

# Mysteries Of Memory Unfold

by Frances Nixon

## Foreword

The author's purpose for the past eighteen years has been to establish a skeletal framework for the design of energies that account for our existence. This includes the design responsible for the ability to record and remember events in our lives.

The acceptance of any scientific investigation requires that other workers must confirm the results; workers who have the knowledge and ability to adequately explore. My basic findings have been consistently confirmed and constructively utilized by members of the [Vivaxis](#) Energies Research Society. We owe a great debt of gratitude to all those members of the Research Society who for years diligently explored and confirmed each new aspect of Vivaxis energies as it was found.

"VIVAXIS is the most important discovery in the second half of this century." This is the opinion expressed in a lecture by a doctor of physics, a member of our Research Society.

The discovery of a Vivaxis is the basic truth upon which all subsequent research has been built. Without this basic knowledge, my research would have ended in a dead end street. Instead, we have progressed with consistent results, to the point that we can with confidence present basic facts of memory that to my belief have never been known before.

From a New Jersey Vivaxis Research member comes this letter of encouragement with these words of understanding and rare wisdom -

You are going through the complexity stage now. Don't be discouraged by people not interested or understanding a technique that will eventually be the greatest gift to all mankind. There is no other answer to human suffering in all its phases.

Since we are energy beings, heaven on earth is utilizing this energy with wisdom for all mankind and ourselves.

In anything worthwhile one must go thru complexity to get to simplicity when the layman then can assimilate it. - Hayden Preston

Although this book is relatively December 25th. 1977 small in size, it has required a tremendous amount of research to understand the underlying complexities and reduce them to simplicities that can be understood by the layman.

**Time will eventually run out for man unless he learns to understand nature's laws and work within their bounds.**

# Introduction

To the man who is seeking we direct our words, So he may find his Vivaxis like the migratory birds. But the man who is taught against his will, simply retains the same opinion still.

The message does not imply that we should all be garbage collectors by believing everything we hear, but it does imply we should learn to search with open minds. If the day ever comes when I think I know all the answers, I can be sure it will be because I am not asking myself the right questions.

Probably, many readers at this point are mentally asking the question, "What is my Vivaxis?" For those who desire an in-depth answer, the subject is covered comprehensively in the Vivaxis loose-leaf Manual (1). The following is only a brief summary -A Vivaxis is created when a group of ambient forces relative to both time and place are drawn into a common core. A sudden fusion of forces that are grounded to the earth generally grounded through a solid that is a suitable conductor. The atomic particles within the Vivaxis energy sphere become literally aligned and magnetized to the geophysical field in which the Vivaxis is created. Tests illustrate that a Vivaxis energy sphere remains vibrating in resonance to the magnetism of the earth at that specific geographic point. The solid can be removed but the Vivaxis sphere remains as a permanent energy package. This is where the story begins of magnetism and life's magnetic energies.

An important arrangement of the basic elements in the compact bone of the fetus appears to take place at the time the Vivaxis is created. This element arrangement gives the fetus a lifetime individual energy pattern that normally is repeated throughout his bone structure. The magnetizing of energies causes a wave link to be established between the Vivaxis and its entity; a wave link that remains constant regardless of distance.

This book deals with the science of memory and covers material that is new in its concepts. We refer only briefly to matters covered in my other publications and endeavour to avoid repeating subject matter previously given coverage in the Vivaxis Manual.\* The latter deals with the essential subject matter and includes: (a) Clearing one's circuits of the effects of X-rays and wave links to foreign Vivaxes. (b) Locating one's Vivaxis channel, (c) Channelling. (d) Techniques of recording and evaluating, (e) Other related subjects.

The prime objective of this book is to present a model of the forces and design responsible for normal memory function. As time progresses the model will probably have additions and subtractions, but for the present it is proving to be basically workable. It is a model we can use as a guide to trace and correct areas responsible for weak or poor memory.

# Chapter 1. Vivaxis - An Important Life Force

Life is beautiful and need never be dull for those who have the wisdom to explore their role in the Universal energy scheme. The research of the Vivaxis Energies International Research Society is focused on basic environmental energies; forces that stimulate vital life-giving wave motions which are recorded emanating from every normal and healthy person. The Society's motto summarizes our objectives, "Remove energy obstructions that hinder healing. Reinstat e a strong wave field in our bone structure and we will find health is there all the time. The knowledge of the wavelengths of our Vivaxis forces is one important key that makes this objective possible."

Vivaxis is a coined word; Viva - life, axis - centre, "Centre of Life." The energies of Vivaxis are of prenatal origin and the atomic arrangements in the baby's bone structure reflect the geophysical magnetism of the place and time his Vivaxis was created, shortly prior to birth. My findings indicate that the basic elements and compounds in the compact bone structure of the fetus align in a fixed arrangement. Probably under the influence of the specific force flows that created the Vivaxis. More significantly, the fixed arrangement of the elements is found to be repeated in the same identical permanent sequence throughout all normal functioning memory tracks in the cranium. The pattern, like one's fingerprints, is individual.

Health comes on many levels, with various disciplines contributing their specialized parts in effecting cures. Our organization does not treat disease, we teach basic fundamentals of life's energies that our research has proved to be essential for optimum health.

Chemists within the framework of our Society have used blood samples to monitor the beneficial effects of saturating the system temporarily with Vivaxis energies to counteract toxic conditions. A typical chemists report is detailed in Vivaxis Manual, Part 5.

To date, we have succeeded in identifying five life forces that work in resonance with each other. The Vivaxis force is the most important of all, for our tests indicate the brain operates on the same wavelengths as those of the individual's Vivaxis. However, the brain requires a proper balance of all its supporting energies to work at top efficiency.

Regardless of the method of treating disease, all disciplines can benefit by humbly exploring the underlying energy patterns that have existed since life first appeared on earth. To treat without the knowledge of these basic fundamentals, can be compared to the continual patching of the cracks in the plaster walls while the foundations of the house are crumbling.

The techniques of recording and evaluating may be mastered by the average person, but only after he has taken the appropriate steps to clear his circuit from distorting influences.

It has taken many years of experimentation to devise methods so the average person can reliably receive information of the five different energy forces in his

environment; forces vitally affecting the normal flow of energies in his bone structure.

We refer to the force flow emanating from the energy waves in our bone structure as our "energy skirt" and we use our hands held in our energy skirt to receive wave stimulus. For example, we often use our eyes to absorb specific wave stimulus. The stimulus absorbed through the eyes is then transferred to eye receptors located in the tips of the fingers and in turn is recorded by the stimulated motion of the hands kept within the confines of the energy skirt. Recording by the foregoing method is only possible because of the energy skirt phenomenon.

There is a great deal to learn about recording with the hands and eyes in order to receive reliable information that can be utilized constructively. Fish, animals and birds in their natural habitat, have sensitized their systems to utilize these forces. Unfortunately, civilization has desensitized man to a point where he is often unaware of weakening and destroying the very forces within himself that nature implanted to work so harmoniously for him.

Our students are taught to evaluate and record various aspects which enhance their flow and likewise the effects of those that disrupt the integrity of their flow. A good percent of our students are able to accurately determine which elements are present in an area of bone and more important if the elements are in atomic resonance. The student is also taught how to reinstate the proper balance when indicated. This feat is largely possible through the knowledge of the wavelengths and frequencies associated with each element. We have consistently observed the correlation between a malfunction in the body and a lack of a normal wave field in the bone structure.

Making corrections to our wave field is a "Do it yourself" project. Nobody touches you, no one channels energy into your circuit, and no instruments are used. Sea salt and ice are natural elements that are sometimes used as aids to reinstate a field into areas of bone. The main requirement is adequate knowledge.

We feel it is a reasonable assumption to say that much of the misery and tragedy in the world today is the result of the ignorance of natural life forces. Civilization tends to introduce factors that distort the natural flow of life's energies upon which our physical and mental well-being vitally depends.

Only those who have explored are capable of judging and becoming fully aware of the tremendous potentials available to them.

## Chapter 2. The Human As A Sensitive Instrument

There are ever increasing numbers of researching people from all walks of life, who recognize the human being as a valuable instrument for receiving information about himself and his environment. The following are comments by Dr. James Swan:

Today we find ourselves facing energy and resource shortages and a number of other environmental and social -problems which cloud the future. Most certainly many of these problems can be attributed to the inability of people to get along with each other, create social systems which foster diversified actualization of human potentiality, and live in harmony with nature. It may well be that in owning and exploring the sea of energy in which we live will lie important clues to unlocking existing problems and allowing for the continued evolution and enhancement of human life. "Everything must be balanced" is one of the general principles which seems to guide our universe. It seems right, then, that now may be the time to reown and use our natural sensitivities and rediscover the world in which we live. (1)

Dr. Swan puts his finger on the pulse of life when he comments, "Everything must be balanced." The atomic balance of our atoms depends upon the same number of electrons as protons in their atomic structures. Only when the atoms in our basic elements are atomically balanced are we in resonance with our environment and capable of being a sensitive instrument.

Human sensitivity is of course a relatively little studied aspect of human potentiality. As with many aspects of human behavior we often know more about the negative or pathological aspects of sensitivity than the positive ones, and yet in our sensitivity may lie the key to greater understanding of human life as well as increased human happiness. For example, some preliminary research by Dr. William Tiller at Stanford University has discovered some extremely sensitive individuals who are able to use their sensitivity to achieve greater understanding of themselves and their environment.

According to Dr. Tiller, "One individual has shown himself to be sufficiently sensitive to respond to a 1 microamp current flowing in a wire imbedded several feet underground. "

Dr. Tiller suggests that the process by which sensitivity occurs in humans may well be very similar to the nature of antennae which are used in electronics. "In the human body the antennae elements are most probably the acupuncture points whose loci lie along the meridian system. Each nerve axon is surrounded by a myelin sheath forming a spiral structure acting as a wave guide to conduct a traveling spiral wave to its end-point just under the surface of the skin. Since recent studies indicate that about 600,000 linear miles of autonomic nerve fibers exist in the mature human, this system can

constitute an antennae system of exquisite richness with respect to information and transmission." (2)

Most people are capable of being highly sensitive instruments, once they have taken the appropriate steps to clear their circuits of distortions. Common distortions are caused by X-rays, wave and electric treatments, pesticides, and in addition all practices that introduce foreign Vivaxes into a person's system.

Ninety percent of ray students who attend classes, learn to record with validity but only after they have taken steps to make all factors right. As a rule, young children and the isolated adults who have NOT been subjected to X-rays or other mutilative treatments can automatically record during their initial attempts. One such example was a lovely nineteen-year-old girl who attended the course as a guest for the evening. She had never had an X-ray, so we persuaded her to come before the class. The young novice was able to record with ease the various influences of the different force flows. Her utter amazement was enjoyed by all the students. We say with a strong conviction, "IT IS NORMAL TO BE ABLE TO RECORD." What is not normal is to have the atomic structures of your basic elements disoriented to a point where you are no longer in proper resonance with the energies of your environment.

The reader will realize as we move further into the subject, that a person's recording ability is directly related to the energy flow emanating from the basic element arrangement in the bone structure. Most of our information is received through using our hands held in our energy skirt. Wires are seldom used anymore, except occasionally in research to determine fixed wave vectors of various elements. Even then the elements that are included in the material of the recording wires have to be taken into consideration.

Experience and an adequate working knowledge of all the forces involved are required in order to evaluate and interpret the meaning of one's recording responses.

This is a vast field that extends into every facet of life and requires tremendous study time. Once the student is able to record and familiarize himself with the characteristic vibrations of an element, he can then, with the tip of his receiving finger, pinpoint the same element in areas of his bone structure. When a student is first informed of this technique of obtaining information, his initial reaction is one of utter disbelief. Ironically, the telltale frequency responses of elements are strong and readily detected by the average recorder. He soon realizes it does not take special talent, it is just being normal.

## Chapter 3. Clues To The Mystery Of Memory

I have no recollection who originated the saying, "Mystery only exists until replaced with understanding." In any event it is an appropriate saying, containing truth and substance.

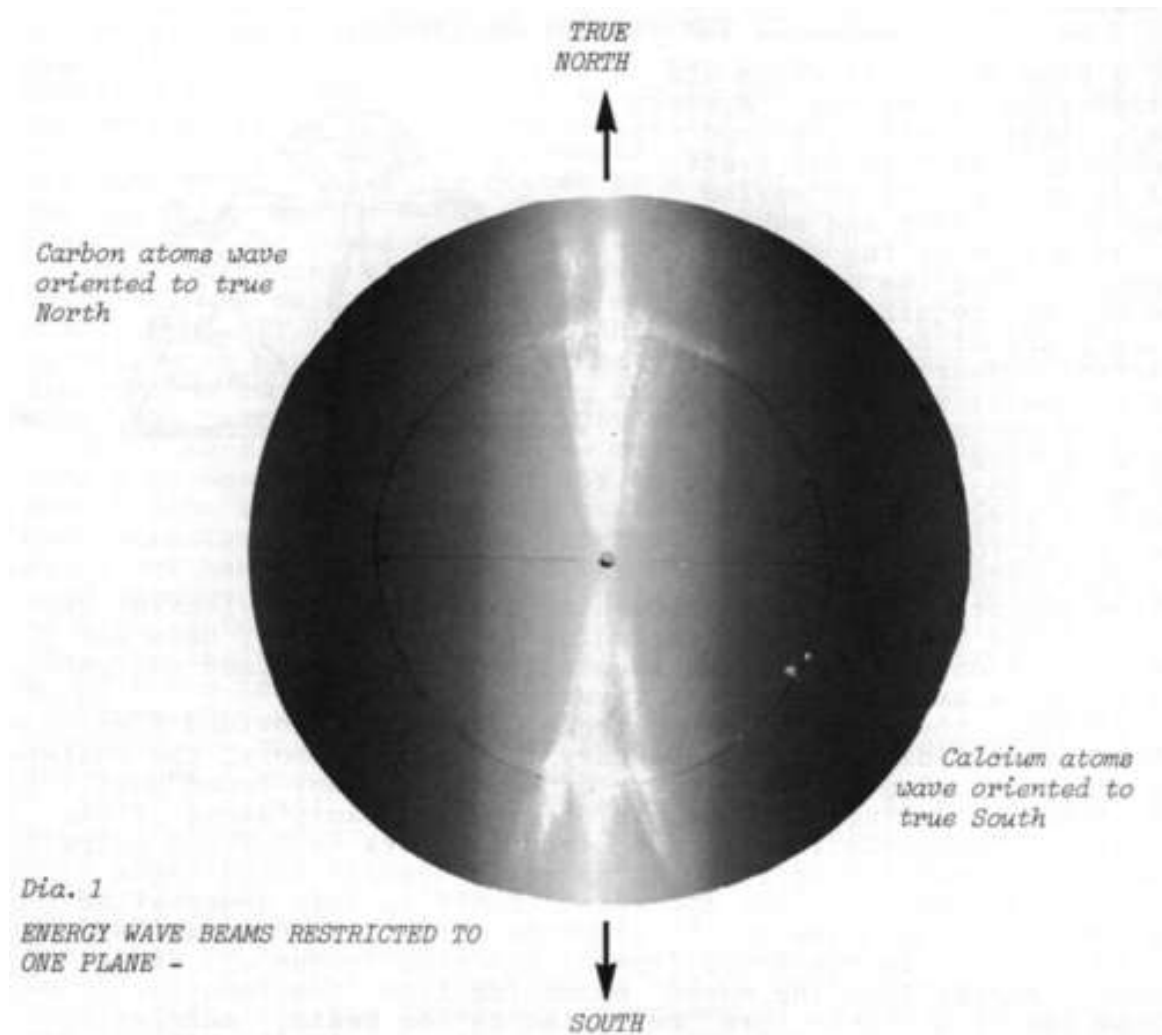

To arrive at the stage of understanding the mysteries of memory has required over eighteen years of constant and persistent research; persistent to the point where it necessitated excluding all else from my life that subtracted from the objective. The knowledge of Vivaxis energies was essential for the development of this science. The foundation was originally laid through my discovery of a Vivaxis. The revelations that followed, including those of memory, have all been built on and around the knowledge of the organized design of energies associated with a Vivaxis.

