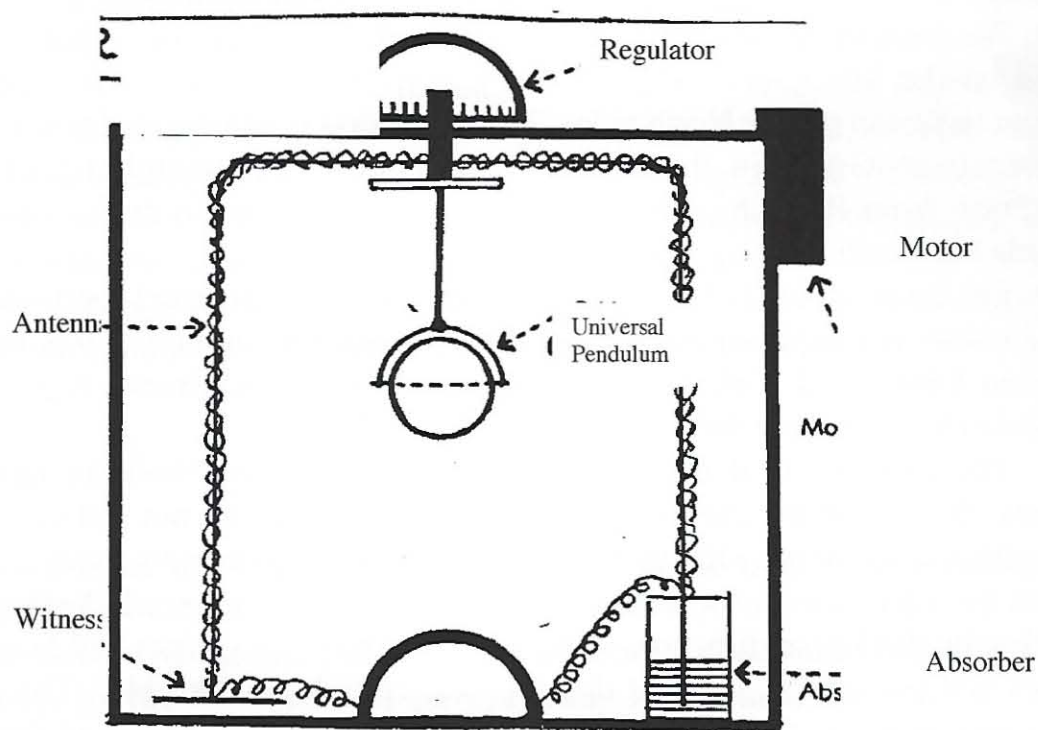

After ascertaining the latter, proceed in this way: place the witness as usual on the South platform of the Wave Detector. Now place the afflicted organ on the witness, not on the North platform as before, but on the South platform with the witness. By turning the disk determine the color that makes the pendulum gyrate. As soon as the pendulum begins to gyrate counterclockwise, note the color that is characteristic of the illness.

For immediate cancer [the curative ray, above] this color is found near Green on the South side, which is, as I say, the true Negative Green by relation to Green on the North side. The separation is ordinarily from 4 to 6 degrees from Green in the direction of Yellow. (Remember that the separation from Pi in the Omega band is also around 6° from the vertical towards the North.)

For inverse cancer [the ray characteristic of the disease] the location of the colors is exactly opposite, that is to say that the curative ray is found between Green and Yellow at approximately 6° from Green, while the radiation characterizing the illness is found near Pi.

The experiment demonstrated to me that the projections of Green-Yellow that must be curative for inverse cancer were not sufficiently powerful enough to act effectively on a tumor. After numerous experiments I have tried to unravel the illness with the spherical Universal Pendulum, gyrating in clockwise direction. Various experiments on water and later on worms and snails, etc., showed that this was completely feasible. The first idea came to me to try this kind of procedure when I had observed that, if one places the sick organ on the witness at the South location on the Wave Detector, and turned the disk, at the moment when arriving at the individual color of the patient, the Universal Pendulum gyrated by itself in

