- I tell him "See you soon"
- He replied "Forever".
- And I saw that the past is just a frozen present filled with this desperately sweet suffering.

To all those who are usually called the dead and the living

To a young daughter: Noëlle Chaudet

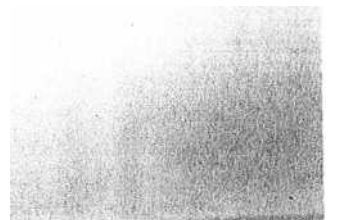

VOLUME 1

PREFACE

OF

LÉON-JACQUES DELPECH

Honorary Professor at the Sorbonne

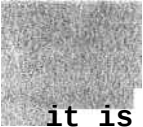

Preface

by LJ Delpech

Professor at the Sorbonne

I met the ARK'ALL Foundation about four years ago. It immediately attracted me to its main goal: the search for and the elaboration of a new form of thought. J. Ravatin, who launched the ARK'ALL foundation, imagined a new way of approaching phenomena and particularly paranormal phenomena. This interested me a lot because I have been passionate about Parapsychology for a very long time (more than half a century). Indeed, I worked during the inter-war period with the great occultist Ch. Lancelin before doing so with Professor Doctor G. Calligaris and at the liberation with R. Warcollier, - Director of the IMI Since the war I also took care of epistemology having been charged by Gaston Bachelard with the report Epistemology and psychology at the International Congress of Sciences of Paris 1948. But above all I succeeded in creating and having accepted from 1973 to 1976, the only Teaching of Official parapsychology having existed in France. This involved two hours of master's per week at the Paris VII Center for Clinical Human Sciences Studies. This teaching lasted three years and it was suppressed because irresponsible young people taking advantage of a long illness that I had at that time (a double cataract) thought it clever to infiltrate fanciful occult teachings (by the presentation they had given of it witchcraft, clairvoyance, etc.), which rightly upset my colleagues. Faced with these eccentric approaches, I distanced myself by sending a report to the President of the EBU for clinical human sciences. Be that as it may, everyone knows the difficulties of interpretation that one finds in these domains and above all the distortion by an overly rational interpretation, which one brings to the very study of experience in this domain. As J. Ravatin often says: "It is not enough to think, you must at the same time know how you think", that is to say, you must be very careful that the form of thought chosen does not destroy what you want to seize. This is why it is necessary to become aware of certain notions such as different possible coherences and fields of coherence. Ravatin states: "What is most fundamental is not the Space-Time structure, (*)

(*) Teaching and Research Unit.

it is the field of coherence. This is launched by the observer, called Obs.

because it takes into account the cerebral approach of the observer, which generalizes **the notion** of observer (as it is envisaged in physics) at the same time **that the latter** is included therein". We are already rational thought, **which** then becomes a field of coherence, and another appears.

the other is **very** rich; it is composed of the rays of coherence whose study is **addressed** in this book by J. Ravatin himself. (Ravatin did not construct a multitude of coherence fields to avoid falling into the concepts of kind system of system, etc. , which while trying to avoid the rational only copy some of his steps and thereby extend it).

I became a member of the ARK'All Foundation and I collaborated on this book for the part devoted to the work of Dr. Calligaris, whom I personally knew well and with whom I worked. I met ARK'ALL researchers, both theoreticians and experimenters, and I got in touch with Vladimir Rosgnilk who, like me, was seduced by the Arkalian approach (it was he himself who asked me to preface his work). Many direct or epistolary exchanges with J. Ravatin enabled Rosgnilk to write the first three chapters of this work: he presented, as Ravatin wished, the concepts and hypotheses of Fuite, of Repere, of Existence without mark, what constitutes the Globality, the non-Cartesian Systems, not completely locatable, and all that relates to the forms, namely: their exts, progenitors, polarors, primers... the systems of the AG type and of the TAG type. These allow to consider

ger parapsychology and everything related to it like the occult in a new light. To the forms are attached the eifs (what people following Enel had called "waves of form" but which are not waves). We find here the reformulated study of the eifs by using the notions of Auréolaire and

Nebular.

This brings me to a parenthesis: I have been a friend for 30 years of Bernard Heuvelmans, the world specialist in ignored beasts and the founder of cryptozoclogy (this being the science that studies them). In his studies, he focused on phenomena related to Yeti-type forms and others reported in many places on the planet, as well as lake monsters such as Loch Ness and finally the sea serpent, etc. . Often these apparitions were treated with derision. Those, like Heuvelmans, who have been interested in it have tried to integrate some of these phenomena as "missing links" or as "forgotten remains" of prehistoric beings. Thanks to the concepts introduced in this book

these incomprehensible beings become localizations more or less stable in time; they can be "shattering" exhalations or something else in this perspective.

Rosgnilk has also taken up in this work publications he made in the magazine "ARK'All Communications" on the UFO phenomenon considered as a form in the process of localization or delocalization with which are associated eifs and states which permeate the Obs. _z and UFOs are mimoids. In his "Conclusions and Digressions" he presented in the form "Pile of stones" According to Victor Hugo's expression, multiple subjects of discussion with Ravatin, Smirne. Pierre Smirne, Serge Audebourg, Georges Hadjo have included some of their publications (published in ARK'ALL Communications) in the book, which extends the subject. Ravatin has attached problems, exercises and answers so that some interested readers can start manipulating eifs with the Arkalian approach, which is not a game of thought or a group attitude that wants to stand out and isolate itself - nor sterile complications. I insist on this a lot because it is a constructive step in understanding and a new awareness. Nor is it a result of the crisis of rationalism, a vain escape, but much more the beginning of an emergence in human thought, an emergence which contains the thought of the Ancients, rediscovered in part by Louis Boutard. Researchers, whose work has remained ignored through intolerance on the part of rationalists or because the technological society could not support their contributions, these being embarrassing for its stability, are highlighted in the course of the book. There is therefore Louis Boutard, Léon and Marie-Thérèse Sprink, John W. Keely, Georges Lakhovsky, Stanislas Bignand, G. Bergé, TH Moray, Frédéric Dufourg, Victor Schauburger, Georges Claude, J. Coutelen, G. Calligaris, and others. They worked in silence and contempt. This book, like the classic one by Auguste Lumière on "The Gravediggers of Progress", contributes to paying homage to them. On this subject, I would like to point out that the ARK'ALL foundation is the only serious organization working on the work of Louis Boutard. Finally let us specify that a thought, a form of thought can be considered as generalizations of the form; the form not being considered as totally present in the space-time structure (which is the support of the assemblies of coherence constituting the field of rational coherence), we are faced with an attitude where the observer lives his philosophy .

In the Bible, Adam named the animals, this is what we could call their integration. Thanks to this book, Man will perhaps realize his dream which is to begin to integrate Man.

PRODUCTION

"Now if you have understood (says the Philosopher to us) you no longer need my explanations... and if you have not understood, it is because you will never understand!"

This thought concludes Jacques Breyer's book "Terre Omega". This is what ARK'ALL says to any reader of the book who will follow this introduction. You have to reread this thought every thirty pages or so, so as not to doubt what some have sought and found! The reader must do as the author does, that is to say, he "leaves the beaten track", that he "finds himself against the current" and that he doubts the certainties which tacitly have invaded, to agree to open up to new thoughts. It is necessary to consider as a very particular case the traditionally accepted research, and by its form of - thought and by its methods as well as its consequences, technological achievements, the fields of the economy, sociology etc... which, all s rely more and more on Aristotelian logic, on the "Cartesian" spirit, both of which are useful for comparing, classifying; but in all research, you must not classify too quickly, you can break something very deep by wanting to see too well: a classification always has a horizon that it cannot reach; this horizon may very well not be in agreement with the classification system used and disappear when the induction-deduction grid descends on the observed domain.

ARK'ALL has sought and found another way; to do this, it brought together researchers from all backgrounds and backgrounds: experimenters, theoreticians. Thus mathematicians, physicists, chemists, biologists, epistemologists, doctors (allopaths, homeopaths, acupuncturists, anthroposophists, sophrologists, psychoanalysts)), engineers, writers, alchemists, clairvoyants-sensitives, and many others still, without titles for some, work in her bosom. He also gave his name to a journal to which reference is made throughout this book.

The field which has opened up is so vast that perhaps other works will follow. There is no question of writing everything down, it would take too long; it is especially necessary to make feel with that which wants to leave traditional knowledge and mediums that it can and must try an escape, a jump... (several terms are possible according to the representation of the reader).

ARK'ALL wanted this book to make unorthodox ideas known to the general public, and on the other hand to accustom this same public to accepting what may seem strange: if a fact seems unacceptable, rather than hiding or rejecting it, you have to change your reasoning.

Ancient books are teeming with bizarre stories, incomprehensible sightings; old people talked about them in the evenings, grandmothers told them to their grandchildren; all the oral and written transmissions are full of it and we must not sweep away tales and legends under the pretext that they are only nonsense and stories. We must then ask ourselves if rational thought is adequate to enable us to bring out a reality from a legend and a tale. Naturally, it should not be deduced that any story told or written is full of hidden mysteries, that a key, also hidden, must, if it is implicit, open onto a marvelous world. Human beings have the right to dream and write novels. But - some dreams are blossomings of flowers, each representing a deep human feeling. This was the case for Jules Verne who imagined in the deepest sense of the term: he was already in the creations!

We come here to the notion of reality which is based on a logic or a tacit knowledge, never called into question. So new ways of thinking are needed; to keep only one would be heresy. Can we imagine a continuity between them? a structure that would allow them to be absorbed into one? This we do not know. If we eliminate many of the logics studied in metamathematics to focus only on those apprehending the real or its extensions moreover sensed by religions, the arts, parapsychology, we can think of forms of thought which would be borderline cases of other forms of thought. So to remain only in the reasoning of the Cartesian is an amputation for the human being. It is the diversity of approaches that makes it possible to place milestones on the way and not a new system that would only impose its dictatorship like the old one.

This book will first present the new concepts that could be included under the terminology: A-logic (name given by the researchers of the TOTARIS group at the congress they held in Paris in May 1976, in order to recall a non-Aristotelian thought; it is not a question here of formulation, but only of an attempt to put in place new concepts, coming out of the rational mode of thought. The form of new thought, which is fundamental in

1 Arkalian approach, perhaps seen as an A-logic: it will be placed at the level of sensation, of intuition. Here it is not a question of analyzing phenomena by Cartesian logic, which is applicable to physical mechanisms, whereas it is insufficient and often inadequate when the subjective and the non-reproducible cannot be separated . of purpose and appearance.

Thus parapsychology distorted by usual thought (since this is how many people who claim to be - researchers in this field regularly consider it), is on the contrary approached by ARK'ALL researchers, from the angle not -Cartesian. It will be said that its study can only be done in another Field of Coherence.

By this new discipline of thought, facts rejected or distorted , because incompatible with the Cartesian system of thought, are immersed in the same bath and become comprehensible; these facts are moreover primers for making logic A. The study is done in duality and the Arkalian research applies, in its approach, to reinjecting the methods of the approach. The researcher is in the working atmosphere which reflects the spirit he has adopted.

Finally, it would be desirable that people who, during the reading, will necessarily come across new words, or known words but used in a totally different sense, do not begin to distort what they are supposed to be. here mean. These major drawbacks which result in the total incomprehension of the thought of the author, Rosgnilk, who presents here and continues Ravatin's approach, are due either to a tendency in the reader to reduce himself to the known, or to a need to appropriate terms to get them to be used in contexts that destroy them instead of enhancing them; this last attitude corresponds to an obvious dishonesty.

There are also those who misunderstand the concepts, i.e. they don't understand them at all and they misuse words like global, overlap,... (for example the total which corresponds to the total of current life). In the notion of transfer, they see a course, a trajectory, the atmosphere, it is the ambiance. Those who want to stay at this level must also forget this book.

The work is constructed in an unusual way. The reader should not be disoriented; setting up chapters, paragraphs,

turns of phrase, new terms established without definitions for the most part, all this is necessary so that readers feel, little by little, during the reading, their minds open up. It is good, if a passage seems unclear or difficult to leave it and go back to it a little later, this several times if necessary; at one point the comprehension is done with the thought of the author. We must not criticize first, but allow ourselves to be impregnated, to commune with the thought of the researchers; if we adopt such an attitude, the brain gradually begins to function differently; it is not a word-for-word analysis of the sentence that must be undertaken, but as in the old books of philosophy, the whole sentence and even sometimes the paragraph are an indecomposable whole; it is a process that is also found in alchemical grimoires where, contrary to what many so-called alchemists say, we are not faced with coded texts or texts reserved for initiates, but in a way of approach a phenomenon where the word has meaning only in context; sometimes it is even the sound of the word in the sentence that must be captured.

The book is divided into chapters. The first relate to the establishment of the concepts necessary to approach a new form of thought, concepts developed for the most part by J. Ravatin. In the same way in these chapters come to insert the eifs, which is the consequence of the new form of thought. Exercises on the eifs are proposed at the end of the work in order to give a beginning of operability to the future researcher in this field. Problems should only be undertaken after the concepts presented have been assimilated and the new form of thinking has been imbibed.

Other chapters focus on little-known researchers, and their far-reaching work. For their understanding, the first chapters are necessary. Thus we find L. Sprink, L. Boutard, Hendershott, TH Moray, F. Dufourg, S. Bignand, JW Keely. Although they are also giants, N. Tesla and W. Reich are only just mentioned, because Tesla's works outside the orthodox field are difficult to pin down, and those known to W. Reich are already described in the works where they are well detailed, even if they are not exposed in a good context.

Many additional notes can be found in the appendices. They complete the chapters and prevent the researcher from getting lost in chapters that are too dense.

Thus are presented the Rays of Coherence and the islands of incoherence

which make it possible to become aware of the extent of the possible visions by the choice of representations of the Universe, which is not that described by rational thought, which has become a particular case of representation. It must be understood that the Universe is only an echo to a field of Coherence. We then see that the observer has not been able, in our world of rational description, to use the freedom of representation, that he finds himself a prisoner of his brain and that he is obliged to do with difficulty what certain representations in which he is much more present would allow him to elaborate fully.

The mathematical theory of Coherence Rays will not be presented here: an outline can be found in volume 9, fascicle 1 of the journal ARK'ALL Communications.

We express our gratitude to the researchers of the ARK'ALL Foundation who allowed us to reproduce certain texts relating to their work , as well as to have been able to participate in their discussions and experiences: among them we mention Jacques Ravatin, Pierre Smirne, Léon- Jacques Delpech, Georges Hadjo, Charles Naville, David and Samuel Franeric, Marc Beigbeder, André Sabourdy, Th. Kahn, G. Steib. Jacques Ravatin helped us a lot in understanding the many concepts, many of which were developed by him. F. and F. Ravatin, his sons, brought their criticisms in the reading of the document; Mrs. J. Martin was responsible for typing the texts. Boris Szezyhel photocopied some documents. Philippe and Brigitte Arrault have reproduced photographs and drawings, Madame D. Bréval and Mademoiselle R. Boix and

F. Colungo participated in the search for old or out-of-print books. On the other hand Armand Hatingais before his death in July 1984, had provided access to extensive documentation on Louis Boutard (his daughter Jacqueline Moreau-Hatingais continues according to her father's wishes). Madame C. Dumont who herself knew L. Boutard well allowed J. Ravatin and J. Dupré to pursue research by lending an important and very rich correspondence exchanged between Boutard and Jean Dumont. It also made it possible to publish a small part of it as well as photographs. Léon-Jacques Delpech, having known Doctor Calligaris very well, summarized part of his work for us. Let's quote again

J. Darnis, M. Simonneau, AG Chénière, P. Godart, A. Férrault, M. Thomas, S. Germain,

G. Sorieux, R. de Montercy, S. Hennemann, JP Gazeau, A. Cheyssial, F. Aujame, FM de Charette, K. Fidaali, who have worked on the devices or intervene in the ARKOLOGY group as well as Professor G. Mesnard who followed certain experiments and Madame. G. Dubois and his team who participated in

manipulations. Mrs. Genviève Febvay, Alain Grangé, Luc Baranger, Richard Bulski, Doctors Mengès and Richand, Mrs. E. Chaudet and Mr. Legrain, made donations of different kinds for the work to be carried out. V. Chavernef was responsible for drafting the patents, Maître Bouvet, lawyer, Maître Lebrouster, legal adviser, L. Chaisemartin, management adviser gave their advice and their time, R. Crossley and B. Walker, through their research in American and Great Britain libraries has supplemented our knowledge of the work of missing researchers of different nationalities, having worked in non-orthodox fields: we would like to thank them all. Finally our memory goes to those of ARK'ALL who worked: G. Gassin, G. Cordonnier, L. Kervran, P. Lamasson, A. Landry.

THE LOCAL AND THE GLOBAL

PART I

Designed by

(France)

The human being, when he thinks, builds coherences. We thus find the coherence of physics, chemistry, biology, medicine, metcology, etc. The coherences are multiple in our modern world. A coherence is sufficient unto itself; by Cartesian reasoning, Aristotelian logic, we build a system from which we will draw applications, for example technical objects. But in a coherence there can be other coherences, for example in classical physics we find geometric optics, non-diffractive optics, thermodynamics, acoustics, electromagnetism... Each constitutes a coherence. Medicine has its coherence and in different branches of medicine coherences appear, such as that of psychiatry, that of psychoanalysis, that of surgery, ... and in these coherences there are still others which are linked to those of teams, chapels, as we often say 'the word chapel is frequently used in the world of researchers to signify that in addition to coherence, there is an impression of closure, of voluntary isolation vis-à-vis other teams working in the same field).

In the Cartesian and Aristotelian type of thought, the set of all / $\forall$; \ the known or unknown consistencies will still be called field_of_consistency '

We are going to distinguish the local which corresponds to the description of our usual field of Coherence (we will also say usual) - it is the field of coherence used in our Cartesian representation of the world, in which Aristotelian logic applies to classical physics or any other logic attached to quantum physics. For work relating to particles (*)

(*) Les Champs de Cohérence have been presented and recorded at the Institute of Physics in Bern and at the Academy of Sciences in Paris (Champs de Cohérence; B. Tivès, 1960). The coherence field design envisioned by us is slightly different from that envisioned by Tivès.

elementary (whose laws obey quantum physics) it is good to refer to the work of J. Von Neumann, G. Mackey, Ludwig, Varadaradjan, C. Piron. The list is not exhaustive; much such work has been done in classical and quantum axiomatics. We will also not give the references, they can be found in all the literature dealing with axiomatic physics, elementary particles, and classical and quantum field theories. C. Piron seems to be the one who is among the most original in the logical formulation of quantum physics and physics in general since his model covers both quantum and classical physics and other possible physics that physicists use without know, Piron's formulation showing that usual classical physics and quantum physics are extreme cases from a range of multiple viewpoints of physics. These intermediate points of view, at the same time a little classical and a little quantum are considered as quantum by physicists who are little informed and not interested in axiomatics. In Piron's case, it is still a rational view, but more thorough and better thought out than many other approaches. To do this, he focused on the action of doing an experiment in physics. We will not discuss his work further and refer the reader to the abundant literature on these subjects.

The 'local'¹¹ therefore corresponds to these descriptions of the world. But suppose that we can find systems that are imperfectly locatable and not even locatable at all (which amounts to supposing existence without reference) whatever the systems of units used to position them in space, to place them in the time, whatever the measurements of the units of force, intensity of electric current, electric voltage, flow etc... In this case, when one will have such an existence without landmark, one will say that one is "attached to the global" (and not "in the global", which would suppose a relation of belonging). are more separable; they could, for example, be in dynamic duality in the Yin-Yang sense, that is to say that we will have neither the set nor the element and at the same time the set and the element. It is a way of expressing in Western thought the dynamic duality which is inexpressible in this thought and impossible to represent for one who has been constantly immersed in Western civilization. This dynamic duality dates back at least 3 to 4000 years

(*) We will prefer to speak of dynamic duality instead of duality alone, the word duality being used in contemporary thought in the sense of either one or

before the Christian era, in China. This is not to say that all people of the e had access to a thought form that contained this concept; this form of thought was perhaps reserved for those operating in what was much later peeled off the occult and which is only a fragment, distorted, of a vision of the world

H. _ . . (**) non _ cartesian . The dynamic duality between 2 entities A and B entails a third term: dynamism. Dynamism is not movement. What makes that we have a ternary. In some cases dynamism is the egregore of occultists , but we will avoid as much as possible using the language of occultists , this having been much overused, terms having taken on multiple meanings as in the alchemy of somewhere else.

Let's take the example of the forest: if we start counting the trees in a group of trees where they are fairly close, tall, leafy, this does not lead to the concept of the forest. We see that regardless of the route chosen to count, the fact of counting this finite set does not give us an account of the forest. But if we put the tree entity in dynamic duality with all the trees , we will have dynamism and the forest entity appears. Here dynamism is the egregore of the forest. From the dynamic duality between the element, here the tree, and the whole, we have created (expressed in the Cartesian representation) a ternary which we will call 1 Enel . Thus, we have just built the enel tree, it is the forest. The enel is relocated. The forest is absolutely different from all the trees which can be identified (we were able to count them, examine their shape, their (A***) size)

When there is a delocalization, ie an absence of parameters, it may not be total; for example: the Philosopher's Stone, a stage in the art of Alchemy; it is more or less localized in space. For other parameters related to chemical reactions, it is not; it can behave like an inert body or as if it were absent.

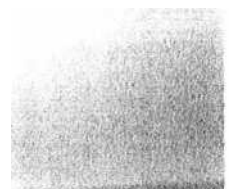

The dynamic duality intervenes in acupuncture.

the other, both keeping their entity. In mathematics, duality comes into play and it even becomes interesting in relation to dynamic duality in the Yin-Yang sense, in the case of projective geometry. Points and straight lines can be exchanged: a point can be seen as a straight line and vice versa. But they are either one or the other.

(**) We will note the dynamic duality between A and B: AI -----'B .

(***) Enel: word obtained from the contraction of the words TOGETHER and ELEMENT which amounts at the same time to paying homage to the author of "the Trilogy of the Rota" whose name is Enel.

(****) The egregore often contains the sense of dynamism and that of enel.

Acupuncture lines and points are a diminished vision of another vision of man and of living systems in general. Among the Chinese this vision extended even to the earth which had its lines and points.

This is due to overly intensified localization and in our locale certain things may appear in different forms, lines and acupuncture points, areas of the soles of the feet (Ingam) in connection with areas and states of the human being , areas discovered by Doctor Calligaris etc...

From the moment we leave the field of rational coherence and become aware of delocalization, lines and points, if we are only interested in acupuncture, can become much more primordial realities around which the vision of the body will only serve as an arrangement on the support on *which* lines and points would then constitute; this arrangement will fulfill these other realities.

There is a kind of reversal compared to the usual vision. But we must be careful that this reversal of an observational order, that is to say in the usual case: the body on which lines and points are distributed and the second case considered here - lines and points around which we are going to rethink the body - does not change the localization of one into the relocation of the other.

The lines and the points are the result of a representation, of a coherence of the Chinese which is placed in another field of coherence and we only have a trace of it in our room. We will say that we have a coherence and we thus recover a very old but very rich civilization.

The purpose of acupuncture needles is to create the dynamic duality between the two representations.

What is improperly called "energy" in acupuncture is dynamism.

This dynamic duality was obtained from two localized representations. For Stéphane Lupasco [3], they are antagonists. Let's say that we can posit them by definition antagonistic and in certain cases, if we don't posit them by definition, they will indeed be antagonistic. Doctor J. Borsarello in [4] gives the literal translation of Taoism which expresses the dynamic duality. (*)

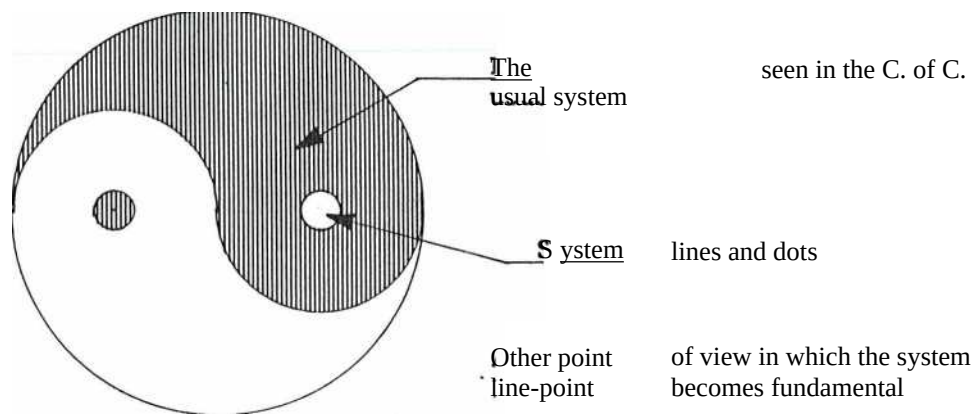

(*) The lines or channels are called by the Chinese the k'ings. It seems that it was Soulié de Morant [1] who translated the term k'ing by that of meridian [2] . The word k'ing is also used to designate a particular point on each meridian: the one where the meridian seems widest.

(**) Lupasco as early as 1935 states a fundamental postulate by which he links affirmation and negation, identity and diversity. This is its principle of antagonism . In the field of energy, this is expressed as follows: when an energy is actualized (which causes a break in balance and a transformation of the system under observation), an antagonistic energy is potentiated (which prepares conflicting updates). The transition from a potential state to an actual state contradictorily implies a transformation in the opposite direction. Lupasco then points out that in passing from a potential state to an actual state, the transformation (which will never be totally actual or totally potential) passes through an intermediate state which he called neither-potential-nor-actual, however that the contrary transformation also passes through an intermediate state of non-actualization-non-potentialization (called by Lupasco state T).

Lupasco's naming of state T is interesting, because it emphasizes that it is not a movement from actualization to potentiation, but a tendency. The antagonism in Lupasco must be placed at the level of the act and not at the level of its realization. Actualization is a certain degree of actualization in relation to potentiation. In the usual point of view the level of the act and its realization are confused (in Lupasco it can happen that act and realization are confused).

Naturally the level of the act does not correspond to an emergence or an immersion. Nevertheless Lupasco's approach is very interesting. It's unfortunate that he's been ignored for so long. We advise the reader to refer to the works of S. Lupasco as well as to the work of B. Morel [5] and to the important book of M. Beigbeder [6].

Let us also point out that what Lupasco calls dynamism is not the third term of a dynamic duality, it is the evolution of a state.

Arrangement of the living system around the line-point system

"One succeeds the other, they are interchangeable, mix, replace each other, but each is not half at all".

And adds Borsarello: "Impenetrable esotericism"! It is not entirely impenetrable from the moment when one begins to feel the delocalization: A and B in dynamic duality constitute a ternary: a ternary which is a unity: the "divine ternary" of Enel [4], This unit is relocated. To consider it, we will describe it localized: A, B and dynamism. But what must be clearly understood is that a localization effect of this unit leads to its breakage and one can, for example, detect a source of heat at the meridians; experiments have been carried out by several authors, in particular by Borsarello who photographed infra-red a portion of the meridian on the cheek of an individual and then resumed photography in visible light. It is the act of localization that has enriched the local. We can, by breaking down concepts of the global, enrich the local.

To speak of Yin and Yang is more to remind the human being of prudence and direction in an approach than to lay down a diagram. The Tao is not an end, it is a path, we must take it to avoid error, and this is where we understand that man does not have access to the truth but always to a difference between two truths.

When we say the sun is Yang, the moon is Yin, the male and the male are Yang, the female and the female are Yin, day is Yang, night is Yin, (*)

(*) Both are 2 opposing forces.

hot is Yang, cold is Yin, ...
we place the Yin-Yang system on the couples

feminine masculine
night-day moon-sun...

and by this means we put them in dynamic duality. (In reality they are Yin and Yang only because we can put them in dynamic duality).

Let's go back to coherence to soak it up. Soaking up concepts by successive returns is preferable to a definition which will freeze the content of the concept.

A representation imposes a coherence; it can even impose a field of coherence. Thus a definition that is too hasty can lead to a break even in the field of coherence by extension of a coherence in this field of coherence.

The usual field of coherence obliges each human being to plan, to extend to communicate with the other human beings; the human being "integrates", such is the consecrated expression, into the society which is rational. What a human being gains by blending into a society, he loses in himself; he loses his personal power. It becomes more fragile, because it is more easily re- , (*) . , , possible in this society in which he has melted by identification; it is not so much the action of blending in that is serious, it is the spirit in which it blends. He loses the possibility of becoming aware of the concept of coherence field and is no longer himself because a coherence field can be more or less in tune with a living being, especially as this field develops. At the beginning, the launching of the field can be satisfactory but afterwards, impurities appear, especially when it comes to the rational field. He then slips into the field of incoherence that all human beings, constituting society, wanting to be rational, try to have accepted as a coherence (**).

(*) An individual, in our rational society, is perfectly identifiable. He is followed from his birth to his death and this more and more. Electronic systems will further perfect, credit cards for example, this imprisoning of the individual in the midst of others. We thus obtain an overlocalization in relation to the usual localization and this individual in the mass of individuals, overlocalized will bring about breaks in the concepts of crowd, of society, entities already delocalized, in order to relocate them and these localizations will themselves produce overlocations. But this process of overlocalization can lead to localization in the field of rational coherence.

(**) Concepts can belong not to coherence, but to incoherence and these concepts entering a field of coherence pollute it.

In the point of view developed in this work a human being does not exist compared to the others, we will say "is not compared to the others", the others are only because it is. However, only those who are aware of it can speak of it. But we don't have the right to think this same position for others, otherwise we fall back into the usual field of coherence.

In the rational representation, the individual is led to play the game of scientific pseudo-objectivity: that is to say, we want to align the values , compare the results. The pseudo-objectivity is in this possibility of constructing multiple scales of comparison, but this is often arbi- (* (** (***)) . .

to milk. The RBBs who apply it as much as they can (it is a justification of their behavior and a necessity to be recognized as a good scientist) extend it to human relations and morality. We arrive at absurdities.

This freedom that the researcher gives himself in his construction and his projection of scales of values is an illusion. He thus gives flexibility to the usual field of coherence and believes that *there* is an escape outside of man in a generalization of concepts. This freedom (and at that moment, we no longer have to talk about it because it is implicitly understood) is in another field of coherence, this one in which the being projects itself at the same time as it puts itself inside. . This last concept belongs to another field of coherence, but then the rational field of coherence can be rethought starting from this other field;

little by little the notion of field of coherence becomes clearer, still without defining itself , the usual field being by construction the negation of field of coherence since it considers itself as universal, wanting to explain the universe that it lets discover; while the other field thanks to which the human being becomes aware that he discovers because he throws and gets into it at the same time. (The being knows

(*) RBB: stupid and narrow-minded rationalist. Not every rationalist is an RBB, but there are now plenty of RBBs in our rational world.