Although the background knowledge of Vivaxis provided the essential building blocks necessary to explore memory, the really essential clue to the mystery of memory was not found until my discovery during December, 1976; namely, "Basic atoms of elements and compounds in our bone structure work in defined pairs and their atoms are oriented to specific natural force flows in our environment."

The important factor in this observation is that when the atoms of the elements within the bone are properly oriented to the force flow of the same frequency, they absorb energy from the waves emanating from that source. These energies are in turn reflected in the brain, muscles, glands, and soft tissues underlying the bone structure. In contrast, when the elements' atoms have some of their constituent atomic particles disrupted, the former are no longer able to absorb the energy waves from their normal source.

The absence of the normal energy wave flow adversely affects the cells of the bone and the adjacent tissues; often resulting in local areas of bone being quite sore when pressed. Prolonged periods of element disruptions are usually associated with body malfunctions. These facts are repeatedly confirmed through research projects. Tests are conducted, so that we deliberately take steps to reorient atoms of a specific element within a bone area, that failed to respond to the stimulus of the force flow of the frequency corresponding to its own.

The before and after results tell a very factual story and give substantial proof of my hypothesis. Many of the stories that give proof are told in this book.

In the diagram, the energy wave beams (light area) represent; two related force flows of carbon and calcium atoms in an energy exchange with the centrifugal force flow from true North and South. The centre dot represents the centre point of a person as he faces directly towards true North. He would be required to face sideways to the North or South flow in order to absorb the energy waves into side areas of bone. - This model applies to other life force flows but they have different elements that respond to their specific frequencies.

One's own Vivaxis channel is the only channel that stimulates a wave response in all known elements of the human body. In a Vivaxis all the life forces are combined in a permanent energy sphere, and they come into the system at a wide variation of angles of tilt, a fact that has to be taken into consideration when channelling.

My first realization of the ability of the atoms of elements to orient to specific force flows, came as I researched the possibility of carbon atoms being a factor in the recording mechanism of our memory. Ironically, subsequent tests showed that carbon was not one of the primary elements found in the memory track, but it did lead to my initial awareness of the orientation of elements.

In the hope of observing the reaction of carbon's wavelength on the human energy wave system, I handed my husband a container of carbon and requested he visually absorb its wavelength.

While scanning and recording the reaction to his wave field, I was surprised to record a stimulated moving wave emanating from his main bone structure. Testing the orientation of the powdered carbon revealed an energy wave flow with a fixed wave vector to true North. This phenomenon made me realize that it was the carbon absorbing an energy wave from the centrifugal force flow emanating from true North. This was my first intimation that an element oriented to a specific force flow and absorbed energy from the flow.

Similar tests conducted with students attending the adult education night classes revealed another important aspect of these energies, "Areas of bone that had been X-rayed lacked the energy wave flow." Unless of course, some means had been taken to correct the side effects of the radiation through reorienting the carbon atoms.

There are ninety-two chemical elements that occur in nature, but the same small selection of sixteen shapes the basis of all living matter. One of the sixteen, carbon plays a central role because of its ability to form complex chains and rings that can be built into an immense number of compounds --- Living systems consist of highly organized matter; they create order out of disorder, but it is a constant battle against the process of disruption. Order is maintained by bringing in energy from outside to keep the system going. So biochemical systems exchange matter with their surroundings all the time, they are open, thermodynamic processes, as opposed to the closed thermostatic structure of ordinary chemical reactions. (3)

Dr. Lyall Watson's comments are timely and can be appropriately applied "to our findings relative to element orientation, and Vivaxis.

Prior to this I had only associated a moving wave with a wave restricted to one plane, which was created when a person aligned to a force flow of a specific frequency; for example, aligning towards the directions of True North or South, Magnetic North or South, or the channel direction towards his Vivaxis; refer to Diagram 1. Previously we had observed the influences of the force flow without full realization of the "ELEMENTS' that caused the stimulation.

Generally, when a person is NOT subjected to the influences of a specific frequency, energy waves are recorded flowing in all directions out of his force field. In contrast, if he is subjected to the wavelength of one specific element, e.g. carbon, his wave field becomes restricted to one plane, oriented to true North, in the same manner that it would be if he aligns into the channel direction of North. Subsequently, we will use the terminology "plane oriented wave".

Calcium in the form of chalk was tested and found to create a plane oriented wave towards true South. It was therefore established that the elements

carbon and calcium in combination work as a team, with dual plane oriented waves towards North and South respectively. In tests, when an individual concentrates on the wavelengths and frequencies of both carbon and calcium combined, the same dual plane oriented wave response is recorded in his wave field. If two elements or compounds with unrelated frequencies are combined they do not stimulate either a plane-oriented wave or a dual plane oriented wave.

At this stage of reading, please do not make the mistake of oversimplifying the attraction of elements as merely negative and positive.

It should now help the reader and the author to have two terms of reference to describe the wave behaviour of elements:

1 - A single element stimulates a "plane oriented wave".

2 - Dual elements with attracting frequencies stimulate "dual plane oriented waves", that travel in the same channel but in opposite directions.

According to physicists, the energy waves we are recording have many properties of electromagnetic waves but in certain other respects have characteristics that differ. It is therefore expedient to select our own terminology and avoid using terms that are used exclusively in the electromagnetic field.

As an example, "plane polarized waves", are defined as - the process of restricting waves of light or other electromagnetic radiation to one plane. Most of us are inclined to relate everything to what is already known. A true scientist and researcher will tell you this is not the way to make new discoveries. What today appears to be a foreign language becomes part of tomorrow's accepted vocabulary. This is the history of nearly all-new discoveries.

Scientists and doctors are continually searching for the energy that motivates our body cells. They have discovered amazing things about chemical workings of the cells in providing electrical currents, but as yet have not found what initially produces this charge. Dr. Wilder Penfield tells us that the human brain contains ten billion nerve cells, while each nerve cell may be able to generate within itself and there is a brain-mind boundary that neurophysiologists recognize and are trying to reach.

But as they approach this boundary an impasse is reached beyond which known methods cannot take them. Dr. Penfield points out that Lord Adrian said this problem would finally be "solved by some enlargement of natural science." Dr. Penfield continues, "We are trying to create that enlargement today, but we must not be too impatient in our desire to complete the quest. After all, it is the revelation of the mystery, which was kept secret since the world began that we are seeking. --- And if the day should ever dawn when scientific analysis of body and brain solves the 'mystery', all men who have sought the truth in all sincerity will rejoice alike." (4)

In reference to the concluding thought contained in the quote, many Vivaxis

students today are already rejoicing, for they sincerely feel we have found a part of the revelation of the "mystery" to which Lord Adrian refers.

The experience of suddenly meeting a group of unfamiliar relatives en masse may be exhilarating but it is also confusing. In order to avoid confusion we will introduce one related force flow at a time.

Normal responses to your related force flows are dependent upon your basic elements being atomically in correct resonance. We have overwhelming evidence that when the elements are atomically balanced, they respond to, and absorb energy waves from, a force flow with the correct frequency. Injuries, X-rays, and damaging drugs, are common causes for the lack of response. Causes that must be rectified before the individual's elements respond normally to the five known Life force flows.

Energy waves of specific force flows seek to keep their own identity by selecting defined channels of travel. They also select defined pathways of travel within our systems; as determined by the arrangements of elements in our bone structure.

Chart A. Identity Of Life Force Flows And Channel Directions Of Force Flows

First - L.F. = Magnetic North and South

Second - L.F. = Vivaxis

All the wavelengths of forces that are normally detected in separate channels of our environment are combined in an energy package within a Vivaxis sphere. This phenomenon is well illustrated when a tester is aligned in any one of his four channelling positions\*; all his elements' atoms respond to the stimuli of the wavelengths of his own Vivaxis channel.

When not within the influences of Vivaxes or other fields, a person's elements normally respond to one of the other four channels in his environment; the specific wave frequency of the force flow that matches the element.

Third - L.F. = True North and South (centrifugal)

Fourth - L.F. = Force flows of the sun and moon.

The lines of force of the sun and moon are recorded at right angles to each other, and at the minor period the sun's line of force is recorded towards the West and the moon's towards the South. At our locale, which is 49 degrees N. latitude and 123 degrees W. longitude, the line of force of the sun gradually moves through an arc of about 22 degrees towards the north, from the minor period to the major period. Hence, at the time of the major period, the direction of the line of force is approximately N. 68 degrees W.. After the major period, the direction of the force flow gradually returns to the West which it attains at the following minor period. Throughout the foregoing sequence of events, the recording direction to the moon's flow maintains a right angle to that of the sun's and therefore moves from South to S. 22 degrees West and back again.

\* Refer to chapter "Channelling".

A minor period lasts between twenty to thirty minutes and a major period lasts between one and a half to two hours. There are two minor periods and two major periods within about a twenty-five hour period. We refer to the interval between major and minor periods as "solunar flow period". Our ability to trace the movement of these two flows during solunar flow periods is due to the fact that a few of our specific elements are oriented to, and absorbing energies from, either one of these two force flows; refer to Chart B.

We associate these force flows with gravitational tide raising forces.

Fifth - L.F. = A band of forces midway between Magnetic and True North.

In our locale it is a band of forces occupying an approximate eight degree arc, located midway between magnetic North and true North, and magnetic South and true South.

Chart B. Orientation Of Elements To Their Specific Force Flows

"N" or "S" opposite the element indicates a North or South wave vector. ( ) indicates duality of elements. The mates for some of the elements shown in the chart have not been determined. The list of elements that absorb energies from the Fourth and Fifth Life Forces are incomplete at this time. In all instances only elements or compounds were selected that responded to the frequencies within our energy circuits., e.g. silica for silicon.

First - L.F. (sodium N.& phosphorus N.& iron S )

Atomic numbers  $11 + 15 = 26$

Second L.F.

The frequencies that comprise First, Third, Fourth and Fifth Life Forces. All these forces form an energy package in one's [Vivaxis](#). Consequently, all our elements respond to the frequencies of our Vivaxis.

Third - L.F. (carbon N & calcium)

Atomic numbers  $6 + 20 = 26$

Fourth - L.F. (nickel - sun & manganese - moon)

Atomic number  $28 + 25 = 53$

Fourth - L.F. (copper - sun & lead - moon)

Atomic number  $29 + 82 = 111$

Fourth - L.F. cobalt - sun

Atomic number 27

Fifth - L.F. oriented elements

Element - atomic number

Iodine N. - 53

(Oxygen 'N. & potassium S ) -  $8 + 19 = 27$

(Zinc N & silicon) -  $30 + 14 = 44$

Silver - 47

Chromium S - 24

Gold N - 79

(Magnesium & sulphur) -  $12 + 16 = 28$

Once a recorder becomes familiar with the wave frequency of a specific element he can readily pinpoint its position in the bone structure. The atoms of each element radiate wave signals characteristic of their vibration with both horizontal and vertical waves. In contrast, a wave train travelling between elements has only a horizontal OR vertical wave vibration that is characteristic of a specific element, not both. In this way a recorder can differentiate between the position of an element and its wave influence.

The atoms of an element only respond to the force exerted by energy waves of the specific wave frequency characteristic of the element. At the Banff seminar in October 1977, we demonstrated this principle with two tuning forks. Both tuning forks were tuned to middle "C". When one of the tuning forks was struck, the tuning fork located nearby started to vibrate in sympathy, even though it had not been touched - Energy had been exchanged through the medium of waves of the same frequency. In contrast, when we tuned one fork to a different note, say "F", and struck the first tuning fork still tuned to "C", there was no responsive vibration felt in the "F" fork.

Students soon find that the same general laws of basic wave behaviour in atoms throughout the Universe, are also enacted within their own systems and thus they are able to relate basic laws in a manner that fascinates them. The difference between life and nonlife is the organized arrangement of elements found throughout living matter; especially surrounding our higher brain receptors and memory tracks.

It is logical that our brain recognizes and responds to the same wavelengths of the elements that surround the brain receptors. If it comes as a surprise to some of us that the elements in our bone structure absorb energies from specific force flows in our environment, maybe the principle described in the following will help our understanding.