counterclockwise direction. This seemed to be an indication that in order to return to a normal state, it would be necessary to act inversely on the illness. And, I have tried to make the spherical Universal Pendulum, while regulated on the color of the illness, gyrate counterclockwise and after a hundred turns, I observed that the illness was affected and that the gyration of the cone pendulum, set for the color of the patient, returned to normal when one placed the witness at the South and the drawing of the affected organ to the North of the Wave Detector. This operation of unfolding of the illness is very tiring for the operator and after several minutes of work, he feels completely exhausted. His vitality on the Biometer falls to 20 and he does not recover his powers for at least two hours. I think that this proves the fact that using the left hand as an antenna pointing at the sick organ causes one to absorb the illness by the force emitted by the pendulum gyrating counterclockwise. It would be necessary to find then a solution that can resolve the problem without danger to the operator. After many tries I have succeeded in constructing an apparatus in which a motor executes the work automatically. This instrument allows me to help without fatigue in most cases of inverse cancer.

Electric Motor for Turning the Pendulum

The process is simple, but demands extremely precise regulation. Begin by finding the color of the illness with the Wave Detector as I have indicated; then set the spherical Universal Pendulum to the exact mark representing the vibration of the illness and set it in motion. During this time, the operator, equipped with a cone pendulum set for the color of the patient, follows the movements of the pendulum from the North side of the Escargot on which the witness and the drawing of the afflicted organ are placed. It is necessary to have two witnesses: one placed in the instrument and the other serving for observation.

At first the pendulum will swing along the extension of the North/Violet line of the Escargot. After several minutes it will begin to make an oval motion, then counterclockwise circling. The time varies from 5 minutes to a half hour, according to the intensity of the ailment, but ordinarily it takes between 15 and 20 minutes. It is not necessary that the operator observe without stop, because this would not be fatiguing. Checking every 5 or 10 minutes is sufficient. When the "unwinding" is complete, the pendulum of the observer stops by itself and this is the moment to stop the motor as well. Verification of the effectiveness of the treatment is accomplished by placing the witness and organ on the Naret board as if for the examination, and, if the setting has been correctly made, the pendulum must swing on the line at  $45^{\circ}$  to the South and gyrate counterclockwise on the North line of the Escargot.

Ordinarily at the beginning, the "unwinding" must be repeated every day, then every two days, and then at longer and longer intervals. But there is another, more exact, way to verify the success of the treatment. On each spherical Universal Pendulum, along the equator, are numbers and letters marking the names of the colors. To Pi the corresponding figures are from 1 to 2, then they get larger. Black is 4, and so on. On the patient's record note the figure after each patient's treatment indicated by the color for unwinding. An amelioration will be noticed, if after several days the treatment and the numbers get larger, that is to say by stretching from Pi. But if one notices that the figure from the first unwinding remains unchanged or even if after it rises, it falls, this is not a treatable case, or it requires and extra-long treatment.

The same instrument for "unwinding the illness" can be used with success in order to put an end to noxious telluric waves that are often found in houses and which are the cause of many maladies that afflict their inhabitants. One proceeds exactly in the manner described, that is to say that after having found the color (wavelength) of the noxious ray, unwind it for the necessary amount of time. I have used this process effectively in a

number of cases. (Note: For a witness, Use a floor plan of the infected house and orient it to the cardinal points.)

I think that the lack of success in the treatment of cancer by X-ray certainly proves the fact that these rays are used for all cases without distinction, and without taking into consideration the category to which the case belongs. For cases in the first category, the X-rays can sometimes be useful, but for the cases of inverse cancer, they are clearly dangerous and only help to accelerate the development of the illness as it would be if it were submitted to Pi radiation.

After twenty years of observing cases of cancer, here is my conclusion: certain cancers can be healed by the methods that I use. There are even cases of spontaneous healing, but they are rather rare. Most of the cases can be arrested in their development, the tumor remaining static, and this can last for years on the condition that irradiations continue. If radiation stops, the ailment returns to growth. There are forms of cancer that metastasize, meaning that new areas appear in other organs that had not been previously affected. These new locations are not necessarily in organs close to the first tumor. Often the new formations appear far away from it. For example, it frequently happens that cancer of the kidney will be followed by a sarcoma of the femur or some other form of cancer of the bone. In this way there can be different kinds of cancer simultaneously, for example, a carcinoma of the kidney and a sarcoma of the bone. The form most difficult to treat is that which attacks the lymphatic system.