(**) The human being is caught in a straitjacket: his usual field of coherence makes him a prisoner. The notion of freedom is brought in to make him forget this straitjacket. Freedom is a dilution.

(***) This replaces the "Know thyself" from the Temple of Delphi; moreover, this idea continues, as André Saoourdy points out, with "And you will know the Universe and the Gods".

, (* ('')) while he is the alpha and the omega)

In Eastern philosophies, reference is made to "the truth which is in itself". The translations and understandings of this expression are generally bad and perhaps the authors themselves expressed in words what they felt without worrying too much about whether other more or less erroneous interpretations were possible. . In any case, when we look at texts dealing with these questions, we must put ourselves in the state of mind that we must adopt when we read or state a proverb (proverbs expressing a common sense); that is to say, at the same time as we assimilate the

· T V Z · ('k')
saying, the proverb, one must discover one's way of understanding. Likewise, the reading of this book proceeds from this principle.

The form is fundamental in the approach of the global because it emerges or becomes anerge in space-time but also, it is the way. At the same time as <m sets up the model, the representation(s), he makes the spirit follow in his approach. You need the object (the model) and the image (the way). From the image we draw the necessary discipline of mind when we leave the usual field of coherence, discipline which in this case is implicitly understood, so as not to fall into phantasmagoria, these perhaps not belonging always in the realm of the absurd (most often they belong to it).

Rational thinking has eliminated fear of the demands of multiple gods and superstitions.

Indeed, the human being having these entities in his representation and knowing them badly, managed to attribute multiple powers to them and submit to many whims that he manufactured from delicate or desperate earthly situations. These representations built in atmospheres of superstition were sometimes operative. They corresponded, in a model, to neighborhoods of comprehension susceptible of a certain operativity. Number of

(*) In most works dealing with non-orthodox subjects, reference is often made to the human being who is the alpha and the omega; the explanation is given: beginning and end. This is intended to be a deeper explanation than that which is usually given, because it blocks, for the reader, any search for deeper sensation. If one thinks of the field of coherence that one launches and in which one puts back, the alpha is generated by the omega in which it is; the alpha and the omega are in dynamic duality in the sense of creation and capacity.

(**) This is also how Jacques Breyer's book should be read: *Terre Oméga* [8]. Reading trains the way (in a more concise form and which gives the example of such a feeling: the voice is the way!)

wizards must have used these processes.

The gods did not belong to the realm of the absurd. It was necessary to find their coherence in a field of coherence.

We will distinguish between local and global; the local emerges from the global or submerges (*) globally by what we call with B. Vives the shifters. But there is also another concept created by Samuel Franeric: the canal. We will come back to decalaire and the canal later.

Let us point out that local and global are not exactly tonal and nagual of the Yaqui sorcerer, Don Juan, quoted by Castaneda in his works [9]. The tonal is the protective attitude that an observer keeps in front of the global. This is not the In al; it is the serenity of belief or the stability of the local at the moment when we look at it, appreciate it, judge it, have the impression of living there. But this serenity is put by Don Juan outside the observer. It is almost a - property, a state of the local in relation to the observer; it must be represented as such in order to feel as a surface and interior state, the tonal.

(** The nagual then is understood as a state of relocalization by voiloc

The observer does what he wants a witness, and puts this witness either in his saillock, or attaches a saillock to him and relocates. The nagual is the state of all these operations. This is why Don Juan says that the nagual is - creativity.

Let's go back to the local and evolve a bit.

When we speak of local, we must understand that it is an echo of our usual field of coherence which is launched by the observer, but we could have other "local" ones. In a coherence field, if the space-time structure is present, a local is the echo but to a local there does not correspond a coherence field such that the correspondence is one-to-one. From the moment when another field of coherence intervenes which is distinguished by the instability of the landmarks, several representations of the local are possible.

The tonal of which Castaneda speaks is therefore a state of the usual local in relation to the observing human being, but it is also a state of the human being in front of the local, that of the "impeccable warrior" as Don Juan says but that the to be hum- ■ in attributes to the local.

(*) The term immersion was chosen by Marc Beigbeder. (private communication).

(**) Voiloc: word created by J. Ravatin from the words neighborhood and locality.

In reality, these two states are in dynamic duality.

On the other hand, in what is presented in this work, there is no separation between objective and subjective. The mere fact of thinking objectively and subjectively prevents access to another representation, another coherence. We break a coherence to fall into the usual local ^v.

The ancients used another mode of thought, which we now express by saying that they projected another field of coherence. This is the reason why their constructions and objects often seem difficult to understand and we classify these objects in the range of aesthetic objects or futilities. As the RBB only matches objects_techniques (objects whose functionalities are localized) [10]. J. Ravatin had, as a teenager, sensed that the An-iciens had another representation of the world and afterwards he had developed his iA^e in what he named: Les Systèmes Non-Cartésiens. In a non-Cartesian system, the feature or features are no longer characterized by the shape, nature and location of the part in the system. Features are outsourced. Such a device, in which certain functionalities are delocalized, is said to be ob i et pheni s te. A Phenist object can even have its components (its components are not subsystems of the considered Phenist object ^(*)^(**)^(***))

(*) We insist on the following point: the Universe is not given a priori and the human being plunges into it. We must understand the Universe as an echo to a field of coherence launched by the observer; the human being launches his field of coherence at the same time as he puts himself in it (which cannot be conceptualized in the world of rational thought). Existence depends above all on a field of coherence.

On the other hand the forms are not immersed in the space-time structure; they are also fundamental by this structure; they emerge from it and immerse themselves in it more or less and the fact that they will be more or less present or more or less absent is manifested by the Emissions due to the Forms and the Fields of Taofel.

(**) Functionality : characterized by the shape, nature and location of the part in the technical object (Gilbert Simondon: private communication).

(***) Thus we are faced with three classes of objects:

- Technical objects : with all localized functionalities.
- Aesthetic objects for which functionalities do not exist.
- Phenist objects : one, several where all the functionalities are delocalized .

A technical object can thus be an aesthetic object, just as a Phenist object can be an aesthetic object. But when we pass from technique or phenist to aesthetics, we change coherence. In the first case we remain in the usual coherence field, in the second case we change the coherence field.

dered as a system) localized, most of the object escapes us is not visible to us because it is delocalized. This is the case of perpetual motion machines which have been treated with derision by the scientific world: if we are faced with a Cartesian system, in fact perpetual motion is impossible even though it is of the first kind: c that is to say, to obtain work from nothing (which is a contradiction with the principle of conservation of energy) or that it be of the second kind: homogeneity does not break by itself (which contradicts the second principle of thermodynamics). But if we are faced with a non-Cartesian system, a Phenist object, perpetual motion becomes possible. To describe the object, its different components is not enough to ensure that we have the whole system and on the other hand to break it down by thought into what we call its components does not mean at all that we describe the same object. The Phenist object totally escapes this type of approach. From the moment functionalities are delocalized, the shape that appears is not enough to describe the system. It is an implicit postulate of the rational way of thinking to believe that by describing a system or its components, we really have the components. Then the principle of conservation of energy and the second principle of thermodynamics can no longer apply; both are two different views of another principle that could be called: principle of localization.

The field of rational coherence develops, throwing into it scales of units: units of length, time, mass, force, intensity, tension, flux, etc. Let us consider the unit of time q_u we launch into the past: this allows, in the field of coherence, to date prehistoric men from the moment when the problems were posed: the ancestors of man, the origin of man. We have successively found various types of prehistoric men and here clearly appears the concept of existence in a field of coherence.

It must be clearly understood that by having become aware that rational thought , by throwing the time scale into the past, we manage to date, but this is not the most fundamental thing, because by dating we realize that everything is done as a creation, which is totally different from the usual point of view. Thus, by going up the time scale in the past (The unit being the millennium), we (*) ... manages to recreate in a field of coherence gives, here the usual C. de C., but thanks to the awareness

(*) We will note hereafter the expression field of coherence by C. de C.

(*) from another C. de C., the ancestors and origins of man. The origins are localized as one traverses the scale. From where knowing **this** effect, by applying it differently, other origins become possible. The great religions follow the trace in our local world of another C. de C.; they express other origins.

The usual C. de C. can become unstable when you throw unit scales at it. But it is unstable only for the one who is aware of the concept of C. de C., therefore who is in another C. de C. In the usual C. de C., the world is forced to be "fixed" because we think we are observers of a world. By adopting the other C. of C., one is no longer an observer in the rational sense: one projects and one puts oneself at the same time and then there are privileged positions for the observer, taken in the new sense of the word, thanks to which the room will deform. The de C. supports worldviews. The Ancients knew all this but in other forms. Perhaps they did not have the language of their C. de C. In our civilization we have the language of the rational C. de C., this is what makes the strength of this one, compared to others who preceded him. Knowledge is no longer the privilege of a caste but everyone can access it. The usual C. de C. language was fairly easy to establish because it uses minimal effort to convey an idea; there, the Cartesian character is present, and our principle of minimum energy is the very expression of the usual C. de C. language.

A myth which was very often evoked and which is always as much is that of Atlantis. All clues to its existence in our C. of C. are the creation in our time scale of the continent and of Atlantis history.

Plato spoke of Atlantis in his two famous dialogues, the "Timaeus" and the "Critias". We will not return to these texts, they are sufficiently well known; many works have quoted them and reproduced passages from them. Atlantis, on the other hand, has been located in multiple places.

Is Plato's story symbolic? Or is it a legend? Or a legend that embellishes older events?

In the "Timaeus" and the "Critias", the author attributes to the narrative exposed to

(*) Looking at the usual C. de C. makes it possible to discover the instabilities of this C. de C. and to become aware that we create rather than discover.

By this process, we nourish the other C. of C. and also by the fact that we become aware that rational thought is a C. of C.

Socrates what the priests of Sais told Solon, legislator of ancient Hellas who traveled to Egypt around 560 BC. The Assembly of priests of the goddess Neith of Sais, protector of Sciences, would have revealed to Solon that in archives, which dated back millions of years, there was mention of the existence of an immense island the size of a continent, located beyond the Pillars of Hercules and swallowed up by the waters after a sudden catastrophe.

In the course of this same story, Solon learned from the priests of Sais of the existence in Athens of a state which, having been attacked by the kings of Atlantis, had victoriously repulsed these invaders. But, a short time later, an unforeseen and brutal catastrophe engulfed the island in the waves.

This dialogue from the *Timaeus*, in which the plot of the history of Atlantis appears, also touches on astronomy, the science of numbers, musical harmony, philosophy and religion. This is how we can place this engulfment of the island-continent at approximately -12,000 years from us.

The second dialogue, the "*Critias*" focuses on the general and physical geography of Atlantis. He mentions details relating to the capital: buildings built of red, white and black stones, a large temple dedicated to Cleito and Poseidon, decorated with gold ornaments, walls covered with silver, a golden enclosure that surrounded the temple near which brought together, at various times, the ten kings of Atlantis, in order to proceed to the sacrifice of the sacred bull previously, (*) **) ably captured by means of a net

Of course, we can say that it was Atlantis that influenced Europe, Asia and even America, and this has often been explained.

In addition, trades, industry, science flourished in Atlantis; there were many ports, canals and shipyards. The trade relations mentioned with the outside world affirm the maritime vocation of Atlantis and suggest to us the use of ships capable of crossing the ocean. The 1,200,000 men in the army, a considerable number, oblige us to admit the existence of a large population (if we stick to the usual point of view).

Plato did not make the mistake of confusing Atlantis with the Americas.

(*) There was, he says, in the center of Atlantis, a fertile plain, protected from the northern winds by high mountains. The climate there was more than tropical and the inhabitants could harvest two crops a year".

(**). We find again the sacrifice of the bull, the rites and ceremonies dedicated to the cult of Myhra widespread in Europe and Asia.

"Another continent lay to the west of Atlantis". He speaks of the ocean beyond the Pillars of Hercules (the current Strait of Gibraltar) and says that the Mediterranean is only a port... It is in this Atlantic Ocean that he places an island -continent larger than Libya and Asia Minor combined.

Very lively discussions have taken place about these stories.

They had their origin in an article published in the "Mercure de France" by Professor Couissin which tended to prove that the mythical character and the absence of scientific basis on which rests the hypothesis of the existence of the Atlantean, this article claiming that it was, in fact, a hoax. For archaeologists, the existence in the past of a link between the "Old World" and the "New World", would provide an explanation to an irritating enigma, namely the astonishing analogies that can be discovered between Egyptian and pre-Columbian civilizations, that is to say, rites, adoration of the Sun, pyramids, use of a ternary symbolism. But these resemblances do not hold, let us point out immediately, if we suppose that these civilizations drew from the same source which is in the process of being primed by emissions due to forms. On the other hand, the ternary symbolism is also found in China and each time that an archaeologist somewhat versed in occultism has approached an ancient civilization.

The search for the position of Atlantis has given rise to countless possibilities. Commentators faithful to Plato's account support, for their part, the position of Atlantis in the Atlantic Ocean and more precisely the Canary Islands and the Azores would be emerged vestiges but on these islands there remains no trace of Atlantis; they are still quite small. While others locate it in the most diverse regions, Greenland, Iceland, Heligoland Island, the Atlas, Mongolia etc... Another rather singular thesis: Atlantis is the moon torn from the depths of the Pacific. It is curious that the authors of this idea did not compare the radius of the moon to the greatest depth of the Pacific, which is about 10 km!

One can retort that Rudolph Steiner had supposed that the moon was born from 'a earth and certain followers of the creator of Anthroposophy support this idea without thinking. It must be said that Rudolph Steiner, in his visions, could have arrived at such a conclusion, but this should not be taken as a scientific truth but as a means which makes it possible to arrive at other conclusions which are useful.

Master Philippe de Lyon had also seen, by doubling

multiplicities of suns behind our sun... likewise, he gave rapid visions to people who asked him questions: it could only be of a symbolic nature or even of the sort of unimportant vision, usable perhaps (because it had been given at a given time), in an astrological chart or something else [11]. Likewise Edgar Cayce and many others. The same applies to interpretations of clairvoyances such as those of Cathérine Emerich and others, where dates of events are given. These dates are not put in the calendar; they are the clue that the event to come could be datable.

The hypothesis of Atlantis engulfed in the Atlantic meets with the greatest number of votes. In France, two scientists have attached their names to this thesis: Pierre Fermier, perpetual secretary of the Academy of Sciences under - Louis Germain, assistant at the Natural History Museum [12].

The study of the bottoms of this ocean shows, in fact, that at a certain time, the shores, as much on the American side as on the European and African side were much more advanced in the sea, while there is, in the center, a plateau submarine (*) whose movement does not exceed 900 m constituted by the Azores. Volcanologists are against this thesis. They claim that the continental plates, by their positions and structures, do not at all allow us to affirm the existence of the famous submerged continent. And we arrive at the hypothesis of the explorer Rebikoff who, through his scuba diving, was led to think that certain pieces of Atlantis would be near the Bahamas, which Edgar Cayce had also seen in clairvoyance. Rebikoff settled in Florida and carried out reconnaissance aboard a small seaplane with a view to finding submerged sites (this technique was perfected in the Mediterranean and gave some surprising successes). He flew over bodies of water in the Bahamas archipelago, and the appearance of a simple geometric shape thanks to the transparency of the water struck Rebikoff: in one case a chamber, in another a 550-meter gutter long, lined with walls hewn out of the rock.

Testimonies brought back by divers like Pierre Carnac mention enormous walls, for example those of the island of Biminij oriented north-east, extending over several hundred meters in length; they are formed

Pierre Ternier gave a lecture at the Oceanographic Institute in 1913 in which he supported this thesis.

blocks of 5m x 5m and 50 cm high. Dating is difficult to establish, but it has been evaluated at -4000 years [13].

But a curious fact was reported to Pierre Carnac: the fishermen of these waters had never seen these submerged constructions before their recent discovery by divers. Of course there were the aerial views, but others, as P. Carnac has confirmed, can be distinguished by a simple boat trip in calm weather. It seems that these walls are localized.

Our classic notion of existence is based on the past, the present, the future. Time is seen as the digital line, even from the topological point of view.

Mars weather can have what we have called cumularies or decals, either -related to The observer, or related to some observers (i.e. for one epoch a cumulative would exist in the past but not for another epoch).

Let us give an intuitive approach to these notions of decalar and cumulative. To do this, suppose a straight railway line, made up of 2 parallel rails and parallel sleepers but of variable widths. We assume of no longer an observer, seated between the rails, unable to move and counting the sleepers. The 2 rails behave like 2 Labatchevsky parallels for this observer meeting on the horizon line. The number of sleepers is finite, this is what the observer knows but he does not know this number and will not be able to know it

(*) The weight of each block is around 25 tons. These blocks are bound by dry cement, which suggests that these blocks were assembled on dry land. Techniques and materials can approach what has been observed in ancient Mexican temples.

(**) The remains would therefore predate the civilization of the Olmecs, one of the oldest known in pre-Columbian Mexico.

(***) Cumulative : term invented by J. Ravatin.

(****) Décalaire : term coined by B. Vivès.

These concepts were developed by these two researchers around the years 1963-64. They didn't know each other. Initially cumulative and decalar had roughly the same meaning, so when these two researchers got to know each other and exchanged their results, they decided to keep decalaire the original meaning given by B. Vivès and cumulative the meaning of leak of benchmarks but followed by a new catch-up of these benchmarks. Note that the definition of decalaire for B. Vivès was purely mathematical. This was taken up by J. Ravatin in a more physical context and slightly different in its meaning from what Vivès had axiomatized.

for the following reason: towards the horizon, the sleepers will be confused, the observer seated between the rails can no longer count. He can't even roughly estimate; it's not vagueness, it's absolutely indeterminate; we have a decalaire. Another case may arise: without reaching the horizon line, we will find ourselves at a moment when the crosspieces seem to be merged and afterwards they become distinct again; in this case we will say that we are in the presence of a cumulative. When we have both cumulatives and a decalar, we say that we are in the presence of a cumulo-declar. We will say that we have a leak on a cumulative or a decalar of the reference.

An example of a decalar can be found in the following old problem: the so-called "chicken and egg" problem. It is presented as follows: In evolution, was it the egg that first spawned the hen or, conversely, was it the hen that spawned the egg? In many scientific congresses, this dilemma has often been raised, seriously or as a joke, but each time it has been quickly forgotten. There were partisans of one and partisans of the other. It was an alternative. This problem is interesting to present in front of the points of view developed in this book because we are in front of a system (*) (**)

(*) The writer Maurice Clavel gives a physical sensation of flight on a cumulative or a decalaire [14] . He writes this:

"Then it was lightning... Shall I say I heard nothing. But do those caught up in it hear its crash? I'm not even sure I saw the lightning. I was on the couch, I was lifted, thrown away, crushed. At least I had the feeling of it, but without any representation as if everything happened in an indivisible time and space. I would be lying if I spoke of a transport and a distance. I saw nothing but night and heard nothing but silence; a night and a silence distinct from all the others by the relation of the infinite to the finite. Two states mingled without destroying each other. , without even recognizing that it was bliss and terror. I even knew that it was a blow struck by the Father. Of what knowledge, I don't know, but I haven't completely lost my knowledge, this detailed memory attests to it. And I felt as if there was a duration embedded indefinitely in this night and in this silence... and I do not believe that I am trying to boast of a grace, car it is one but modest and current..."

Maurice Clavel describes a sensation of approaching a cumulative or a decalar . Some will consider it and classify it as what is commonly called a loss of consciousness. There is indeed a disturbance of consciousness in the rational point of view of things, but in this real-life example, we can feel the imprecision of identification which characterizes the approach of cumulo-decalaires. The description is made after the fact, but the memory has kept the imprint of the flight from the usual landmarks.

(**) The theory of evolution is placed on the usual time scale. In Palaeontology we begin to sense discontinuities there. These are only the index of an imperfection of the system of projection of the time scale.

recursive: egg-chicken-egg... According to the rational point of view, we go up a scale which we launch following this simple recurrence punctuated by another scale which is that of time. Very far on 1 scale, talking about a chicken and an egg no longer makes sense.

We are faced with a typical case of a phenomenon observed on a small time scale of 10,000 years ... 30,000 years and which our rational thought carries over the entire time scale, for example up to the secondary era. We are not in the presence, in the distant past, of a dynamic duality between the hen and the egg but a decalogue from which emerges the hen-egg system which

seems recursive to us.

The decalogue only exists because we have created a neighborhood, we, ■ ■ ■ (* (**)) sets up the decalogue which moves from the global to the local .

Give us a series of stakes planted in the ground and protruding from the ground, all these stakes being in the same plane. For an observer who stands on the ground in the plane, looking at these stakes, these stakes are on a background

what constitutes the distant landscape. The landscape and the suite of stakes can create

for this observer a decalogue if everything is well arranged; this decalogue will depend on the observer, he alone will be able to use it? Sometimes, it will be necessary to add other shapes to obtain the decalogue, for example another

shape on the bottom can be a constellation at any given time. The series of stakes can be replaced by a mountain range observed from a certain place.

So if we consider these stakes and the background, or the mountain range and the background, we have carried out arithmetics at cumulative shift. Alignments are perhaps such forms. The menhirs are of different heights; this can correspond to an existence coefficient of the number in arithmetic. Perhaps also some small streams or rivers that have disappeared or

(*) This representation makes it possible to compensate for our impossibility of immediately observing the global and on the other hand makes that in our localization error, we create an operative representation. The human being, even from error, must always derive a truth (truth on his own scale). It is redemptive death in life. It is the manipulation of archetypes for those who have not understood. It is the stopping of the race and the sublimation for those who want to be gods. It is the dilution in the solvent that will become a decalogue. It is homeopathy at the level of form. It is the disappearance of the level in favor of plenitude. It is the outside of concepts.

(**) In a work by HP Lovecraft and A. Derleth [15] we find this: "We must congratulate ourselves, full of gratitude, on the fact that the human mind is incapable of establishing relationships between the various elements of the Universe. We live on an island of ignorance, in the middle of black oceans of infinity, where it is not given to us to venture very far..."

whose courses have been diverted may have played a role. The arrangement of the more or less localized forms of the Local plunges us back into delocalization. All these delocalizations from the more or less localized constitute leaks from the Local to the Global. These are the ones most easily accessible to us.

By making this hypothesis, don't we suppose that we can judge without any notion of time? Do we not place ourselves as a privileged observer in relation to a possible observer? Considered in this way, we arrive at Dunne's "serial time" [16]. It is a recursive process. We will not stick to this point of view because it is absolutely artificial and this tendency to construct the observer of the observer etc. indefinitely, is not a correct observation of oneself but an illusion . which brings us back to judging step by step, therefore, to being unable to escape localization. Any process that involves the infinity of the numeration or that is in one-to-one correspondence with it does not correspond to a correct process. Nature does not work that way. One can, to describe - rupture or evolution, a chosen phenomenon ~ model which does not copy reality point by point, but it is necessary to be wary of the model in which one introduces a method which imposes the usual C. of C.. We will endeavor to present . , , . (* (**)) a new notion called creation from Pass_in_1_Coming

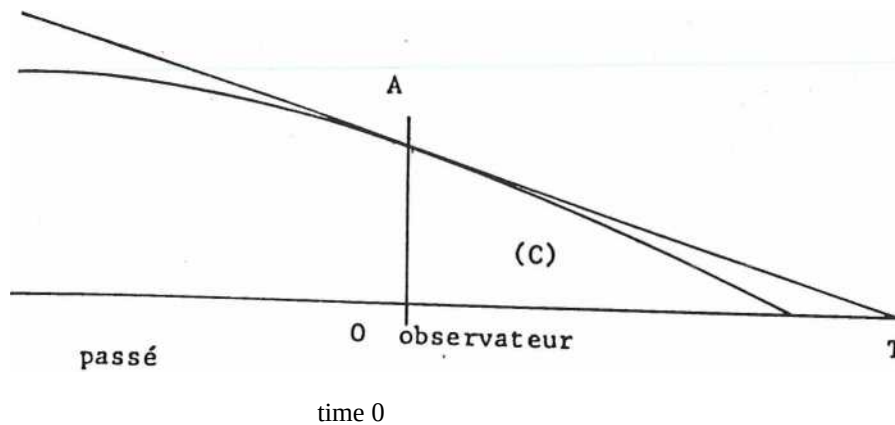

We must not forget the privileged position of the observer. The observer is the origin of the landmarks. He launches his markers and these, in a given C. of C., generate a reality because there is coherence. Thus all the indices of Atlantis, the texts of Plato and all that followed since Plato until our time, make that Atlantis is appearing and when it will be there (will have been found -on in the rational C. of C.), we will find in it all the clues of its disappearance approximately -12,000 years ago . This process enriches the room. Edgar Cayce described it in a more or less folkloric way in his "readings".

Thus another existence is profiled which will come to convey towards the USUAL existence, this last known thought on the number line.

(••) Concept imagined by J. Ravatin.

Let's complete this paragraph by adding that the notion of infinity applied in physics imposes localization. A model is not forced to follow a phenomenon step by step but certain parts of a model lead to a C. by CS Lupasco [3] introduced instead of infinity, the transfinite, which corresponds to intuition physics of infinity.

(**) This point of view should not be opposed to that of Relativity. In relativity, the observer corresponds to the point of view of the physicist. The notion of consistency is not considered.

This diagram should be understood as follows: the line E is that of the passage of time according to the usual point of view. The curve C has meaning only for the observer 0 who is the origin of the time scale that he projects into the past.

When E. Cayce was, by his doublings, observer he saw because he placed himself in A intersection of the vertical in 0 and the curve C and the tangent in A intersecting the straight line K in T gave him on the axis 0 E , the spawn point of Atlantis (on the time scale). Thus, he saw the reappearance of Atlantis in T but for him, it had disappeared -12000 years ago because he participated, without knowing it, in its relocation. The date at T was valid only for him because the curve C was his.

This curve has no origin; it is constructed by the observer)
 0 . In reality there is only a point A and a straight line AT which gives approximately , for 0 ,
 by accumulation of the proofs of a past existence (but
 which never took place) a creation on E around T .

What we said for Atlantis is also true for the continent Mû discussed by Churchward [17].

In the creation of the Past in the Future, what becomes of the events attached to what is usually called (and this in a relative way) the near past? Let's take the case of his parents, his grandparents, his great- (**) grandparents "those we have known and who have disappeared, and those we have not known but of whom we have heard because his relatives knew them.

This is where the immersion of stabilization takes place, that is to say that (*) It emerges from a decalar.

(**) Together, they constitute a channel.

in this near past, we have a kind of extension of the notion of present (and the , v -1 I (*)
absolute present is felt only by the near past.

Time is counted down through a recursive process. We perceive two notions at the same time: what we live and what we project (here the time scale) and the scale originates from the lived moment. This is how they are connected.

But you have to reflect on yourself and ask yourself what you think when you accept the usual point of view. These supposedly recursive systems carry with them their own destruction. Is it due to nature, which recurrence refuses , or to our intellect, which itself breaks its model? The two answers are not at the same time positive or negative, nor are they mutually exclusive, they are in dynamic duality.

In paleontology, we launch a time scale -10000 years, -20000 years, ... -100000 years, ... -500000 years, -1000000 years ... we arrive at -2000000 years and this to find the origins of man. We find skeletons of increasingly old human beings. The earliest skeletons found in the 14th century were -30,000 years old; now we are at -2000000 years!

The cumulative is a flight of landmarks followed by a resumption of stability of these landmarks; like 'the decalaires, they are definitive leaks. In these cumulative localizations can be made, which will be $r^{(**)}$ generally stable. Thus we create the image of the past thanks to the past. In pale

(*) The notions of near and absolute cannot, in this case, be defined separately. The absolute present is felt as a limit of a period of time. And the near past as an addition of time intervals. The advantage of talking about the recent past is that there is no fixed limit; it is a feeling.

(**) This process is not recursive; that is to say that the creation of the past thanks to the past is not done by the past. So let's say that:

Any recursive system is to be rejected but its use is operative in the sense that it creates what is sought.

We find ourselves in Paleontology in front of a_creation_from_past_in_the_past.

Scales are attached to shapes; they are not separable from forms. The number is intimately linked to the form. "The number is the form" said Anaxagoras.

The human being is a form, living beings are forms and the time scale associated with them will be more or less compatible; it will bring out certain beings who will be an image of the abstract entity being-human with modern man as their origin and localized neighborhood of man -2000 years to

ontology, we go from one human type to another older human type (which we will define a priori or during the research) and we go back in time thanks to the time scale. These two combined scales: that of the human type placed on that of time will give the creation of the past in the past, make discover the origins of man, his way of evolution. In the usual C. de C. the observer is absolutely unaware of his privileged role of origin, of launching of scales, of the superposition by plating of 2 scales, of neighborhood, and especially of cumulation. Thinking in the other C. of C., we see that the overly simplistic and inadequate models of the rational approach are trapped by nature which returns what we are looking for as long as it is coherent. with the rational (but this is understood only from the moment one possesses the concept of C. of C.). This action in the rational (i.e. creating the extension of the model, at the neighborhood level, provided for in the model by applying the model to reality), applying the human representation, from its swelling to no longer being able to be accepted by the real, causes the cumulative to burst; a new older skeleton appears and so on" and) and). * (*)

-5000 years (but without precise limit).

This neighborhood is not separable from scale and is not separable from past, present, or future discoveries about the human race. One cannot say that this neighborhood carries everything within itself; it is a facet of a notion that cannot be represented to us.

(*) The questions should not be asked: "what if we had not dug at such a time, at such a place", or, "was the skeleton at this place before we dug"? These questions have no meaning. It is absurd. The absurd is not the equivalent of negation. There is the yes, the no and the absurd. To create indetermination between the yes and no, or even making Logics with discrete or continuous values (like certain works carried out by Poles in Mathematical Logic) does not bring in this third possibility which is the absurd. Gérard Cordonnier had understood this very well when he advocated in his lectures (begun in 1933-1934 and conducted until his death in 1972) a logic with three values: the yes-the no - and the third which he called the "damn". is the absurd. The human being carries the absurd within him. This is where the Judio-Christian religion has put the entity Satan, which can also be a state. The usual C. of C. does not correspond not to the absurd but it can lead to it because its strength is also its fragility.

Let us point out that mathematical logic considers this third term as an abuse of language and takes care to track it down, but an axiomatic in physics has almost never been formulated to account for such a vision of the physical world.

(**) We are faced with the partial acceptance of a model or models placed by the mind, on Nature. This model allows us to bring out another vision of Nature, even if it is not correctly understood and it is here that we will say that the model is operative. Nature is not mute in the face of questioning: it is active (it is the usual representation substituted here for our new representation which makes us express ourselves in this way). In the classical point of view, discovery comes down to discovering and placing in the time scale. In the other point of view, it is the time scale that launched created what we find: the discovery leads to an emergence due to the acceptance by the Universe of a time scale, as it can lead to the emergence of the operability of a device and when this operability has taken place, it can be resumed as many times as one wishes, as when the skeleton of a type of prehistoric man localized, it is there for everyone.