The compressed incandescent gas near the surface of the Sun sends out all colors and therefore all wavelengths of light. When such continuous light traverses a layer of cool gas, such as our atmosphere or the atmosphere of Jupiter, the vibrating atoms and molecules are activated and steal from the beam precisely those wavelengths characteristic of their rates of vibration. When we analyse the light with a spectrograph we measure the wavelengths that are missing, and so identify the atomic or molecular thieves who are responsible for the loss. The missing wavelengths appear as dark lines in a spectrum. (5)

A similar phenomenon of wavelengths being robbed from our environment is experienced when a person aligns directly into a specific force flow. As an example, suppose Mr. X aligns towards magnetic North and South. Mr. X's sodium and iron atoms immediately become activated and absorb both horizontal and vertical energy waves from the magnetic North and South force flows. They continue to do so until the atoms of these two elements have reached their energy saturation point. During the interim, persons within a radius of approximately thirty feet are unable to record the normal energy wave response in their sodium and iron atoms. Mr. X has temporarily robbed

the two required wavelengths from the environment. This is one reason we discourage channelling in the presence of others.

Channelling to one's Vivaxis, as described in Chapter 12, has by far the most depleting effect on spectators in the vicinity. The reason is apparent, for a wider spectrum of wavelengths are involved and consequently a larger range of the spectator's elements are affected. A spectator capable of recording would find a lack of normal energy wave response in many of his elements. A person's atoms are normally absorbing wavelengths characteristic of their rate of vibration or frequency, but in far lesser concentration than when he faces directly into a force flow.

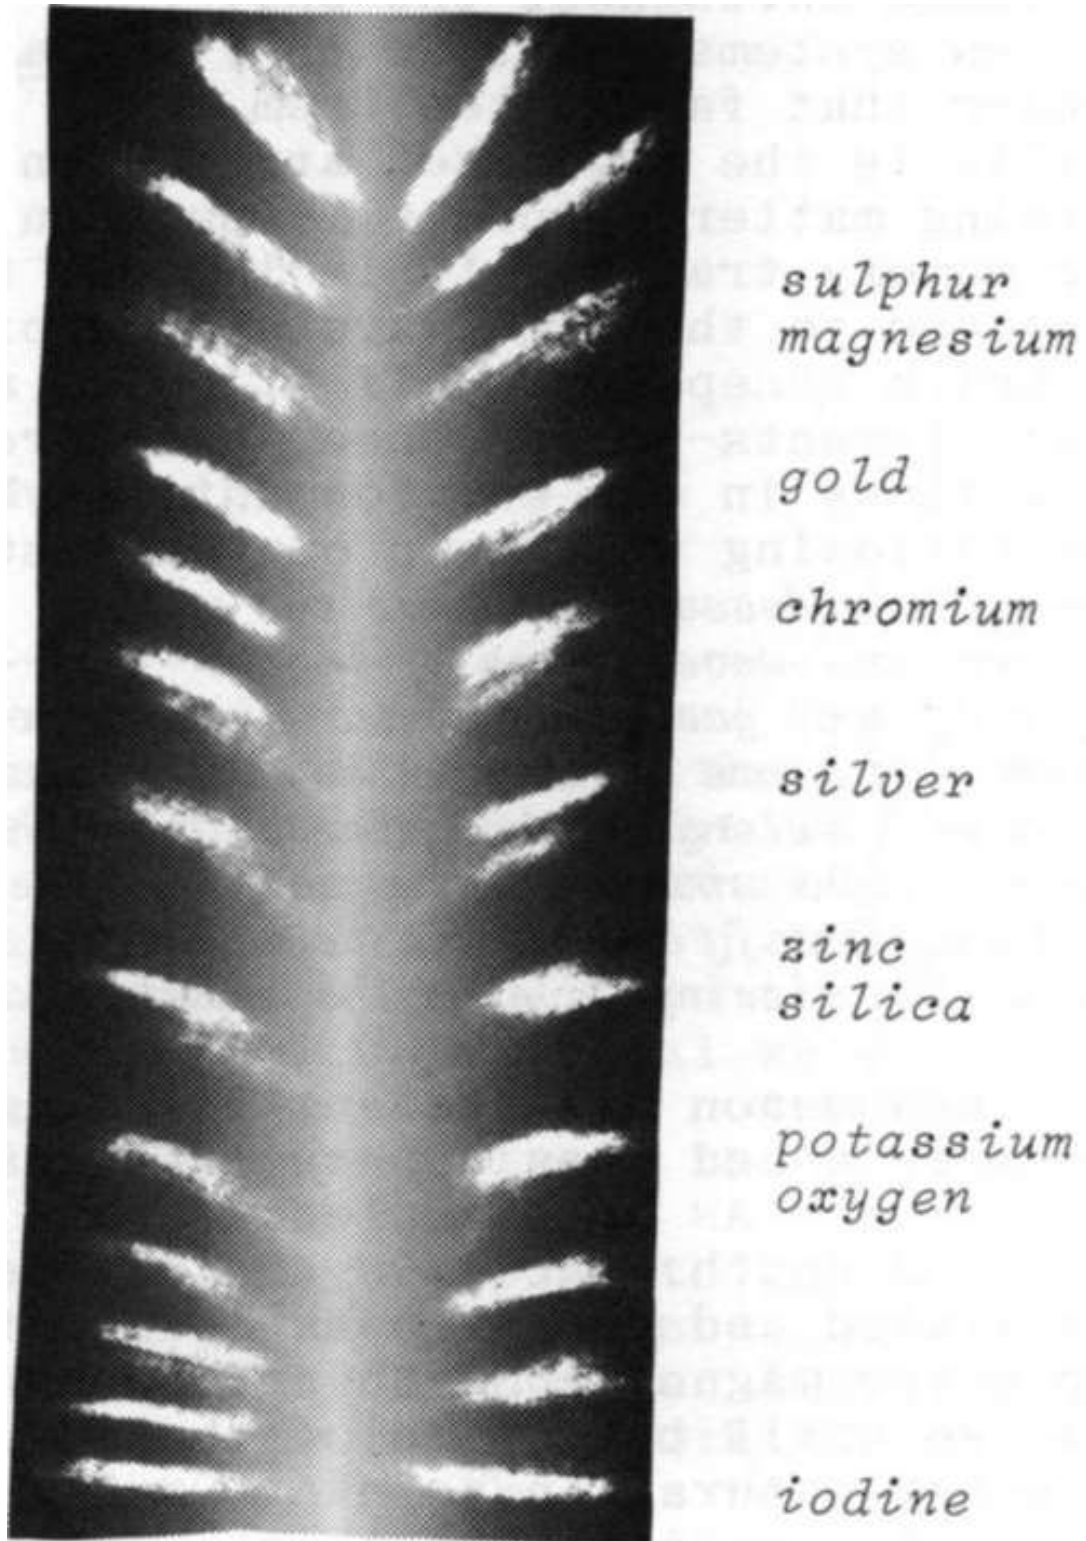

Any circumstance that affects the normal energy absorption of our elements also affects our memory mechanism. The effect may be temporary or of long duration. For example, strong and direct exposure to most types of electric and fluorescent lighting inhibits the normal energy wave supply of solunar forces absorbed by such elements as nickel, manganese, copper, lead, and others.

The foregoing remarks are not directed towards lights that are now available and designed to radiate all the spectrum of natural light.

The following diagram is a sample of the variations in the angle of head tilt required to stimulate the different atoms of the elements when a person is facing directly into the Fifth Life Force flow. The gaps illustrate elements that are not yet identified, but their stimuli are recorded.

The arrangement, sequence of the elements, and the angle of head tilt required to receive responses from specific elements is characteristic of the individual and normally remains consistent for that individual. Thus, the element arrangement for each person differs.

Consequently, one individual's iodine atoms might always respond to the frequency of iodine when his head is level and faced into the Fifth Life Force, but another person's iodine's atoms would respond only when his head was tilted at a specific angle into the force flow.

Dia. 2. FIFTH LIFE FORCE CHANNEL.

## Chapter 4. Magnetic And Gravitational Groups

A physicist friend on July 1st., 1977, made an interesting observation relative to the magnetic properties of some of the specific elements that I had found attracted each other. Using the periodic tables he calculated that several of the dual elements' atomic numbers, when combined, added up to the atomic number of a magnetic element.

Taking a tip from my physicist friend, I later used the periodic table to calculate the atomic total of other dual elements. It was through this mode of research that I was guided to the discovery of the all-important iron-magnetic groups and the solunar-gravitational groups, as shown in diagrams 3, 4, and 5.

The element arrangement in the iron-magnetic group appears to be common to most people, whereas in the solunar-gravitational group, variations are encountered among individuals.

Subsequently, we will refer to one group as the magnetic group and the other as the gravitational group.

### **Symbols**

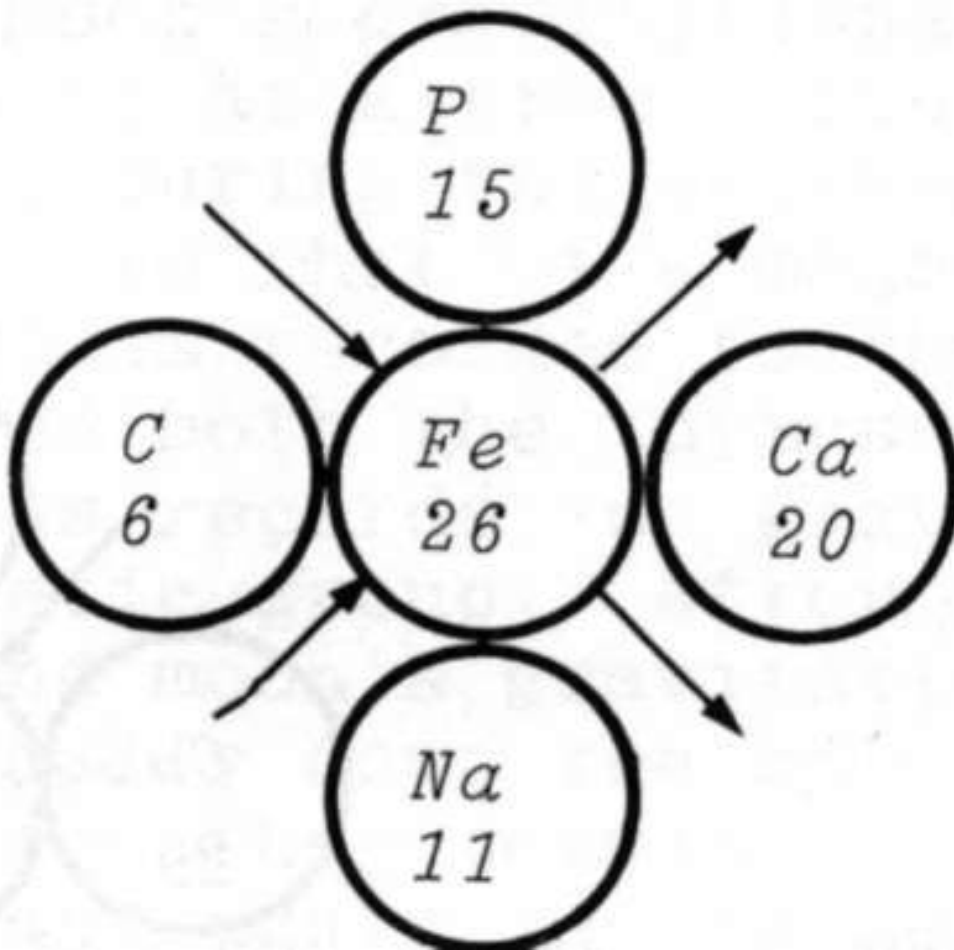

Fe = iron

P = phosphorus

C = carbon

Ca = calcium

Na = sodium

Dia. 3. MAGNETIC GROUP DURING MAJOR AND MINOR PERIODS.

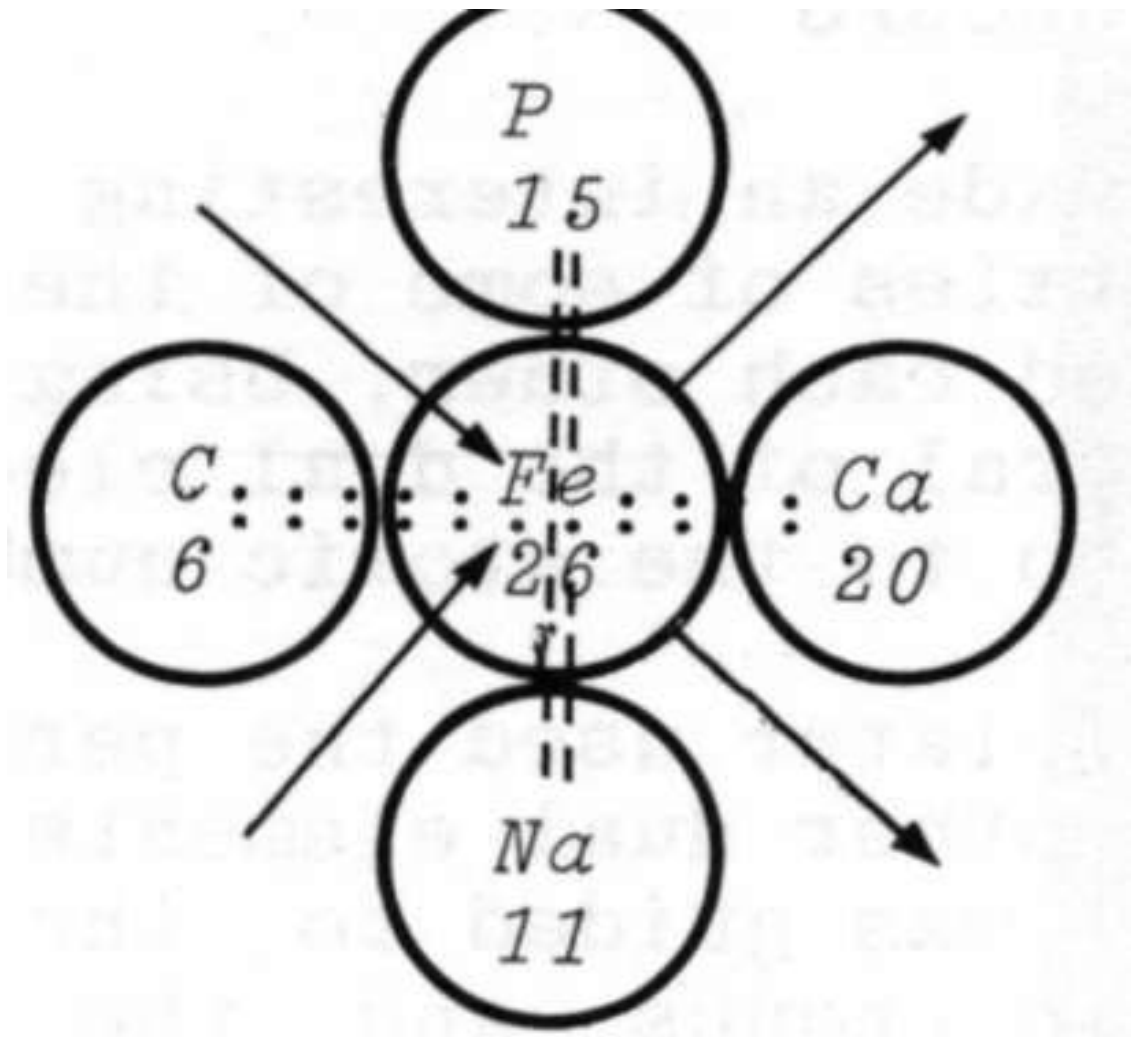

Note how the iron atoms are the focal point of the magnetic group. Note especially the dual elements surrounding them have electrons and protons in their atomic structure that add up to the same as those in the iron atom - 26.