In such a case, a finger affected by sarcoma after amputation and treatment by X-ray provoked the affection, via the lymph ducts, first of the elbow, then the armpit, forming packets of painful ganglions; the affection propagated to the mediastinum for the final invasion of the entire lymphatic system and death of the patient rapidly ensued. This case could not be treated and the suffering of the patient was intolerable. It is true that the patient was young, 31 years. In general cancer develops with the most rapidity in young subjects, while in older persons it progresses slowly. But one should not generalize. Each case is an individual one, and only with continuous observation will the course of the development of the cancer reveal the manner in which it requires treatment. And continuous observation allows one to then judge the effectiveness of a treatment and indicates what kind fits a particular illness. There is no standard treatment, and one can never claim to have found a miraculous cure for all cancer. If one is successful in attenuating suffering or even healing one or two cases, this does not mean he has found an infallible remedy. Unfortunately, it so often happens that when a researcher has a success he makes an overblown

claim and wrongfully encourages the physicians and the unhappy martyrs to cancer ready to cling to any frivolous and illusory promise. For these it is a case of the drowning grasping at straws.

In America they are doing interesting research with prisoners who have consented to be inoculated against cancer. As I have said, there are some cases of spontaneous healing of cancer duly noted by different analyses. These cases can happen thanks to the existence in the human organism of an anti-cancer agent that destroys neoplastic cells in formation, just like the phagocytes destroy bacteria and certain microbes. If the observations made on the American volunteers give the hoped-for results, a decisive step will be made in the treatment of cancer and will permit hope that it can be cured.

We hope to end up with a result that will free humanity from this sword of Damocles, which, with the development of civilization, affects more and more of humanity.

#### 4. HIGH BLOOD PRESSURE

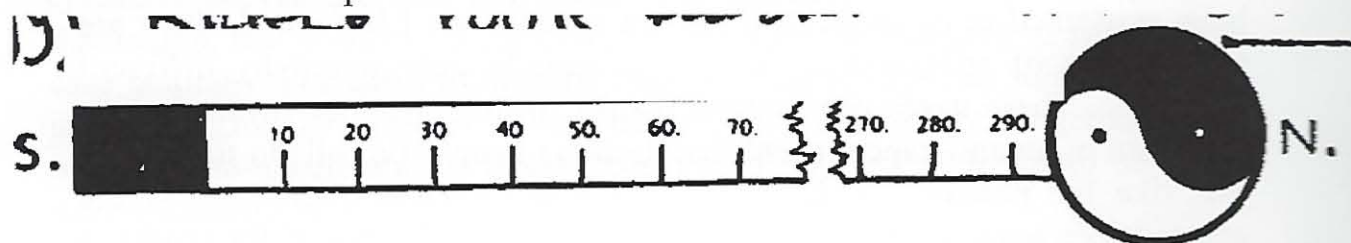

Everyone knows the dangers presented by too much arterial tension especially at a certain age. It can be a cause of stroke, apoplexy, and resultant partial or total paralysis. Official medicine finds it difficult to lower the pressure, and, if they sometimes succeed, the treatment is rather long. During this time the patient is continually under the threat of suddenly becoming an invalid.

I propose a very simple and quick way to lower the blood pressure without using any medication at all.

Before explaining the process, I will describe a simple apparatus that I devised and that anyone can make for himself. It effectively replaces the oscillimeters used by doctors; there are different models, all based on the compression of the artery during which a manometer indicates systolic (maximum) and diastolic (minimum) pressures.

My instrument is composed of a 60-cm. ruler divided into 30 sections marked by numbers from 10 to 300. Each section is divided into two by a mark. The sections measure 2 cm.; their divisions measure 1 cm. On the left side (to the South) of the ruler is a little platform 2 cm from which the numbers begin, 10, 20, 30, . . . On the right side (to the North) is a Yin/Yang which turns on a pivot. The instrument is placed on the worktable, the Yin/Yang to the North and the platform to the South. As the drawing shows, this instrument is basically similar to the Biometer turned

the other direction and a bit longer. The witness of the person being examined is placed on the platform and the cone pendulum is set on Red. Red is for all persons without exception and without taking into consideration their personal color.