We are faced with 2 concepts: a present and one of its neighborhoods, and a time scale; and it is classically assumed that this neighborhood can be arbitrary and that such neighborhoods can be constructed which will be able to contain the time scale. This is precisely where the shoe pinches. A neighborhood serving to generate a ladder cannot swell beyond measure to enclose this ladder.

From the moment when we suppose the recurrence to be unstable, that is to say possessing within it its own destruction, we cannot therefore pass from a near past to a too distant past. A time scale isomorphic and homeomorphic to the line of the real numbers is not correct but its false character will be operative and allow entities to emerge which will more or less be placed on this line.

Hence these skeletons found, old by our arithmetic, about 1 million years, are creations-responses to our usual mode of counting.

This time scale is creative as a technical object repeated in a large number of copies can be, because from the (non-fixed) number comes a new entity, not localized, which can in certain cases be localized. This noun-bi-: (not fixed) is not a number but a cumulative or a shift.

The concept of being-human-supposed-to-have-had-an-origin, and therefore similar to us (we admit slight differences and by continuity in time or arrive at very strong differences) constitutes an origin and a neighborhood thanks to to which we can launch a scale that will generate a type of representation.

(***) it should _{not} be deduced from this that the process will repeat itself ad infinitum.

, (*)

If we focus on the thought of the Ancients, it appears that they used the concept of Aether. This aether which the physicists have taken up by the ether and of which they have demonstrated the non-existence. In reality, the aether of the ancients and the aether of the moderns were not the same thing at all. The moderns are completely misguided because, hastily, they thought they understood the concept of ether seen by the ancients (as in the case of many judgments they passed (**) on them). Marcel Locquin also points out that for the concept of atom it is the same; the moderns understood nothing of the thought of the ancients and Louis Boutard demonstrated this very well [18].

The ancients relied heavily on the notion of form, which they did not always see as it is envisaged in the rational world.

A form can be thought of abstractly, or seen in a certain neighborhood. In both cases the Emissions due to the Forms and likewise the states. , (***) will be different

To approach the concept of Aether, we must return to the form: the form is seen as an abstraction, or the form and its surroundings (a neighborhood of the form) and in this second case, if we look at a painting for example, we often use (****) the expressions: foreground and background. The form_view in the foreground can be detached from the background or on the contrary seen with the background; in the latter , ... (A****) case we will say that we see it plated" on the bottom . This form then takes on another character that J. Ravatin calls ' A ureola iré ' of the form. Thus if ->n performs the same operation on the space-time, that is to say that one places the ccnc r : Space-Time on the Global, there appears the ureolar A of the Space -Time which is the Aether.

The Auréolaire is most often found in poetry, with metaphor. The poet, to convey the sensation, uses a process of the kind A is to B what C is to D and we often forget the importance of the sensation that feels the one who hears or reads the poem containing this artifice of construction; we have a feeling because thanks to the **4** terms presented: (A,B;C,D) there springs a *five-* ('k'k 'k'k'k'k) fifth and this is what we called the halo . The halo obtained from the four terms in proportion (as we say in mathematics) is the same as the previous one: form on ground, and we would have with four terms: (Form, Ground; Space-Time, Global) as aureolar the Aether (this which we will state; space-time is globally, what form is fundamentally, what has the aether as a halo).

(*) These are the Greeks, Egyptians, Sumerians. Among other peoples (in India for example), we find the concept of aether but it is not expressed in the same way. It is equally necessary in the Great Gnosis. We will also make no distinction between what has been called the gnoses = Dorian gnosis, Ismaili gnosis [19], Joannic gnosis, etc. Louis Boutard, whose work we will present later, worked a lot on the Gnosis. He found the "substantial marrow" as Montaigne would have said, but he does not give a definition. We immediately point out his definition of Philology "Philology, a science of meticulous, irrefutable method, is the Science of Sciences, the history of History, it demonstrates without reply, and reduces to nothing forgers and deniers" (definition which we was very kindly transmitted by Mrs. C. Dumont, this person and her husband having known Louis Boutard very well).

H. Cornelis and A. Léonard in [20] tried to define Gnosis; they admit that it is an arduous enterprise and first of all propose this: "Gnosis a secret teaching, of a religious nature, which promises a salvation that comes from knowing oneself as a stranger to the world of daily experience, experienced as an oppressive fatality".

We have there more an observation of a state on the human being and of the human being at the same time than a definition of Gnosis. So they speak of pre-gnosis, of gnosis (heretical gnosis, diffuse gnosis, gnosis of Valentin and his disciples, gnosis of René Guénon, of Simone Weil). We give a bibliography on Gnosis, indicated by Cornelis and Léonard in their work [20].

We must not forget the Nag Hammadi texts, probably discovered in December 1945 by a group of Ethiopian peasants, who had gone in search of fertilizer. They unearthed in Upper Egypt about sixty kilometers from Luxor a sealed jar; when broken, it was revealed to contain some 55 papyri. These are now known as the 'Nag-Hammadi texts. The jar had been buried in a cemetery on the edge of the hamlet of Hamra Doum. One of the members of the group took the manuscripts back to his home in Al-Qars, a village two and a half kilometers from the place of discovery. In 1948 H. Ch. Puech of the institute, J. Doresse of the National Center for Scientific Research and Topo Mina, then director of the Museum, were among the first to announce the discovery to the scientific world.

JE Ménard in [21] gives a definition of Gnosis:

"Knowledge comprising the revelation of the transcendent world by which the Gnostic rediscovers his initial divine being and achieves salvation".

In [22] JE Ménard adds: ..."Gnosis which was above all a philosophical-religious stream for which salvation consisted in knowledge or better still in recognition by man of his divine origins". And further still "Gnosis could be defined phenomenologically as a mystical theory of the identification of man with his celestial "In-self". -even ' ' [23] and [24].

The Nag Hammadi texts do not; should not be confused with the Dead Sea Scrolls. These were discovered in 1947 by a young shepherd in a cave in the so-called Qunrâm region. The Dead Sea Scrolls come in the form of Hebrew and Aramaic scrolls; they are probably of Essene origin.

As for us, we will take gnosis back to at least 8000 years, that is to say 6000 years before our era, and we arrive at Sumer. Or one can consider Gnosis as an already less complete knowledge whose entire content would have been found in Sumer.

(**) Private communication and also presented at the 8th ARK'ALL Symposium.

(***) We will see these notions later. See also ARK'ALL Communications.

(****) Here the observer takes on its full meaning. It is more than the observer in physics. It takes into account the shape and a certain surrounding of the shape, which in the usual point of view would be placed in a subjective way. On the subject of form, as well thought of as an abstraction in form and its surroundings, it is necessary to think of form not as immersed in the space-time structure, but as emerging from this structure or immersing themselves in it. Space-time structure is no more fundamental than form; it is given with it.

(*****) The word bottom is in the terminology of S. Lupasco [3]. It signals besides in its works on "Gestalt-Theory" through which this concept of bottom was introduced - (See in [3]: The Principle of Antagonism and the Logic of 1'Energie).

(*****+) on the other proportion $\frac{A}{BD} \frac{C}{-}$ does not cause any halo. It's a hand simple definition.

Among the Chinese, the seasons were not presented in their natural order of succession, but according to alternations: the South complemented the North. The West complemented the East. We added a center.

We thus had 5 terms: North, South, East, West, the Center.

This can be considered as follows: (South, North; West, East) has the Center as its halo.

Then they created correspondences between these 5 elements and 5 colors , for example in 5 musical notes, in 5 numbers etc... These correspondences were made in order to use what we will see later in this work, M-type Magfeu thought. [25]

		Picture	matches			
			Hong-fan school	School by Yue-ling	Musical notes (known as fundamental)	
North	Winter	Black	1	6= 5+1	Yu	
South	Summer	Red	2	7= 5+2	Key •	
West	Spring	Blue green	3	8= 5+3	KiB	
East	Fall	White	4	9= 5+4	Chang	
Center	Total year	Yellow	5	5	Kong	

This thus made it possible to obtain the halos:

(Summer, Winter; Autumn, Spring) has the whole year as its halo. (Red, Black; White, Blue-Green) has Yellow as its halo. (2.1; 4.3) has as halo the number 5. etc. ..

So the year, the color yellow, the number 5 was much more than what we usually put in the year, a color, a number. The usual notions are thus as if surrounded by a halo (delocalized) reason for which the word was previously proposed: halo. François Duprey-Pacherand in [26] gives a summary of the correspondences established by the Chinese

- the 5 Geniuses of the Orient
- the 5 Palaces of Heaven
- the 5 Heavenly Signs
- 5 virtues, 5 flavors, 5 pets
- 5 badges, 5 smells, 5 main viscera of man
- 5 punishments, 5 duties, 5 natural qualities etc...

Now consider two types of crystals: quartz and obsidian . These will come in the form of blocks. Let's put the quartz block on the obsidian block; the first constitutes an F shape and the second an F' shape;

F'

we will write F. It appears from the high fields of Taofel. (The Taofel Fields are of the Eifs). Then, in our representation, F is a new form which emits at

F'I

high fields of Taofel. F is a delocalized form, we no longer have either F or F' but F (F overlapped by F'). It should not be hastily concluded that each time a stone is placed on another, there will be an overlap. This concept can only be felt by the pendulum or a personal intuition. When we

F'

is in front of such a shape F we test with the pendulum to detect another shape, a possible overlap. One thus finds overlaps, in Voodoo, of human beings by entities (the snake for example)", in eu'te Voodoo the overlaps are sought. The human being, when ridden in a ceremony, should no longer be seen as a form like a human being. It is the tendency to localize that brings us back to the localized, human, habitual form. When working on forms and the emissions of a form are poorly detected, one must ask oneself if it is not overlapped. So, if this is the case, you have to work on the overlapped form;

■ ■ ((*) **) this one is no longer in our usual representation

There is also the overlap between numbers. This was foreseen by G. Barbarin who had put it in place on numbers [27]. But what he didn't know was that a number N overlapped by a number P gives a cumulo-shift arithmetic, that is to say a sequence of numbers which by rights is not stable. (This means that from a certain number we can no longer ensure with certainty what we count). Cumulative and even a decalar may appear.

Let us point out that we can make such arithmetic understandable to each individual. We will see later forms that we call " forms which depend on the moment ". This arithmetic, attached to every human being, behaves like this.

In a cumulo-shift arithmetic, there will always be only a finite number of numbers, but we can never know them all. It appears

(*) In this case it is about the Enel attached to the serpent, that is to say the knowledge of a people relating to the serpent entity.

(**) You also have to be careful not to overlap when working on the shapes. One can also be overlapped by a state; for example, a very great fear can bring about an overlap.

The expression "Issuance of a form" is improper; it will be considered more correctly later.

(*)

in counting wandering. This series of numbers and their escapes are determined by the pendulum or by clairvoyance, on occasion. When one has this arithmetic tick attached to an individual, one can use it as a witness of that individual. It is in total transfer with him.

Another extremely important notion in the field of forms is the equimsey; shapes can be equimsey with respect to each other as we have seen that they could be in overlap. We can even find, by application of the principle of transport, that a human being can be in equimsey with a conce. The term equimsey was created by J. Ravatin to account for a behaviour.

(**)

very special of 2 forms F and F'

F/F' means that F is linked to F' by a third form which can be a trajectory, a number, a thought-form etc... What is fundamental in the concept of equimsey is that F and F' represent not only aspects of a relocation but used suitably allowing to have

(*) Not to be confused with the notion of blur, a notion that we will not use. Similarly cumulative and decalar are not fuzzy passages. If we take Zadeh's theory of fuzzy sets again, membership of a set extends to the entire segment [0,1] and not as in Bourbakist mathematics to the set {0,1} (for this last membership is 0 in the first case and 1 in the second). Zadeh adds for example the membership 0.6 between 0 and 1 to bring the notion of vagueness. Here, with the cumulo-decalaires, we can never put a value of belonging to a set. We simply know that there is a finite number of elements. We have rather a flight, a shift, a wandering in the whole on the way of counting.

For the record, let us recall that the theory of fuzzy sets was presented by A. Kaufmann in his work: Elements of the Theory of fuzzy subsets (Edit. Masson) Paris 1973). Volume 1 deals with the basic theoretical elements. It will be easy by consulting this first volume to convince oneself that the notion of vagueness has nothing to do with that of leaking elaborate concepts.

Consider in a plane two points A and B, separated by a distance d. Suppose that the numbers announced after choosing a unit small enough for them all to be greater than 2 belong to a cumulative shift arithmetic, that is to say that there is at least one cumulative, this will be the index that the plane will behave in a certain region placed between A and B as if it were elastic in this region, or as if several planes were sliding on top of each other in this place (one does not know anything about landslides). We will call this a splitting of planes.

(**) When 2 forms F and F' are in equimsey, we will write F/F' or F'/F indifferently.

* * • Z (•k)

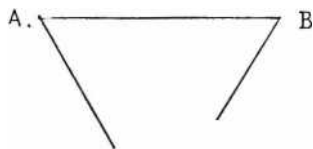

access to the wealth of this relocation. The equivalence between F and F' means that F and F' are the emergence (known as a sheaf) of a delocalized notion (** (***) (***)).

Consider a form A such that A is only defined because (•) she transforms. To make this new concept felt, we can say in an abbreviated way (which often makes share the feeling): A is its own transformation. Which means that in reality we cannot, by any of us, have a representation of A: A contains its dynamism. For example, A may correspond to a cumulo-shift arithmetic and A will run through this arithmetic. (A is not in dynamic duality with this arithmetic). A can only be a form considered during a certain interval of time; considered at a given moment of this interval, it has no meaning; if we want it

(*) This is what happens at the spring and autumn equinoxes. These two moments are in equimsey (the duration of the day is equal to that of the night). If we know how to use this equimsey, we can have access to the movement of the earth for a year. This movement is brought back to a form at a given instant, but the manipulation must be done at one of the equinoxes.

(**) J. Ravatin points out that Jacob's Ladder is an allusion to an equimsey thanks to the manipulation of two ladders.

For Jacob, the dream presented itself in a decomposed form. Jacob is on the ground and he looks angels who climb the bars to disappear into the sky and angels who emerge from the sky to descend the ladder. The distance between two bars indicates a unit.

fi

Instead, consider two ladders located at

A and B on the floor. We count from A to fi and we count from fi to B. An observer in A launches his counting scale and this flees towards fi whereas an observer in B has his indeterminate scale because it emerges from fi. number of values and known p). two observers who are separated, as remarked -

quer André Sabourdy, in the game of Basque pelota; it is necessary to suppose the invisible from ton for the players in A and B and A is not supposed to know the existence of B and reciprocally. For A, we reach fi by a decalar. For B the ball emerges from fi

If we assume a scale on the segment AB, then fi is no longer delocalized, it will move on AB. This fi will be a projection of the delocalized fi.

(***) Q_n does not consider here an infinitesimal transformation as is usually done in mechanics.

(****) What we will write AI ----- . We can also say: A is, because it short what it is.

to consider it thus, one shatters it as one shatters a mode of understanding by considering the concepts: objective and subjective; such a faith that $\mathcal{E}$ is only by an interval of time will be said to be a form which contains its toæps^{^^}. A form that contains its time will be a special case of macron. In general any shape that

(**) 'H will contain a dynamism will be called a macron. A pregnant woman is

(*) It is interesting, starting from this concept, to see the approach of Bergson said by its author "cinematographic character of our knowledge of things". [28]. Bergson's way of seeing has been strongly criticized by physicists and also by mathematicians. They did not feel that Bergson considered a movement as indecomposable and that a mechanistic formulation of movement did not satisfy his mind because for him, to think of a point of the trajectory was to freeze the movement. As the scientific researcher is not interested in the birth of ideas but attaches himself to the formulation of a theory assembling the concepts, Bergson's remark was considered as useless research. Bergson considered, without expressing it as such, a mobile in motion as a form that contains its time. If we want to begin to understand the strength of a ritual, carried out by gestures, we must see that the ritual comes down to different macrons (this is what we find in religious services, any religion without ritual is ineffective. On the other hand, sects have rituals but the states of these are harmful most of the time. The ritual is composed of macrons who, thanks to their relocation, are in transfer with the god or gods invoked before and during the ritual).

(**) The term macron is already known in the field of physicists. Macron is used in Morphogenesis writes the mathematician Ralph Abraham. (private communication). Morphogenesis is the study of the evolution and arrangement of forms drawn from chaos. This notion of chaos is found in the Rigveda, the Yi King, the Kabbalah, in Heraclitus etc... The study of the processes generating forms is ja Morphodynamics. The Catastrophe theory of the mathematician René Thom Ou-a-denies to explain morphogenesis by mathematical models.

A macron is a form or an assembly of forms, but these assemblies of forms appear in a defined medium.

Examples:

1) Consider a metal plate on which we put sand; by vibrations caused by a violin bow rubbing against the plate, there appear lines on which the sand collects; these are called Chladni nodal lines. The plate photographed by laser interferometry gives a diagram: this diagram is a macron.

2) Bénard cells in a liquid constitute a macron.

But there are many other macrons; it is obtained in liquid crystals in the presence of solid phases.

One can also couple macrons; this sometimes gives rise to new macrons.

In what interests us, we will consider three totally different possibilities of considering macrons.

Either we take the macrons as they are, that is to say their shapes, **and** reproduce them by appropriate montages. That's what JW Keely did

a macron (naturally as we understand it here); one must not think of woman and fetus separately; an X-ray analysis breaks the C. of C. in which the macron is to bring us back to the usual C. of C.. The woman goes through a cumulo-decalar arithmetic which is that given by her fertilization with the man (male-female fusion). Birth is a partial localization because the human-being child is never totally localized; a human being is very little localized. We also fall into the AI -----B scheme. B is a trend localized macron AI ----- . We will say that AI-----generates_Bk ' .

Fermentation in alchemy is a macron. If we come back to the usual definition of a macron, let's forget its external environment which generates it, then it can be considered as a macron in the sense that we have considered it!

Gods can play the role of macrons. Let us see, for example, Yahweh who was the Enel of the people of Israel; when he speaks to Isaiah "lahweh spoke to me again and said to me..." The Enel lahweh behaves like an Ai- form (it does not overlap Isaiah). Isaïe becomes at a given moment a localized tendency of AI . But this macron hides another, it is that of Enel lahvé which gives rise to lahvé, not located, we have an AI -----B with B not located. The whole phenomenon is reduced to the diagram (AI -----B) I -----C . Broken of macrons can enrich Enels.

Let's see the seal of the Templars: two riders on a single horse. It can be interpreted as follows: As the horse runs down a dusty road (as they were then) ridden by a single rider, the dust accumulates in wisps behind the horse. The rider, the horse, the moving dust and the time of the gallop should not be considered as separate notions * (*) (**)

to make some of his devices using sounds. These will emit what we will later call Eifs. (which does not mean that the macron in its middle has these associated Eifs).

Either we will use the macrons in their circles to amplify or transform the Eifs . Either we transport macron's definition of a coherence in a field of coherence (the usual one) to the other C. of C. It will therefore be a form which contains a dynamism (the word dynamism here is not taken literally). usual sense but in the sense already seen at the beginning of this work.)

(*) Note that B may very well not be localized and then AI -----B is will behave like a macron.

(**) lahvé corresponds to an era: it was Enel, but it is no longer Enel.

res. This must be seen as a form which runs through its cumulo-shift arithmetic or as a form which contains its time; in the first view the arithmetic is marked by wisps of dust. So it is no longer a process that takes place. And the fixed way to render this macron is to put a second rider on the horse, identical to the first it seems. The second rider symbolizes the first who in his ride becomes aware of the macron he will generate. On the medal, to reflect this process, the rider is doubled by a second rider who. is the reminder of a phenomenon of the (* (**)) kind ritual

If we break up a form (that is to say we consider the form at a given instant) which contains its time, we have a phenomenon known as unwinding. More

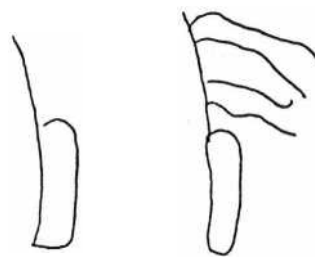

generally if we break a macron, we will have an unwinding (**)

Consider an arrangement of shapes that resembles the two riders system and that in general does not result in a macron. For this we give a form F and suppose

1) than by building more elaborate than F^ (in F the it simultaneously constructs a form F^ he there is already a part of F^)

2) also assume that and F^ are in equimsey.

As we announced, we will not have a Macron. This example is interesting because it can serve as a model for the birth of a sheet of plant. Leaf being a localization of the final result

In some cases, maybe just an emergence of 2 '

(*) A ritual carried out by an initiate allows a transfer with a macron. The sequence of gestures or incantations triggers the transfer. We can then have overlaps or equimseys with the macron.

(**) A ^Q -----B will mean A takes place following B .

designate the aether by $\mathcal{A}$
space by E
time by T ? and space-time by ET
and by r one mark in AND .

Using the previously given notation, we will have $(\mathcal{A}, ET; ET, r)$ which will have a halo and this will be the voiloc (v) associated with an observer.

Two processes I -----and c -----between $\mathcal{E}$ and $\mathcal{A}/V$ (i.e. respectively the aether overlapped by the voiloc and the aether in equimsey with the voiloc) represent in the following way

$$\begin{array}{c} \text{you} \text{-----} \\ \mathcal{A} \text{-----} 1 \mathcal{A}/V \end{array}$$

let's see $\mathcal{A} \cdot \sqrt{V} \text{---} \mathcal{A} \cdot \sqrt{V}$ and $AL \cdot \sqrt{V} \text{---} \mathcal{A} \cdot \sqrt{V}$

The first will be called a " globallance " and the second an " etalance ". The space E is a globallance representation and the time T is an etalance representation. E and T are only possible representations; these are the ones that are accessible to the human mind but maybe there are others?

and etalance are in equimsey (* (**)) On the other hand globallance

We see that space, time, aether, voiloc are intimately linked but we cannot say that one depends on another or others, or that one involves the other except in the case where the halo appears.

We can find here a sense of the thought, often quoted, and interpreted in many ways, of Hermes Trismegistus "All that is above is like all that is below". The top designating an elsewhere, we must therefore look for the concepts of our localized representation in the elsewhere. (It is not the comparison between the infinitely large and our everyday world, or between the infinitely large and the infinitely small). It would rather be a nod to the researcher so that he goes from localized to delocalized.

Let us consider another halo: $(\mathcal{A}, ET; ET, F)$ will have the "Eif" as halo. As a particular case of the eifs, we have what the researchers named around the years 1930-35 "Ondes de Forme". This denomination had been

(*) The equimsey $\wedge ci$, based on delocalized notions, is obtained by transporting the consistency of the definition that we gave it previously.

(**) F denotes a shape.

(HAS)
 given by Enel ^v (Count Skariatine), Bélizal, Chaumery. Researchers like the Servraux brothers, 'Morel, Turenne, Chaisemartin, La Foÿe, Lafforest, have adopted this denomination. The TOTARIS research group proposed Emissions de Formes because its researchers immediately realized that we were not dealing with waves but with something quite different. J. Gattino corrected by Emissions due to forms what is more correct from the grammatical point of view. (Pagot adopted the term Emissions of Form [29]).

Enel had sensed the strangeness of this phenomenon, but despite the fact that it was he who, after his return from Egypt, launched the study of these emissions in France.
 sions, the researchers who followed him brought this research back to a
 (***)
 rational way and too hastily placed the Eifs of Enel on the electromagnetic spectrum, either below the hard y-rays or beyond the Hertzian- (****)
 born . The detection of the Eifs was done with a pendulum or a rod; these instruments are only stimulants of the mind which enable it to feel more deeply and to begin to escape from C._of_vs._usual. Pendulum and stick or any other method of detection of this kind (we can avoid taking these instruments which are still only an intermediary between the human being and what he wants to feel just as the technical object is an intermediary Between
 1 man and Nature thought in the usual C. de C.). spnt necessary when one wants to apply the principle established by our care and named: "Principle_of_transport_of Coherence ". This consists in using notions intervening in a coherence

;)*) We take this opportunity to provide a fairly complete bibliography on the work of these researchers.

(**) Enel had a deep esoteric knowledge and only the other researchers in this field were aware of the usefulness of such - knowledge. In the case of Enel, already in Russia, he had, very young, been in direct contact with phenomena placing themselves completely outside the usual paths.

(***) They stayed in the same C. de C. but the process uses the other C. de C.

(****) Q_n can therefore very well do without a pendulum, rod, etc. This is the case, for example, of Samuel Franeric, researcher at the ARK'ALf Foundation, who has the answers directly in the head to the questions he asks himself. This allows him in the case of his doublings to direct himself, and to test himself, therefore to obtain very rich results by this means. This is how he became aware of the notion of canal which is different from that of decalaire.

In the same order of ideas, doing a ritual at a given time, for example taking into account the moon, a constellation etc..., all this can constitute in certain cases crutches for the spirit. The human being must work as much as possible in the halo of the spirit; the spirit can itself be a halo.

(*****) This transport can, in certain cases, be a transfer.

ence given and to transport it into another coherence found in the same C. of C. or in the other C. of C. We have previously used this principle: for example when we considered the equimsey between globallance and stall. The answers to the questions asked using a pendulum or a rod involve the representation of what is being sought as well as a tacit knowledge. Very good dowzers like Father Mermet had a very personal model for finding coal streaks, buried walls, lost objects: ray that came from the sun, ray that came from the moon and location in relation to these two rays. For him, his model was operational. But that depends on the cerebral convolutions of the manipulator and each dowser becomes more or less aware of it, wanting to detect what he is looking for, but not being interested in the quality of his model. This is one of the reasons why dowsing is not a science; it is not of a transmissible language; each manufactures its own representation and what it transmits are simply the recipes. As for tacit knowledge, it is never mentioned. We find dowzers who, to look for running water, imagine the water in the ground as flowing in a solid medium, whereas it happens that it passes through sand, so that we have a continuous transition from a fluid state to a fluid-sand mixture state. So what does the dowser detect when with his foot he marks the edges of the underground current which he crosses perpendicularly? It announces a kind of average between the real water current and a fictitious water current whose flow would be the same but taking place in sealed walls (as taken in rock or in pipes). But the detection is correct, the composition in salts of the water can also be correct and likewise the flow rate if all the fluid is recovered at the outlet, which makes it possible to check the accuracy. answers .

In the field of eifs, we sometimes come across the case where an error in a test nevertheless leads to a correct result: let's look at the example of a cancer detection on an individual. It was found by Jean de la Foÿe and André Philippe that a person with cancer has a growth rate of V_p (eif which we will see later) and its field_vital which rotates up to 180° clockwise (vital field: concept discovered by Foÿe). But we can find cancer patients for whom the rate of cancer is not very high. This error nevertheless allows a valid interpretation of the cancerous state in the example chosen, because implicitly the person manipulating the pendulum confuses the cancerous state with a high rate of and rotation of the vital field.

But this is not without danger because in this research, one can arrive
à des errors which are not correctable.

Another mistake often made by commuters in the field
of the eifs is this: the commuter gives himself a set of possibilities which
will be examined one after the other. As often, and here is the error
committed, the operator will assume that the answer is one of the elements of this set, then he will inevitably find an
answer. Unfortunately, he misstated his problem, and his answer is wrong!

When we want to detect with pendulums or rods and when we particularly work on a witness (plan,
photograph, ...), it can happen, this is quite rare, that the answers to the study are imprecise and even there is no response at
all. In this case, we realize that we are in the presence of do. what Ravatin called: a grid (because it was precisely during a
study on a plan that he sensed the notion of a grid); grid, because everything happens as if the detection were partially or
completely obscured. A grid can be wanted by those who do not want a detection to be made on the forms in which they are
interested or have been interested; it can appear on its own.

When during a test you come across a grid, you have to, as we say, lift it. For this a ritual or forms are set up
on the plan, the photograph... The grid can remain lifted after the ritual has been performed or the forms have been removed;
more often it falls. Example of a case where we find a grid: The Miracle of Lanciano.

Lanciano is a city in Abruzzo; around the 700s there was in the monastery of Saint-Légoncien, where the
monks of Saint-Basile lived, today the convent of Saint-François, a monk who went from day to day as long as in the
consecrated Host was present the body and blood of Christ. However, he constantly prayed to God to remove from his heart
this wound which afflicted his soul. While one morning, after pronouncing the words of consecration, he found himself
deeper than ever in his error, he saw the Host transformed. The Host had turned blood red, it seemed to be a piece of flesh
and the consecrated wine to be real blood which coagulated into five irregular clots of different shapes and sizes. The monk
turned to his faithful to share with them his astonishment and his joy at the miracle^{^ J}. Multiple scientific analyzes were
made on this flesh and this blood since (*) It is possible that at the beginning of the blood red coloring, the monk, taken by
stupor (state favorable to transfers) projected on the transformation, miraculous certainly, in progress, his hope and his
distress and then the orientation was made towards flesh and blood. But that's just a guess I

1574 until recent years and will certainly still continue. All the historical course and the detail of the experiments can be found in [30]. A few pages *are* devoted to it in [3-1]; this book is interesting for the multitude of miracles of this type or other strange phenomena of a religious nature listed and described.

It appeared a few centuries after the miracle, a grid, which makes it impossible to test correctly; the ritual of the mass, made in this church, raises the grid during the duration of the mass and after it falls. Very strong Eifs appear and permeate the celebrant and the faithful who follow 1 office. But 1 imprint can last after they get out of the church. Transfers, when the gate is lifted, can occur with an' *this* holy places.

Pendulums can be of multiple shapes and multiple materials, this matters little. Some shapes, like the Egyptian pendulum, are still more sensitive to swing response than others. Some people make knots in certain places of the string supporting the weight of the pendulum, these are only mental conventions. They may be multiple depending on the manipulations.

On pendulums are imposed signs and figures (letters, words in square Hebrew, in Sanskrit, in Enochian language, or any other), knot of life, etc...

It does nothing to consider the pendulum and rod as mechanical systems. When in the hands of the operator they are (*) (**)

(*) The manipulator is not overlapped by his instrument, neither overlaps it nor is he in equimsey with him. There is no dynamic duality.

(**) On the subject of the manipulation of the pendulum, it is interesting to point out the experiment carried out by Baron de Reichenbach with sensitives and reported in the work of Rochas [32]. Reichenbach had devised a small device in which the pendulum wire is wound on a drum in such a way that it can be touched where it is in contact with it, but not in its free part; the whole is protected against the agitation of the air by a glass cylinder. By placing his finger on the wire, covering the drum, when this finger is that of a sensitive, the pendulum starts moving after a certain time. Reichenbach points out that if the left hand is placed on the right hand, the pendulum does not work. He relates this to his theory of odic phenomena.