During major and minor periods the wave exchange between elements is not recorded<sup>^</sup> but it is recorded during solunar flow periods; refer to Diagram 4.

The two arrows pointing into the iron represent the wave attraction of a gravitational group towards the iron group.

The two arrows leading away from the iron represent the wave attraction from the magnetic group to a gravitational group.

The discovery of the energy wave interplay between a magnetic group and a gravitational group has opened many new doors towards a deeper understanding of life's energy design, and the design of energies responsible for memory.

Dia. 4. A MAGNETIC GROUP DURING A SOLUNAR FLOW PERIOD.

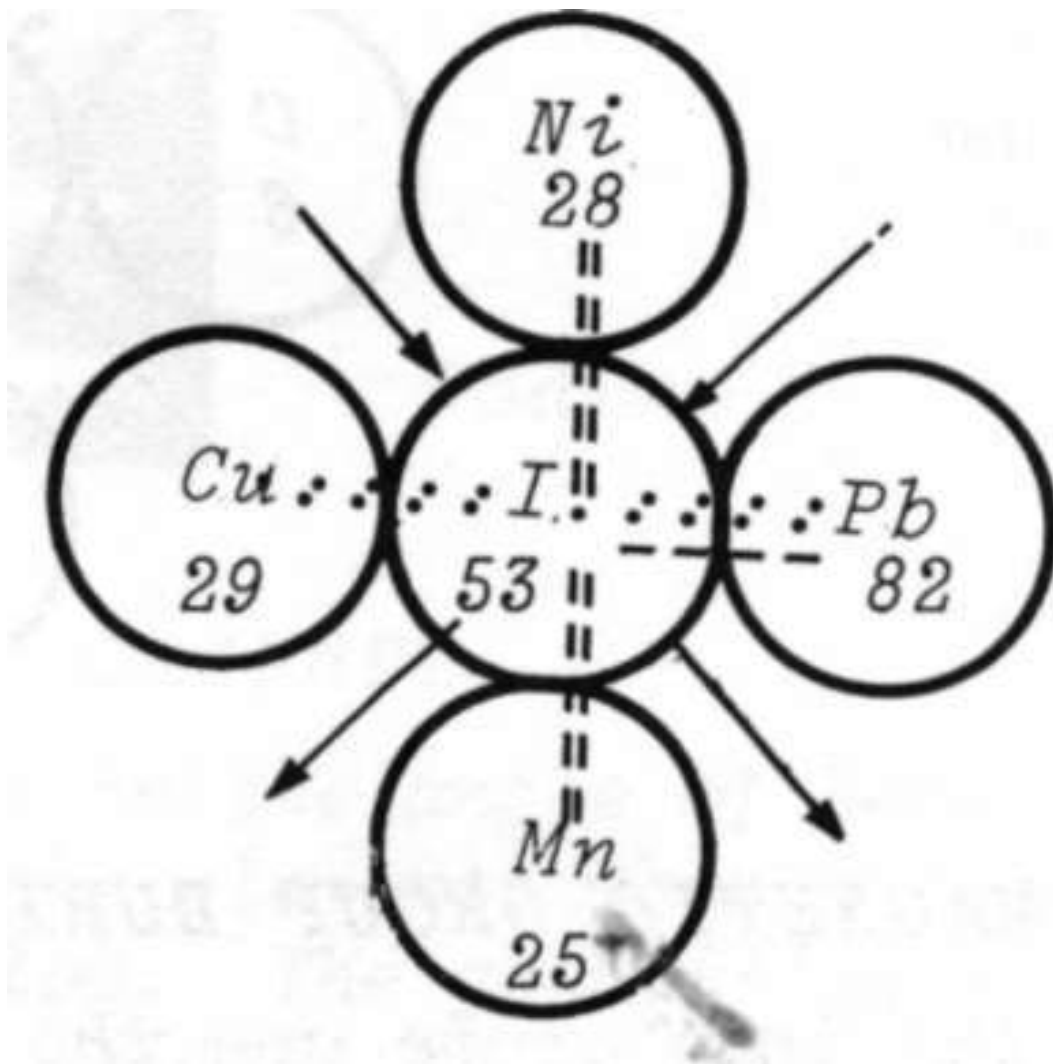

Recorded during the solunar flow period.

The arrows indicate the wave train exchange between strategically positioned gravitational groups.

Note the horizontal wave attraction between dual elements. This phenomenon is observed in the magnetic group, only during solunar flow periods.

Symbols -I = iodine Ni = nickel Cu = copper Pb = lead Mn = manganese

Arrows = the wave trains exchange between strategically positioned magnetic groups.

Dia.5 A GRAVITATIONAL GROUP DURING SOLUNAR FLOW PERIODS AND MAJOR AND MINOR PERIODS.

The element arrangement shown in the diagram is characteristic of the author's numerous gravitational groups but not necessarily the same as those of the next person. A limited number of variations in the selected elements for the gravitational groups can be expected. Note how the nickel and manganese atomic numbers add up to the atomic number of iodine. Copper and iodine atomically add up to the atomic number of lead.

The telltale stimulating responses of the lead's atoms give us a picture of lead in the group as the atomic focal point. Lead is the only element in the group that responds to the horizontal wave frequencies of all the other four elements in the unit. Lead atoms also have a stimulating response when the tester mentally concentrates on the moon. We are all well aware that lead is regarded as a toxic element, but is it a toxicant in very small amounts? My colleagues and I have observed its role of absorbing solunar flow energies in conjunction with copper as part of our apparently normal energy package.

The recent identification of nickel, silicon, tin, and vanadium as essential trace elements for mammals, including humans, added them to a list already containing copper, chromium, fluorine, iodine, iron, magnesium, manganese, selenium, and zinc. Cadmium and lead were being explored as possible additions to the list. (6)

A continuous wave train, characteristic of the magnetic groups, is recorded slightly left of the body centreline, travelling up the front of the body and up the spine, from the navel to the thymus gland. During the solunar flow period this wave train attracts the sun and moon's gravitational force flows into only one section of the spine at a time. The angle of the incoming flows gradually changes during the solunar flow period. The closer the time approaches to that of a major period the nearer the sun or moon's stimulus is recorded to the thymus gland. During the entire major period both the thymus and the navel remain stimulated. The thymus records a gravitational group and the navel records a magnetic group. After the major period, the influences of the sun and moon's gravitational force flows are recorded moving gradually down the spine. Approximately five and one half hours later they terminate at the navel when a minor period occurs and again the thymus and navel become stimulated. During the major and minor periods the incoming flow is in a vertical plane.

The foregoing phenomena are now used to determine the times to expect major or minor periods and replace all previous techniques.

It is highly significant that a magnetic group is located at the centre of the navel and a gravitational group is located at the centre of the thymus. Within the gravitational group are four elements of the Fourth Life Force that absorb energy from the various wave frequencies of the sun and moon's gravitational force flows and in the centre of the group is an element of the Fifth Life Force, iodine; refer to Diagram 5.

The author speculates that both the Fourth and Fifth Life Force flows are of gravitational origin. The elements that orient to them have vertical clockwise spins, while the elements oriented to the First and Third Life Forces, have vertical counterclockwise spins. The author further speculates that the Fifth Life Force flows are gravitational, but from influences other than the sun and moon.

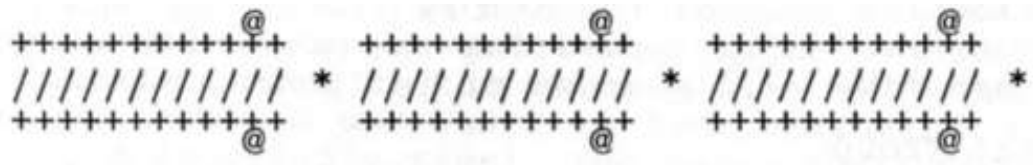

It is a fascinating topic but one that should be the job of physicists to eventually solve.

Magnetic and gravitational groups are strategically located throughout the bone structure of the body, notably at important energy centres. An experienced recorder should be able to locate them readily through the ability to follow wave trains leading from a magnetic group to a gravitational group and vice versa.

The magnetic and gravitational groups play specialized parts in the memory mechanism, as illustrated in Diagram 6 in the next chapter.

## Chapter 5. Memory Tracks

The centre memory tracks consist of elements of the Fifth Life Force. The arrangement and sequence of elements is characteristic of the individual and is repeated from left to right in the same sequence in each of his memory tracks. The elements oriented to the solunar flow also have variations characteristic of the person. The memory tracks have a stimulated wave motion during memory input and during the period of memory recall. Each track has two bars of dual solunar elements. In one individual the solunar elements in the memory bars might be nickel and manganese. In this event, the nickel bar becomes stimulated only while information is being fed into the memory track. Its mate, manganese, on the reverse side of the memory track, only becomes stimulated during memory recall. A similar phenomenon is observed in the magnetic and [gravitational groups](#). The magnetic groups located between the memory tracks, become stimulated when information is being fed into the tracks. The gravitational groups situated above and below the memory tracks, become stimulated during memory recall. Both groups play opposite roles that are vital to the memory mechanism.

/// = All known elements oriented to the Fifth - Life Force (memory track)

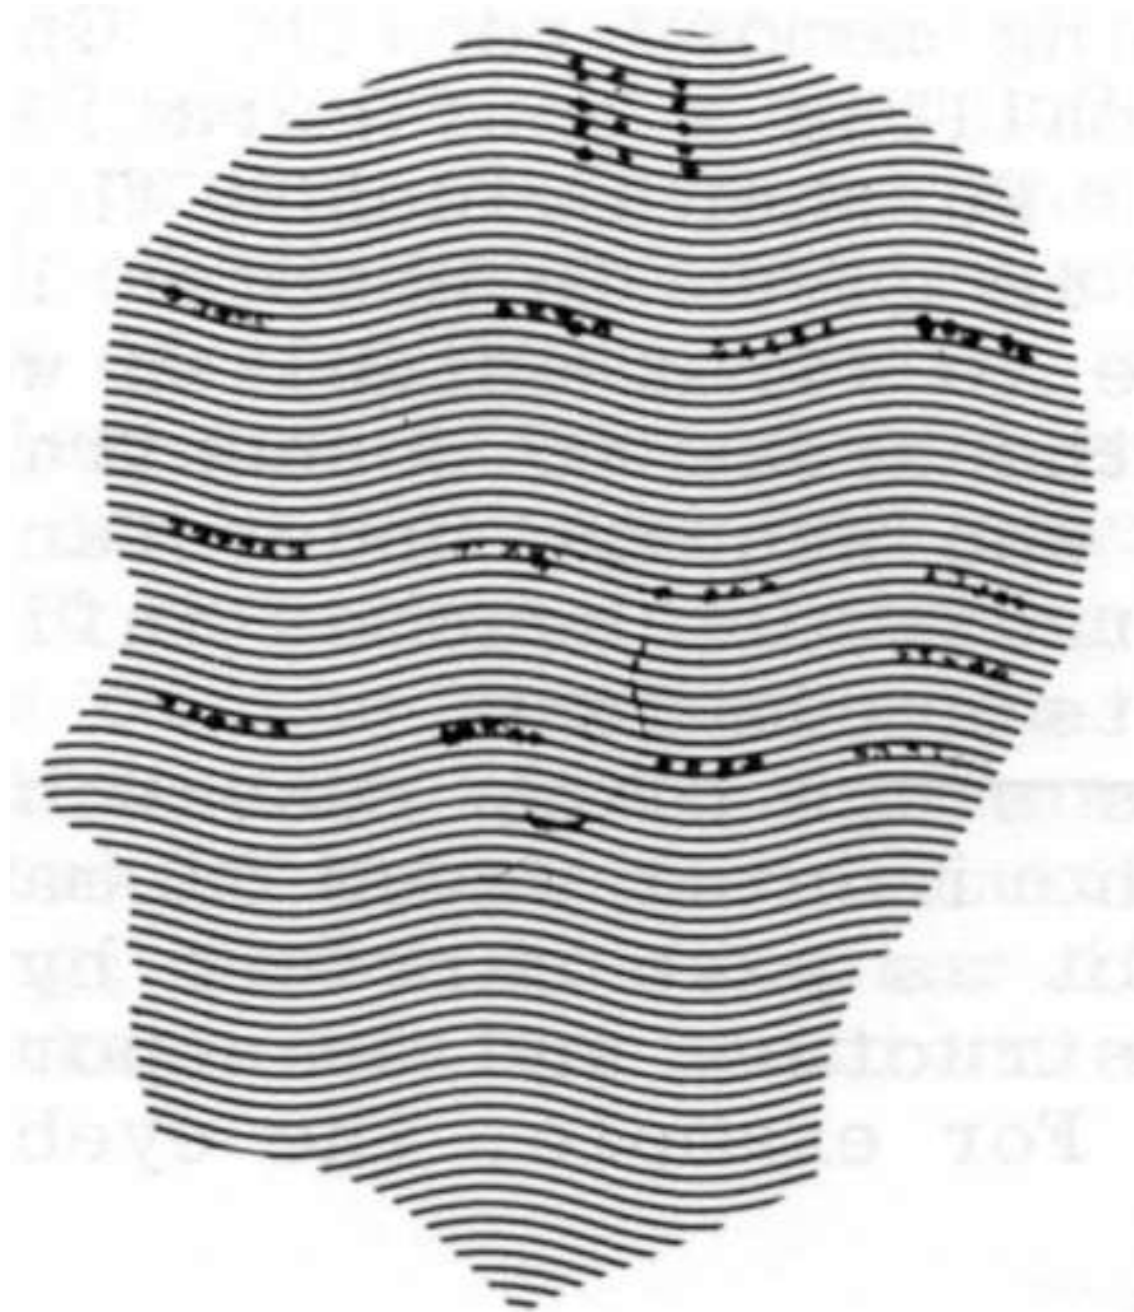

+++ = Dual elements oriented to the Fourth - Life Force (memory bar)

\* = Magnetic group

@ = Gravitational group

Dia. 6 MEMORY TRACKS DURING SOLUNAR FLOW PERIOD.