In order to find the systolic blood pressure turn the Yin/Yang in such a way that the black part aligns North, that is to say in its position of equilibrium described in the previous chapter. In order to find the diastolic, turn the Yin/Yang so that the white aligns North. The pendulum gyrates above the ruler while the operator slowly moves it along the ruler from the witness toward the Yin/Yang. At a certain moment it ceases to gyrate and swings across the ruler indicating a number. This number represents the systolic pressure if the black of the Yin/Yang is to the North, and the diastolic if the white is to the North.

Some physicians who have worked with me have been able to verify on their oscillimeters the exactitude of the indications of this instrument.

Now comes the question of knowing how one can lower blood pressure that is too high. My observations have proven that arterial pressure is related to the adrenal glands. Also, each time that I observe an abnormal blood pressure, I examine the glands. There are some cases where the two glands are affected, but the more often a single one presents the signs of derangement. The examination of the affected gland is made by the means described above, that is to say by the Naret board and the Escargot. Then with the Wave Detector, one finds the color that re-establishes the equilibrium of the adrenals. This found, set the Universal Pendulum exactly to this curative color. Place the drawing of the affected gland with the witness of the patient on the Escargot oriented Violet to North, and place above it the handle of the Universal Pendulum set for the curative color. It is necessary to have a second witness of the patient that is placed on the platform of the instrument detecting the pressure. Then bring the cone pendulum to gyrate over the ruler as described above. When it arrives at the number previously indicated, notice that it begins to oscillate and to pull back. In bringing it back toward the witness it will indicate a lower number, then gradually diminish. Ordinarily this operation takes no more than two

minutes, and it is necessary to quickly remove the Universal Pendulum from above the witness in order to quell its action. In order to avoid creating a shock, never lessen the pressure too quickly. For example, if the pressure is at 200, it is necessary to be content at first with having lowered it to 180 or even at 170, but it is never necessary to make it descend to the normal level in a single session. The lower tension obtained persists ordinarily 48 hours, sometimes more. If the tension has a tendency to go up again, one can repeat the operation anew.

If a new examination using the Naret board and the Escargot is made, one notices that even after an exposure of just two minutes the equilibrium of the adrenal glands is re-established.

This simple instrument described above can have other applications, and I will describe some of them in the following chapter.

## CHAPTER VI

### UNDREAMED OF POSSIBILITIES

In the preceding chapters I have treated questions that, while being perhaps new for certain readers, relate exclusively to manifestations of the physical world.

Although invisible worlds and their existence is not even surprising to many, their vibrations compose forces that govern the visible world surrounding us. Pain coming from different forms of disequilibrium that can be healed by these vibrations are also for the most part of the physical order, affecting physical bodies. I have had an insight that the origin of an ailment is not always in the physical organ specifically dis-equilibrated at the moment, but that its original cause can be elsewhere and exist on an order beyond the narrow framework of the physical body.

The teachings of the ancients, whatever the civilization to which they belonged, described the human as a complex being of which the body is only a part, as well as the most inferior and least important part. Apart from the material form that we see and can touch, man is composed of other elements invisible to the eye and intangible, but which are, nonetheless, the essential elements constituting his Ego, his individuality. In general in the teachings of ancient Egypt and the Hebrew Kabbalah, and from India, Tibet, and China, recognition was given to the double nature of man, what certain occultists qualify as "spirit incarnated."

The difference between these various teachings consists in the manner in which they divide the complex being that is man. For example, the Egyptians considered man as being formed of nine distinct elements, which, from the dense material body, became more and more subtle until the ultimate state of complete spirituality. (For details, see my *Origins of Genesis*.) The Hebrews consider man as being composed of three distinct elements tied to each other without intermixing. Each of these three elements was in its turn subdivided in three, matching the number of the parts in the Egyptian teaching. (See my *Trilogy of the Rota*.) The Christian religion also recognized the three components of man, notably the body, soul, and spirit (St. Paul).

These three elements are united during earthly life and their union precisely represents the state of living man. This state of life has an indeterminate duration and is unpredictable.