In conclusion, there is a shaking effect of the pendulum flyweight , which cannot be explained by the amplification of small movements.

already less localized than usual. We find a similar case in spiritualism, but here these are tables that move and can even levitate (generally without any special effects). The table is no longer the usual technical object or aesthetic object; a difference however remains between the manipulation of the pendulum and spiritualism; it is that in the latter, states can appear on the experimenters which can be harmful, which makes these de-

placement of objects should only be produced with great care (*)

The Eifs are therefore detected by pendulum or rod or directly $\sim i$ (**) (***)
felt by 1 observer

They therefore correspond to:

- 1) a more or less advanced delocalization of the form or the system of forms,
- 2) I am also aware that the Obs. is in front of the form and that he has considered it known to be in the ET. (usual point of view) or partially immersed in it,
- 3) and also to the following fact: Obs. while knowing its origin, flattens its vision, that is to say considers what surrounds it exists: outside of it. This position of $> .l'$ Obs. is in the usual C. de C., but the fact of having become aware of it places it in the other C. de C. It is a bit like a shadow of the usual C. de C. on the other. The 2nd C. de C. accepts this position as long as the Obs. realized it. It is not an excess of language nor an extension , it becomes an operability. This is all the more valid since one cannot arbitrarily think of a human being as an origin (i.e. launching his C. de C.

which is found to him as well as all that exists). But this can only be experienced by the Obs. and then there is only one Obs. But human thought seems forced to choose to define itself to hold this position in which the Obs. throws her C. de C., despite knowing it, she can't use it that way. And this impossibility of use is the "thinking tablecloth", Teilhard de Chardin's noosphere [34]. Thus a blockage on a human scale is creative and operative for the human species.

Let us consider the following image to help understand certain phenomena: either a curve (C) supposedly not accessible to the Obs. but of which he

(*) The experiments carried out by Camille Flammarion, Colonel de Rochas, Charles Richet, Doctor Karl du Prel, and Proferrio, Schiaparelli, Aksakof, and other researchers at the beginning of the century in Paris, with Eusapia Paladino as medium, were not not tainted with harmful states [33],

(**) Thereafter we will write the observer: Obs. An Obs. can make movements at the level of representation only and not physical, which can only be done by the observer. ■ - -----

(***) This shadow is used by the 2nd C. de C.

will know that there is that a piece is a curve (C) MN. MN will have no sense that because we know

1LM* (**) (***) $\forall p \bullet \dot{u}' > i. ; \sim$

- ' ■ ■ \ | not a word,

s- NOT

(C) M

Suppose that the Obs. please know more about the curve (C). It will expand MN to M'N' . The Obs. believes that MN is contained in M'N' in the set sense, and this is his error, because in passing from MN to which it corresponded (C), to M'N', we have passed from (C) to a equally inaccessible curve (C'). When exploring M'N', MN tends to disappear.

The Obs. will try to make up for the difference that there is between (C) and (C) and a more or less intense localization will occur and it will be an M''N'' portion. Let us recall that the portion MN has meaning only because there exists, not localized in its totality, the curve (C). It looks like a Fractal Object from afar. The fractal object is never accessible in its entirety, but we have it from a perfectly traceable primer by a recursive process, a very (£ }

ieee wave. (C) is said to be MN progenitor and MN primer of (C). In the case of the forms and $F^\wedge$ seen previously where $F^\wedge$ is reproduced in ,

$F^\wedge$ and building up simultaneously and in equimsey, $F^\wedge$ is the progenitor of F. . Curve (C) is a shape associated with Voiloc. The Voiloc is connected (.

locally by what we call the ancron. After these considerations, it appears that when a detailed study is undertaken in the mode of rational thought, what is obtained is simply a deformation of the curve (C) generating MN . Seeking detail is equivalent to enlarging MN; the deformation of (C) into (C) which follows, produces a creation which corresponds

(*) Progenitor because it is (C) which engenders MN but the Obs. has access only to the primer, MN and (C) are not in dynamic duality; between the two there is an equimsey. We will write $F^\wedge = \text{Gen } F^\wedge$. you

(**) Ancron comes from the verb to anchor. The voiloc de l'Obs "anchors" to the premises thanks to the "ancron".

(***) See Annexes I and II.

to what we discover by looking for detail.

is almost always outsourced, and F_2 will be said to form a coupling of the AG (Primer-Progenitor) type.

Ti (**)

Most realized forms have a Progenitor. A technical object per .xample has a parent. The multiplication of identical technical objects can densiciate its progenitor; we can even arrive at a spawner which slides towards another spawner if the number of technical objects is very large. (*) (**)

(*) It should be noted that experiments are only valid for RBBs when they are reproducible everywhere or in many places and under multiple conditions. It is more interesting, and it is another method of research , to be interested in the possibilities of success of an experiment: the place proposed, a favorable time, the state of the experimenter, are sometimes necessary . Thanks to such an attitude, the multiplicity of paths of discovery is immense and we arrive at living systems which know how to adapt to the moment. Pa< this way the human being joins the gods; that is to say that it is not a question of building the localized, it is necessary to arrive from the delocalized to the localized. It is this "journey" from the deepest delocalized to the localized which is important and the forms, the assemblies of forms, bring with them delocalized functionalities which adapt to this "journey".

(**) pi is no one -to - one correspondence between forms and parents. It may happen that different forms have the same progenitors. A form like the labyrinth of Chartres cathedral makes it possible to act on the originator of a form. He himself has a parent. Let's see some examples of progenitors: a natural or chemically treated oil has a progenitor. It is not the volume of liquid that gives it, it is the oil entity; a silicone oil has a progenitor. A transistor has a progenitor, but when it is mounted in a device, its progenitor disappears to enrich that of the device. A crystal has a progenitor, and mounted in a device it generally keeps this progenitor.

The organs of a living being have no progenitor because they are forms that are cut out by an overly Cartesian view. They are over-localized. Over -locations can also lead to instability of the room and it is possible that new locations may arise to compensate for this instability.

Let's see another notion established by Ravatin about the forms: it is about the Ext.

To feel this new concept, consider for example a shape like the pyramid of Cheops. It is almost full; its rooms, its corridors providing access to the king's chamber and the conduits leading to the side faces all have a small volume compared to that of the pyramid. Ravatin asked himself the question: did the Ancients see the environment as we do, -and especially among the Ancients, the high priests of ancient Egypt. It seems that they had access to other notions that we find little by little or which are equivalent to them. One of these notions is the ext_of one_form. The ext of the great pyramid does not

is neither interior nor exterior, it is delocalized. It is a concept attached to the global. By taking a solid shape, for example a cube, a ball, and by digging several small diameter holes in it compared to the dimensions of the shape, we create exts. For the same form, several exts can be obtained according to the number of holes, their depth, their arrangement on the form. If, on the contrary, we take out of the shape solid or hollow small diameter rods, we will not create an ext. On the other hand, if we have several holes and several visible rods, we can have an ext. A crystal always has an ext even if it has no holes. A living being, plant, animal or human being, most often has an ext. If he doesn't have one, it's serious for him and those around him. A human being who has no ext will attach himself as a parasite to those around him and if this is also from birth, he will attach himself to a person and the latter will be completely sacrificed. Also when the human being does not have a birth ext, it is very difficult to give him one. It's an infirmity for someone who is like this, but it happens that this invalid takes on states that make everything happen as if his instinct intervened alone; without any intelligence he manages to be accepted and sometimes succeeds very well by blinding those around him (îfcÿc) to get himself adopted, help, to their detriment of course

The ext of a form and its parent are totally different; the ext is generally not in equimsey with the form; we have seen> a human being can have no ext when he has a parent. If we take two miscible or immiscible liquids, we can give an ext to the mixture from a volume and of a very specific volume V_9 of the first and second liquid respectively. From (*)

(*) A. Sabourdy and J. Ravatin noticed that the snake entity, if it is tested by a man has an ext while if it is a woman who tests, she does not find one.

(**) These cases are usually detected by doctors, but there is not much they can do. Psychiatrists sometimes try to intervene, but they only displace the anomaly, that is to say that the patient seems to have evolved a little while he keeps his parasitic attitude. All attempts to use forms to give the patient eifs and to make him disappear from the harmful state (in the eif sense) in which he is, are also unsuccessful.

(***) All the great castles have not been reviewed. On the other hand, the constructions involved in what are called large ensembles must rarely have either an ext or a parent, and even more rarely both. The large ensembles were baptized by the promoters, to attract the client, residences . But it is absolutely not residences in the sense that it was still understood 40 years ago. These residences had for some an exterior that was impregnated with the neighborhood: trees and woods surrounding the residence. Architecture, as J. de la Foÿe pointed out in his work [29], is taught and applied indiscriminately; especially since the 2nd world war (for lack of dwellings dt with the massive destructions), which made it possible the horde of the promoters to grow in name and in power and to involve in its wake many architects who are only able to draw cities without souls. In these aberrant constructions, made on places that have not been studied for their eifs, there are also very often harmful eifs and even harmful states.

R. de Lafforest drew attention to this issue in what he called "The houses that kill" [29]. Harmful eifs are also found near high-voltage lines: a 100,000 volt line is surrounded by a sleeve of around 80 meters in radius. A line of 200,000 volts carries in V" up to 170 meters; a 400,000 volt line, up to 350 meters. It is easy to check with a pendulum or a rod that the "intensity" in Vg does not decrease with distance but remains more or less constant and falls suddenly. This is what is responsible for many disorders affecting people living under or near high-voltage lines, the electric field between the line and the ground being much less harmful than the Vg.

A research group has been set up in France which is studying this form of pollution and trying to remedy it. This group is called ARKOLOGY. He is particularly interested in the field of investigation of geobiology, but while geobiology - tries, from rational points of view, to restore atmospheres which at the start are harmful, Arkology resumes from the approach given by the Fondation ARK'ALL applies it to housing, but extends it to a much larger area which is architecture in general, and even more to Art in all its forms. Extensions of the views of this group are considered in allopathic medicine, homeopathy, acupuncture, anthroposophy, etc.

Arkologie has as president an expert-architect, Serge Hennemann and with him are architects like Maurice Thomas, Jean-Paul Gazeau, Philippe Arrault, Francis Aujame ... researchers who have become specialists in forms like Raymond de Montery or osteopaths like Alain Cheyssial who applies only Arkalian thought, and realizes that the osteopath locates the functionalities .

In architecture, it is not enough to test a house piece by piece to list its eifs and states. The house can be considered as a whole and then the eifs and the states are different from those of each room. Those who live in the house are in contact either with the emissions of a room when they live in this room and in their representation they place themselves in this room, or with the emissions or the states of the house considered as an entity when they think of their home. Everything depends

of 1\$ representation and let us repeat it once again, it is one of the reasons which makes that the dowers, when they lean on places, do not find the same thing; the representation of what they are looking for and their definition of the place they are testing is not the same for everyone. It is necessary in architecture to bear in mind what is being represented in order to announce the results of these tests according to the chosen representation. We can therefore, if we study a house, represent it as the assembly of its rooms, or as a unit, the hearth where a family will live, or even the house and its close neighborhood as indivisible. Can we continue to expand? We would thus have the house and the department or the country etc... It would be absurd to continue such a recursive process and it would be to misunderstand the approach that we have tried to give since the beginning of this chapter. From a certain moment the concept of house and more or less large neighborhood will flee, and if we want to find eifs and states to such a unity: house and very large neighborhood, we must take flight into account.

Naturally, the eifs and the states of the rooms can also depend on the ^{tones} which are there, that is to say on the furniture, the pictures hung on the walls or the arrangement of the furniture. Example: seats by their shapes, their respective positions and places in the room, can for example have a harmful state or cause that a person seated in an armchair, because it is often a massive seat, will be overlapped the time that she is seated by another person placed in another chair according to the provisions previously indicated.

We see that the architect and the decorator have a serious job to do before playing with the shapes. Lafforest and La Foÿe have insisted enough on these points in their respective works for us to come back to them. However they did not consider what we have established: the exts, overlaps, the study of the house as a whole, etc...

Nor should we make too hasty systematizations here: for example, any clogged well, still containing mostly stagnant water, emits harmful emissions vertically from the well, in particular a high V_g . One could observe such jiuits in gardens which had no such harmful emissions at all, yet clogged, and with stagnant water inside; of course this is not the generality. We even found a clogged well covered by a house and there were no harmful emissions in the rooms or in the house as a whole. Maybe the shape of the house eliminated harmful eifs? There were also no harmful states.

It happens that in the study of certain places it is difficult to test. There may be a grid, then with the help of appropriate forms we raise it; it can remain up or recover as soon as the forms necessary for the test are removed. This grid can be a protection for those who approach the place, it can rise as soon as the inhabitants of the place present themselves, finally many possibilities arise between the grid, the inhabitants of the place and the foreigners. When one finds, after having raised a grid, harmful states, if one does not know how to eliminate them it is necessary to put the grid back in place. It is sometimes difficult to eliminate harmful states; most often we do not know how they came there, and if moreover there were intentions, we do not easily know - what these intentions contained in possible surprises. to avoid "kickback". It may be that there is no grid on the place, but that the place, the dwelling are in transfer with another place. This case occurs quite rarely but it must be detected because there is no point in putting a rebalancer to eliminate harmful eifs if there are any. The place with which the

transfer occurs can be near or far. If we work on a plan, we sometimes go beyond the limits of the layout plan and therefore do not know the place in transfer with the house studied. In this one the people who lived there could not sleep, they really did not feel at ease. By putting on a very good balancer (and there are few valid ones) they slept very well for three nights and then everything went back to how it was before. There, a study made by A. Grangé and J. Ravatin led them to discover this transfer and the rebalancer had to rebalance the place approximately 800 meters from the house with which the transfer was made. It suppressed for some time certain harmful emissions from the house, because it momentarily broke the transference, then the latter reformed, the rebalancing was no longer useful. It would have been necessary to increase the power of the rebalancer, by increasing for example its volume, its mass or the electric voltage on which it was connected but it is always boring to have in a house devices connected to high voltages. In this specific case, A. Grangé and J. Ravatin imagined 2 copper shapes, one placed in a dining room and the other in another room, which broke the tr-'-sfert and then the rebalancer gave all its effect.

Regarding rebalancers, multitudes have been made since Tureune. Let's say right away that there is no such thing as a universal rebalancer and few are valid because many people who make them know little or nothing about eifs, or if they do, they neglect states; it came to our knowledge a so-called rebalancer made by two people who understood nothing about eifs, which sometimes eliminated a few harmful eifs but created almost every time it was installed in a house extremely harmful states; this device in addition was sold quite expensive which did not help. In this case, to make such a device harmless, it is best to put it in two well-closed plastic bags and then it can be placed in a closet or cellar, it has become absolutely neutral. We must also be very careful about this: any form has given eifs in a certain volume, by this volume, there is a threshold below which the eifs and states can change completely. So you shouldn't put a rebalancer in too small a volume if you want it to work well.

We were able to observe another kind of rebalancer which, although it eliminates some harmful eifs, begins to have a completely harmful state throughout the room where it is located as soon as it is placed in front of a mirror. Naturally the - seller, when this major inconvenience was mentioned to him, did not care. If we come back to less dramatic cases, let us point out all the same that it would almost be necessary to study the rebalancer for the place. Finally, some rebalancers, which are also transmitters (there are very few of them) can intervene effectively in a large number of cases. It is also necessary to pay attention that some become "saturated", that is to say are no longer effective from a certain time of use and this without there being grids which appear smells. A rebalancer which becomes saturated, it is enough every eight days either to pass in running water if it is of a material easily supporting this treatment, or to brush it vigorously etc... Rebalancers must be oriented, for d others this is not necessary. The shape called "Luksor" must be oriented to the north of the shape, but this orientation depends on the location, or the size of the room where the shape is located. We were able to verify once that this localized form had to be oriented every day because its power to annihilate harmful eifs varied with the phases of the moon; This presents very delicate forms of manipulation. .11 is difficult to make a rebalancer that does not depend on orientation; it must be thought of, during its development, so that it is easy to arrange it in different places. It must not saturate . In general, it is not necessary to place a rebalancing device-transmitter on a post of

television because its transmitting character disappears and if it is a rebalancer alone, it may very well no longer rebalance anything (a black and white television set sends a V" at 6 meters and the color set at 8 meters; this has been found by A. Philippe).

It is a good idea not to place the rebalancer near the ceiling of a room, nor at floor level (except in a few special cases). Nevertheless, when possible, it is preferable not to have to put any rebalancers. Indeed, if the owners of the house move and take their device and if the environment has not changed, everything becomes as before. Architects therefore have an advantage in studying the place (basement, presence more or less close to high-voltage lines, transformers, terminals, finally what all our modern world brings), on plans to take good care of the forms (parts, framework, air and water ducts) of materials, to avoid pyramid-like shapes for example. They are not always harmful but it can happen because the house built in the shape of the pyramid of Cheops is not at all like the pyramid of Cheops internally, neither on rocky ground, nor even if it is oriented like the pyramid of Cheops, with the different environment, different materials, harmful states may occur and even transfers with other places.

A Mexican architect won at the age of 47, in 1971, the first prize in the competition for the Hervico Colegio Militar, the Military Academy. The largest project that he has realized so far constitutes with the 90 million dollars that its construction cost, one of the most spectacular and ambitious architectural projects of this booming state that is Mexico. Christophe Biirke [38] quotes "Having never been the subject of any report - it is a forbidden military zone - the Academy represents one of the best examples of the ambition to which the modern architects: the synthesis between the tradition inherited from an ancient past and the functionalism of the modern era". But this mixture is not at all necessary. The old forms - corresponded to very precise needs which were not those of work rooms in the sense that we understand it, of dwellings (example of the famous pyramids of Teotihuacan). This architect's build has some Vg and Jg in places but there are no harmful states. (The Vg leaves by certain oblique openings, its intensity varies with the position of the sun). The buildings built in a large plain surrounded by mountain ranges are beautiful. But we must not generalize this habit of making pyramids or other imitations of ancient constructions when the architects who embark on such constructions know absolutely nothing about these civilizations in the most important field, which is that of religious practices. the past. Philology is then necessary and not yet philology in the sense in which we understand it, but in the sense in which Louis Boutard (*) understood it and applied it.

It's not because in the more remote parts of the Yutacan you can find coke and hamburgers and the Indians who crowd into the cities buy plastic anoraks in the department stores and slowly unlearn to dress according to the tradition of their fathers (they no longer even know how to use the old looms), that it is necessary under pretext to put people back in contact with their so-called origins, to build dwellings, factories, libraries, in shapes reminiscent of ancient forms. It's just another joke. We still find this in the frescoes, paintings, sculptures, executed in the "Indian" style which adorn a good number of buildings in Mexico City. They reflect a failure to integrate folklore into architecture. We come across forms that

(*) See chapters later; they refer to Louis Boutard and his works.

no longer agree, no longer marry, because they belong to different eras and even worse, they are a mixture of the aping of one era with another era. Back to Hernandez: abroad, he was especially noticed thanks to the Mexican pavilion of 1 "Expo 70" in Osaka, Japan. It reached, according to the point of view of many so-called modern architects, its best technical performance with the tower of offices and workshops built in Bosques de las Lomas, a suburb of Mexico City. He imagined a form of crossed double pyramids and for this he was inspired by the pyramids of Tulum and Tatin. This realization of Hernandez is interesting from the mechanical point of view, resistance of materials. In the 36-meter high ground are the stairwell, the elevator, the rooms necessary for supplies. This earth itself constitutes the support for the double pyramids which intersect and are themselves supporting elements. In conclusion, we use forms absolutely not adapted to civilization, linked to other forms only for mechanical, utilitarian and aesthetic reasons while the primordial concern of the ancients, which was that the form be an approach towards the delocalized, is not respected at all. Harmful emissions may appear, as well as harmful states, pollution of the place or of nearby or more distant places, all of this is possible and is completely neglected.

About the Military Academy of Mexico, realized in 400 hectares of terrain, we are far from the notion of sacred place of pre-historic centers like the sacred place of Teotihuacan in which we find large expanses surrounded by mountains and this not for the purpose of a natural defensive wall as I thought and aped the architect by drawing the plans for the Military Academy.

Of course it is not forbidden to copy forms, to impose functionalities on layouts, but above all they must not be justified by a pseudo-attachment to the past (the architect expresses himself: "We are aware of our historical journey. We must break the imbalance that exists between our own sensitivity and the foreign forms that reach us. Mexico has a cultural heritage that we have no right to squander, because the most important thing for a people is to preserve its fundamental characteristics"). By taking up initiatives of forms from the past, we can, as they have not been understood in our modern civilization, generate unexpected phenomena of the kind of transfers with the past, but with deformations such that very harmful states are installed by times and this in an absolutely unpredictable way. The misunderstanding of the achievements of the Ancients is too great to try to use, aping what is left of it even purely for decorative purposes. It is not because architects, for the most part, are devoid of ideas, no longer have inspiration, that they have to gargle with phraseology to justify their mediocrity. When inspiration no longer blows, words do not replace it. Thus triangles, parallelograms, polyhedrons, prisms inscribed in gigantic cubes, succession of pyramidal blocks, use of decorative motifs from Teotihuacan, as well as motifs from the Maya and Toltec civilizations, create a dangerous disorder. And when Hernandez or his admirers and journalists in search of articles speak of the "magical reality of his work", they do not suspect that in these achievements, there is truth in a sense that they do not imagine: magic can appear and where does it lead?... Human beings do much more than they believe when they realize. He must pay attention to this.

With architects who call themselves modern, we find ourselves in a situation where we take a piece of Chartres Cathedral, a piece of the Sainte Chapelle in Paris, a piece of the Arc de Triomphe in Orange, of the Porte de Mycène and the Eiffel Tower, to make a library!

The creative breath is only rarely felt in the minds of our era. The proliferation of research fields and the very large number of researchers in these multiple fields is not an indication of profound creation. Searches and seekers manifest themselves only in the usual C. de C.; many researchers only make fragmentary collections of results without creative power, which rarely lead to a far-reaching discovery. Others have imagination but only extending the rational C. de C., they cannot absorb the thought of the Ancients and some of their works which have come down to us.

: it is presented under a pledge absolutely meaningless where the architect seeks on his drawing board, thanks to the lines, volumes creating impressions of "power", of "dynamism": there the architect thinks of a "parallelepiped sinking into the ground" to "break the imbalance between our sensitivity and the forms that are foreign to us"... By this phraseology, which is only an escape from the prayer of awareness of the lack of deep inspiration, we fill the head of the student in architecture of a pseudo-knowledge which will lead him only to dn.; research at the level of elucubration and will make him completely ignore his creative role.

This architectural work has been considered here as an example; what was made is found almost everywhere in other forms, other styles in other countries, other continents.

An architect can predict a lot about states and eifs on his plans. Knowing the place, with the plans, it is easy for him to foresee according to the forms and the nature of the materials the harmony of what he achieves with the living. A plan must be oriented; note that the geographical orientation can be disturbed by the environment in which the plans, the maps are installed (example: a desk, a table cluttered with various objects, natural or artificial lighting). Paper projects are steeped in the eifs of the workplace; the architect must ignore this and check whether the transfer with the location is correct.

A plan must have enough detail for the transfer to be correct.

A blueprint can be used to rebalance a location

1) Either with a rebalancer put on the plan or associated more generally to the plan. This method only works for a certain time because despite the fact that the rebalancer is not saturated, the plane-rebalancer assembly can behave as if there were a saturation, the transfer no longer takes place from the plane to the place. (Here we become aware of this word transfer which absolutely does not mean passing from one place to another, by a path, but something which enters into the characterization of the first place and

Let's tackle some new concepts before going any further: Let's consider two identical enclosures G_1, G_2 , separated by a corridor H

HG_2

These two enclosures can be made by 2 pieces with rectangular horizontal sections and trapezoidal vertical sections

There is also a skylight in the slope of the roof in each room. These pieces are at the same height from the ground and mounted on stakes; H is a staircase allowing access to the two rooms by symmetrical doors (the rooms being symmetrical with respect to a plan). They are first assumed to be empty . By the lighting, the location etc... we will have an atmosphere in G which will be the same as in G² • We will call "Atmosphere" the atmosphere of G¹, el of G². For the system system G², there will be only one atmosphere which will be at the times in and in G² (entirely) and it will only exist by and G¹ and their positions. The atmosphere is felt only when one is in or G¹, but is not localized; it is not a state. We had already had the eifs; we will see the states; there is also the atmosphere or atmospheres. (The atmosphere is not an impression subjective" since we omitted in our discourse the words objective and subjective for the reasons cited in this connection) . As a special case, G₁ can be considered as a mirror image of G, then G² will be the reflection of G₁. The GG system, and ^atmos - sphere A will be named as a TAG type system (T for transfer - A for atmosphere - G for generation).

likewise, a liquid can have an ext after having put in it a suitably chosen **solid , or one can still make this liquid circulate in a conduit of special shape, and at a certain temperature.**

An oil, whatever the container that contains it, has no ext but Ravatin arrived after various treatments, in particular by charging it with eifs to give it an ext and this for all vegetable oils, natural and even chemically processed. For silicone oils, it is more difficult to make an ext appear. These oils that have an ext have very interesting medicinal properties. In Alchemy, a number of manipulations give exts to treated materials. It is advantageous for obtaining the Stone to start from a material having an ext and to be careful not to make it lose it. Overlaps and equimseys between exts during operations occur. Matter serves as a support for transformations occurring at delocalized stages.

Let's see examples of forms having or without exts and progenitors. :

- The great temple of Deutera (Egypt) has a progenitor and an ext.
- Egyptian cat mummies have ext and progenitor.
- The Temple of Karnak, the Sphinx, the pyramids of Chephren and Mykerinos have ext and progenitor.
- The menhirs and dolmens of Brittany have neither exts nor progenitor, but can have some by rituals; likewise the alignments of Carnac.
- An obelisk has no ext or spawner.
- The Delphi site has progenitor and ext.
- The Temple of Poseidon, the Parthenon alike
- The Stone of the Sun, the quipus have ext and progenitor.
- The Machupichu site in Cuzco has a pure ext and a progenitor.
- Indian tents have an ext and a spawner (attached to those who erect them).
- Michel Ange's painting entitled "The Creation of Man has no ext but has a progenitor (not that of Michel Ange).
- The Mona Lisa, the Last Supper by Leonardo da Vinci have an ext and a progenitor (that of Leonardo da Vinci).
- Castles like that of Azay-le-Rideau (in Touraine) or the castle of Ver sailles have ext and parent. i"")
- The painting: The Starry Night by Van Gogh has no ext but has a parent (not Van Gogh's).

- The paintings of the painter Roland Cat have ext and progenitor (that of the author).
- M. Escher's paintings do not have an ext but a progenitor (that of the author).
- The Victory of Samothrace has an ext and has a parent (that of the sculptor).
- The Venus de Milo, no progenitor, but has an ext (that of the sculptor).
- The complete Temple of Balbeck (Temple of Jupiter) has neither ext nor spawner.
- The so-called Farnese Bull Group has progenitor and ext.
- The Arc de Triomphe at Place de l'Etoile in Paris has neither ext nor parent.
- A church, a cathedral have ext and progenitor (except churches that are too modern).

- The Synagogue of Florence has ext and progenitor.
- The Alhanbra of Granada
- The Omniades Mosque in Damascus
- The Mosque of Cordoba
- The Mosque of Ibn-Toulon
- Christ has a pure ext and a progenitor.
- The Great Buddha of Long-Men
- The Temple of Angkor-Vat
- The Temple of Warriors at Chichen Itza (Yutakan)
- The Temple of the Sun in Palermo
- A piano has no parent or ext.

- A violin has an ext, but in general does not have a progenitor.
- If we take violins like Antonio's
- Stradivari named "Il Cremonese 1715" and that of Andréa Amati "Il Carlo IX di Francia" of 1566, they have ext and parent.
- Savart's trapezoidal violin has neither ext nor progenitor.
- Chanut's violin has an ext and a progenitor.
- Sulcan's fiddle has no ext but has a progenitor.
- A cello has an ext and very often a progenitor, but cellos of average quality do not have an ext. , or a weak ext.
- A string bass has a fairly weak ext but no spawner.
- A clarinet has a weak ext, but no progenitor.
- A saxophone has a very weak ext and no progenitor.
- A slide trombone has neither ext nor progenitor.

- A harp has an ext but no parent.

Nevertheless, among these last four instruments mentioned, there may be some which have different characters.

If we consider the $5 = 4+1$ elements of the Chinese, the last being the aureolar made from the first four, and we apply it to the organs: heart, kidney, lung, liver, spleen; we have :

the aureolar: spleen from (heart, kidney; lung, liver). The halo here seems localized, but it is a delocalized notion attached to the spleen which has neither ext nor progenitor. This point of view on Chinese medicine is interesting because the system (heart, kidney; lung, liver) with an aureolar attached to the spleen, will have a progenitor, which enriches by the possibilities of manipulations with the global.

It was found by Alex-Georges Chéaière and Kabire Fidaali that the Great Wall of China gives an exterior to China, in addition to the defensive character that could be granted to it. Through rituals, emperors and magicians of their courts could act on the outside of the country, which then reflected on the country itself, in different forms depending on the ritual performed.

The progenitor action seems to explain the phenomenon of rotating tables The table at rest constitutes a form F . She has a progenitor $F^\wedge = \text{Gen } F^\wedge$;
 $F^\wedge$ and $F?$ are in equimsey. The people around the table have the well-known (and very poor) model in spiritualism which is that of the spirit of the deceased with whom they believe they communicate. Besides, they can be overlapped by

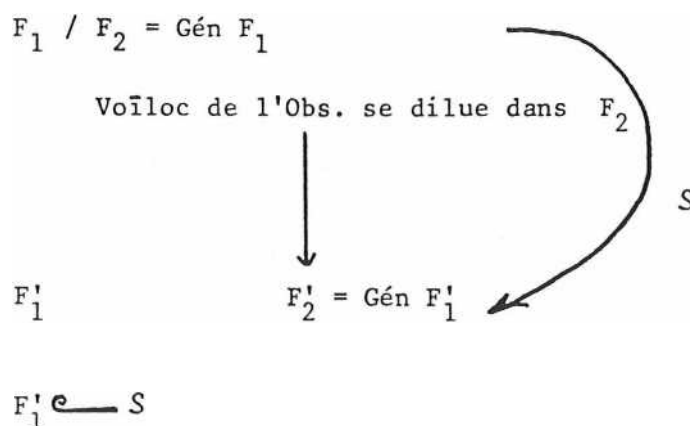

their representation and care must be taken as it may appear a pollution
 tion of the state of a or more persons participating in the session. Suppose
 for simplify that it there is only one person. The voiloc by its anchor
 will receive the model chosen by the experimenter. This voiloc is going to melt
 in $F?$ to give a f), who will be the progenitor of a certain form $F^\wedge$
 and F' $F^\wedge$ is going to be a macron (Table
 not 2 is going to be almost the moving table, we relocating nonstop
 and can be separated from its movement; it is
 and who see her move to tell a story).