Samples showing variations in element arrangements between two different people: A's memory track - iodine, oxygen, potassium, silica, zinc, silver, chromium, gold, magnesium, sulphur. B's memory track - chromium, oxygen, potassium, iodine, silica, zinc, gold, magnesium, sulphur, silver.

Dia. 7. POSITIONS OF MAIN MEMORY.

## **Tracks**

The positions in the diagram are relative. They are located on both sides of the cranium.

Diagram 6 illustrates my model for the basic element arrangement of the memory tracks within the bone structure. The approximate position for many of the memory tracks is shown in Diagram 7. We observe energy operating the mechanism of the memory tracks through five main sources of influence, namely:

- 1 - The Magnetic group
- 2 - The Gravitational group
- 3 - The dual elements of the memory bars oriented to the Fourth Life Force
- 4 - All the known elements that absorb energies from the Fifth Life Force band of frequencies.
- 5 - Communication brain receptors.

With our present knowledge we have the required information enabling us to reinstate the memory tracks, the connecting Magnetic and Gravitational groups, and the solunar dual element bars. All play key roles in the memory mechanism.

In the days before we were aware of the elements in the Fifth Life Force band, we were limited in our potentials for repairs, but nevertheless our former approaches were capable of reinstating the very important magnetic groups connecting the memory tracks.

Many of us find it is fascinating to record the definite role the environmental forces play through the medium of our elements. As an example, one of the two bars, flanking all my own memory tracks, consist entirely of nickel atoms, which are moon oriented. When information is being fed into my memory tracks, the moon's influences are recorded travelling in a direction from right to left. During memory recall, the sun oriented manganese bar becomes activated with a wave flow in the opposite direction, from left to right. TESTS - to confirm that the compact bone in the track is actually storing the information like a magnetic tape.

When the item being recalled in one's memory is small in its wave message content, only the first portion of the memory track records the message. Furthermore, even though the memory thought is repeated continuously for a time interval of several seconds, the stimulation is confined to the first section of the track during memory recall. The author recalling a configuration of three dots spaced closely together conducted in one such test.

Further evidence that the cranium bone stores the information is given in chapter 11.

We have to first establish what is normal before we are fully aware of the areas to concentrate on when our memories are weak. For those who acquire understanding of the individuality of their energy circuit, it becomes infinitely

more interesting as additional facts accumulate.

At this stage of my research, I have consistently observed that the horizontal waves of magnesium and sulphur, within our system, act as wave carriers by imprinting other wave patterns on their structure and transporting information from one area to another. For example, the eyeballs have an overall wave field that responds to the horizontal wave stimulus of magnesium and sulphur. Up to this point in the book the author's model has only included a normal energy pattern where all factors are right. If all our elements were in resonance and in balance our story would end here but instead our story is just beginning.

Deviations from the expected invariably alert the researchers to investigate further for what is required for the model. In order to be valid the model must remain consistent with the underlying design observed to date. Unfortunately, civilized man has disoriented nature's original design to such an extent that deviations in most people have become the rule and this researcher was not altogether an exception.

It was only due to the fact the author had managed to avoid the disruptive effects of routine X-rays, that she was originally able to record effectively enough to discover some of nature's fundamental energy designs of life; including a [Vivaxis](#). While exploring deeply into the memory brain area she discovered the Fifth Life Force flow, but at that time her own energy system was out of resonance with the many wave frequencies of the Fifth Life Force. It was puzzling to her that as she aligned to its force flow an energy wave rejection was encountered; a rejection that continued as she tilted her head back into the flow. The rejection made itself manifest in several ways - a telltale conflicting motion of her recording hands and later, several hours after exposure, a most unaccustomed tingling burning sensation in areas of the right ankle and heel.

It was the latter discomfort that eventually made me smarten up. The painful discomfort would continue for days. In order to be thoroughly convinced it was the Fifth Life Force energy flow that was the cause of my misery, I repeatedly subjected myself to its energies, only to be confronted each time with the same miserable results. It was rather like hitting your head with a hammer to find out how nice it felt when you stopped. When some of my students were alerted to this phenomenon, they experimented and experienced the same rejection. Misery likes company, especially in this case, where it gave us substantial proof of a factor that affected us all adversely.

## Memory Tracks. Continued

My deep respect for nature made me realize the fault was ours, not hers. What discrepancies did we all have in common? Dentistry, vibrating drills, anesthetic drugs, X-rays of the teeth and mouthj we found that any or all of these practices could disorient the elements in the bones of our jaws, teeth, mouth and the vertebrae of the neck. Stressing the affected bones and channelling with one's head level into one's Vivaxis had obviously reoriented many of the elements, but not those belonging to the Fifth Life Force or the force flows of the sun and moon.

Subsequently, I found these forces come into our Vivaxis channel at various angles. This fact is now taken into consideration in a new revised technique of channelling; refer to Chapter 12.

My immediate objective at this stage was to reorient all the elements and compounds in the bones of the mouth, teeth and face that are normally oriented to the various frequencies of the Fifth Life Force. My recording had given me enough information to realize that each element, or pairs of elements triggered responses while at various angles faced into the Fifth Life Force. Using appropriately applied pressure in conjunction with channelling, while my head was gradually tilted into each angle of force flow, I was eventually rewarded by reorienting my central control into resonance with the flow of the Fifth Life Force. Later, I learned that the mid point on top of the head is an important Magnetic Group centre, and in the roof of the mouth is a Gravitational Group centre. Between these two energy exchange centres lies the hypothalamus, our centre control.

Now, as I tilt my head gradually into each new angle of flow, the atoms of the elements oriented to that force flow respond with a lively stimulated wave motion. More importantly, I now use the force flow to reinstate areas of memory track that were no longer recording.

The areas most responsible for obtaining information for filing in the memory tracks are the ears and eyes. If the normal energy wave supply is deficient in either of these organs, naturally the memory messages will be incomplete and weaker than normal, and consequently will not be retained too well.

Fortunately for us, our eyeballs have many bone areas in the cranium whose elements' energy waves are reflected in the eyes. The part played by the eyes in the memory mechanism was well illustrated to the author through a test she conducted on her own eyes. The left hand side of her left eyeball lacked the normal responses to magnesium and sulphur. While her eyes remained straight forward, she could see from the corner of her left eye two drafting instruments hanging on her studio wall. When she sbut her eyes and tried to recall the two instruments, her recording showed a lack of normal stimulative response in her memory tracks.

Similar tests, viewing other scenes confirmed the fact that although she could see out of the corner of her left eye.the required carrier wave of magnesium and sulphur was missing. As a result information was not being transferred

into her memory tracks. In contrast, information received from other areas of the left eye was faithfully transferred and recorded in the memory. In essence, only three quarters of the picture she actually saw was being recorded for future memory recall. This discrepancy was traced and corrected, through reorienting the elements magnesium and sulphur in a small area of bone located on the left corner of her eye socket.

Other parts of the eye are dependent on other areas of bone for their sulphur and magnesium wave field, It becomes apparent that one requires the knowledge of all the numerous factors in order to make 100% repairs to the memory mechanism.

Uncle Bob was a typical example of a person who lacked the ability to transfer information into his memory tracks. Bob's inability to remember the present occurred after an accident, which involved severe blows to the head and other areas of the body. His memory mechanism had faithfully recorded details of his earlier days and he was still able to relate back to them with remarkable accuracy. In contrast, he was largely incapable of remembering events in the present. I recall particularly, how day after day, he would gaze out of our picture window and see the same lone boat anchored in the lagoon. "Whose boat is that?" he would question. "It i\*s our boat", we would reply. Five minutes later he would be asking the same question. The routine of asking, "Whose boat is that?" continued throughout his month long visit. Uncle Bob died many years ago, but the phenomenon of remembering his past yet not recording events of the present made a great impression on me.

There are many factors capable of contributing to the common complaint of poor memory but perhaps the one most commonly overlooked is dental work that affects the bones in the roof of the mouth. For, as previously mentioned, a section in the roof of the mouth is in direct alignment with the top area of the cranium. In between is important brain matter plus the central control system, the hypothalamus. Teeth X-rays like all X-rays strip electrons from atoms thereby reducing the normal energy flow. The vibrating drill does further damage to the normal atomic structure of our teeth and bones in the mouth and jaws. In January 1977 issue of McLeans Magazine, Dr. Tony Brammer of the National Research Council is quoted as saying, "There is a potential problem among workers who operate vibrating tools and equipment." Long before this article appeared, members of our research society were acutely aware of the ill effects of vibrating power tools. Now we are also aware of the problem of the effects of the dentist drill in relation to memory.

Most of us, at sometime or another require our teeth filled. The obvious answer is education and taking steps to counteract the adverse effects after each visit to the dentist. Not only would our memory remain unaffected but it would be safe to assume that our teeth would stay much healthier if the normal flow of forces were reinstated in the teeth and bones of our mouth, jaws, and vertebrae of our neck.

## Chapter 6. Education

My training at Art School hardly sounds in keeping with what one would expect for a person who has delved so vehemently into the sciences, yet strangely, that was where my awareness of energies radiating from the human bone structure originally was stimulated. My particular interests were modelling and figure drawing from real life. Our instructor was an inspiration to me. 'Study the underlying bone structure and model it in first,' her words became well imprinted on my mind. It became second nature to absorb with my eyes and mold with clay the energy emanating from the bone structure of a model.

In 1975, I appeared on a radio station CJOR talk show. The radio commentator greeted me rather coolly prior to being on the air, "And what makes you think that without a science degree you could discover anything as important as this?" In answer I reached in my brief case and handed him an article. He took a few minutes to read it and his attitude switched to one of warmth and encouragement as we proceeded with the program. The article was by Sydney Harris, "Daily Colonist", Victoria, B.C., November 24, 1974.

The proper attitude to take toward an "expert" in any field is one of reserved respect. "Respect," because he has applied himself diligently, and knows far more than a layman can comprehend about his subject. "Reserved," because it is rarely the expert with formal training who makes the most notable advances in his field. Men trained in one field who delved into another with the innocence of a child and the fervor of an amateur have made a startling number of inventions and discoveries.

They were thus able to see what the expert could not - for, in a sense, knowing too much about a subject arbitrarily delimits one's sense of what is "possible" or "feasible". ... To make basic discoveries, one must remain childlike in some respects, asking foolish questions, and refusing to accept pat answers that really answer nothing. Experts are good to check and test one's ideas against; they usually know what cannot be done, but are not as perceptive in knowing what can be done outside conventional formulations. ...

By rigorously departmentalizing science and technology, as we do, our society tends to generate more and more experts, and fewer and fewer inspired amateurs who feel free to dabble in related fields. Experts have contempt for far-ranging minds, which refuse to confine themselves; and our educational system rewards only those who continue to learn more and more about less and less. This is not the way to discover anything, except how quickly the imagination congeals and the spirit shrinks in such an atmosphere.

We certainly respect the opinions of professional scientists, but we would only retard the development and utilization of our findings by confining ourselves solely to satisfy the limitations of their instruments.

In order to obtain consistent and reliable results, we are required to humbly observe the wave behaviour within the bounds of our own auras and bone

structures. Further, we have to know how to relate energy changes in our environment to changes in our circuits and interpret their meaning.

Following are excerpts from a tape of a lecture given by a recent graduate of physics who received his doctorate of physics at Cornell University. The informal talk was given at the Nixon residence on Thetis Island. Among those attending were students from Vancouver Island and several members of the Vivaxis Research Society executive - Date, July 1977.

"I received the five parts of the Vivaxis Manual and was very impressed and became very interested. I felt it was a fantastic new discovery. I am more like a scientist and my interest in it was that of a scientist. I felt it was a major new discovery, the major one of the second half of this century - the first one I consider Einstein's Theory of Relativity.

When we talk about a scientific phenomenon we have certain conditions for it. It must provide consistent observations, re-peatable time after time. There are, of course, times when we see something only once, we see it erratically; but a scientific observation must be consistent. The other conditions for this scientific experiment are that anybody is able to do it given the proper set of conditions. In our case, the conditions are being free from the mutilating effects of X-rays and other radiations. So, in Vivaxis I think conditions are met and in my estimation it is a very profound scientific discovery.

Now, I understand its therapeutic value is very, very attractive and most people are attracted to Vivaxis, I do believe, due to its amazing effects on the human body. It restores the body more like to what nature meant it to be in the first place.

I am more related to the evolution of man on earth, I stress this word "earth" because our earth has a set of magnetic properties and it would be stupid to think that we, living species on earth, are not linked to it through this property. It is a magnetic property. So that is how I became fascinated with this new discovery of Vivaxis; how it very nicely links man to the earth.

I believe we need a theory to explain all the observations that I have been accumulating so far by Frances Nixon and it should be the job of the scientists so that they can present it in a coherent way to the scientific community and later on hoping it becomes a text material. Now, every time we are at the threshold of a new discovery, we may or may not be able to present it in terms of existing knowledge. We may have to postulate new things. They many appear new and far out at that time but later on they become every day vocabulary.

I quote this young physicist, who was well qualified to judge after I had spent five full days, plus several evenings, devoted exclusively to briefing him on the basics of element orientation. He was taught how to record and evaluate for himself and I might add he was an exceptionally apt and responsive student. On first arriving, he was unable to record either with his hands or with a recording wire; these discrepancies were due to a chest X-ray. The bones of his upper torso, arms and hands, recorded the telltale radiation damage to the atomic structure of many of his elements through the lack of normal stimuli response.