At a certain moment, for whatever reason: accident, illness, or finally old age and resulting wearing out of the organs, man dies. That is to say that something cuts the strings uniting the superior elements of the complex being to its material part. The body still living only yesterday commences to disintegrate. One notices that at a certain moment the cell division that characterizes the state of life stops. It is death that follows, the end of the existence of man as an incarnated individual.

But all the ancient teachings as well as those of the Christian religion do not consider physical death as being the end of the complex being that is man. Death is but a transformation, a change of state. The ties uniting the superior elements to the material shell being broken, the physical body disintegrates into the different elements that composed it and which dissolve, but the life of the superior parts of the being continue, now free to rejoin the higher planes from which they came.

All the teachings of antiquity as well as Christianity are based on the dogma of life beyond the tomb in which the souls, once they are disincarnate, participate. There is no disagreement among the points of view of this conviction that is at the base of all metaphysical and religious teaching. The only difference consists in the forms in which the diverse doctrines represent the life in the hereafter. Everywhere we find the same notion of Good and Bad, the former merits reward, the latter punishment, or Hell. The more the teaching takes a material form, the more the idea of Paradise and Hell is concretized. For the ancient Egyptian, the image of Paradise carries fields of wheat six cubits tall, rivers full of beautiful fish, and a countryside where one never sees a viper or venomous insects. Hell in their imagination was full of lakes of fire where the fisherman burned for eternity and vipers enveloped them with their icy rings and cut them into pieces.

The Christian religion inherited the concept of these tortures. They are found in the teachings on Gehenna and on the eternal fire into which the fisherman will be thrown. The Muslim religion defined Paradise as a place of joy where the dead will eat well in the company of beautiful women, the *houris*.

We can see that these infantile representations of Paradise and Hell were invented to influence the materialist mentality of humans whose spirit can only conceive of material things. The threat of Hell touches the imagination of primitive beings and curbs their evil impulses. Hell as depicted seems necessary to prevent humans from doing evil, while the rewards promised in Paradise encourage them to be good.

But this perspective can only influence those beings at a rather low level of culture. As soon as man begins to reason, doubt arises in him, and he no longer believes that a beautiful pleasure-garden or eternal fire await him after death. The discoveries of science weaken the teachings of theologies and empower man to think that death is the end of everything, and that after the last breath, there is nothing. This erroneous idea is followed frequently by people so that they can neglect the laws of morality. They say to themselves: "Let's get as much as possible of the joys of life, because after death, there is nothing more."

It is precisely to combat this condition of the spirit that characterizes our sad materialist century that I have decided to divulge several of my observations to those who want to accept them. These observations can, moreover, be reproduced and checked with simple procedures by anyone who is open to new horizons with regard to the continuity of life beyond death.

After all that has been said in the preceding chapters, the reader knows that every person can be classified according to one of the colors of the solar spectrum by the vibrations that characterize him. With the use of the adjustable cone pendulum one can find the color that corresponds to each individual. This, as I have mentioned, constitutes the first phase of every examination. The pendulum gyrates above the witness of a person once it is set at his personal color. And, what is produced on the witness of a living person is likewise produced on that of a deceased person. But while in the case of a living person the pendulum indicates on the Biometer the number of his vitality and in the extension of the Violet line on the Escargot, it gyrates or swings according to the state of health of the subject. If it is a dead person, the pendulum rests immobile on the Biometer and on the Escargot.

This is the first sign that indicates death. In all cases, this observation can and must be checked. One way to monitor it consists of moving the pendulum from the West side of the Escargot along the + Green extension. If it is a living person, the pendulum will swing and if it is a deceased person, it will gyrate counterclockwise.

There are still other possibilities for checking more effects. Use the large ruler that has been described in the section on blood pressure. The Yin/Yang at the North end of the ruler adjusted to the state of equilibrium, meaning the black part to the North, place the witness on the South platform. The cone pendulum is set on Omega, which is found at the top of the shank above White. For a living person, the pendulum will give 80 and for a

deceased person, 105. These two figures are unchanging and identical for everyone.