Between $F^\wedge$ and $F^\wedge$, there has been some change of state S . F_j will be broken by the Obs. and it will have the unfolding_from_Macron. It will be $F^\wedge Q$.S. The moving table is the result of this process. We have enriched the local a little but in the case of spiritualism this enrichment is quite poor because what is injected into the voiloc of the manipulators is often without value, themselves

having started from the assumption that it is deceased persons who intervene. The best results obtained with this hypothesis, when they occur, and this is rare, are of the same order as those given by the scripto-pendul e. the

scripto-pendule allows you to have answers to questions asked that you do not expect and this quite often. In a certain sense, the scripto-pendulum is more effective than the pendulum. It is a bit, from the point of view of the richness of the answers to the questions asked, an intermediary between the pendulum and the dream, the dream being by far the richest; especially the dream when it presents itself as a dream in the biblical sense of the term.

Summary table: (the bar / will mean here: in equimsey)

Human beings often use what are usually called cultural vehicles (denominated by vehrels). These are legion in our society. He makes them enter by the anchor in his voiloc where there, from the delocalized abstract notion, they can fix themselves on progenitors of forms. We will say no more about this.

Before going further in the field of eifs, we must point out (* (**) (***)) the Od. of Reichenbach, the aura, the so-called Kirlian effect, the Orgone of Reich. The aura and the auras (there are sensitives who manage to see up to seven of them), the Kirlian effect, have been very often presented in multiple books and reviews, which saves us from describing them again. The auras, the Kirlian effect seem like an extension of the local. They are linked to the voiloc of the sensitive.

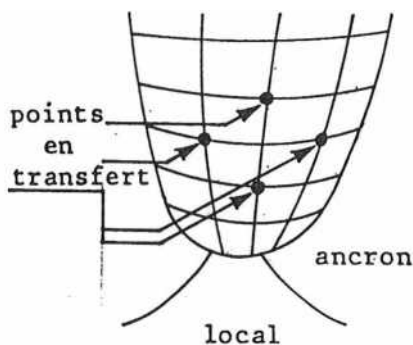

(*) Effect also discovered by the Kirlians because it was first reported by a Frenchman around the 1830s.

(**) Such is the case of Marcel Locquin; this gives him a lot of clues to test and find the states of a living being.

(***) $\mathbb{E}_n$ France Kirlian and most detailed photos were obtained by Georges Hadjo. He goes much further in this area than other researchers, his photos revealing more details of form and the colors being more varied and beautiful. His qualities as an experimenter, the characteristics of his montages are necessary for his success, but his personality intervenes equally

Let's go back a bit to the voiloc. The human being launches his C. de C. at the same time as he gets into it. Take the image of the net thrown by the fisherman. Let us confuse net and fisherman (we will say that we have two confused forms). Launching your C. de C. and getting into it will be two similarly confused actions. But the human being cannot bear such a representation, it is not on his scale, so he sees himself in what he has launched, he does not confuse the two forms. In this case, as he has become aware of the C. of C. which is not rational, he keeps a kind of neighborhood which contains delocalized, $\dots * (*) (**)$,, and this neighborhood is linked by 1 anchor at localized . The voiloc can be

represented by a network of lines

Some points on this network are in transfer (these points are at network nodes).

These points are the ones that will create the marker in the room. We saw previously that the voiloc, is the aureolar of $(\mathcal{A}^{\wedge}ET; ET, r)$ so we were already talking about the frame to define the voiloc and now we seem to obtain the frame from the voiloc; r is the notion of reference while the arrangement of

lie a lot. Regarding the Od., Reichenbach advises to detect it to place oneself in a room in which the light is subdued, to place one's hand opposite the eyes, in distinct vision and to consider the end of the fingers standing out on a dark background arranged a few steps back. People will see it resembling a vibration of warm air, colored sarees. In the - example quoted he gives an argument that it is not the heat of the fingers. What escapes from the hands is communicated to the water, it is different according to the right hand or the left hand. This produces apparent variations in temperature, (apparent, because any measurement with a thermometer, even a sensitive one, gives no variation). Similarly during a chemical reaction, two poles of a magnet, a diapason in vibration, water flowing in tubes, it is possible for a sensitive person to see a light. This can be concentrated at the focus of a lens, reflected by a mirror and there is a polarization effect; on the photographic plate, it will give an image. For the Baron de Reichenbach, for the Colonel de Rochas, it is about the Od- A. de Rochas had arrived by putting a subject, a young painter, in deep hypnosis, to make him execute from nature a series watercolors representing the odic scents as he sees them or thinks he sees them. Reichenbach had also made such attempts.

(*) The ancron is a part of the local on which the local is concentrated but the local is deformed to impregnate the ancron. The anchor is an imprint of the lo-al at the same time that it waters the local by the voiloc.

(**) The fact of seeing in the C. of C. and of forgetting that one launches it, an operation that one cannot imagine, this difference makes it possible to launch the markers in the room.

points in the frame forming the voiloc will make it possible to find a landmark in the room. The notion of marker is necessary to build the voiloc, but the voiloc can generate many markers. The soul, a concept widely used by poets and also in many religions, cannot be placed in the voiloc. It is a halo: (Spirit, Body; Global, Local) has the soul as halo.

The room can be enriched by the voiloc; an observer having enriched it, another can do the same operation, using for example technical objects, to also enrich the room and a new phenomenon will appear:

• • . (*) auras, 1 Kirlian effect

This network structure of the voiloc is found in the networks called "Hartmann" network. This is detected by the form:

made of brass. We can choose another material but to detect this network this shape is important. If we modify it a little, the detection is less clear. It can also be drawn on a cylindrical pendulum. The Hartmann network is made up of roughly rectangular cells (the rectangles can be quite deformed) of 1m80 by 2m in side length. We can eliminate this

(*) In a technical object, the functionalities are first thought out; as previously mentioned, they characterize the shape, nature and location of the parts in the technical object. Another approach is to search for location paths and then you get weird devices that seem to only work with their authors. These devices can work with other people, they can even be reproduced, the main thing is that they have been made at least once but thanks to the process using location paths.

Sensitive crystallization by Rudolph Steiner is thus presented as a support for localization and those who practice it further perfect it, they become sorts of sensitives, because they localize by paths and these paths extend into the crystallization. The paths of location are actually the formation in the veil of points in transfer and the location is done by the ancron. In Alchemy, the appearance of the exts, of the eifs at high levels, allows during the work (the process varies for each alchemist because the Universe is used, but an assembly of forms is not imposed) to adapting to the moment is a bit like the meaning of the expression of the Ancients "Everything is in everything".

We can say that (by the principle of transport of structure) that the functionalities then come to marry the material which is in the course of work.

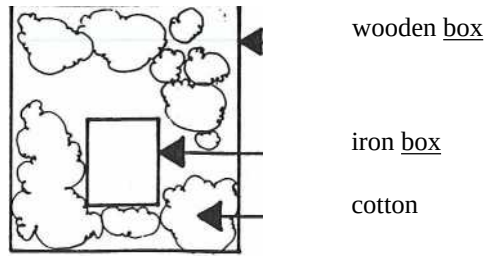

network: researchers from the ARK'ALL Foundation, after mounting a Sprink device (operating with 45 kV to 50 kV of voltage and 42 to 48 pA of intensity) were able to remove the Hartmann network within a radius of 500 m around the device during the operating time of this device. The network reappeared as soon as it was stopped. This network covers the entire Earth.

But there were two other networks found. Among these, Bélizal had found one whose almost rectangular meshes were 4 to 6 m on a side. Another network had its rectangular mesh smaller than that of the Hartmann network. None of these 3 networks is a sub-network of that of Bélizal. Naturally these last two networks are not detected with the previous form. It may even be that other networks can be found: with square or rectangular meshes; one could perhaps have some with triangular or hexagonal meshes (which would correspond to the complete filling of a plane). It would be necessary for that that Voiloc of a person is structured of a network with triangular or hexagonal meshes. Because, it seems, given the multiplicity of these levels, that they are plated by an unconscious representation. Each adapts more or less to what the searcher needs to find. The voiloc receptacle passes into a receptacle on the surface of the earth. Returning to the Hartmann network, it is not exact to say that the emission V , often harmful, appears at the nodes of the network. In the city of Moulin, some were found at almost all the nodes (and certainly not at all) because there were a lot of V_- in the district or districts where the verification was carried out, on the other hand, we can find at places that are not nodes. We fall, during the detection in one of the errors previously indicated where an idea a priori favors a search, but can also lead to errors.

Through the Voiloc the human being locates and afterwards he can use the localized .

With the orgone boxes of W. Reich [35], we notice a variation of temperature between the inside and the outside. Here it is no longer about impressions. (*) as in Reichenbach's experiences. (It was on one of these questions of temperature difference that Reich and Einstein got angry, the experiment carried out in Einstein's apartment not having been carried through to the end by his assistant Leopold Infeld). The fact that the phenomenon becomes perceptible, measurable, means that there has been localization, therefore the appearance of energy.

(*) We also find a temperature variation in the assembly produced by Bélizal, Morel, Chaumery and inspired by the work of Enel on the hollow sphere shape (known as the C-30 bomb) equipped with 1/2 spheres inside and a battery of Alnico magnets oriented east-west.

Orgone box, called "Orgone Accumulator" by Reich.

The Eifs are delocalized whereas the orgone, the Od., the auras, the Kirlian effect are, in part, localized. It is the enrichment of the local. Our civilization is very focused on everything that is visual, but we could just as easily localize effects linked to the other senses of human beings.

We now need another notion, that of Nebular. The Nebularity of a form F is a very partial localization F' attached to an F or (we have a set of forms) which is such that F' is more or less localized with respect to F. The Od. corresponds to a nebula of a shape. In the same way the auras correspond to different nebulae of a human being, which depend on nodes of the network of the veil of the sensitive one. The Orgone is another nebula, itself attached to certain nodes of the experimenter's veil, and chosen by the design of the phenomenon studied.

In the study of poorly localized phenomena, it must be considered that there is an impregnation of the researcher's progenitor by his idea. The state of the experimenter changes; visual, auditory etc. are transformed in such a way as to intervene in the birth of nebulae. This nebula is later detected by other people who imbue their voiloc with what the first experimenter has found. Should we deduce that the nebular did not exist before someone reported it? As a nebular it is true, but the voiloc was a kind of probe which impregnated the global to extract the nebular from it. Here, the researcher becomes more operational than the researcher of the world of technical objects. We should not deduce from the above that we can create any nebular. Everything is linked to a C. de C. The researcher can emerge from this C. de C. and then there he must be very careful; get out of a

(*> Nebular is a word made from nebulosity.

C. de C. leads to the appearance of inconsistency which, it does not appear as a field but as "islands" according to the terminology of Marin de Charette^v without links between them, or else being able to overlap. If the human being is not ready in front of an island of inconsistency or if a kind of C. de C. aping is formed with a system of islands of inconsistency, harmful states for the human being can appear. permeating the observer and those around him and even the devices they manipulate.

Do the Eifs correspond to a nebular? They are a halo: a halo is located at the intuition level to render a notion of depth (and not of dimension) in the delocalized, whereas the nebular corresponds to the notion in the delocalized of envelope and support at the same time. But the eifs, from the moment when the observer makes a classification of them in a given representa-
 tion can be considered as a nebular'. Many researchers who have approached the eifs, had a localized representation, or a more or less clear sensation-in comparison with a physical phenomenon such as of an undulatory nature, or of the propagation of a light ray such as one considers in geometric optics etc..., so they never felt them so. Here the Eifs become the nebula of a halo.

A lot of isolated researchers and remaining isolated all their lives and unknown to everyone, their documents / notebooks, notes, ending up in attics at their death and after being thrown away during family moves, were attracted by the eifs and in gave somewhat similar approaches, at least when it came to classifying them. This comes, as was previously pointed out, from the representation that the researcher gives himself as well as from his tacit knowledge. Some, and this is true for the most part, did not even deal with the notion of state, which we will see later, which led them to a simplistic (but sometimes useful) classification of what they called the "good waves" and the "evil waves", or the "beneficial fluids" and the malefic fluids, if moreover they were impregnated with the language of the spiritualists. (*) (**) (***)

(*) Marin de Charette, Private communication.

(**) For an observer the apostles around Christ constitute a nebular but for him, he projects them mentally on the background which constitutes the human species, they are a halo. Leonardo da Vinci's painting "The Last Supper" renders these nebular and aureolar very well. Teilhard de Chardin's noosphere is a nebula of human thought.

(***) This denomination "good waves" and "bad waves" nevertheless makes it possible to test a place and even to rebalance it. It is a very simplistic description but the dowser can make a representation for himself. It will simply be difficult to transmit. Moreover, it will not adapt to the use of eifs for industrial purposes, for example.

Enel had, after his return from Egypt, around 1928 given a classification; to do this he had created a correspondence between the **visible part** of the electromagnetic spectrum to which he added the infrared and the ultraviolet with the eifs. For him, it wasn't confusing; but essential-
(*) . . .

related to colors. He could have chosen a completely different scale. Himself i in acids and bases: thus we find:
moreover classified them as

Red R	\	
Orange O		
Yellow Y	\	so-called acid-positive colors
Infrared IR		
Black N	?	

and

Blue B1		
Indigo I		
Violet Vi		so-called negative colors in basics
Ultraviolet U-Vi		
White R _c		

He found a correspondence between the "colors" and the various elements of nature and the organs of the human body. He used this correspondence to heal and had spectacular results. He summarized this in his works, we will not develop them further.

On the other hand, these correspondences are interesting because they bring together the fact that from the moment when we look for a correspondence, in an unexpressed way, we place two sets and the ordered set of emissions in "view" (because we can place them on a circle or a straight line), in this delocalized domain of the eifs, flattened on that of the organs for example, entails an operativity on the elements of all the organs.

Enel could have chosen another scale, for example, electric voltages, electric or magnetic field intensities,... and on certain divisions of the dial say, I have an emission every 15 volts, every 5 amps, every 10 gauss etc... Bovis and Simonetton have also built devices that supposedly measure the wavelength of the human being in ang-

(*) Enel had realized that the "emissions" were not electromagnetic waves, whereas some who followed him did not have his lucidity, as we have already pointed out.

(**) Colonel de Rochas seems to have discovered 2 of them, one blue and one red, but he is not sure that they were eifs. To work on these eifs it is good to have a transmitter tray. These are made by researchers from the ARKOLOGY group; they can be obtained at the address given at the end of the book. These trays are circular or square; squares are more stable.

We did not talk about green in the list given by Enel; he had noticed that the green was simultaneously positive and negative and he put another green, which some called gray because placed between the white and the black, and which I named negative green. It is this negative green which mummifies the meat, the fish ; it stops decomposition and kills all microbial life. It is found in the great pyramid of Cheops and in the statues of Easter Island.

But the work continued and Bélizal, Chaumery, Morel, the Servranks Lafforest brothers, La Foÿe built multitransmitting devices, most of them described in the references cited above. The spectrum found by Enel and which was continuous since it took into account the emissions between the colors, was extended in its discrete part composed of the emissions called "colors". This first spectrum was called undifferentiated compared to the so-called differentiated spectrum which included a so-called "magnetic" part and another called "electric" part, and this was wrong for these denominations. Hereafter we will keep only M for magnetic and E for electric and will quote them only as emissions of type M or E. The spectrum of "colors" has been separated into two, now called differentiated spectrum. All the emissions in the differentiated spectrum will be those of the undifferentiated spectrum but they will also be either of the M type or of the E type, and this whether this spectrum is continuous or discrete.

and similarly replacing M by E .

The so-called negative green is most often $V_{\sim}$.

(XI

Eifs can be either type-neutral or M-type or E-type.

But have we exhausted everything? It seems not, because Morel and Chaisemartin had foreseen what they had named vertical emissions and which they detected with the so-called fictitious cone pendulum. On the other hand, La Foÿe does not use. (*) ** (***) knows that the discrete color spectra, undifferentiated or differentiated Tests using these spectra or the continuous spectra may very well not give the same results which seems obvious a priori in the sense usual physical measurements but in the domain of detection by pendulum or rod, as we have already pointed out, as everything depends on the representation, we cannot say that the discrete point of view will be less precise than the continuous point of view . There will be no Gaussian, nor will there be a sharp function at the points of the continuous spectrum for the points of the discrete spectrum. The results may be similar or completely different; we repeat it again: everything depends on the representation of the researcher. Other isolated researchers arrived at completely different classifications adapted more or less well to the domains they wanted to tackle: either illnesses or the search for harmful places, for example. The classifications given to the eifs are somewhat equivalent to the different phenomena: auras, od, orgone, Kirlian effect. According to what the Obs. puts as concepts in his model, he recovers a phenomenon.

The eifs are more fundamental than the auras, the orgone, the od, the Kirlian effect because each time we have these manifestations, the eifs are detectable but the converse is not true. The form **is rich** in potentialities of expression and the discoveries of Reichenbach, Reich, the multiple researchers of the Kirlian effect, of auras have extirpated some of them but there are certainly others.

Researchers from the Totaris Association (core of the ARK'ALL Foundation) followed the classification given by Enel and extended by Bélizal, Chaumery, Morel, Lafforest, La Foÿe).

(*) This does not mean that they are both type M and type E.

(**) We will subsequently name the eifs of the discrete or continuous differentiated or undifferentiated spectra: eifs of the BCM level in memory of Bélizal, Chaumery, Morel.

(***) Jacques La Maya in [36] also adopted this classification. He simplified it a little by using the denominations: "good waves" "bad waves"

fields of Taofel.' These appeared during work on the device imagined by Léon Sprink [37] using an electric field between four electrodes arranged symmetrically inside a polygonal wooden shape; cross-corruption should occur when the unit is functioning properly. And at the point of intersection of the two coronas, a hearth of eifs forms, but not immediately after energization (which can range from 50 kV to 300 kV and ijerne 600 kV). As Ravatin described it in [25] following a personal remark

nelle, immediately after the setting in tension	on, appears a fort	V_w and the spectrum
continuous M extends on both sides	from until V^*	M ; then appears
the UVi [^] ; this continuous spectrum as well as	the UVi [^] hold for about three	

fifteen minutes. There appears a new phenomenon which Ravatin has named effon
drement, a notion he had created to explain the transition from a technical object to a Phenist object by what he called
"collapse of functionality [24]

and this next to the image of the phoenix which dies and is reborn from its ashes. Thus, in the case of the experiment on
a Sprink device mounted by Ravatin and D. and S. Franeric, the usual eifs disappeared for a few minutes and are

(*)

appearance of other eifs named Fields of Taofel The fields of Taofel are classified since there is in our tacit knowledge
the notion of value. And

it seems after discussion with Chaisemartin that the first fields of Taofel are the "vertical" emissions that Morel and
Chaisemartin had anticipated. Sprink's device gives a collapse but there could be others between different eifs of the
level we named BCM Have we exhausted everything? We will see that we are still far from it. It is not a question of
making a systematic classification as in the case of a herbarium, but it is useful to have scales of values in this field of
the delocalized. In the realm of eifs, mirrors are very important. A mirror, close to an emitting shape can completely
change the eifs and even change the state. There are devices, called atmosphere rebalancers, which placed in front of a
mirror start emitting harmful emissions, or no longer even play their role of rebalancing, or even worse, create harmful
states. This is because the designers are not competent enough in the area we are developing here, or even some are
absolutely incompetent. Mirrors can be flat, concave or convex. We must now consider several points of view: either
the form in front of the mirror, therefore form and mirror, or the form, the mirror and its

(*) Taofel: word created by J. Ravatin from the words: Tolerance, collapse , sprawl.

image, or the image of the shape. The eifs will be different depending on the representation chosen.

From the notion in the usual C. of C. of the image of an object in a plane mirror, by the principle of transport of coherence, let us apply it to numbers. We will thus have 1 image of a number. If n is the number, we will designate its image by n and we will thus have the numbers bars". The numbers crossed out are useful for classifying the fields of Taofel.

first field is 1 < -----1 1 , i.e. 1 in dyna duality
mic with 1, which can be marked on a cylindrical pendulum. Likewise he comes

2 i --J
3 . --<3
and after it's 4 i -----' 4
5 to --4 5
etc... up to 28 i ----1 28

But the concept of field of Taofel starts to flee and one designates what comes after by

CO | 4 00

where the sign [∞] (the infinity of the usual numbers) is crossed out here. This sign ⁰⁰ corresponds to a decalar ; there is therefore a decalaire for the fields of Taofel. This decalar is no longer a Taofel field, it simply indicates that the concept flees in the sense that we saw it previously ^k.

Have we exhausted all the fields of Taofel? It seems not!

(*) The sign " [∞] curve
which must

corresponds to the so-called "Oval Cassini" curve. It's this being
drawn if you want an answer to décalaire.

THE LOCAL AND THE GLOBAL

PART II

Designed by

(France)

Let's go back to the study of a house on a plan by an architect (who is therefore an Obs.):

We have 2 systems:

System 1 : the flat place

to which the $G^\wedge$ refers

goes thanks to the Obs. be confused with the

$Z \pm \setminus$

System 2 : (TAG)

The action of confusing will be the transference; the atmosphere will appear as soon as system 2 is applied to system 1; it is a particular case of transfer that we have tried to make felt here. In other cases, it will be explained - otherwise, up to the banal case where there is an exchange from one point to another with

a trajectory or not. If we have the trajectory, it will be very ordinary! In assembly such as TAG, a person P a placing himself in $G^\wedge$ can act on person $P^\wedge$ such that he puts himself at a certain place of and $P^\wedge$ same place a in $G^\wedge$ (symmetrical place in the symmetry existing between

to

G2

(*) Systems (1) and (2) behave like 2 forms. These two forms will be confused. Thus the concept of {TAG as a form} applied to the system {place to which the plan relates} creates an atmosphere which is that of the {{plan and its vicinity} and of the place}; another TAG was thus constructed. The symmetry is not respected. We talk about it further.

One can wonder what makes a TAG work, that is to say a system of 2 identical pieces symmetrical with respect to a plane and with an atmosphere (the place on which the two pieces are installed, the moment in the day, the evening or the night, are favoring to have the atmosphere). In $G^\wedge$ at a certain place appears not a shifter but a channel. One could also obtain effects with two pieces $G|$ and $G2$ symmetrical except for a certain detail (the shape defect $G\%$ for a detail is not symmetrical to $G^\wedge$) and this without atmosphere. It is also interesting to use two for my $F|$ and $F2$, F_2 almost identical to $F^\wedge$ except for one detail. This leads to intense relocations (any detail does not lead to success).

and $G^\wedge$). We will not develop here any more this approach which can go further than cranial osteopathy. (It should be noted that such a TAG assembly is tricky to achieve). The architect, the dowser, when they work on a plan ignore all of this mental process, but the TAG concept is in the tacit knowledge of every human being. In the usual C. de C. the concept of a TAG-like system does not exist. It is a structure that belongs to the other

C. of C.

Let's look at a phenomenon that is often discussed in parapsychology: the appearances of the dying to the living. Camille Flammarion has devoted an entire book to this subject, which will save us from citing anecdotes which are numerous in his work and which can be consulted for further information [13].

A distant person either from another or $P?$ ($P?$ in the process of dying- jj therefore having no rational place with her, (but these two people being often linked by a feeling of love or a deep friendship) has a very clear contact with the dying person at the very hour of his death. Contact is a vision, there

sometimes has words heard and animals present react (so it is not not a psychological phenomenon). The person $P^\wedge$ is in a certain environment $G^\wedge$ (for example his room), and the dying person $P^\wedge$ in an environment $G^\wedge$. If the atmosphere in $G^\wedge$ is the same as in $G?$ then, we have a TAG system. For P , there are $G^\wedge$ and $G^\wedge$ sharply separated; from the fact that $P^\wedge$ feels the atmosphere A , which, it has the property of being detectable both in $G^\wedge$ and both in while being delocalized, $P^\wedge$ will confuse in its representation $G^\wedge$ and and this for a little while. It is often at the moment of a state of death for the person in G^2 that the TAG type system arises but therefore very little time because for the creation of A , P , and P are necessary and at the moment of death of $P^\sim$ the state of $P_{,,}$ is

1 2 zz —
 puts to change (death is a change of state for the one who assumes it; it is death only for the others. The notion of death of a living being is only a question of observer). From the escape of the state of $P^\wedge >$ there is put in place a system $G^\wedge$, $G^\wedge$ and A with $P^\wedge$ in $G^\wedge$ and P^2 in $G^\wedge$ which have fairly precise positions; if these are not respected, it does not happen

nothing and third parties can be found in view. But if an animal is close enough to will have a sensation of an unusual phenomenon

$G^\wedge$ or close to $G^\wedge$ and nothing P and in a good position it because thanks to $P^\wedge$ in $G^\wedge$ with A

■ G_Q is partly present in $G^\wedge$; it will be P_2 or part of P_2

Let us complete this paragraph: it would be incorrect to say that A is identical

tick in $G^\wedge$ and in $G^\vee$. We detect A in $G^\wedge$, we detect A in $G^\vee$; is delocalized. A is the atmosphere of $G^\wedge$; it is also the atmosphere of G_2 but A in G_2 , it is localized. A behaves as a channel of $G^\vee$ to $G^\wedge$. Between $G^\wedge$ and $G^\vee$ there is no dynamic duality, no overlapping, no equilibrium.

We have seen that to have a TAG, it is symmetrical with $G^\wedge$ and $G^\vee$ must at least ask themselves what becomes of it with respect to a plane. We can see the symmetry when $P^\wedge$ is situated for example in France and P_2 in Asia, on a village a hospital bed, in a room G_2 .

$G^\wedge$ and $G^\vee$ are obviously not symmetrical with respect to a plane. Is the condition of symmetry essential?

It needs to be replaced by something else. In general there is a strong sentimental bond between P_1 and P_2 .

Thus the system 1 ($P^\wedge$ in $G^\wedge$) and P_2 in $G^\vee$ are connected by a feeling or memories.

It goes, thanks to P Obs. be confused with the abstract concept of {TAG} system 2. This will create an atmosphere which is that of the TAG: (P in G_1 ; P_2 in G_2). This two-phase approach avoids symmetry. If we want an operational TAG directly, we need symmetry.

of death twenty-four hours after death, even several days or more, could also be envisaged.

weeks or months. Manifestations are rarer when it comes to years.

Also involved in these phenomena are reciprocal oaths, promises, commitments with the future deceased [2]. In these cases, the TAG is insufficient.

trying to explain them.

As far as the Eifs are concerned, we found those at the BCM level, then the Taofel fields. Have we exhausted everything by choosing this approach (because as we have pointed out many researchers have each created their own system with which they manage very well). The classification developed by Enel seems satisfactory and the C. de T. are easily formed (the first one) by collapse. We could have obtained other effondrements in the continuous spectrum and would have appeared other C. of T. which, one

(*) Often the "TAG" will not be symmetrical. We will still use some of them with success. This is the case of the TAG associated with the construction plan, when the plan relates to the construction; the draughtsman, the architect when they make the outline on plans of the construction create an atmosphere on the two, which makes that with the pendulum, one can work on plan like on the place; it is good that the plan is oriented; this orientation is to be found sometimes with a pendulum because the plan is in a room where there are objects which can disturb the atmosphere of the TAG.

We have already seen in a footnote of the previous chapter and [34] and this thanks to a rebalancer associated with the plan, that we could rebalance a place, but it is tricky. On the other hand, we can detect on the plane eifs and states of the place and afterwards, if the ground is harmful, put forms in place which eliminate the harmfulness; if the house is not yet built, it is a good idea to modify the plans (for example: angles of the roofs, position of the chimneys, shape of the rooms, coating of the walls, ventilation of the cellars - it is necessary to avoid enclosed masses of air - , transmitters of electromagnetic waves that are too close, transformers that distribute 320 Volts and 220 Volts in towns and countryside, for industrial and domestic use, etc.). It is often reported that above closed wells, harmful eifs are detected. This is often true and La Foÿe and Philippe insisted on this point .

Nevertheless,
during work on a house in Essone (this house was built on a blocked well in which there was still a little water) no harmful eif was detectable in its vicinity; the shape of the house intervened to neutralize in this case.

As we have already pointed out, when you can avoid rebalancers, you should do so. Unfortunately, houses have already been built and we can no longer touch much and it happens that anomalies appear long after construction by transfers with other places which have changed for multiple causes, or because in the house objects in noxious states have been confined or even inhabitants come and bring with them deplorable states. Often in these cases, the rebalancers, even if they are transmitters ,
are useless

can assume, would be expressed by dynamic dualities between digits and crossed out digits or between equimseys (eg: 1/1, etd...). Have we exhausted everything ? He does not seem; because one can find by working on old Sanskrit, an eif which corresponds to Verb Créateur. And what is curious with it is that with an adequate choice of forms, one can obtain all the other eifs whether at the BCM level or whether they are C. de T. It can, cel the latter also generate eifs called by the person who detected them.

P. de Montgrand, mass emissions - (they seem to be linked to the mass of the objects more than to their shape - the orientation of the object and its environment matter a lot). They are detected associated with rather shapeless stones or geometrically simple shapes. Note that the eifs of the BCM level, or the C. of T. are linked to the shape, but also to the mass, but here it is necessary to follow

the mindset of those who have approached this field. Either they became attached to the form and then thought of little by little that the mass "Form Waves " while realizing also intervened. From a concept that seemed to them fundamentally linked to the form, they took into account the mass, the nature of material, of the orientation of the shape in space, of the environment, etc. either, and Montgrand is perhaps the only one, one can focus on the concept of mass, in which case he has been led to focus on the orientation of the form in space, on the environment of the form sometimes ; we could just as well have focused on the concept of sound without worrying about any transmitter; besides some thought of, what they called "sound waves" as there were the "waves of form or the "waves of mass". There was never a description of the "waves of sound" Enel had "Mass Emissions", Keely, "Ethereic" Force, Moray, "Radiant Energy",... Lakhovsky, "Universion" [3], and we could certainly find others. by rummaging through attics or libraries in search of forgotten documents. Eifs can be detected on the devices of Sprink, Keely, Moray, Lakhovsky... In the case of Sprink, " Emissions of Mass". (Sprink's "Mass Emissions" not necessarily being the same as Montgrand's "Mass Emissions"). It will be admitted here that the eifs and the "Mass Emissions" are different .*)

(*) In the case of the apparatuses of Moray, Keely, Lakhovsky, the search for "mass emissions " has not been attempted, although their search does not present any difficulty. Grammatically, it would be more correct to replace the term "mass emissions" with "mass emissions". In the case of the Sprink device, only the eifs which are at the BCM and C. de T level were really sought. Regarding "Emissions due to sound" we insist on the fact that we would have had a classification that would have appeared from the moment sounds are used first. Afterwards, the extension of the results can be undertaken.