Carbon atoms, being the most prevalent atoms in the human system, play a vital role in the ability to record. He first reoriented his carbon atoms in his bone structure so they once again responded to the stimuli of true North and absorbed energy from the wave frequency of that specific force flow. He did this in two ways:

- 1) Exposed each area in turn to true North, while he held a bag of carbon on the X-rayed area for a period of six seconds.
- 2) Exercised and stressed the bone areas while facing into true North and South and also magnetic North and South. Through the foregoing procedures he reoriented the carbon, calcium, sodium, and iron atoms sufficiently well for the eager researcher to record, locate, and use his own Vivaxis channel. This last achievement enabled him to make further corrections.

From a physicist's point of view he refers to "Vivaxis, as a most profound new discovery." On this point I would like to comment, "We should regard all those, who have correctly located the channel to their own Vivaxis, as valuable discoverers of major import." If I were the only one who could locate my Vivaxis channel, then it would have little meaning. But when all those who have taken the appropriate steps to make factors right, can then locate their Vivaxis channel and utilize its force flow to direct energy to non-energy areas, then "it has meaning!"

Further, it meets the requirements of a scientific experiment; namely, anybody can do it given the proper set of circumstances. A thought that bears repeating, it is normal to be able to record the energies emanating from the atomic structure of the basic elements in your compact bones. What is NOT normal, is to have your atomic structure so messed up that you can no longer record!

One challenging doctor wrote me quote, "Our energy is derived from oxidation of our foods. If oxidation ceases, life ceases." In his opinion, that totally accounted for our energy supply. The author could fill the book answering this challenge, but in brief, we have consistently observed that our basic elements' force flows are required by all the organs responsible for digesting and oxidizing our foods. Our observations are evidently supported by the views of Henry Schroeder, M.D.

The trace elements are more important in nutrition than are the vitamins, in the sense that they cannot be synthesized by living matter as in the case of vitamins. Thus they are the basic spark-plugs in the chemistry of life, on which the exchanges of energy in the combustion of foods and the building of living tissues depend. (7)

The need for education is very apparent and hopefully we can look for those in the fields of education to lead the way.

Vivaxis knowledge, due to its recent stage of development relative to elements, now aptly lends itself to classroom study material. The material should stress a normal energy pattern and the role one's basic elements play.

At an early age students can be taught the factors that enhance their energy circuits and the practices that weaken them. The text material of course would

have to be adapted to the various levels of understanding. There is probably no better way to learn basic biology and physics, than through your own recording of the wave behaviour in the atomic structure of your basic elements. However, the environment in a classroom is not suitable for recording and channelling. These two aspects of study need not be a requirement for a student, unless he so wishes to explore on his own and in the confines of his own property.

How can we explain and interpret all this adjustment, all this pulsing, vibrating, radiating life, all this striving and growing and unfolding in the world of grass and trees, of insects and birds, of beasts and men, of innumerable and unpredictable changes and variations (as unpredictable as the quantum of energy in the atom) straining toward more perfect living? How shall we account for all this compelling urge of evolving life, except as the response of the command of a supreme Intelligence manifested in mind and revealed in nature? (8g)

Some of my most rewarding instructional experiences have been teaching professional men and women, including physicists, medical doctors, chemists, chiropractors, naturopaths, and teachers. Their minds are trained to analyse. Further, they have the background knowledge that is so valuable for incorporation with the basics of Vivaxis.

Another very rewarding instructional experience was teaching Vivaxis courses, four sessions, each of ten weeks at the Malaspina College adult night school. We have those responsible for arranging all the courses, to thank for the initial advancement we made in the realms of memory. The courses stimulated enthusiasm as expressed by Ben Dyer whose letter originally appeared in the Vivaxis Journal, January 1976 - December 15, 1975. - Report on ten-week course sponsored by the Malaspina College and instructed by Frances Nixon.

The benefits derived through Vivaxis are manifold as shared by an enthusiastic class of young, middle aged and retired. The fortunate young responded quickly and successfully, whereas my response was much slower, due to carbon monoxide poisoning forty years earlier, followed by chest fluoroscopy in excess of five hundred times accompanied by dozens of X-rays etc., over a thirty year period. Neutralizing these effects required about eight weeks with the patient guidance and assistance of Fran Nixon. Reinstating the correctly aligned field in the related bones followed more rapidly.

Since then the benefits derived are wonderful to describe, including a clearer thinking mind, greater power of concentration, a more retentive memory, improved hearing, quicker focusing eyesight, the complete disappearance of minor aches and pains of thirty years duration. To this must be added a newfound energy, which provides a priceless inner glow. Beside me stands a rejoicing wife enjoying the satisfaction of a completely healthy knee that was seriously arthritically inclined after being subjected to two serious falls. She has also shared many similar improvements to mine.

These and countless other benefits besides greater knowledge you may possess by becoming a student of this expanding vital subject, Vivaxis.

Signed - Ben Dyer.

Ben Dyer attended the first three complete courses and his contribution and assistance in the classes earns him a special honourable mention. The reader will note he refers to, "greater powers of concentration and a more retentive memory." Both these facilities are improved by taking corrective steps to remove the adverse effects of X-rays and wave links to foreign Vivaxes. However, we only learned to pinpoint, and correct malfunction of the memory tracks during the fourth adult Vivaxis course.

The classes were restricted to twenty students and registration for the last was filled several weeks prior to its start. Twelve of the twenty students were graduates from previous classes. It was therefore decided to keep their enthusiasm alive by researching the energies responsible for memory. In return, these students promised to assist the beginners in attendance during the intervals between classes; an arrangement we felt that added considerably to their experience. As the saying goes, "An adult learns by teaching a child." In this case the saying should be qualified to read, "An adult learns by teaching another adult."

The purpose of my memory course at the adult night classes was not to teach the students what was already known about memory, but to guide the individual towards exploration of the unknown through his ability to record and receive information. It was a stimulating experience for all who participated and we gained an understanding of our memory mechanism that far exceeded all our expectations.

## Chapter 7. The First Memory Class

"Why do some privileged people have the ability to play by ear?"

The Vivaxis instructor asked herself this question, as she prepared her schedule for the first memory class. Recalling a serious infection in the left ear around the age of eight years, she placed her receiving finger on a memory track located behind her left ear. There was no response in the track as she silently hummed a familiar tune. In contrast, the same test conducted on the memory track behind her right ear stimulated a vibrating response; a response that was recorded with a stimulating motion in her free hand.

Fascinated, she continued the testing after playing several tunes on the organ. The memory track responses were consistent with the previous test. Next she reached back in her memory for a tune she knew prior to her ear infection. As she silently hummed "Jingle Bells", the left ear memory track vibrated with instant memory response. The word 'fascinated' flows spontaneously from my pen, for I was extremely FASCINATED and ELATED at the first breakthrough to memory. The second breakthrough came after a period of experimenting, when I found a combination of sulphur and magnesium sulphate (Epsom salts), laid against the bone of the ear, temporarily reinstated a section of the left ear's memory track. It now recorded tunes I heard in the present, but its memory gap remained during the period when I was eight years old up to this time.

The teacher arrived at night school with a tape recorder containing a tape of the tune, "Mexican Hat Dance." It was a gay tune that suited the jubilant mood of the students, as they started to record the responses in the various memory tracks of their ears. Her experiences with the defective ear track were duplicated and confirmed by several students in the class.

Although the magnesium and sulphur were not the final answer to the reinstatement of memory tracks, they lead to the eventual utilization of all the frequencies in the Fifth Life Force, used in conjunction with the stimulation of the designated bone area.

It was significant that among the group who could validly record, we got consistent results. Many of the students assisted in pinpointing various memory tracks. They located some that myself and others were not aware of, for the simple reason ours were no longer recording. The fun began when the students found that they could trace the event and occasion when a track became disoriented.

The teacher had her share of disoriented tracks and the class rocked with laughter when she arrived one evening announcing she had determined when one of her tracks had ceased to record. It was the day before her wedding.

The usual parties, rich foods and excitement that commonly precede a girl's wedding had taken their toll and this poor girl was miserably ill with a nervous stomach. Mother was frantic! Since a large white wedding was planned for the next day. The service was to be held at Christ Church Cathedral and friends and relatives had arrived from distant parts. The doctor was called and the possibility of a bedside wedding was contemplated. My deficient memory track became stimulated when I recalled all the events up to this time. Further,

it recalled the doctor handing me some oral medication to take. From that instant all recording ceased until it was reinstated some forty years later. The side effect of the tranquilizing drug was the price I had to pay for a quick recovery that enabled me to walk down the aisle the next day.

My other memory tracks, which were not directly affected by the drug, recorded the events of the day with clarity. I recall one amusing incident that was well recorded in my atomically stable memory tracks. During the part of the service when we were required to kneel and hold hands, my groom's hand started to shake and tremble. This nervous reaction on his part was extremely shattering to the young bride who questioned him after the ceremony. His answer was typically masculine, and is repeated for the humour involved. "When I knelt at the altar, I suddenly remembered I had FORGOTTEN! TO GET THE SOLES OF MY SHOES REPAIRED."

Poor memory has lots of company and when you really start to explore the many practices of our civilization that contribute towards it, you begin to understand why. However, there are many natural causes too, such as a severe blow caused in an accident or oftentimes during contact sports.

## Chapter 8. The Effects Of A Heavy Blow

The following stories are the experiences of some of the students who attended the night school classes and specialized in researching, "MEMORY".

MARY DOUGLAS

Mary has marked an area of **memory track** that lost its ability to record for twenty two-years. The accident occurred when she was a young girl. While diving with carefree abandon she hit an unseen obstacle. The marked

memory bar shown in the photo, did not record the swollen, black and blue nose that resulted, but her other memory tracks did. The force of the blow was severe enough to cause a painful eggshell crack, not easily forgotten.

Mary Douglas, a teacher by profession, attended several weekly [Vivaxis](#) night courses of ten weeks each, plus a six day Vivaxis summer workshop. Mary was an apt pupil with a keen mind that enabled her to evaluate constructively. These attributes made her a valuable asset in the exploration of the elements responsible for her own memory. Her recording results fundamentally duplicated mine and those of others in the class, namely:

- (a) - All her normal functioning memory tracks recorded strong wave stimuli as she recalled past incidents.
- (b) The memory track bone area located on her nose, failed to record events that occurred since the time of injury. This was consistently confirmed by Mary's own recording of the injured memory track.
- (c) - The injured track responded quite normally to all events that had been recorded in its structure prior to the time of the injury.
- (d) - After the injured track had the atomic structure of its elements reoriented, it once again recorded and responded with strong; wave stimuli to events which occurred since the reinstatement. Yet, there is still the gap of twenty-two years between the accident and restoration. The gap remains as a permanent blank in its memory.

The memory tracks on either side of the nose appear to be the only tracks that memorize a scent and in this role they can be regarded as partially specialized. The qualifying word "partially" is used because the nose tracks also record general information in the same manner as do the mass of our memory tracks.

It is indeed fortunate that nature, in her wisdom, has supplied us with numerous recording tapes. If it were not for nature's generous endowment of duplicate recordings, most of us would be going around like chickens with their heads cut off.

One man drove a return trip of two hundred miles to attend each weekly night class. His problem was lack of normal memory due to cerebral malaria. The severe side effects of the disease had played havoc with his memory mechanism. The desperate man complained that he spent a good part of nearly every day just trying to locate his car, "But where did I park it?" Most of us find we have occasional lapses of memory due to a temporary deficiency of normal energy flow but in this man's case it was a chronic condition that required reorientation of elements in his cranium. Vivaxis knowledge helped his memory retention considerably, plus relieving the continual pressure he had previously experienced in his head. The latter is a common complaint of those who suffer from element disorientation in the cranium.

The weakness of one's memory is generally in a direct relationship to the number of injured and malfunctioning memory tracks and component parts. The happy side of the picture is that it is now possible to remagnetize and restore the recording ability of the injured tracks.

The arrangement of elements in the bone structure of the memory tracks is analogous to a magnetic tape. The deeper we probe the more acutely we become aware that magnetic and gravitational forces are responsible for the memory track's ability to record and retain knowledge. During my early research with magnets, I found that a Vivaxis was always created at the site where a magnet became magnetized. Furthermore, the magnet was wave linked to that Vivaxis. Heavy blows to a magnet can destroy its magnetic properties, in the same manner that a heavy blow can destroy the magnetic properties in a bone area.

## Chapter 9. Creation Of Individuality

In my estimation, a person's individuality in the arrangement of elements in his **memory tracks** and other areas of bone, reflect the influences of the environmental forces relative to the particular time and place where his **Vivaxis** was created. One of the most moving experiences of my life was testing the wave link between a baby and his newly created Vivaxis. The baby, at the time, was unborn but restless in the close confines of his mother's womb.

Tracy and Shawn with their mother, Mrs. Pat Johnson

Having attended adult night classes, the mother, Pat Johnson, was well aware of the reality and importance of her own Vivaxis. She could readily locate the channel to her Vivaxis and on many occasions had effectively used Vivaxis methods to direct energy to non energy areas, including several of her memory tracks. During her pregnancy Pat was a pioneer in research and to my knowledge, has the distinction of becoming the first woman to determine when her baby's Vivaxis was actually created.

Pat had been alerted to detect a possible chemical change around the seventh or eight month of pregnancy. On the night of the new moon, November 12th, she felt a peculiar hot, tingly sensation in her hands and feet.

At this point of time, she got out of bed and in the living room started to record her elements' responses to the various force flows in her environment. When she came to record magnetic North and South, her responses ceased abruptly. For a brief interval Pat felt an unusual sensation; her arms had a numb heavy feeling as though they did not belong to her. When the sensation passed and her arms regained their normalcy, so did her ability return to record the force flows.

Pat had pinpointed the position in the room where this event had occurred and was overjoyed when I offered to confirm what she felt might be the baby's newly created Vivaxis.

Detecting the wave link between an unborn baby and his Vivaxis was a new experience for me and I might add a very beautiful experience. I held the centre of my receiving (left) hand over the place that Pat had pinpointed. The recording wire, held in my right hand, swung with unusual vigor with a fixed wave vector homing directly towards the pregnant mother's navel, indicating that my left hand had located the position of the unborn's Vivaxis. I was careful to make each recording very brief. Tests conducted when Pat was out of my sight were definite in their confirmation of the position of the Vivaxis. The mother and baby would turn twice and the recording wire with the usual four-second delay would turn twice also. If I moved my receiving hand a few inches from the centre of the Vivaxis, the recording wire lost all wave motion and direction.

Soren Bruce Johnson was born November 28th. 1977, fifteen days after his Vivaxis was created.