Then set the pendulum for the lower Omega, that is to say, at the opposite Omega found at the bottom of the shank under Black. For a living person the pendulum will indicate 70 if the person is in good health, and less if ill. The more serious the malady, the lower the figure below 70.

For a deceased person, the measure varies according to the time passed since his death. Immediately after the death the number will be very low, say 5 or 10. But the longer ago the death, the larger the number. For example, for a person who died 50 years ago, the number might be 30 or 40; if 100 years ago, the number may reach 50 or 60. But there is no hard and fast rule, and it is not possible to generalize. It seems that it depends not only on how recent the death, but more especially on the state of evolution of the person; the more evolved, the higher the number. So it follows that the more materialistic the person, the lower the figure. Observations on some hundreds of cases seem to confirm what I am saying. If the dead person has acquired a high degree of spirituality, the number indicated by the pendulum can reach the high limit of 105. What lead me to this supposition was checking a relic of St. Theresa. I then noticed that when the pendulum was set at the lower Omega, the figure of 105 was reached.

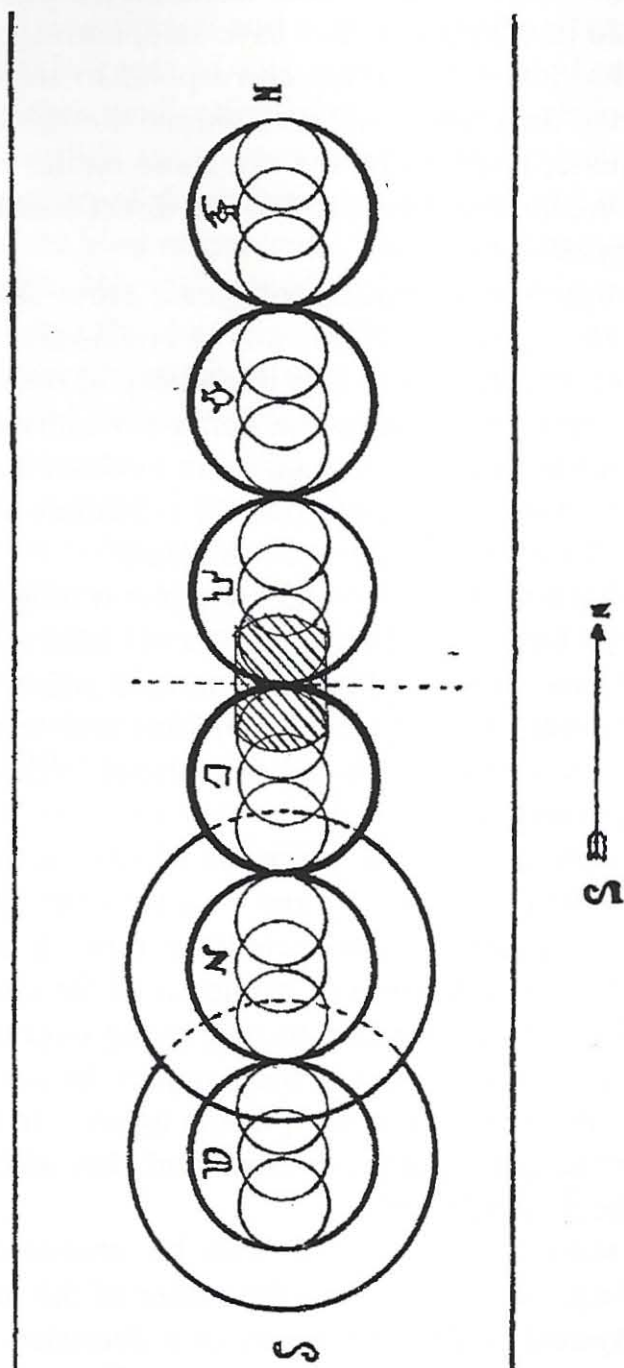

Another instrument for testing is based on the figure with concentric circles that I mentioned in a preceding chapter with regard to the method of Mme. Chantereine (see p. 14). According to many researchers, among them de Rochas, man emits an aura around his body of radiations forming circles of practically 8 meters in diameter.