The feeling always with a localized tendency that the operator uses means that there are regions where the eifs are detected and regions where the "Mass Emissions" are detected. Between 2 large pebbles, oriented, sometimes several kilometers or several tens of kilometers apart, we will find a whole path of Mass Emissions [4] while we will not detect anything from the eif point of view. It was even detected "emissions of Massé' over thousands of kilometers).

Researchers from the ARK'ALL foundation thought they had found what they called "emissions due to movement" or "dynamic emissions" or (* *) displacement emissions". These conclusions were presented in [5] Turenne les first reported and called them "movement waves" [6] Lafforest reports them in [7] as "dynamic waves".

Consider a shape that we put in rotation. Let us take for example a torus which one throws in motion around an axis perpendicular to its own: for example a wooden ring placed in a centrifuge. To wedge the ring well and not break the symmetry completely, we put 4 of these rings cornered to each other, 2 by 2, tangentially. The rotor was surmounted by a winding of copper wire, which was connected to another copper wire itself surmounted by a series of horseshoe magnets whose role was to amplify the eifs leaving through the wire of copper when the rotor was stationary. Here the rotor is set in motion by an electric motor. At a certain speed, new "emissions" appear. They can be detected later on fixed forms such as the labyrinth of Chartres Cathedral; this form makes it possible to generate all "emissions".

Ravatin had given the following classification for "Travel Emissions" :

states to forms; but the eifs of the BCM level will probably not be found, because everything depends on the classification of what was found from the sound. Regarding the colors, from these we find the eifs of the BCM level. It is from the colors that Belizal-Chaumery relied on the work of Enel.

(*) The expression "dynamic emissions" was given by Jean-Christian So'énen, because he imagined that these "emissions" were generated by the caduceus (in the shape of a volume but not in a flat shape).

These "emissions" $T, R^{\wedge}$, require certain speeds to be detected. For example, we detect them at the exit of a barrel of an assault tank when the shell exits and on a certain route of the shell, but if the assault tank moves without firing there is none. has not; the speed is not great enough in the case of this mobile. Do you necessarily need a high speed to detect them? No, since fixed forms like the labyrinth of Chartres Cathedral can generate them.

- 1) those due to translation (T)
- 2) those due to rotation (R) which are subdivided into three types:

Rotate at	left (R_0)
	Rotate right ($R^\wedge$)

and on the pendulum appears a response to a third rotation that apparently did not meanless as a movement and which was named by Ravatin, neutral rotation $(R^\wedge) \cdot \wedge a R^\wedge$ seems to be related to inertia. It is detected when starting an airplane on an aerodrome where there is, for example, V . It is much less accentuated during landing, even if there is $V_{,,}$. La Foÿe had been made aware of these "emissions" $T, R^\wedge, R^\wedge, R^\wedge$. For him, it was a matter of eifs with which the life node was associated and the life node would have produced a dynamization. In this case, La Foÿe not wanting to extend what there was at the BCM level; found with its classification and its symbols which constitute a whole, a characterization, since there is something to detect and which, from what it has been signaled previously, in the by pendulum, can be found in a whole E what we are lo unconscious way it is assumed to be in this set that is the response.

previously, in the search

These “displacement emissions” are not Taofel fields.

The shape $\backslash$ (we mark one of the vertices with a $\text{''' f } (*)$ oriented in such a way that the axis y is oriented to the north of form (on the figure the shape north at the top). We then have the “emission” T $\cdot (**)$. With the pointed shape at the following corners

Before going any further, consider the curve defined mathematically by the equation of trajectories orthogonal to circumferences of constant radius whose center moves on an axis $x'x$. If we rotate this curve

(**) One way to impose shape north on a plane figure is to put 2 dots, one black, and one white following the diagram below. If you are not @ on a flat surface, you cannot do so.

Figure 1: At the surface of the ground, we are in the approximation of the tangent plane.

(which is formed of 2 symmetrical parts around $x'x$ called tractrices) around $x'x$, we obtain a surface called pseudo-sphere. This curve is therefore a section of this pseudo-sphere by a plane containing the axis $x'x$. (We agree to call the entire curve tractrix).

Let us carry the tractrix on a cylindrical pendulum and test above the shape seen previously pointed or not. There's no answer; but if one directs the left hand over this shape by placing the thumb on the folded little finger, one detects the tractrix.

So what we had called Displacement Emissions looks like BCM level eifs to which is associated an additional character which is given by the tractrix.

T , H_p , R_g , R^j are not eifs but are what we will call "eifs envelopes". There are therefore four types of envelopes. In summary: the tractor allows you to see if there are envelopes on BCM level eifs. To detect the tractrix, one may need an artifice (the thumb on the little finger). On a form like the one given previously, pointed or not, we can only detect the envelopes and to have the eifs, we must use an artifice.

An important notion in the field of eifs is that of state. We will first start from the notion of state perfectly well defined in mechanics for a system of n moving particles. The state is a point in phase space. The possible positions of this point in this space will represent the possible states of the system. Let us now use the principle of transport of coherence: and let us immerse this state in the domain of the eifs, that is to say in the other C . of C . that we have previously presented. We will thus have obtained the concept of state of an eif and state of a shape. The states will be detected by pendulum, rod or sensations. On the clocks we are going to put signs. Following La Foÿe, we will begin with the Hebrew square. La Foÿe was put on this path [8] by Bardet [9] • now square Hebrew has been used for a long time for the construction of talismans, pentacles, tarot decks; we will not quote 'all the references which relate to books of magic, but in Enel [10] we will have a good outline of this manipulation of the Hebrew square.

One could consider other alphabets, other signs; Sanskrit for example, but Sanskrit has become more deformed over the centuries than Hebrew; or again the Enochian language of John Dee [11], or fabricated signs $\vee$ (*) The tables constructed by J. Dee can only be used at a given time and by J. Dee himself or perhaps Kelly, the one who assisted him in his operations. If we want to take them for research, we have to modify them.

by each operator but then in this case, it is possible that one arrives at conclusions which. can only be used by the person who created them, and which are therefore difficult to transmit. Certain Hebrew words to characterize states are not spelled quite correctly (e.g. Bardet found KShPh for magic). It should not be forgotten that these states corresponded to notions that were accessible to the Egyptians and Hebrews 3500 years ago; concepts from one civilization are not necessarily affordable in another. signs _

allow access to forgotten concepts, but it may happen that they have to be modified (for example permutation of letters, or deformation of letters as in the case of the Hebrew Shin which must be pointed in the middle then ז , "T" $\wedge$ whether it is used either unpointed or pointed right or left) / ⁷

Is the KShPh used to characterize any effect of magic? That a phenomenon is in KShPh state means that this phenomenon is not in a C. of C. for the Obs.-human being. It may not be in a C. of C., either because the human being does not have enough knowledge about the phenomenon in question and so it does not seem coherent to him, or because this phenomenon is not on a human scale. In the second case the KShPh will be very bad; there will be more the reversed shin and even shatam and shadaim which, in square Hebrew, will reinforce this satanic side of the state of the phenomenon. These states can in certain cases give rise to localizations (which if they are tested will have all the characteristics of or states); it will then be seen the Luciferian descriptions reported in the great religions and in the folklore of the peoples; these descriptions have the same states for any human being regardless of their origin. When the KShPh is found, there is an inconsistency; if it can be mastered (for example by providing new knowledge which can make it coherent) it is not too dangerous, but if it cannot be mastered (either because the attempted approach does not is not sufficient to make the phenomenon coherent, (£ &) or because it is totally incoherent on a human scale, it must be avoided. (*) (**)

(*) Square Hebrew can be used without permutation of letter. Another modification must be made; we will not present this process here.

(**) One could think of using the entities which one finds in the religions supplanting the human being, to be able to handle this inconsistency without danger. It should not be forgotten that these entities correspond to scales of value thought and launched by the human being, which made it possible to create enels. Overlaps by these coils or equimseys are possible between them and the operator. They can preserve him from harmful states, but he is not at all sure that he is able to work with the inconsistency.

Some violins, placed on a table, respond to KShPh when they are
 • (* (**)) in a certain direction, for example east-west (the neck is in the east and the table in the west). If we remove the soul of the violin^J they no longer respond to this state whatever the direction. When they are played they generally no longer respond, but when the instrumentalist plays the instrument and holds it in such a way that we have the preferred direction mentioned above, (***) the instrumentalist-instrument ensemble responds to KShPh

For some violins, the fact of being oriented in a privileged direction puts them in an incoherence.

Not all states of the magic genre will be K Sh Ph

You can find something like this: K.Sh.Ph.

and genre: KoShoPho

K.Sh.Ph, or KoShoPho states are not unique in their kind, there are families of both types; there is a leakage of the notion of state in these two cases.

There is also a «K Sh Ph<; it is a magic found by testing the Yin Yang. And there are still other states!

In the case of living things, plants, animals and humans, we find what La Foÿe called: field_vitale The vital field has four components that we detect directly or with artifice. The four components are written:

. There is also the right Shin pointed in the middle, vertical to the living being.

Every living thing must have a vital field. It may not be found, this is often a sign of poor health or coma in a human being. In the case of a cancer patient very often the vital field begins to “turn” clockwise and can reach 180° from its - initial position where it stabilizes until death. When a living being dies, the vital field disappears . It can rotate' it follows rotational movements

'(-*) Paganini's Guarnerius violin had this property. Note that average student violins also have this property.

(**) Note by F. Saison.

(***) When Paganini played his instrument, the Paganini-his Guarnerius ensemble responded to KShPh regardless of direction.

(****) This is not a criterion for clinical death, because as we have indicated, it can disappear before this same clinical death. La Foÿe had found that a living human being has the knot of life at the left-handed temple and that for a dead person it is detected above the mouth. He had noticed that in very special cases it could appear all over the face (for some mystics) or on people praying intensely.

Note first of all that placing the knot of life at the left temple for a living human being and at the mouth for a dead one is a bit too systematic. In addition, in the case where these positions of the life node are respected, the transition from the living state to that of death, upon detection, cannot be confused with that given by clinical death. If we send eifs with high C. de T. from a form which will be described later called barred form (others could be used), on a dying person, he begins to take these eifs and his vital field which becomes weak at this moment is clearly detected. But even after the knot of life has been detected on the mouth, by this process it can be replaced on the left temple: life does not return for all that. We are simply delaying certain processes that take place at the level of the eifs.

of the head and with a certain delay if these movements are sudden; a dancer turning on tiptoe catches up with her vital field in her rotation, but the latter regains its stability as soon as she freezes.

In the case of a plant, the vital field is quite fixed. With an artifice, as we have pointed out, it is detected. By appropriate forms, put around a tree or against it, one can make his vital field rotate, but if there are other trees close to him, a kind of sympathy will occur and the "vital fields" neighboring trees will turn slightly to put back in place that of the tree on which the experiment is carried out. So you have to be very careful: very powerful transfers can occur. It can even happen that the affected plant causes the experimenter(s) who disturbed it to pass into the KShPh state with reversed shin.

A crystal has no vital field; you can put one on it, but again you have to handle it with great care.

La Foÿe had posed several areas (levels where we work):

the spiritual: RWcH

the vital: LNPhShcHYH

physical: HhARTs

They are not eifs, nor states, nor atmospheres, they are therefore what one could call levels. This stems from the distinction between inanimate (physical) substance - a commonly accepted scale of values.

Ç living plant or animal (vital) and life (
the living or dead human being (spiritual

From this it is confirmed that man has something more than animal and plant?! Quick and easy conclusion! The RWcH level, as pointed out by J. de la Foÿe [12] risks saturating the devices transmitting eifs, disturbing the detections (reduction in the precision of the eifs). level of being master of eifs and status detections. The classification into levels will undoubtedly lead to intermediate cases, especially if one has the usual notions of inanimate, living and psychic as an ulterior motive. You have to stick (*)

(*) La Foÿe gives the example of the detection of V_M at the RWcH level which, at the level of the needle of the transmitter disc, gives a very close to the axis of the needle, but on both sides. We find in the axis the emission of YHWH with the unpointed Waw.

only as mentioned above in the answers with these different clocks without using images belonging to our civilization or tacit knowledge. A pet of a human being and when that human being treats it as an equal, responds to RWcH as a level. Naturally there can be a very strong transfer between the animal and its master, or even the love of two living beings, the animal and the man, creates a common state. (It should not be said that the animal has arrived at the level of man; the comparison between man and animal is unfortunately too usual a view). In general the animal does not need the RWcH level. Avoid combining HhARTs, LNPhShcHYH and RWcH in ascending order. (The notion of level makes one think of an order relation).

Note that if we test for example a plant, a human being, we will not have a response to the corresponding levels, but these are levels which are respectively accessible to them and which are generally outside of them. It is an equivalence. We will therefore call them levels_of equivalence.

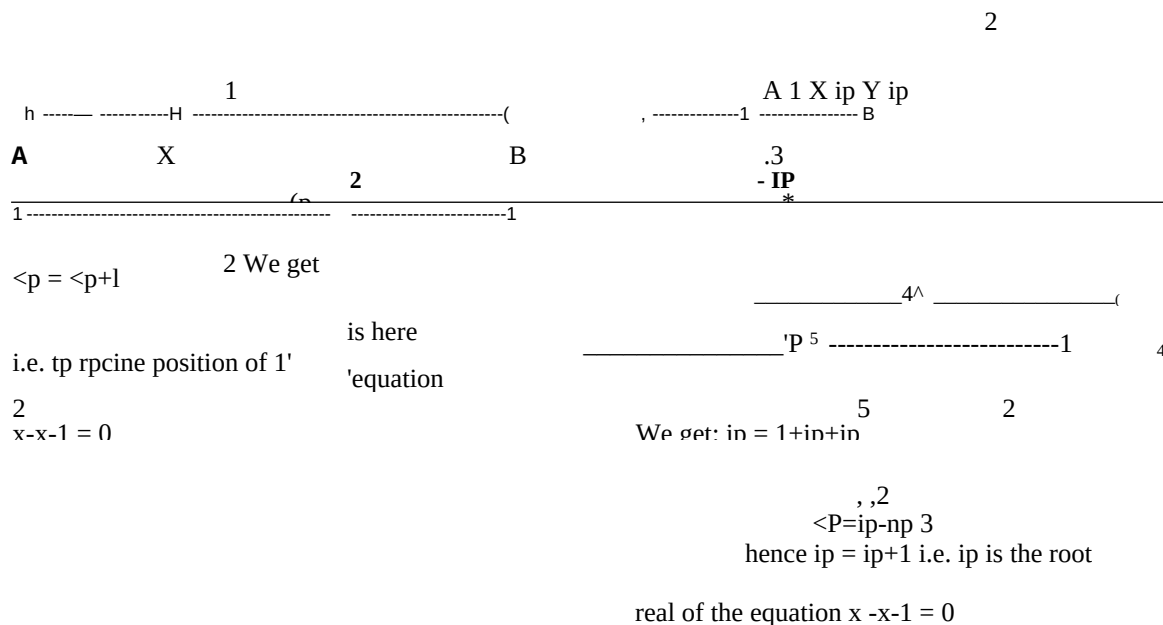

A form that emits at all three levels is in the KShPh state, but the converse is not true. It would therefore seem that when one has life and one is at the levels of equivalence one is in incoherence. It is indeed an inconsistency . This inconsistency is either due to the fact that we are not yet ready to tackle the phenomena that arise, or because these phenomena are not on a human scale (that is to say that for being human, it is complete absurdity).

A planar form that operates at the RWcH equivalence level is the regular star pentagon [8].

Triangles in general respond to KShPh, but as La Foÿe had verified, the right triangle with sides 3-4-5 does not respond to KShPh. He thought there was only this one. But there are others: not all right-angled triangles with integer-valued sides correspond to KShPh. And there are others! To present these other triangles we need a result discovered in 1924 by the engineer Gérard Cordonnier: it is a number generalizing the ^çjmultiple properties of the golden number ϕ , and this number was called by his discoverer : Radiant and written number. Now consider a segment AB. (*)

(*) Many dogs are only the projection of the capricious representation of their master. Then they will never respond to RWcH. The same goes for small "apartment" dogs that become animal antics.

A simple definition of the Golden ratio (ϕ) is: find between points A and B, a point X such that the three segments thus determined are in geometric progression. We will take $AX = 1$. The extension giving rise to the radiant number ip consists in seeking not a point X but two X and Y such that the six segments are in geometric progression. We will take $AX = 1$

Cordonnier sought to generalize by making families of progression, corresponding to the placement of points X,Y,Z,T... between A and B. Then he realized that it is no longer possible to place all the additional segments on the same progression as that of the first segments. Thus "the progression with the 6 segments for obtaining the number ip presents the maximum of perfection in manifestations of arithmetic properties on a z (*) geometric progression".

(*) Gérard Cordonnier has often presented his results on the radiant number ip during conferences. He even had a mystical view of the properties of this number and the figures possessing it in their structure, but we will not talk about it here. His first conferences relating to the Radiant number take place in the years 1934. Within the framework of the TOTARIS Association and the ARK'ALL Foundation, ip was presented to researchers at the second ARK'ALL Symposium which was held in Tours in 1975.

Let us point out for the record that G. Cordonnier was still interested in the stigmatized in Europe at a young age: he went to see them, observed them attentively, photographed them at different times. This is how he got to know Thérèse Neuman, Padre Pio, ... Before his death, he had begun to put together a book: "Beyond the Golden Number... the - Radiant Name ". Unfortunately his death in July 1972 prevented the release of the 3 volumes planned by him. Perhaps the first will be set up by his family and friends?

The approximate value of ϕ is 1.618; that of ϕ^{-1} is 0.618,...

Much has been written about the Golden Ratio; we refer the works to the multip. ϕ can be obtained from a sequence known as the Fibonacci sequence (Multiple properties of this sequence can be found in the small work by N. Vorobiev [12]).

To do this, we start from 1. We take this 1 and add it to the previous one, i.e. $1 + 1 = 2$, and we always add to the previous number to obtain the new number of the sequence. Write this sequence of numbers twice as follows:

1-1-2-3-5-8-13-21...

1 1 2-3-5-8-13 ...

Let's make the ratios between corresponding numbers on the same vertical. This , $\frac{21}{13}, \frac{13}{8}, \frac{8}{5}, \frac{5}{3}$

gives

$\frac{21}{13}, \frac{13}{8}, \frac{8}{5}, \frac{5}{3}, \dots$

it is the sequence drawn from that of Fibonacci. Its limit is ϕ .

For ϕ^{-1} , we will build the sequence of numbers obtained as follows: we carry 1 three times and each term is obtained by adding the two preceding the last:

1-1-1-2-2-3-4-5-7-9-12-16-21-28-37-49-65

-86-114-151-200-265-351-465. ...

By describing this second sequence under the first and shifting only one rank

1-1-1-2-2-3-4-5-7-9-12...

1-1-1-2-2-3-4-5-7-9...

hence the ratios of numbers on the same vertical

$\frac{1}{1}, \frac{1}{1}, \frac{2}{1}, \frac{2}{1}, \frac{3}{2}, \frac{4}{2}, \frac{5}{3}, \frac{7}{3}, \frac{9}{4}, \frac{12}{4}, \dots$ whose limit is ϕ^{-1} .

This last sequence will be called Cordonnier's suite.

One can from ϕ , as from ϕ^{-1} , construct polygonal spirals

Recall	approximate value of ϕ	: 0.755
	ϕ is close to $\frac{3}{4}$ and	$y = \phi^{-1}$ is close to $\frac{4}{3}$, ...
	ϕ is still close to	1.10.
	$9 = Z(\phi) = 1.151 \dots \phi \sim (*)$	

(*) In the usual literature, the Fibonacci sequence is that of integers which generates the sequence of fractions. In the Cordonnier sequence, 1 expression will apply indifferently to the sequence of integers and to the sequence of fractions?

rings and rosettes.

Another spiral from $6 = \sqrt{jp}$ and angle 40° derives from the study of tetrahedra whose 6 sides are in geometric progression. A limit tetrahedron aligned in AXYB defined the progression ip . One of the tetrahedra has 3 successive trirectangle edges with the progression 6.

$AB = 1$

$BC = 6$

$CD = ip$

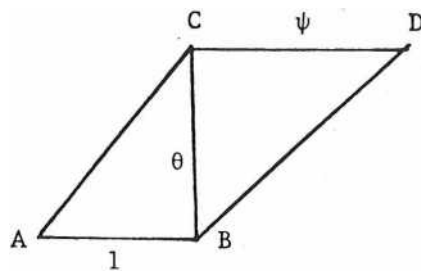

If this tetrahedron is hollow

full, it has an ext

so that an ext. appears).

he has no ext but if he is

weak (he doesn't need to hole it

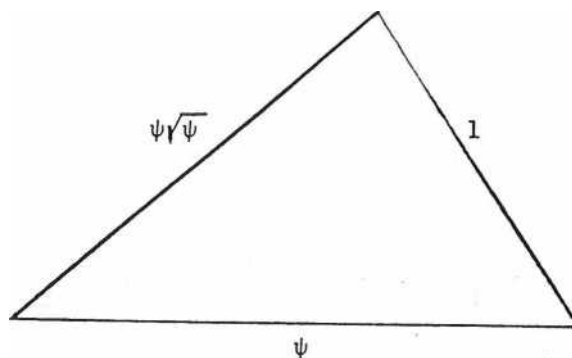

To get the tetrahedron (ip)
turn 90° around BC .

Back to triangles

and in particular to that of sides

$l, ip, ip/ip$.

Its angles are very close to $40^\circ, 60^\circ, 80^\circ$. This one does not respond to KShPh.

In the same way the pentagons starred or not, not regular naturally, constructed from ip do not respond to KShPh.

Perhaps there are other triangles, other pentagons which do not correspond to KShPh?

Not everything strange has a KShPh state. Consider, for example, the stones that apparently move on their own in California's Desert of Death. In this very hot desert - in 1958, 88° was recorded at a height of one meter - (the Panamint Indians called it with an expression that can be translated as "the cauldron of hell") large stones move in leaving a trail in the cracked earth. Around them no trace of footsteps.

The Chochoné Indians were familiar with these wandering stones. For them they were driven by an invisible genie. An old prospector spoke of the influence of a magnetic field but it would have had to be intense and the stones contain a lot of iron, which does not seem to be the case [13].

Several hypotheses can be put forward: the first is that of wind action, but the trajectory of the stones does not coincide with that of the prevailing winds which, in this case, should have been blowing in a storm. On the other hand, sometimes an entire group of stones moved, sometimes a single stone traveled, leaving the others behind. The magnetic field hypothesis is to be rejected.

There were also some people who thought that the stones moved when they were stuck in the ice. Since not all of them moved at the same time, that also does not hold.

Arthur Clarke in [14] points out a hypothesis that may hold; it is due to seven years of observations: the greatest number of movements occurred during the winters of 1968-1969 and 1973-1974 and always at the start of a storm. Two researchers Sharp and Carey summarized their report: soil moisture must not exceed a certain value to be able to give rise to a thin layer of mud covering a solid base of ground. Conditions should be gathered within an hour or two after the water has spread over the surface of the soil. According to these two researchers, the smeared areas in front of some stones that moved suggest that there was only a thin film of water covering the surface of the ground when the stones moved.

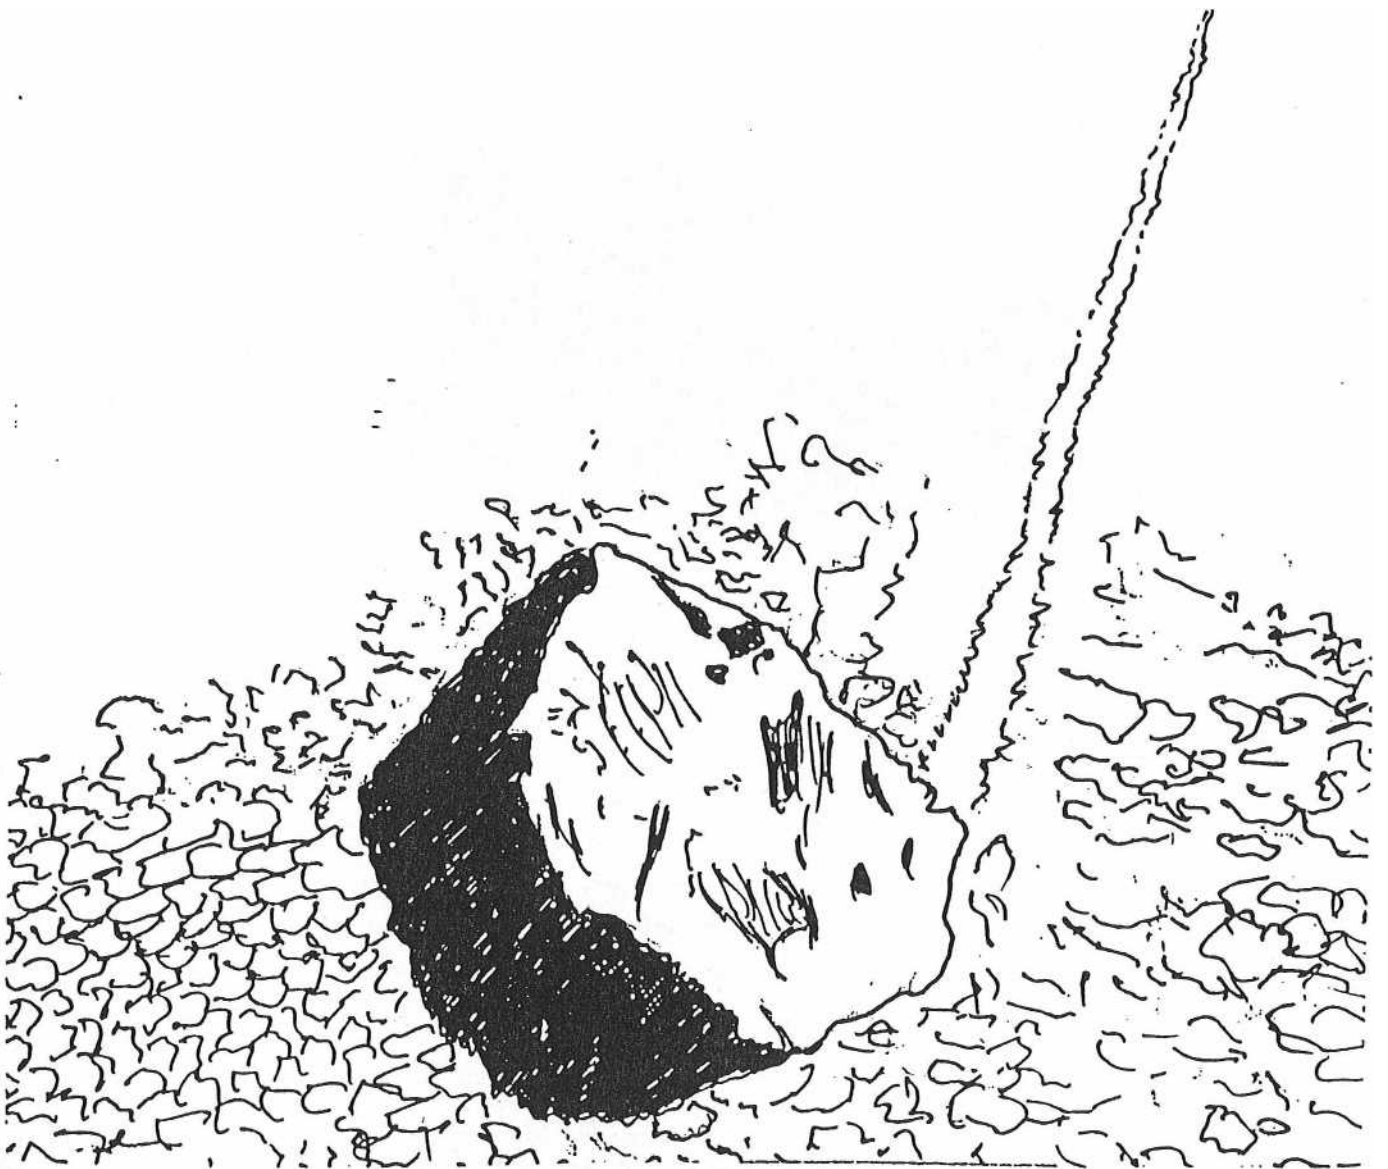

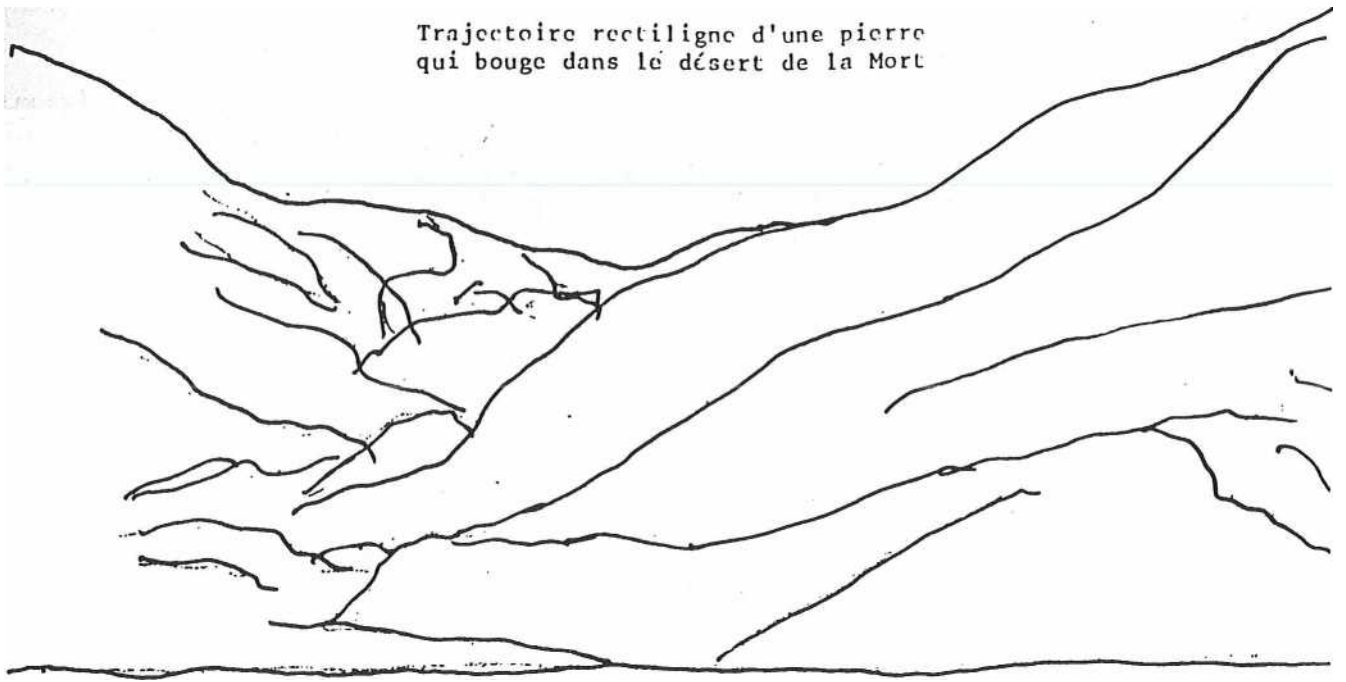

According to this hypothesis, it is therefore necessary to have abnormally strong gusts of wind and slippery wet ground, but with very strict conditions.