Many times I have tested the wave link to a baby and his Vivaxis, but not before birth; several of my previous publications described these experiences. One noteworthy fact is that the baby's wave link flows vertically up or down from the centre of his Vivaxis and then in a horizontal wave train to him. Consequently, in the event that Pat and the baby were located on an elevation below that of his Vivaxis, I would not have detected the wave train with my receiving hand held above his Vivaxis.

The experience of detecting the wave link between the unborn child and his Vivaxis made a profound impression on me. It was sheer beauty of creation the new pulsating life energy that I recorded through the wave link; a wave link connecting the unborn baby to his Vivaxis. My first reaction was one of elation, but was then replaced by a genuine sense of sadness, "How could man in the face of all this evidence be so insensitive and unaware of the laws of creation that link him so beautifully with the magnetism of the earth and Universe?"

Pat also participated in the memory class research project. During the course she located four memory tracks on her face that had ceased recording when she was a young girl of thirteen. Pat was able to trace back the tracks' malfunctions to an occasion when she fell out of a top bunk, hitting her face on a suitcase as she crashed to the floor.

Her tracks have since been reinstated and are recording well enough to give her one hundred percent in a recent government memory test. "I went through high school as one of the dummies and look what I am really capable of. I wish I had known these simple laws years ago." This was a comment made by Pat, and shared by many.

**The Knowledge Is Here And You Do Have A Choice Of A Good Memory Or A Poor Memory**

## Chapter 10. You Do Have A Choice

In most instances you have a choice of a good memory or a poor memory. The food you eat, the exercise you take, and the mental approach you take to life, are all essential to health, as well as to an alive memory. In short, a toxic condition temporarily impairs the memory mechanism.

The trend today is to take substitute trace minerals and in many cases with beneficial results. Yet, in our observations, the oral doses fail to replace or correct the essential atomic balance in the organized arrangement of elements embedded permanently in the bone structure. The question arises, "Is there a relationship between the need for substitute trace elements and the disruption to the atomic balance of elements in the bone structure?"

Kay Fortin attended several [Vivaxis](#) night courses. Kay is a prime example of a person who endured incredible suffering, largely due to ignorance of basic laws of energies. When Kay first attended night school her eyes literally bulged from the pressure behind them. We give her full marks for using her own initiative in utilizing her Vivaxis energies to restore the energy flow to normal. We make it clear to all students that we do not treat but it is their prerogative to learn to apply the laws of natural energies to themselves. They should have a choice and only education can give them that choice. Ignorance could have condemned Kay to a continued life of misery and suffering. Instead, she is now leading a full and useful life as a wife and mother of three. Kay writes her own story as follows:

I had visions of becoming a permanent cripple. I had terrible moments of anger and depression as a result of waking up every morning with violent headaches and carrying these headaches through the day, fogged by 692s. My eyes would pop out with pressure and just the light of day would be blinding. My mental processes were not functioning properly and I was in a constant daze. The headaches would total approximately twenty days out of the month. I went to doctors, specialists, and X-rays were taken only to be told I had a degenerative disc at the top of my spine. This would progressively grow worse. I would eventually have to wear a collar. My doctor jokes about old age (after all I was 39) and also that it were just growing pains.

Kay Fortin.

I was scheduled for further X-rays at Victoria Hospital in February 1976 whereupon they proceeded to tilt me upside down on an X-ray table, strapped by the ankles, to allow the fluid injection in my spine to flow down to my skull, and enable them to take pictures. Another day, wires were taped to my head (similar to an octopus) to record the brain waves. Once again, I was tranquilized for more extensive X-rays and wheeled into an operating room. I was injected with another instant-acting needle and succumbed immediately only to wake up to a 100 lb. head that lay on the bed with me (mine of course). At this stage of the game, I didn't know where I was located and felt more miserable than ever. I realized I felt worse now than when I arrived and that didn't make sense to me. I wanted out before I remained there permanently.

My husband so kindly listened to my pleas to escape as I was now scheduled for an operation to remove the disc. The doctor was furious with me but then admitted I wouldn't have been the same after an operation of this sort, so conceded to my leaving. I lay on my back all the way home from Victoria to Lake Cowichan and stayed that way for three weeks, continuing to do my household chores slithering around the house like a snake and had to crash to the floor every few minutes to make the excruciating pain in my head subside.

I eventually worked my way to a sitting position after two weeks and through sheer determination. After three weeks I was able to get out in my car to go shopping, only to race back home and throw myself on the floor until the pain went away. After the pain of those X-rays ceased, I was now back to the original headaches I had previously, so nothing was really accomplished. Then I read "Vivaxis, Spiral of Life" and "Magnetically Yours", by Frances Nixon. I attended her ten-week course in Duncan to learn more about life's energies and how they affected your physical and mental well being.

Call it witchcraft if you like, I call it a bloody relief.

I no longer have headaches or pressure behind my eyes, my personality seems to have changed, my eyes are much clearer and I no longer have the expression of pain on my face. My husband said I look ten years younger! and by God I feel it!

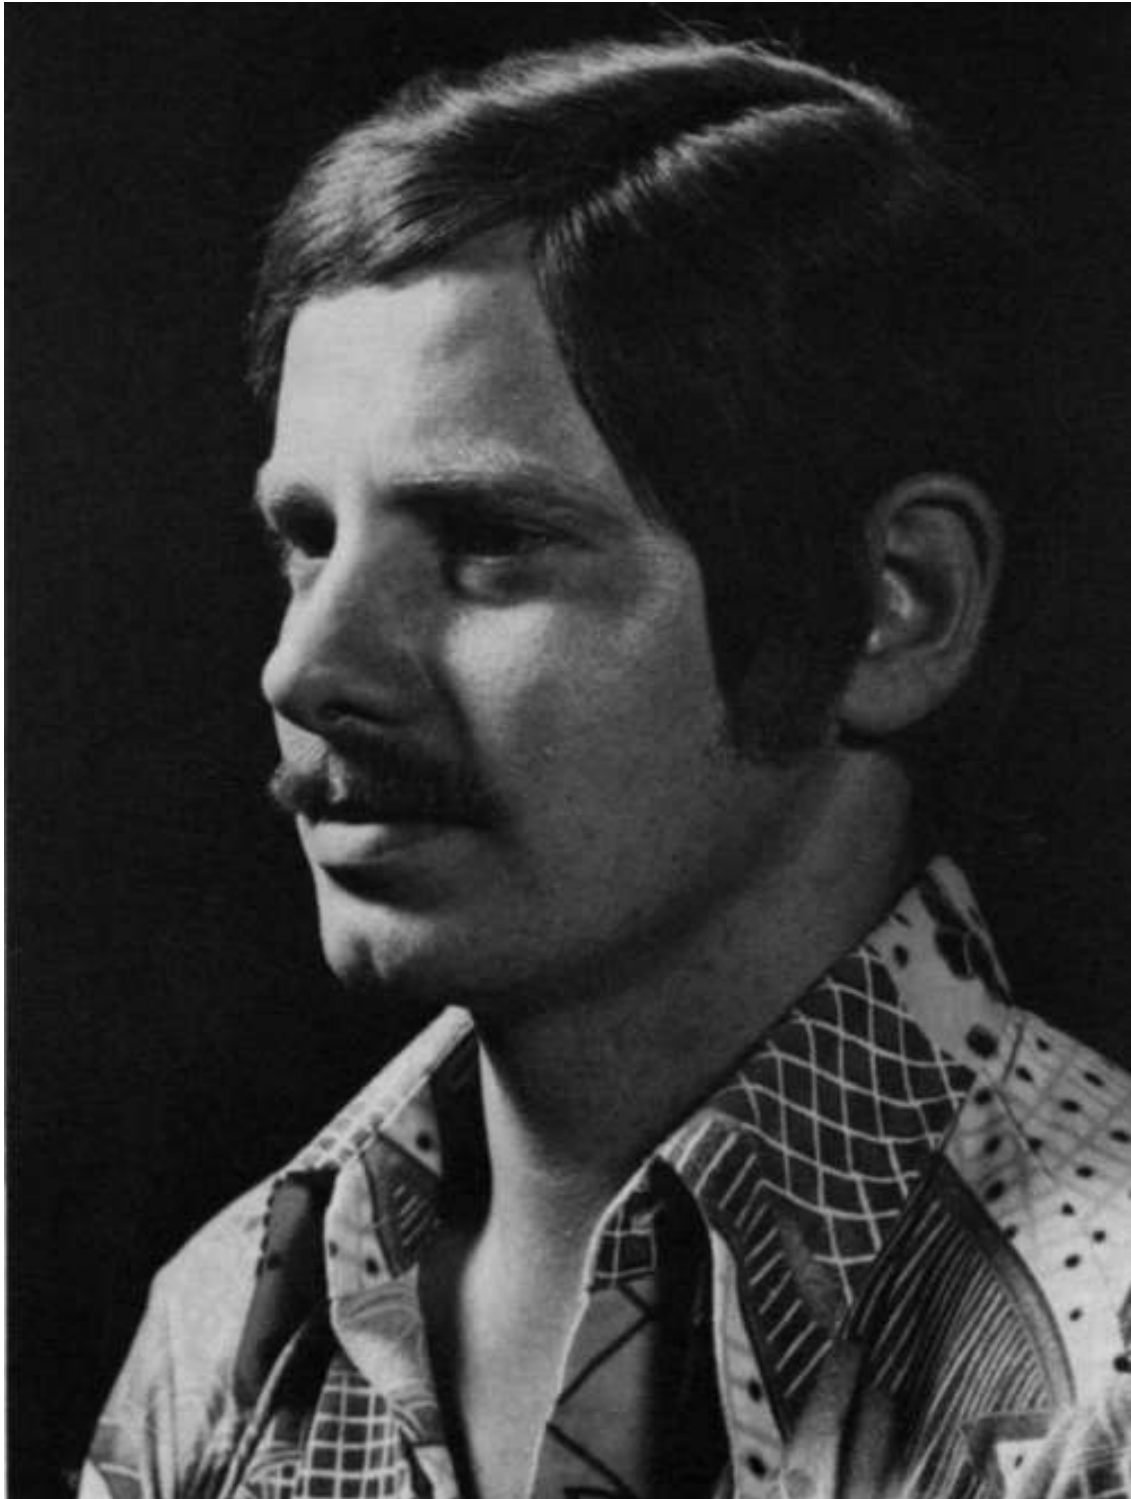

I found out that the cause of the headaches was due to three motorcycle escapades, one of which I was riding over a washed out road filled with large boulders and decided it was a cinch to conquer, only to have my bike go out of control. I shot over the rocks, landed on the back of my head and saw stars. This was approximately five years ago and my headaches had started after that.

Kay Fortin, December 8th., 1976

Kay later attended the memory course and was able to determine through her recording, that the **memory tracks** located on the back of her cranium, had lost their ability to record events occurring since her last motorcycle accident.

For man to mutilate life's intricate design of atomic structure with highly ionizing radiations is a sacrilege that casts an ugly reflected shadow on our earth and on mankind.

We do have a choice through avoiding practices that destroy the integrity of nature's design.

George Giricz.

George Giricz learnt that he had a choice of either suffering from chronic allergies and sinuses or through the knowledge of Vivaxis correcting the condition. He chose the latter course.

Today, it is difficult to associate George with a person who originally could not record and suffered with a severe sinus condition. He was a conscientious

student and contributed tremendously during the classes including the memory courses. He is now an excellent example of man's ability to sensitize himself to the responses of his own elements, relative to his environmental forces. More importantly, he has the ability to interpret their meaning, a feat that requires experience plus a high IQ. Further, George now has the knowledge required to reinstate his memory tracks, if and when the need arises, thereby increasing his potentials in his future life.

Marion Powling.

Marion Powling discovered, at an age when more than half of her life was still ahead of her, that, "she too had a choice." Marion's choice was literally, "To see or not to see." The desperate young woman related her predicament to a

class that listened in shocked silence. She described how she had undergone two operations a few years ago. Both operations were designed to alleviate migraine headaches. The surgery involved a technique of freezing the nose and bones around the right eye socket. Marion claimed the operations did little to deter painful headaches but they did cause alarming side effects; including gradual loss of sight. Blind spots were developing in her right eye and her eyesight had deteriorated to a point that caused both she and her doctor to become very alarmed. The right eye socket bone instead of being firm and hard, had a mushy soft texture.

As this detrimental condition was demonstrated to the class, I questioned, "What other conditions are we apt to find in the bone?" "NO FIELD IN THE BONE," the students correctly chorused. In essence, the elements in the affected bones had been atomically disrupted; consequently their frequencies were out of resonance with their normal source of energy supply.

Fortunately, the elements in the eye socket bone are not the sole source of energy supply to the eyeball. Nevertheless, their lack of supply was capable of seriously impairing Marion's sight, causing frequent pain and swelling in and around her right eye. After the elements in the injured bones were reoriented, the former pain and swelling condition completely disappeared. It is now two years since Marion reinstated the atomic balance of the elements in her bones and recent eye tests have shown there has been no further deterioration in her sight since that time.

Her own recording ability enabled her to determine that the memory track above the right eye lost its ability to record information. The memory blank dated from the time of the first operation and up to the time she reoriented the elements in the track.

Marion reports that with Vivaxis knowledge she has reoriented several other areas of the cranium that lacked normal energy flow. The results have shown her that she does have a choice. She can now live a normal life without the agony of torturous migraine headaches and equally important without the terrifying threat of total blindness. "So little can do so much," yet "so much can be destroyed, through ignorance of fundamental element arrangement." Another student in the night class found Vivaxis education gave her the choice of clarity of thought as opposed to confused thinking. While a bright six-year-old child, she suffered a severe illness, with a side effect of inflammation of the brain, encephalitis.

After reinstating the normal atomic order in the elements of the cranium, she wrote a heartfelt letter describing how much clearer her head felt and she commented, "When you have lived with a mud-dleheaded feeling you don't know you can feel different. I now feel so sorry for people who don't know that they can feel different."

## Chapter 11. A New Life Line

There are times when injury and trauma are so severe that the creation of a new **Vivaxis** is literally required to provide a new lifeline. One such case involves a couple, Ron Collison and his wife Pat. They both faithfully signed up for each new session of Vivaxis classes. Ron's progress to sensitize himself in recording his elements' responses will never cease to amaze me. After I relate the hurdles he has had to overcome, the reader will understand the reasons.