One can detect the afflictions of the physical body by feeling them himself, but when disequilibrium affects the subtle parts of the complex human, it is necessary to look for the origin in one of the circles more or less distant from the body. Since my method is based on work at a distance, and every examination is made not on the patient directly, but on his witnesses and with the aid of anatomical charts, I have reduced the schematic drawing of the concentric circles to the scale of 2 cm. per meter and this allows me to pursue my research at my worktable.

To re-establish the rapport of each circle with a zone determined by the subtle being of a person, I have relied upon information from the ancient Egyptian and Kabbalistic teachings.

I have drawn a line that must be oriented according to the North-South meridian. On each side of its center it is divided into eight parts, each represented by a small circle whose center coincides with the North-South line. The center of the line has a ninth circle that corresponds to the

physical body. The eight circles to the right side, to the North, represent the Egyptian divisions and the eight circles of the left side, to the South, the divisions of the Hebrew Kabbalah.

It is as easy to work on the circles to the right as it is those on the left, on the Hebraic or Egyptian divisions; the result is the same. These two parts only serve as a double control for the results obtained. The only difference

consists in the fact that if there is an equilibrium, the pendulum gyrates in counterclockwise direction on the right part while on the left part it gyrates clockwise. Whichever side one chooses for the work, on the Egyptian or the Kabbalistic part, the circle in the middle, as I have said, corresponds always to the physical body; the next two circles correspond to instinctive and subconscious elements; the next three circles to animal elements and to the will, to the Egyptian double; and finally, the last three circles relate to the most subtle elements of the human being, and are in direct contact with this spiritual state, with the spirit.

Two currents of opposite vibrations originate from the Center of Universal Life, crossing in a spiraling motion all the circles and the animate life, which then becomes individualized. It is interesting to notice that for a plant or a fish, a single current animates the being for individualization, notably the negative current. If it is a human, or an evolved animal, like a dog, for example, there are two currents of opposite vibrations that interlace and are united in order to form a vital spiral with two poles.

In order to simplify this instrument and to render it more practical, I have cut the drawing of the large concentric circles, and I have left only their diameter along which are placed the eight circles on each side of the central circle constituting to the right the Egyptian divisions and to the left the Hebrew divisions. This allows me to use this instrument in the form of an easily managed extended board.

To determine the state of a person, place his witness at the center on the side corresponding to the physical body and with the cone pendulum set for the color of the witness, examine each circle in its turn. If the person is living and in good health, the pendulum will gyrate on all the circles. But if he suffers some disequilibrium, the pendulum will swing over one or more circles corresponding to the various parts of the complex human, indicating the affection is of an astral, mental, or even spiritual nature. In this manner one can not only understand if an ailment is mental, but also determine which part of the subtle being is affected.

But the most remarkable result that can be obtained with this instrument is the following: if one places at the center of the middle circle corresponding to the physical body the witness of a deceased person, the pendulum does not move at all over the witness, thus indicating the death of the physical body. But it will, however, gyrate over the circles corresponding to the subtle elements of the person, thus proving that the ceasing of life in the physical world continues in the superior worlds.

Another method gives the same results! Take the witness and pointer in the left hand and the pendulum in the right hand, and touch the end of the

pointer to one circle after the other. The pendulum will react in the same way as in an anatomical chart examination.

In summary, use of the board establishes the origin of a state of insanity in a living person and determines the element of his being that is affected. Certain cases of this type can respond to some treatments, but sometimes neither medication of any sort nor projections of vibrations as have been described can give results. It is necessary to find other means, and the description of these surpasses the capacity of the present work. To get an idea of the kind of treatment that is used in these cases, I recommend reading my book, *Magic Cures of the Twentieth Century*.

Concerning the deceased person, this instrument permits not only defining the exact moment of death, but also the state of evolution of the soul of a deceased person at any given moment.

The instrument can even give other results, but as I have not yet concluded my research, I cannot mention certain things that I believe to have discovered before conclusive experimentation confirms them.

In a future accounting, I hope to be able to make known to the reader certain observations that will probably reverse some of his perceptions but will open a new era of knowledge.

For the moment I will stop in the hope that this little book will be useful for equilibrating the health of incarnate beings and to assure them of the certitude of the continuity of life beyond the tomb.