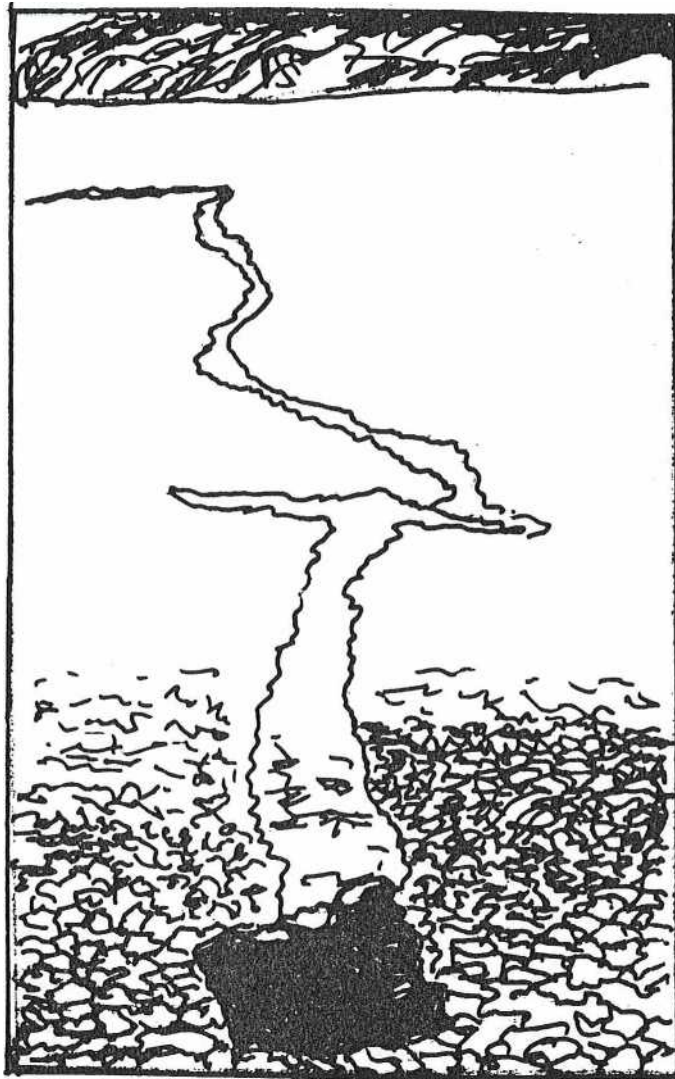

Remember that no one has ever seen these stones move!

When tested, no KShPh is found as a state; but when one tests a form, a phenomenon, it is necessary, if one does not find an answer to a certain number of questions, relating to the eifs, the states, the ext etc..., to ask oneself if the shape is testable.

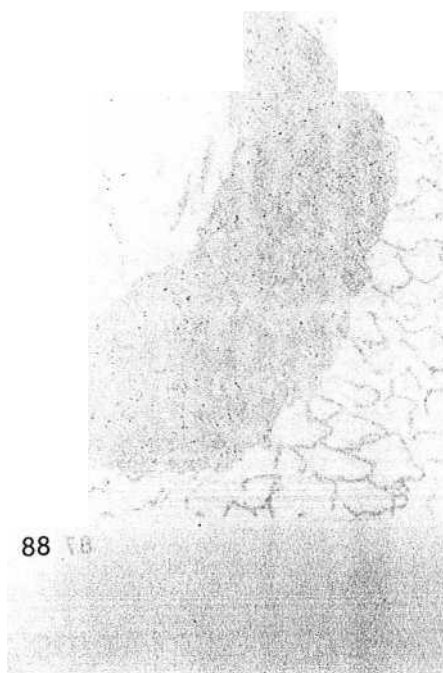

There are forms that are not testable; non-testable forms, we can surround them with forms that make them testable. These non-testable forms have no grid; it's different; simply at first glance they are untestable. One can, also to make them testable, put them in a certain

Trajectoire rectiligne d'une pierre
qui bouge dans le désert de la Mort

Tormented trajectory of a stone on
the cracked ground

.atmosphere or change the state of the Obs.

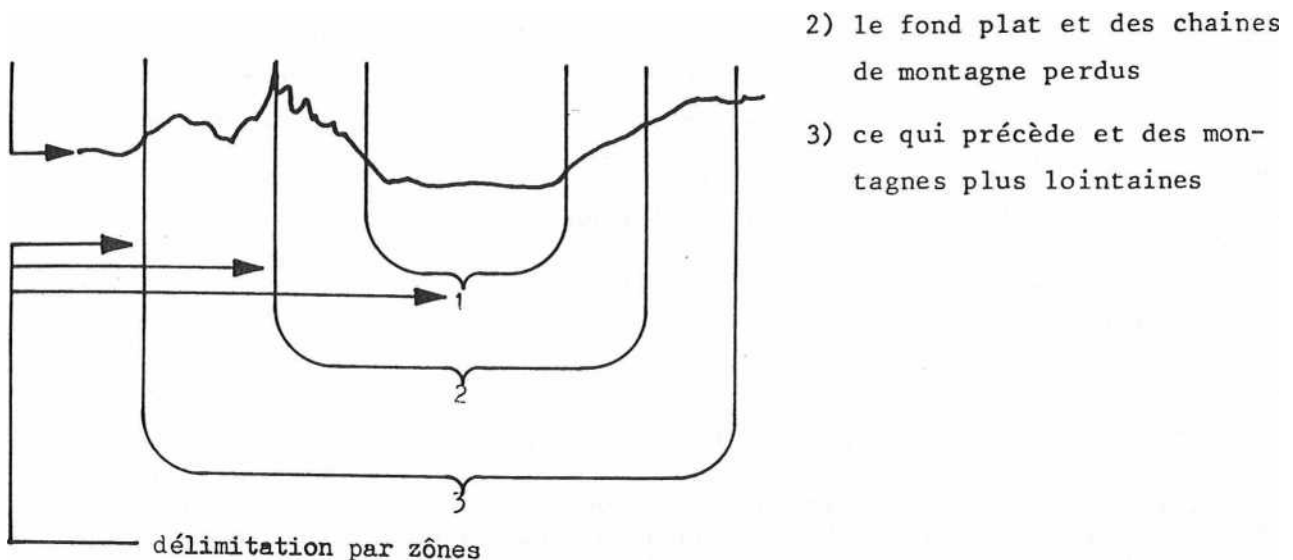

When we make "moving" stones testable, we don't find much to associate with. On the other hand, the flat and cracked bottom on which they are located responds to the channel.

In the case of a relief similar to that where these stones of the Valley of Death are found, it is necessary to immerse oneself again in the context of the forms. You can see several types of places:

Rough profile of the desert in the place

where are the stones

1) the flat bottom

These divisions are arbitrary. We cannot continue this construction by recurrence, because afterwards there appears an escape from the form; that is to say that the places 1-2-3 constitute a localization of a form which we call "form in flight". And this is somewhat the case with the places where the stones were. They are in fleeing forms.

In conclusion, let's say that this strange case of "moving stones" can also be considered from this angle but the study remains to be done, here only a beginning has been given. Let's move on to other bizarre manifestations found in the realm of the occult: ghosts and their photographs.

The phantoms photographed are not necessarily in the KShSh state. On the other hand, the "UFOs" are in a KShPh state. These are antics of technical objects and living systems. Note the rapid studies carried out by Serge Audebourg on the subject of spontaneous combustion of human beings [15] (this has never been noticed on animals, but it is perhaps not impossible for them as well). Some have thought of the "secret fire" of the alchemists as the rap-

i 'sb' if JA* i.

pelleRonald J. Willis v[16],

Although it is hardly mentioned, these cases of "spontaneous combustion" are very numerous; Charles Fort cites several of them in [17], as well as Vincent Gaddis [18], Eric Frank Russel [19], Francis Hitching^{^ J} [20] where you can find two photos: that of Doctor J. Li Bentley, eighty -twelve years old, semi-invalid, found on December 5, 1966 in the morning and a peasant who was found in the 19th century almost completely consumed, while next to him, in the barn, the hay was not on fire. The test made on these two cases gives a KShPh state with reversed shin. Naturally no more vital field or psychic field. There are many V's. There are also 0 , J and In, . There always remains one ext but it is not detected on what remains of these human beings. It should

have more documents to go further in the study of these cases of spontaneous combustion of human beings. It seems that this has never been observed with animals.

In the case of the levitation of human beings, one does not generally find KShPh as one would have expected. From some photographs

(*) J. Willis points out that Doctor Dixer Mann, in a work on forensic medicine, gives a certain number of cases of combustion. Mann believed like many others that the victims were very heavy alcohol drinkers; this hypothesis does not hold because among those charred there were some who did not drink alcohol. A case of combustion occurred in public, in Chelmsford in England, where in the middle of a ball a woman started to burn with brilliant blue flames and in a few minutes, only a small pile of charred ashes. The huge temperatures summoned (2500°) are not possible because nearby objects are generally not affected.

(**) Cases reported in [20].

- In January 1905: Elizabeth Clark found dying from burns, in an intact room. Unfortunately she can't explain anything.
- In July or August 1941: Lois Irene Chapman, found dead in an armchair which was touched to her, but in the close environment, very little damage.
- In June or July 1959, an unknown person was found burned to the point of identification in a car that did not burn. Could he be identified from the car? , : , i ...
- In November 1943: Madge Knight was seriously burned in bed between her sheets which remained intact. Unfortunately she died a few days later and could not explain anything before her death.
- In December 1959 Billy Peterson suffered third degree burns and internal burns but his clothing was intact.
- In October 1963, Olga Worth was burned to death in a car that never burned.

-iAü.

taken during Yogi's levitation sessions in India, S. Audebourg realized that during the session, the Yogi had no more shin on the head or vital field. He still had his ext and his psychic field. But this has only been verified in a few cases. Again, it takes a lot of documents to see a valid explanation appear (unless we are in a total inconsistency!). The unusual manifests itself with what is called in Tibet "the Snowman", in America "the Big Foot", the "Sasquatch". For all the historical reminders, we will do as before, we let the readers refer to the works and reviews dealing with these questions. Here, one can read Bernard Heuvelmans and Boris Prochner [21] and also refer to the bibliography given at the end of their work (this one, although announced as being summary, gives an important list of articles and books relating to the "hairy men", to the men of the snows" including the Yeti, the Ksy-gyik etc... And there are other works that we are not citing here which deal with some of these phenomena in their chapters. Interested readers will easily find them. Let us see the photograph which can be found in one of these books, that of a "Big foot female", taken from an article by Tom Disdale [22]. from a color film taken in California by Roger Patterson. It can be found in other works. The advantage in the work cited here is that it is quite large. This form was at least 2.5 meters in height. When tested we find no KShPh, but she has no vital field, no ext and she has a lot of V . On the other hand, it has a psychic field (like a "memory" but not directly, we will talk about this term "memory" later). It is a localization which is not stable.

Traces left in the snow by the Yeti respond to KShPh , but these traces are not testable, to detect the state they must be made testable . There is no shin.

li
x
— (*)

 Heuvelmans' "Pongoid man" does not respond to KShPh or any other state of this kind. When he was "alive" he had no vital field. About the , . . , (**), emissions, it is difficult to detect because of the ice. Nevertheless, there is some Rg which is perhaps due to the process of wearing out the cold. When it was "alive", it seems that it had a lot of .

(*) The name Pengoid Man was given by Prochner and Heuvelmans to a being discovered in a fair, locked in ice, in the USA in 1968. This being was hairy; his height had to be between 1.50 m and 1.65 m. It had a sagittal crest above the head, but lacked protruding canines or an opposable big toe. His description was reminiscent of the "Snowman" of the Himalayas.

(**) B. Heuvelmans saw it in a box filled with ice that a fairground exhibited at fairs in the USA to make money.

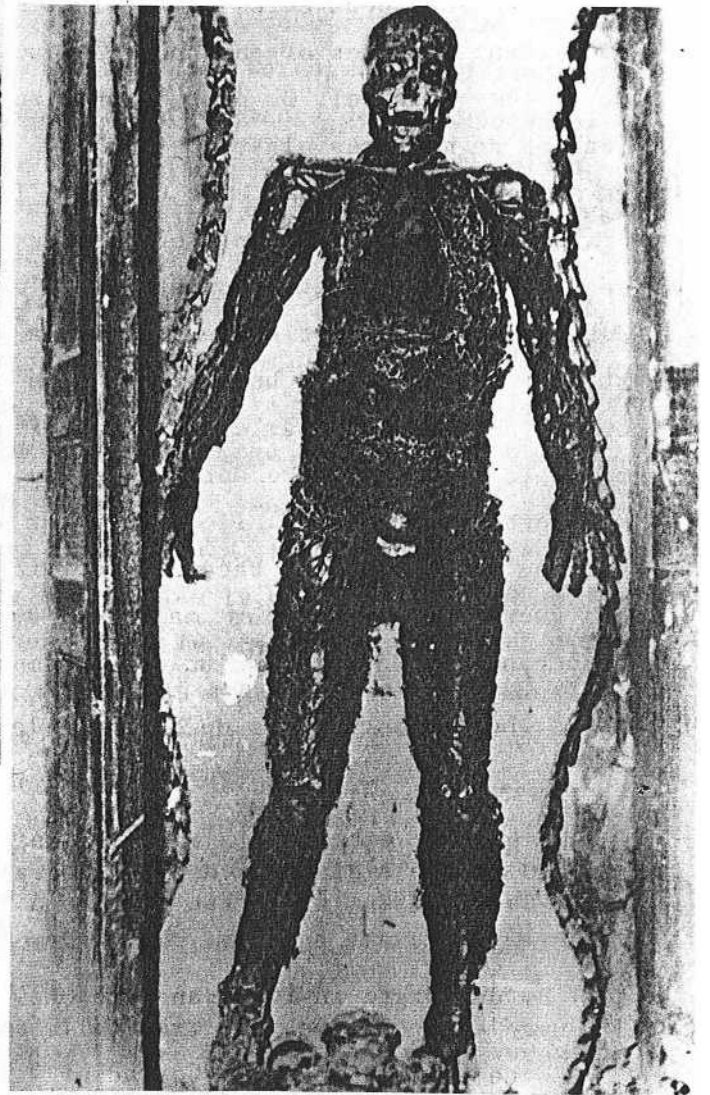

These beings may possess different characteristics. Their localization processes are therefore not the same. What emerges from what precedes is that they do not have all the characteristics of the living: (it is incomplete living) and they have other characteristics. Traces on snow respond to KShPh; they were made, we can think it by a being which responds to KShPh whereas those (Big-foot and Pengoid Man) tested on photographs do not respond to this state. As for the tracks in the snow, in some cases they may not even be made by a localized being, but the delocalization of this thing is such that it is not seen and the tracks seem to form on their own.

In conclusion, we see that these beings are not "**forgotten*" prehistoric men. We are in front of more or less complete localizations.

Let's continue our search for inexplicable phenomena: for that, let's see the anatomical studies of the Sansevero chapel. Work has been carried out on them by David and Samuel Franeric [23], Samuel has moreover completed the study with a "mental" duplication. Let's say that doing a "mental" or "physical" duplication on such cases does not give an exact film of what happened. Images that are symbols intervene, images coming from a tacit knowledge and images that are brought by the society in which we are immersed; there are also grids; there can be one or even several, that is to say that when you have raised one, you have to make sure that there are no more - sometimes, it is quite rare, you find a second one. We lift it too. The grid is detected not by the one doing the doubling but by a person who is next to it (this is how David and Samuel work) and puts himself in constant transference with him. At the pendulum it directs the one which is in duplication. Additional information can be found in an article by Raymond Réant and Serge Audebourg [24].

The Sansevero chapel is dedicated to the Virgin of Mercy; it is located in a small street adjoining the Palace of the Princes Sansevero de Sangro which leads to Piazza S. Domenico Maggiore, in the center of Old Naples.

During past centuries (until 1889) the Palace was linked to the Chapel by a passage used by Don Raimondo de Sangro (1710-1771) to complete his studies in mechanics, hydrostatics, anatomy, printing, coloring of marbles and stained glass etc... studies which were to lead him to

Beings of the Sansevero Chapel

inventions considered prodigious in its time In this chapel one finds the most beautiful marbles of Italy; being little known, few people know about it^\

Over the past centuries there has been a dark legend around this chapel, fed either by the bizarre hobbies of Raimondo de Sangro, or by the "anatomical studies" he had carried out and which are still visible today in a niche. , kept in two glass cabinets.

They are two very tall human beings of whom only the skeleton remains supporting a few organs for which only the venous system and the arterial system remain. It has been possible to obtain such an effect for a few years by injecting plastic materials, but at that time there was no question of it. Another method had to be used. There is no KShPh of any kind on these two beings; these are not in transfer with each other. We have no RWcH. These two beings no longer have an ext. which is annoying because the ext. is detected after death as during life. They still have their parent. The shin comes out of them through their mouths, which is not always the case with the dead as we have already pointed out: for example Patchita, the "Mexican surgeon of despair" as Pierre Derlon called her [25] now deceased. doesn't have the knot of life coming out of the mouth. It does not come out on any other part of his face (study made on a photograph). Patchita operated according to a method similar to those of Filipino healers, but she still used a sharp instrument that gave for an obs. the impression of incising.

The two corpses in the Sansevero chapel have eifs at the BCM level (*) (**)

(*) In addition he embellishes the chapel that his ancestor Giovan Francesco had founded in 1560 and that Alessandro de Sangro had enlarged in 1608; he placed there the tombs of his ancestors and had the vaults painted with frescoes by FM Russo, a pupil of Solimena.

(**) R. de Sangro invited Francesco Queirola, a sculptor from Genoa who created a masterpiece of technique, a very beautiful statue, called "Desinganno".

The Venetian Antonio Corradini sculpted the "Pudicizia" there, a statue of a veiled woman with a very soft aspect, representing the mother of the Prince. At the same time worked in the chapel Francesco Celebrano, the author of the sepulchral monument of Cecco de Sangro, ancestor of R. de Sangro, Persico and finally Giuseppe Sammartino, the author of "Cristo Velato": on a mattress of marble, leaning on a blanket of porphyry, lies Christ. Sculpted in marble, a very fine pleated veil covers it and lets the forms of the corpse show through.

To detect them it is necessary to use the continuous spectrum. We find for one as

eifs a line between $R^\wedge$ and IRj , , one between UV . and $v.$ and ; for
the other a line between $BC.$, one between $V.$ and MM $V..$ and $J.,$, one between $R,$ and $x E$ one between $V.,$ and M
and IR M' , a line between $BC.$, one between $V.$ and MM $V..$ and $J.,$, one between $R,$ and $x E$ one between $V.,$ and M
 $IR^\wedge$ and Ng and one finally between V_ϵ and BC E

Prehistoric caves are filled with clues that lead us to believe that their inhabitants used magical processes. Let's see for example Rouffignac, the Hundred Mammoths cave. In [26] S. Audebourg outlines a study he conducted in this place. Rouffignac, in the Dordogne, is a privileged place in prehistory. Excavations began about a hundred years ago. We find ourselves in the presence of limestone plateaus in which there are many natural shelters and caves in particular. In September 1901, Breuil, Capitan and Peyrony discovered there the engravings of Combarelles and the paintings of Font-de-Gaume; in 1940, it will be Lascaux and in 1956, Rouffignac.

The history of Rouffignac begins around -40,000 years ago, with the occupation of the cave by the great cave bears [27] • You can even see the traces of their enormous claws on the rocks inside. Then the men live in the cave, which is placed at -12,000 years. They belong to the great hunting civilization that haunts the overhangs of the Vézère, feeding on reindeer , bison, horses, mammoths. The epoch is called the Magdalenian; the tools are of stone and bone; the blades are taken from scraper-cut flint. Thanks to the bones of reindeer they make spears, harpoons with barbs for hunting and fishing. They know fire and light the caves with resinous torches ; they unearth the black oxides of manganese on the rock.

Let us quote a thought of Abbé Breuil: "the reindeer is an animal easy to hunt and no one needs magic to seize it". If that's the case with the reindeer, it's not the case with the mammoth, even though some of these gigantic animals have been hunted down by tricking them into falling into pits.

If we go back to the cave of a hundred mammoths, we see that it has multiple galleries that look like a tree. Moreover it is a pure ext.

Engravings and paintings are found in many places in the cave, widely disseminated. There are nine patterns of facing mammoths (In some cases it is necessary to illuminate obliquely for the pattern to appear). The artists have

sometimes used the shape of the rock itself to obtain part of the animal : this is the case of a prominent kidney which represents an eye. The silhouette of the animal has been drawn in such a way as to place the eye in the right place. But it is above all necessary to study this engraving by the living light of a torch so that the drawings come to life and take on their relief. In the light of a torch the effect is accentuated, because the flickering light creates a pseudo-movement. On the other hand the holes and the bumps of the rock which intervene in the face of the animals and around them still create stability of the desired state. They will make it possible to place the animal in its wild context without having to understand the woods, the plateaus, the gorges etc... The sorcerer will be able to travel more easily by thought and he will thus manipulate the Enels attached either to the mammoth, or to wild forest. His incantations and magic gestures will put these Enels for example in overlap.

L. Nougier in his little book [27] clearly points out that paintings are linked to magic and lets it be understood that this magic can be operative, whereas many paleontologists, while realizing the magical reasons for the latter, have relegated these reasons in a so-called obsecurantist past.

Drawn mammoths do not respond to KShPh but could take part during rituals in preparation for hunting. The ritual had to be done on the Enel attached to the mammoth entity, the sorcerer put himself at the service of the hunters by putting himself in transfer with the progenitor of an animal of the horde which had been spotted by pendulum, doubling or dream (this by people of the tribe). Multiple possibilities could be used to magically isolate an animal from the herd; enel of the herd, progenitor, vital field of an animal, enel of nature, etc... had to be manipulated in multiple ways, for example through rituals performed in front of stylized or symbolic representations, through personal mental representations or attached to the clan; the clan had an enel; this one was certainly in close contact with the sorcerer who also had to use it during the fights between tribes. The "spirits" of the dead were also invoked, these being in reality either the parents, or representations put in place with the clan's elite. The mental representation of the time had these concepts or absolutely fundamental equivalent concepts.

(*) It is easy to understand here that the notion of subjectivity which imposes the usual C. de C. prevents any operation from being initiated. What the obs. is superimposed on what is the figure drawn on the rock and gradually approaches the process of creating forms such as the gods could engender it. To appear in the local a form shakes the Enels attached to them to the global. The human being operates between the two. If subjectivity is imposed, obs. sinks deeper into the room.

The figure that has intrigued many researchers in the cave of a hundred mammoths is the so-called "Great Being".

On a natural piton, two black bison and this almost human figure are staged. It doesn't appear to be a caricature, but make no mistake ; is it rather the drawing of a fleeting vision or of a figure seen in a dream to which a message was associated and which a man has reproduced? If we consider the figure alone, as a face, it is not attached to an enel, but considered in the cave which is a pure ext, it is linked to an enel. When the "Great Being" was invoked, the overlapping of the high priest or priests took place. There is a little V where the figure is engraved.

On the "Great Being" we have KShPh and the right shin from which it seems that the b-.nsnes who used the "Great Being" did not create evil states.

Magdalenian "Great Being"

Let's see the apparently living forms called water monsters, water monsters
soft as those of Loch Ness and other lakes, sea monsters named snakes of „ • (*)
sea because of their shape which most often recalls that of a snake

About these "monsters" one can refer to the works and bibliographies quoted in them [29,30,31,32]. But there have been many other books and articles in many journals on these subjects.

(*) The so-called Tasmanian monster does not have the shape of a large serpent. Its body, 7 meters long, 6 meters wide, was covered with a kind of down or fluffy material and had neither eyes nor mouth, nor skeleton; its surface was hard and at the same time plastic. It cannot be attacked with a knife or an ax [28]. By working on a drawing, we were able to draw from it that the state is a KShPh with reversed shin. This monster is close to OSNI (Unidentified Underwater Objects). The tests for these are those found on UFOs. These again are locations that are not stable.

If we refer to the observations of Loch Ness, these are numerous and go back quite far in the past. The forms observed in the lake are not identical, this cannot be due to unserious observations; there were certainly some, but valid researchers have taken up the subject and from the photographs we see that we have the KShPh state with reversed shin. There is a strong V. In addition, photographs were taken with sonar in 1976 by Roger Parker, an Englishman assisted by James Buchanan from the University of Stirling, then in 1977 two other color photographs, by an isolated researcher. On the image obtained with the sonar we do not test the KShPh and the , but we see that the shape comes out of a shift, which is more difficult to test on the usual photos- / £ \

The ^k. The state and eif are only on the more localized form.

In J. Berton's book [30], an interesting encounter is reported

between the author Berton and a certain Holiday which took place in 1975. According to Holiday, these "monsters" are only forms, balloons without consistency, composed atoms aggregated for a short time by a plane which is superior to us laughing and trying to deceive us to an end that we do not know...". Holiday really felt something abnormal thanks to the photographs and the multiple testimonies reporting various forms. An exorcism seems to have been done in the year 565 by Saint Columba who was born in Ireland in 521. At that time people were not afraid of ridicule and accepted non-Cartesian phenomena not out of ignorance or naivety but because some sensed the unusual in the world and transmitted it in the form of These forms are found in Loch Morar, in certain lakes in Ireland, in Iceland, in Sweden, in Canadian lakes and also in the USSR.

In the seas similar locations occur and the forms have been referred to as the "Great Sea Serpent" because they are sometimes gigantic. It may also respond to KShPh; we certainly do not find

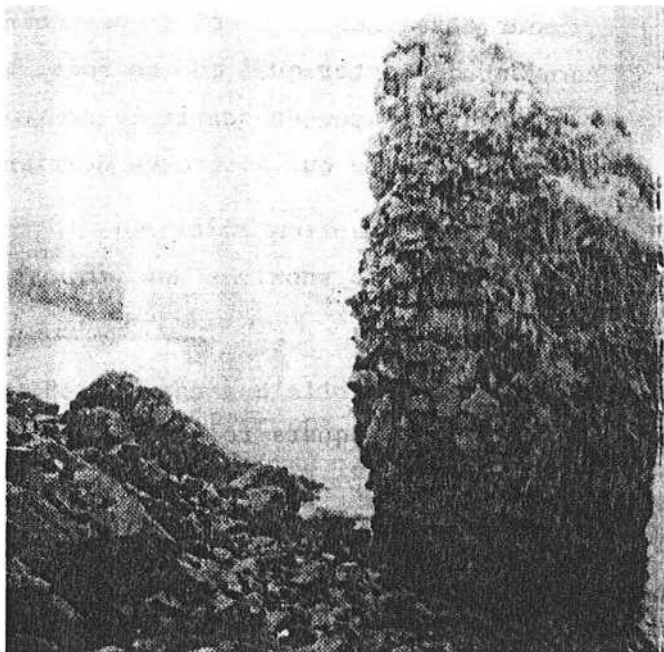

.(*) The document you are working on is not always perfectly suited for testing; for example, it is difficult to test on a "poster". The "poster" allows only a weak transfer, even the poster.

When you test a reproduced photo or a newspaper, despite having an acceptable transfer, you have to be careful that the process of reproducing the newspapers can generate eifs that are not on what you want to test. It is therefore necessary to eliminate these eifs by thought; fortunately, these eifs do not return to the subject of the product. On the other hand, in the case of the usual photographs, transfers are easily made and it is necessary to avoid putting them on top of each other or, if photos are used as controls, mixing them during an eifs treatment, states of one that can pass over to another.

vital field. A certain volume of water seems to be necessary for the decalaire to form (it may be that in lesser water reserves forms too small to attract attention are located). Sea serpents, monsters of the great lakes, locate in the water; Yeti and other beings on earth; they have characteristics of the respective environments in which they arrive. The shapes look like beings from the past. "UFOs" are located in the air or outside terrestrial space; they had some tendencies of what the human species places in the future. But for the "UFOs", as John Keel remarked among the first, the form depends a little on the time. It is located in the Middle Ages of boats in the air. In this case, this antics of technical object was not adapted to its environment, but was perhaps attached, still according to John Keel, to the folklore of the time.

Let us cite another case where there are states to be handled with care: these are piles of stones found in Iceland and in which the old people of the island or even young people find powers. They say that in some of these heaps of stones "live geniuses". They sometimes visit these mounds (which seem of natural origin) and seem to maintain a dialogue with the entities and this on the occasion of births, marriages, bereavements, purchases of plots of land etc...

We present here two of these mounds photographed by Raymonde Boix and which we insert here with her authorization. On photo n°1 we detect

KShPh with straight shin and a transfer with something?

!""'b 't JE? V" jü::/ </>• -- ' '•
 -f' 7' V f 1' < . Gj-
 ■ ■ :: 7V-XJ '," ■

On photo n°2, we find
 KShPh, no shin but RWcH is
 a psychic field.

Photo n°3, still taken by
 R. Boix in Iceland, is
 also interesting, because if we test the hollow
 which is in the foreground, the
 entire hollow responds a little to KShPh.
 This place, perhaps, could have been used
 for certain ceremonies; however
 , before attempting anything,
 one must try to feel the kind
 of inconsistency behind it.

One can still find KShPh states in religious banquets of antiquity, for example Greek [33].

In the first canto of the Iliad, Ulysses will return the beautiful captive Briseis to her father and then make an
 tory sacrifice to Apollo. Here is according to Homer the order of the ceremonies constituting this sacrifice:

1) **Prayer: "Hear me, god, . . ."**

2) Immolation of victims, butchering, preparation of meat, cooking (grilling **and roasting**) .

3) Banquet where everyone receives "equal share to satisfy their hunger and thirst".

6) Music: song of a "beautiful pean" where we celebrate, to complete the appeasement "Apollo who throws his features far away"

When the music was used for what we called "to call the spirits", it created states of the KShPh type with RWcH sometimes. Some music, some songs are, on the other hand, performed to make harmful states disappear. The great religions have used them a lot. The origins of the music are not known. Some traditions trace it back to contacts between men and gods, contacts where the gods would have brought it to men. It is certain that humans have sometimes heard melodious songs at certain times. If we had tested, despite the fact that these phenomena are called magical, we would not necessarily have had a KShPh, or a K.Sh.Ph. or a $K_c Sh_o Ph_{,,}$ (**) or one of those other states that we have above

The music combined with the dance can create special states in a place or on the dancers or on a wizard who participates in the ceremony and can thus begin certain rites. The states that form can overlap the participants. Rhythm creates states, liturgy uses song and music with special instruments (not all instruments bring about the desired effects, especially during a religious service, and the music played can even in some cases be harmful, even if it seems innocuous).