Mr. & Mrs. Ron Collinson.

During December, 1965, Ron was working as a faller at Port Renfrew, B.C. In an effort to save a fellow worker from a large falling tree, Ron was hit by the tree as it crashed to the ground. Most of the force of the impact was on his

helmet protected head, although he also suffered shoulder and back injuries as a result of the impact. He was rushed to the hospital in Victoria where holes were drilled in his head to remove blood clots. He was unconscious for several days. During that time Pat stayed constantly beside him. Holding his hand, words of love and encouragement flowed continuously from her lips. Love is a very powerful energy force and in my estimation Pat supplied the force required to give her unconscious mate a new Vivaxis and a new, "life line."

There is one dramatic record of a house painter that fell from a great height and suffered such concussion that he remained unconscious for two weeks and had to be intravenously fed. After a week in this condition, all the creases in his hands vanished as though they had been wiped off with a sponge - and then, as he regained consciousness, the lines gradually reappeared. (9) We have no record of such a phenomenon in Ron's case, but we do record the evidence that both Pat and Ron are now linked into a common Vivaxis and the energy changes probably have been reflected in the lines of Ron's hands.

In January, the doctor operated on Ron's head, cutting the top of his skull open in a horseshoe shape to remove bone slivers. The depression is still very much in evidence. As though this was not enough to endure, he also suffered two fractures of the spine. His injured shoulder is still two inches lower than his other one. Amazed yes! Who would not be amazed that any man could undergo so much punishment and today be living a very full and active life? "Active life", this aspect most likely is one of the contributing factors of his amazing recovery. Ron digs by hand his half-acre, compost fed vegetable garden. He powers his own fishing dinghy with a pair of oars. In essence, his sum total of daily exercise far exceeds that of the average man. Logically, this type of down-to-earth exercise would beneficially stimulate the wave fields in his bone structure.

Great credit is due to the doctor whose skills saved Ron's life but credit also has to go to his wife Pat for her part in his recovery.

The **memory track** located on the injured area of Ron's cranium lost its ability to record information after his accident. The question comes to one's mind, "Did the injured and splintered bone retain the information filed into its structure prior to its injury?" The answer to this query gives further proof that the memory messages are filed in the magnetic tapes within the bone structure of the memory tracks. The badly crushed and splintered bone memory track did not retain any information filed before the injury. This is in contrast to other cases where the memory tracks lost their abilities to record, but retained the taped information filed in the track prior to their injury. In Ron's unusual case the bone was crushed and splintered, and if the previous recordings were filed in the bone of the memory track, then the recordings would logically be destroyed, and "THEY WERE DESTROYED." It would be comparable to a damaged magnetic tape with pieces torn off.

## **Chapter 12. Vivaxis Channelling. 4 Up And 4 Down Method**

This method is designed to include a wider range of force flows that have only recently been discovered.

The following method of channelling in one's channel includes a method of absorbing all the known force flows to which man's elements are orientated. Reference is made to the atoms of elements in one's bone structure that respond to stimuli of the same frequencies and have one restricted plane of orientation. As an example, carbon and calcium have wavelengths that orientate to true North and South respectively. A VIVAXIS is comprised of an energy package that contains all the following environmental forces which flow in the following directions -

1 - True North and South.

2 - Magnetic North and South.

3 - Fifth Life Force, which is a band of force flows occupying an arc of approximately eight degrees between the directions of true North and magnetic North, and true and magnetic South.

4 - The sun and moon's solunar force flow.

WHEN ALIGNED IN ONE'S VIVAXIS CHANNEL, THE ABSORPTION OF ENERGY WAVES RELATIVE TO THE ANGLE OF HEAD TILT.

a) - Atoms of carbon and calcium absorb energy waves when the head is level.

b) - All the elements and compounds that orientate to the 5th. L.F. have characteristically different wavelengths and frequencies that are absorbed into the individual's system at varying angles of head tilt, above the level position.

c) - As the head is tilted down below the horizontal in positions 5, 6, 7 and 8, the Universal energies are absorbed first; as the head is lowered further the various elements oriented to the solunar force flow absorb energy.

The energy stimulus received at each new angle is recorded by the free-swinging hands.

It is to be expected that all who have had dental work involving freezing injections, drilling and X-rays of the teeth, will record numerous rejections as their heads are tilted at the varying angles. The rejections are due to the disorientation of elements in the bones of the mouth, teeth and jaws, including the hard palate in the roof of the mouth. The central control system has been adversely affected. The first step, therefore, is to reorient all the elements in the bones of the mouth. One's Vivaxis channel can be used effectively for this purpose, providing the person can determine his own channel and is not linked to foreign Vivaxes.

When stimulating bone areas by using a press and release technique, press with one hand, and at the same time-release pressure with the other hand. Six cycles on each area of bone is generally sufficient stimulation. If you fail to get results it is probably due to one or both of two reasons:

1 - The stimulation to the bone area was too brief.

2 - You failed to introduce the required wavelengths into the bone while it was still stimulated.

We find the most effective technique is to stimulate the bone while it is subjected to the required force flows. Then, while your hands are held freely by your side, let the bone absorb the force flow for about eight seconds without further stimulation.

### **Method To Counteract The Adverse Effects Of Dental Work**

1 - Use the thumb to press on the bones of the hard palate. At the same time use your three middle fingers of the other hand to press on the centre top of the cranium. Press alternately, first on the palate then on the cranium. Stimulate both areas as you channel as directed in each of the eight positions, tilting the head at the various designated angles - 4 up and 4 down.

2 - Again channel 4 up and 4 down, this time while chomping your teeth and jaws.

3 - Your objective this time around is to reorient the atoms of the elements in the vertebrae of your neck, including the transverse processes, the side portions of the neck vertebrae. The 5th L.F. energies travel down the side transverse processes. Repeat the 4 up and 4 down channelling while stimulating the vertebrae of the neck.

4 - Your objective this channelling round is to make certain there are no energy blockages in the coccyx (tail bone). Now use the press and release technique on the centre hair whorl of the head and the coccyx, while channelling the eight designated positions. The elements in the entire spinal column will benefit from this exercise.

Step out of your channel, stamp and exercise your feet, using a Charleston motion for the balls of the feet.

The 4 up and 4 down technique of channelling balances the system's energy flows well and can be utilized more often than previous methods of channelling. However, in all instances tolerance depends upon individual energy needs. If too much energy is felt, it can be rapidly dissipated.

Method: place a small portion of dry bicarbonate of soda in a Kleenex or suitable wrap. Hold it for three seconds on all centre points; top of head, roof of mouth, bridge of nose (between the eyebrows), bilateral point at the centre back of the head and against the bone areas directly above the ears, on the same parallel as the bridge of the nose. Discard the soda immediately after using.

Experience will teach you how to evaluate which elements are disorientated in a bone area. Testing can be done while out of your 4 channelling positions and your head is tilted at varying angles. Testing will also be more valid if you avoid being in the direct force flow of any of the four other mentioned force flows in your environment.

### **Channelling The 4 Up And 4 Down Method**

#### **4 Up**

Start channelling facing into your **Vivaxis** towards position No. 1. Start with your head level and very slowly tilt it back as far as it will go. Next, gradually return it to the level position. During this entire exercise it is essential to use the full power of your brain and concentrate on bringing energy into your system.

Hands are allowed to swing freely by your sides - eyes closed.

Next, turn right (clockwise) into positions 2, 3, and 4 and repeat the same exercise in each position.

You are now ready to start the 4 down routine.

#### **4 Down**

Return to your original position facing into your Vivaxis channel, which is now position 5.

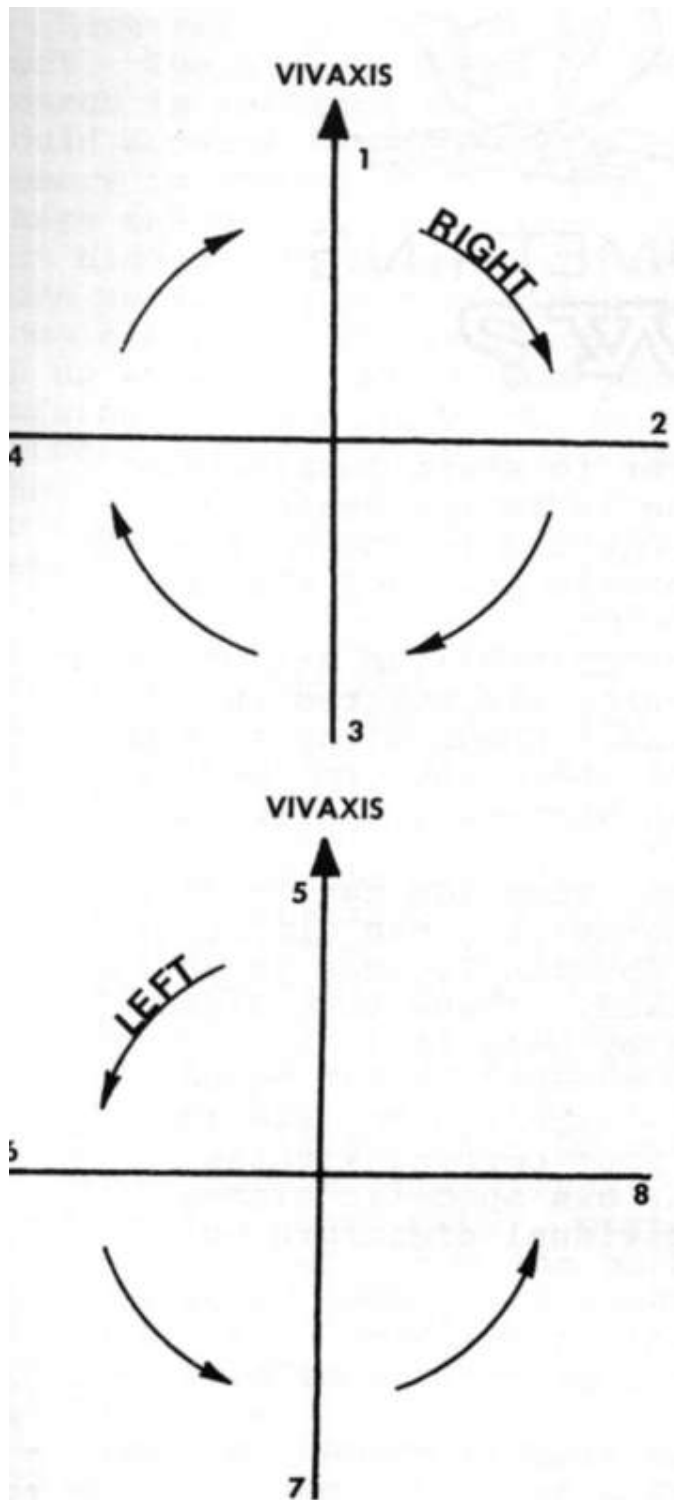

Start with your head level and very gradually tilt it down until your face is parallel with the ground. Next slowly return your head to the level position. During this entire exercise, it is essential to use the full power of your brain and concentrate on bringing energy into your system.

Hands are allowed to swing freely by your sides - eyes closed.

Next, turn left (counterclockwise) into positions 6, 7, and 8, and repeat the same exercise in each position.

Follow the channelling by exercising briefly and then neutralize. Press both hands against a surface that is in direct contact with the ground.

This method of channelling is designed to take in a more complete spectrum of force flows than former methods. It therefore replaces methods used prior to November 1977.

Dia. 7. Looking for something new?

The reader is naturally eager to start looking for his own Vivaxis channel. If he is as fortunate as the birds, who have not been subjected to the mutilative effects of X-rays, then the chances are good that he will be able to readily locate it.

Preliminary requirements for channelling and deter-ming your correct prenatal

channel is covered in depth in the Vivaxis loose-leaf Manual. Channelling to your Vivaxis is only recommended for those who are familiar with all aspects and have taken appropriate steps to clear their circuits.

You are only ready to channel when you can readily determine your own prenatal channel and can differentiate between it and possible foreign Vivaxes to which you might have become wave linked. These wave links to foreign Vivaxes are created by many of today's therapeutic practices, a topic covered in the Manual.

Another person should not be expected to take the responsibility of determining your correct Vivaxis channel for you. You have your own specific element arrangement that puts your individual signature on your own Vivaxis energies.

## Conclusion

Research into memory has been an extremely challenging project. The average person's initial reaction to our memory research is inclined to be one of rejection. The idea that one could account for the hidden forces that are responsible for memory is incomprehensible to most people. Yet, once they know where and how to look, they soon find the forces are anything but hidden. Perhaps we are required to set our sights high before we are capable of achieving feats that formerly appeared completely beyond our reach. The research into memory has opened up an unprecedented new understanding of our whole body. Reference is mainly to my initial discoveries of the interplay between magnetic groups and gravitational groups. Not only are these two groups essential to memory, they are equally important to the mechanism of the entire body. Much of our future research will be devoted to this vital aspect of our energy field.

Every year some of the mysteries of the preceeding year are solved and new ones, once thought beyond the expectations of solution, appear within reach. To fully appreciate the current discoveries in their full concept, the reader will find it helpful to become familiar with the fund of knowledge already accumulated in the Vivaxis Manual.

Every sailor requires a properly charted course in order to steer in the right direction. As the author concludes this book she is charting the direction she feels she should now steer. POINTS FOR CONSIDERATION -

- 1 - Eighteen years spent developing the science to its present stage has made her an experienced authority on the subject.
- 2 - She only has a limited number of productive years ahead and for the next ten years, from 1978 to 1988 her objective will be to distribute the knowledge to areas where it will do the most good for the largest number of people.
- 3 - We will concentrate, particularly on courses for professional people who have the background training to supplement the science of memory and Vivaxis. In this regard we suggest that nature oriented doctors are among those who are well qualified to utilize much of the knowledge contained within this book.
- 4 - Those who desire Vivaxis therapeutic help have two avenues open to them.
  - (a) Learn through the Vivaxis Manuals to help themselves.
  - (b) Persuade their therapist to take a Vivaxis course and in turn guide them and others in its usage.

Neither time or the laws permit me to give individual therapy.

As at this date of January 1978, a completely revised section of the Manual is scheduled. The section will include the utilization of the many new aspects of element orientation discussed in this book. The loose-leaf Manual is available through the mail order dept. of Magnetic Publishers, P.O. Box 718, Chemainus, B.C. Canada V0R 1K0 .