Certain music, imitating animal leaps (example the kangaroo dance around Port Sackson creates states which are of the same kind as (*) (**)

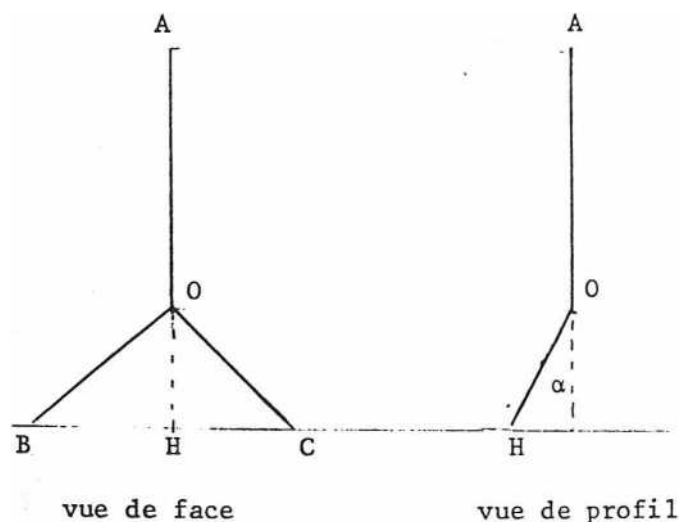

(*) Péan: song of joy - the word implies the idea of healing - it can also personify an idol or confer victory.

(**) Let us also point out the songs of perdition in America, the songs to make the earth sterile, the homicidal incantation in Christian civilisation, the effects of so-called magic songs on animals, the use of magic songs by Scandinavian, songs for the evocation of shadows, ghosts, songs to make it rain among the American Indians, among the Chinese, songs for birth, songs for raising livestock, magic songs and the love among the Romans, among the American Indians, again among the Septentrinaux, the same against snakebites, for medicine among the Indians etc...

those which were generated by the wizard in the caves by incantations on representations of the animal: mammoth, bison, reindeer... these states do not feel on the Enel of the animal to fall back on an animal of the family of the one who is chased away. Often a small drum is used to imitate the leaps, trot, gallop of the future victim). The goal of imitation is to create states that will apply to the imitated form. The imitated form is put in transfer with the form-imitation. Overlapping, equimsey, dynamic duality of one by the other or of one and the other can occur.

One can wonder if the vital field (its four components and the right pointed shin) is sufficient to characterize the living. It seems not, since we find human beings who have none when they are very weakened or sick, yet they are alive for the usual assessment.

We can find a form that characterizes the living. It is not flat; it is composed of 3 segments OA, OB, OC such that OA is vertical, OB = OC and the angle BOC is equal to 120° . Let OH be the height of the isosceles triangle

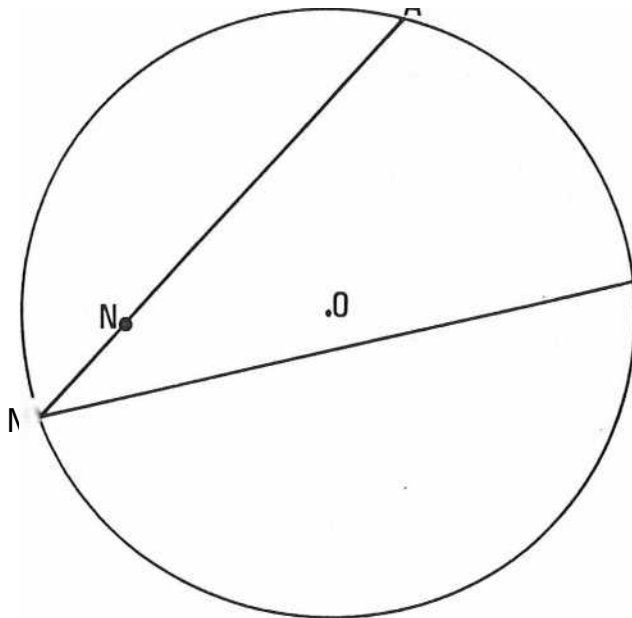

BOC, α has the angle of OH with extended OA: α is all equal to 33° or 43° but of these two values it is the first which seems the best. If we take $OB = OC = 1$, then $OA = \text{ip}$. This form (which we will designate under the name

tion: support of the living) emits what we have called the Creative Word z , (*)

(*) Abbreviation VC If we test a living being directly, we do not find the VC The support form of the living does not hide the VC; to detect VC it must be considered as a "memory". If we make the shape with a material such as wood or metal, and put it with its large vertical side and the 2 V-shaped parts down, we will directly detect the VC (we wear this shape on a cylindrical pendulum). This word "memory" is chosen here to convey a feeling of the unexpressed and the unexpressible at the same time.

with which one can generate all the eifs and even the "emissions due to the mass". If we realize this form in wood or metal and we put a cylinder centered on AB, it immediately takes on a vital field. This form has an additional fundamental property: vertically from 0, at the level of BC, one detects, because it is not localized, a form which symbolizes a rhythm. To life is therefore attached a rhythm; what is realized in all civilizations. We can look for a form that renders this rhythm only. We find a fixed form which realizes it; in the expression of a rhythm, there is no origin; the shape will be obtained from a convex closed planar curve. The circle is acceptable to serve as a base, it must remain traced. In this rhythm which can be expressed as $\{(1,2,3), (4,5,6)\}$, that is to say 2 times a group of 3 and then we resume identically; to represent it you must already have one which symbolizes the passage from a point A to a point B around a point M. Here the point M plays a role of pivot in the sense that it is found for example in the dance:

is a position of the
right foot, M that of the left foot
and the dancer leans on M
to bring his right foot from
A to B. The trajectory of the right foot
is not necessarily the arc
AB. It turns out that in order to express
the passage of motion from A to
B,
such a shape must be constructed. The flat shape
thus produced is not complete .
It is necessary to
point the segment MA in N and

builds a shape which expresses the passage from A to B by the pivot M. Was it really necessary to point MA? If we don't point, we can as obs. impose the meaning (here A will go to B) of the form and give it an operability. It may only work for you or for a select group of people. One can perform a ritual on the form to impregnate it, that is to say, one gives it an atmosphere; in this case it can be used by a multitude of individuals. But the fact remains that someone can still transform or destroy his operability. The form can be attached to an enel, which stabilizes it.

read a lot; the enel is presented differently according to the times, the civilizations, thus the form will follow these changes; a form used in a ____..... . . . (*) civilization may very well behave quite differently in another the numbers have been used a lot in grimoires; maybe it's because their construction is simple? Their structure is rich in properties. The simplicity of construction makes all the numbers quite present to the human mind, and therefore easily manipulated.

There are forms on which we can impose a character that will make it a universal form (on a human scale, it must be specified). By pointing to MK, this is what we achieved. Is this score immutable? that is to say that in a complex figure where we will bring a point A to a point B with a point M as pivot (pivot as we considered it above), we verify that a pointing on MA is necessary, but the point is not always such MN, that — is constant; it is determined by the pendulum.

Thus there are rules that allow to give a character to a form. Whence in the delocalized, there are rules of association which make it possible to manipulate this delocalized. We find the Cartesian in the non-Cartesian (NC). There would be another stage where we would have NC for the composition of the NC Stonehenge was perhaps, at certain very precise moments, a form which engendered a rhythm? At certain sunrises or positions of planets and stars in relation to the site, a delocalized rhythm of a kind different from that of living systems could have occurred, but this rhythm skillfully recovered by overlaps or equimseys, which they obtained by rituals, could have effects on human beings placed in a certain place unsuspected by us. The Stonehenge shape, even complete, would not have been enough to obtain the desired effect at a certain position of the stars. It was also certainly necessary to have the

(*) There are many people who want to have a ringed improperly called "Atlantean" to protect themselves from bad influences or to give themselves tone. They wear this ring all the time and on any finger of any hand in the worst cases. This form was immersed in Egyptian civilization, no one knows how; moreover, she could come from another civilization. We can also cite the case of statuettes or necklaces from the Far East, Africa... which are not harmful on the spot and which transported to Europe for example pass into a KShPh state with reversed shin. Some forms were built to support a particular ritual. They must not be used for any other purpose or perform other rituals in front of them; one can trigger transfers with harmful effects (in particular transfers with a past that one is almost completely unaware of).

are worth the pointing seen above. This could be achieved by placing in different places on the site wooden barrels or human beings marking very precise positions; the rhythm was on. Localized or non-localized effects could be felt; perhaps we arrived at temporary relocations of high priests who were themselves prepared for these kinds of exercises.

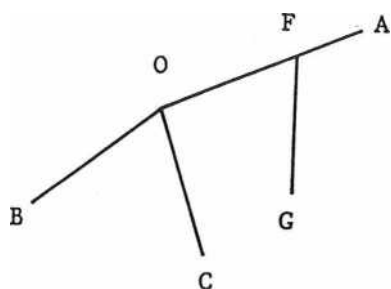

One of the alchemical steps is the construction without support of the fundamental form of life, which entails the form-rhythm or even the construction of the form-rhythm alone, all this totally delocalized and by work. • • (*)
of 1 alchemist on matter

African dances, for example, are intended to give this form-rhythm to the whole of the tribe.

None of the forms like the Loch Ness monster and the other lake monsters, the Sea Serpents, the beings such as the Yeti of the Himalayas, the Sasquatch of the western coast of) , further north, just across the border with the United States, have absolutely no basic form of life.

Another form is associated with them. It thus presents itself in perspective
tive. OA is horizontal. The angle (OB,OC) is 120°). The angle of the BOC plane with OA

extended is another 33° . In

addition there is FG which is perpendicular to OA and vertical and which is placed in the plane of symmetry of OB with respect to OC. We do have $OB = OC$ but OA is no longer equal to ip . The length may vary according to the (** (***)) locations. There is a rhythm associated with this form; it is not an extension of OA and totally different from the rhythm found for

After the fundamental form of the living, we will move on to what Ravatin has called the Psychic Field. This concept can be detected on forms absolutely inert (at least in appearance).

In animals, it is not generally found. There is nothing equivalent

A psychic field is found in *Australopithecus*, *Pithecanthropus*

(*) Very few Alchemists have suspected this!

(**) With "UFOs are associated such forms.

(***) A living animal "very close" to a human being can take on a psychic field.

from Java, Neanderthal Man etc... These are individuals and not skulls; a human skull as a form has no psychic fields^ even an entire skeleton.

. “, (**)

After death, the CP does not disappear immediately, you have to wait about 30 days lest you no longer detect anything.

On the previously mentioned locations, there is no CP, simply a "memory" of CP in the case of forms with a humanoid profile.

There is a CP on the stone blocks mentioned above which are in Iceland. Some dead trees, still planted in the ground, take a CP during the full moon; it is possible that druids used them during their ceremonies, on full moon nights, because this CP of the dead tree can overlap the neurons of a human being who is quite close to the tree. Sometimes stones are found in the countryside or the woods that have a CP

They can be used for the production of eifs associated with shapes but also for other things.

You can make your own shapes with CP and associate them with each other. This opens many horizons that extend even further the field presented in this book. Note that this concept of psychic field does not systematically lead to a state with RWcH. We thus see that an approach in which we let the concepts come is more flexible than an approach in which we begin to pose the separations usually used in the rational C. de C. such as physical, vital and spiritual, words behind which it is thought of the inanimate, living world (plant, animal) and human level. The choice of a more adequate representation than another allows an inspection which may be just as thorough, but with less danger.

The rational C. de C. arrives in our time at the limits of stability; an instability appears in its enormous extension, and also this extension means that this C. de C. is no longer on a human scale; it escapes the human being. From these two reasons, there emerges a darkening of the rational representation which is manifested in particular by the UFO phenomenon (*)

(**)

(*) Abbreviation for Physical field: CP and for Vital field: CV

(**) The concept of CP is not to be confused with that of intelligence.

"UFOs" or "OSNIs" are not extraterrestrials or buried civilizations that come out from time to time. This does not mean that life does not exist outside the earth, in the Universe. The physical Universe, echoing the usual C. de C., can contain life and certainly does. It will still be necessary to be careful, from the moment when a form of non-terrestrial life will meet a terrestrial life at the C. de C. which will be used by the human being who will be present at the meeting. To contemplate this is to have a mental experience in the present moment. It is valid because there is no transport of obs.

We can be in the other usual C. de C., by not taking into account the concept of C. de C. and say to ourselves that we are facing an extra-terrestrial entity.

We can be in the usual C. de C., taking into account that we project this C. de C. at the same time as we put ourselves inside; then we will place the extra-terrestrial in this context.

We can be in the other C. de C. and within a radius of coherence of this other C. de C.; if you are skilled enough, you can move from one ray to another ray which can give advantages to the obs. before starting a dialogue with the entity which will then no longer necessarily be extra-terrestrial.

"UFO", "OSNI" are antics of OT and living systems. Before the first airships flew, craft were seen at night over small towns in the USA, resembling the airships that were to appear 10 to 20 years later. In this antics, there is thus a sort of improvement, an extension of l'O.T. from the moment.

Let's talk about "UFOs". (For the "OSNI" it is the same). We find for them neither CV nor CP but is associated with a form of the same kind as that found for locations such as water monsters, hairy beings etc... The state is KShPh with reversed shin and we also have shatam and shadaïm. In emission, it is very rich in V. You can find other eifs. It cannot be said that there ^b(*) is a characteristic spectrum. Many UFOs come out of a decalatre. A very interesting remark is made by Charles Bowen in [35]. It tells a story where a disk shrunk before disappearing. Charles Bowen adds in this connection: "One has the impression that something of fan- (*) It is always the same, if one supposes it, one will find it and so from an error as one As already mentioned, we will have a way to tell on a photo if we are in the presence of a UFO-type phenomenon or not. The trap seems big sier and yet it is often ignored by researchers.

tastic is here, a huge track. Captain Howard told me that his gigantic UFO, seen over the Atlantic in 1954, seemed to shrink even though it remained the same distance from observers. In the case of Whidby Island, in October 1963, the gray craft, 3 meters in length, resembling more a winged airplane than a disc, suddenly shrunk considerably and tilted so that its part rear sank into the ground..." We could go back to the abundant literature on the subject of multiple similar cases. We will not do it here and refer the reader to the multiple works and (*) reviews

The departure at very high speed of the UFOs and their sudden disappearance correspond to the flight into a decalaire.

If one is interested in UFOs, one must think of them as a monkey trick; these are linked to technical objects and their spawners as well as to spawners of classes of technical objects. A technical object has its localized functionalities ; moreover, it is not a form that emerges, it is completely localized. It imposes an extremely high density of localization, much more than a galaxy which can be emerging or immersing.

Astronomy brings results like the distances between celestial bodies, the question of localization not intervening. But the celestial bodies - , . (**) (***) can be more or less present in the ET structure. Through OTs, there is an internal localization of functionalities. They are a support for localized functionalities. In this, they bring a density of localization much more than the universe they are in. OTs are the very archetypes of the rational C. de C. From the moment we imagine concepts that are not in this C. de C. (like the relocation), the physical universe presents itself

(*) Let's say that obs. who is in front of 1'0.VNI, wants an explanation. The machine, partly localized, places itself in the usual C. de C. with its inconsistency and "explores" to justify itself. UFO is a distribution of features (distribution here has a stronger meaning than distribution - it's like a function of weight). It changes as the transfer progresses with the obs.

(**) TO Technical Objects ; PO_Objects_Phenists.

(***) I n ^{these} lacks of localization, a phenomenon that we will call "fraetant" may also appear. A form may not be in its place in its delocalization, and then fills up for example with the past of the form, if it is the time parameter that is affected, or a "lengthening" of the form if it is the space parameter that is touched. We will thus have a particular case of " fraetant ".

a little differently. As the concepts of the other C. de C. will increase, that is to say that the other C. de C. will be constructed, the echo to this other C. de C. . will be stronger and stronger and a completely different construction will give way to the first. We must always think the obs. throwing its C. de C., placing itself in it as we have said several times, but now we add a precision: when throwing the C. de C., we must assume that its echo is more or less well formed.

We are at a time when the usual C. of C. becomes unstable by excess of localization (one could say by overlocalization). These overlocalizations lead to imbalances which are filled by new localizations, such as UFOs. An overlocalization can be diluted in a neighborhood; at certain points this dilution can be concentrated and a new localization appears . The multitude of OTs brings into existence - spreading which it passes (* (**)) a existence-dilution. The UFO does not always have the same localization scheme . It can be presented as the nebular of the progenitor of a family of OT, the nebular having at the same time the characteristics: support and dilution . It can still be a Table in the sense of the occultists (as we say John Dee's Table, that is to say an assembly of figures or letters, or signs carried on a paper or a parchment and on which works in magical practices a person to achieve a specific goal).

The UFO presents itself as a table for the obs.; the table has the characters: support and absorption. When the obs. enters the UFO, it materializes these two characters; In the UFO phenomenon the method of approach of obs. who begins to feel the phenomenon, becomes the realization Reasoning in the usual C. de C. is like a degenerate neighborhood of the dream

(*) The UFO looks a bit like a waking dream. There is a message attempt. In dreams, there is a discreet allusion to an act which can bring about a change of state or the creation of a phenomenon if it is realized in everyday life; it is like a seeding of a ground, the ground being habitual life. The UFO can bring the beginnings of knowledge, it is rather rare; when there are exchanges with entities, the messages are quite poor (at the level of that of a sect). On the other hand, in the attitude of the entities, what they were supposed to present, there is food for thought... and the beginning of a research on realizations of apparatuses which would then be POs is to be considered.

(**) UFOs, OSNIs, monsters of land and water will enter the type of phenomena that we call mimoids and the mimoid and all that is attached to its location is what we enclose in the concept called formeriade . The formation is a generalization of what is usually called pheno

The mimoid is placed as a formal extension of the OTs in a degenerate neighborhood of a dream. The dream is a kind of formation.

Several diagrams are possible to explain the formation.

- It would be an unstable location by successive collapses of different macrons.

A phenomenon that is attached to the $\hat{U}$.VNI phenomenon is the one called in the USA "Les Mutilations de Cattle". It started fifteen years ago. It used to occur even in much smaller numbers. The first time this was reported dates back to the end of the 19th century.

The literature on this subject is less abundant than on $\hat{U}$.VNI; this is why we will develop the subject a little more.

We discover on the territory of the United States by the thousands of slaughtered animals: bulls, oxen, cows, calves, horses, some bison attacked in their zoos. In general, corpses are found with cut udder or rectum, sexual organs, tongue, a lip, an eye with its eyelid; moreover, they are completely drained of their blood and no drop of blood is found near the corpse. The wild animals whose traces are found always stop at a good distance, and in particular the scavengers absolutely do not touch these carcasses. If it is the body of an animal belonging to a herd, the other animals in the herd move away from it at least 30 meters. Around the corpse there is no trace of struggle or imprint; even the flies avoid landing on it and the dogs are frightened when led near the carcass on which the worms do not appear.

The attacks occur at night, sometimes near homes. Some animals are found a kilometer from their fenced meadows, as if they had been carried through the air.

Many more or less far-fetched rational explanations have been put forward; we will not retain them because by testing the corpses of these animals

leads "UFO". In the formation of physical laws are abolished. It is the emergence or the immergence of forms which localize dynamics. (The dynamism is delocalized but in the formation of the parameters try to cling to partial localizations. It is a localization by cumulo -decalar arithmetic). The gravitational field is an index of localization, of a form, likewise a magnetic field, but it corresponds to a localization in progress, not uniform on the form. If one localized the dynamism of the form, then these fields would give fantastic energies.

there are quite special states and eifs.

On April 23, 1897, a farmer, Alexander Hamilton, told a strange story that was reported in a Kansas newspaper. This story can be summed up as follows: he saw with his farmhand a cigar-shaped machine, dark red with a kind of basket on top with strange beings inside the basket who chattered between them in a incomprehensible language. The machine rose in the air above one of the cows of the farmer's herd, she began to moo, a rope took her by the neck and went up to the machine. Despite the efforts of the farmer and the valet to cut the rope with an axe, the cow was hoisted up to the cigar-shape which then disappeared westward. The next day the farmer found his cow's head and hind legs.

The Indians know that these massacres are generally not rational phenomena. Few witnesses witnessed the mutilations or at least they don't mean anything. Let us give some details of cattle found sacrificed.

A white residue was found that oozed from the corpse of a calf to the ground, like a spider's web. By analysis the substance proved to be a petroleum distillate.

Part of a calf's jawbone which was found cut was examined in the laboratory: it was found not only that the incision had a jagged edge , but that it had also been very clearly burned.

An incision in the flank of a mutilated calf has been found on examination to be of the type that is made when performing caesarean sections on cows; the female calf's genitalia had been removed and the intestines were protruding from the wound. Puncture wounds in the animal's jugular vein have been found in many mutilation cases. The theory has been advanced that a saline solution (to better remove the blood) is injected into one opening while the blood is pumped through the other, because most animals are drained of blood.

On a cow there were 55— to -xp- in V because as we have 20 20 b*
seen, in the field of eifs, announcing a value when imposing a scale does not make much sense; one can find several and even a multitude of values. Note that a book on these mutilations was written on the subject by F. Smith [36] . He even mentions unlit black machines (they were first taken for army helicopters by peasants), which passed at very low altitude above the prairies [37].

THE LOCAL AND THE GLOBAL

PART III

Designed by

(France)

Let us consider the following case: a person arrives at a certain moment in a place, following a given trajectory at a certain speed (for what follows it seems that the four conditions: place, trajectory, moment, speed are essential, but perhaps are other conditions necessary?)

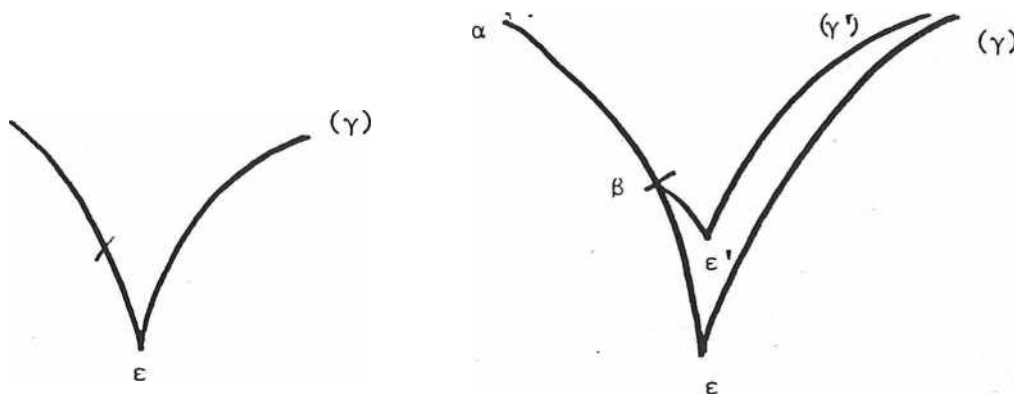

Let these 4 conditions, 6 be a moment belonging to the past in the usual time scale.

Let MN and its progenitor (C) , PQ on (C) but without intersection with MN .

Consider (MN, PQ; a , B). This has aureolar (y) and (y) = Gen a ; (y') = Gen B

$$a/(y) = \epsilon ; B/(y') = e'$$

Remember that the equimsey corresponds to a sheaf emergence . (Here everything is delocalized but by structure transport we use a previously established representation). It may happen that B stands in the sheaf and gives the diagram below:

(ϵ) is then impregnated by (e') and the Obs. in a lives a construction in which there is impregnation of a polaror by another polaror . We will name (*)

(*) It is advisable to complete with annexes I, II, III.

this construction a fractant

Fractants occur from time to time: for example in the case of certain arrangements of boats and planes or people located in the area called "Bermuda Triangle".

What's in the fractant? Whoever enters it either feels a sudden change or a slow deformation of the environment in which he finds himself. As many of those who enter a fractant cannot believe it, it is difficult to speculate on what they have seen or are seeing. There is a space-time structure.

The best known examples of fractants outside areas like the "Bermuda Triangle" are the poles, Agartha, Shamballa. Regarding the North Pole, which was flown over in 1929 by Admiral Richard E. Byrd, it seems that he joined a fractant and that he came out of it' ¹. Charles Berlitz in [1] cites this story: Richard Byrd found himself, during his flight, emerging from a fog bank and he was then flying over an ice bank where he was able to distinguish lake vegetation, large animals as well as humans who seemed to guard these animals. Byrd described what he saw because he had the radio on board and his trip was thus broadcast almost immediately on American territory; unfortunately, the end of his adventure was not known because intense jamming appeared making the pilot's words inaudible.

It therefore seems that Byrd entered a fractant but in a gradual and not abrupt way, which allowed the radio waves to leave the fractant.

Another case of entry and exit of a fractant occurred in Sologne where a couple around the 1960s found themselves during a walk in the forest between La Motte-Beuvron and Cerdon (two villages in heart of Sologne) in a place where after leaving their car to take a few steps.

The sky was covered with fog above the treetops before the phenomenon occurred. Then suddenly the landscape changed completely and they found themselves as if in spring, in an old village, it seemed to them, of a millennium, without noise, where everything seemed fixed and even the trees gave them the impression of a stage set. (*)

(*) In general one enters the fractant but one does not come out of it. Most fractants have no entrances or exits; there are some that have an input but the output can only be obtained by a knowledge of certain manipulations on the spawners.

We will not recount the course of this whole adventure in detail. Suffice it to say that the couple gradually grew concerned about the strangeness they were in and the two people, on retracing their steps, saw their car. As soon as they touched the doors everything went back to how it was.

They had entered a fractant. They were able to come out of it in the same place as they had entered and this thanks to their car which served as a "door". Entry and exit were packed instantly. Information taken after the fact by the two interested parties, it seems that a village in these woods was abandoned around the 1400s. By duplication with S. Franeric, the indication of a fractant was quite clear, unfortunately the study on a fractant is tricky because the individual in the process of splitting puts into it fantasies of the usual world. A fractant sometimes comes down to a shop in a district in which the person enters, buys something; the interior of the store seems old to him, the people who serve dressed in a fashion long since abandoned; the person pays for his purchase, the amount of which, obsolete in our current francs, with current money and he is given change in current francs. She comes out, meals come a few days later and the shop no longer exists; after research, it seems possible that such a shop existed at the beginning of the century. In this case, also summarized here, it is interesting to note that the person to whom this adventure happened came out with an object that could be tested. For about 30 seconds the test has nothing (there was no grid) given then little by little there appeared high Taofel fields. To the person, it seemed to him to live an interference between two eras; the gentleman who served her in the shop was a form in polaror £' imbuing the e; this form was slightly deformed in its acts by its impregnation of £ by e' but adapted quite well. There may be cases where there is no adaptation and then the transition for the one who lives the adventure is very unpleasant.

Questions like: was this man who served in the shop really alive, or is he still living? What if the person buying had dragged the seller out? don't make much sense.

There was consistency of attitudes, of words, in this fractant despite it not being quite like in our time. There were anomalies but the whole was consistent.

A case that has become famous is the adventure that happened to two English women,

Miss Moberly and Miss Jourdain at the turn of the century and this case is known as the expression "the Ghosts of Trianon". There too it is a fragment in which the two people entered and left. This story is detailed in [2].

She first performed on August 10, 1901. They were together.

On January 25, 1908, Miss Jourdain alone returned to the scene, but she did not take exactly the same route as the previous time.

She came back again on September 12, 1908. She had the same depressing feeling as in 1901 and 1902: a sort of estrangement, a muffled voice, a different yearning for things. The entire stage, sky, trees, buildings, quivered like a theater backdrop. Miss Jourdain, like the previous time, like during the visit with her friend, felt difficulty in moving like in certain nightmares. She left the path she was on; as soon as she got out things went back to normal.

In these three experiences in fragments, the two English women thought they had seen Marie-Antoinette, Queen of France, the wife of Louis XVI.

They were not the only ones to have seen something at Versailles; where they went to the Petit-Trianon.

An American family, the Crookes, had lived in Versailles for two years, from 1907 to 1909. The father, the mother and the son had all three, at the same time and twice, seen a person corresponding to Marie-Antoinette, but here it was near the Grand-Trianon. Danielle Hemmert and Alex Rondène in [3] point out some differences in the costume of the so-called Marie-Antoinette (they had met the two Englishwomen in 1914 and had exchanged their impressions); on the other hand, as the two Englishwomen had seen, the lady was drawing.

Another time Mrs. Crooke saw a man in an 18th century costume. Another day Mr. Crooke, walking alone, heard music: it was old melodies played on stringed instruments of yore.

Sometimes a curious whistle had preceded the appearance of the phenomenon.

In October 1928 two other English women who know nothing of those who have preceded them at Versailles arrive almost at the place where Miss Moberly and Miss Jourdain had met gardeners dressed in the old fashioned way. They too suddenly feel depressed. They see a shape, an old man with a haircut (*) J. Cocteau was very interested in the story of the "Ghosts of Trianon".

a three-cornered hat and dressed in a slightly faded and laced green livery. Then one of the two Englishwomen asks him for information on the Petit-Trianon; he responds in a loud, harsh voice, in unintelligible French. This scares the two women who quickly move away, but turning around there is no one there.

It should be noted that this also happened in the previous Versailles adventures, that is to say that people seen in the fractant seem to be erased suddenly as soon as the gaze falls on them.

The first time, in 1901, the two English women saw a kiosk. This was not known to any historian; it was found later, drawn on the plans of an 18th century gardener. Perhaps there was one, but not necessarily like the one drawn and, which was consistent with what the two women had seen.

It should not be deduced that in the fractant we see an image of the past. When we go back to [2], we see that there are inaccuracies in the places, the costumes from the time of Louis XVI, that it is necessary to introduce motifs into the costumes of the gardeners who are rather from the period- Louis XV. This is not a precise description but rather a settling down of a short history of vestiges from several eras. This comes from the fact that the Obs is at a and hangs up g as explained above, but the g is on the parent of a and it is on Gen a that the ladder of is launched. time. In this story, we have precisely what happens in the fractant. (a story that seems to be built from snippets), a kind of caricature of our construction of the past by launching the time scale. The Obs. .en a is more or less transported to B" and this unconsciously lies, but it is necessary that (MN, PQ; a, B) has taken shape.

On May 21, 1955 another story was reported at Versailles which was experienced by a London lawyer and his wife. They saw a woman and two men walking peacefully; the lady was between the gentlemen and they were chatting. The lawyer's wife was especially interested in the dress of the woman while the lawyer in the clothes of the two men. The clothes were unusual for the time . And all of a sudden, they didn't see anything anymore - they must have lost interest in it for a few moments, but not so much that they were hidden by forms present.

We will not go into more detail about the "Ghosts of Trianon".
Many other facts can be found there and are just as strange. We arrive

thus in this fractant at the conclusion that we find ourselves faced with an incomplete construction.

If you test a human being who has entered a fractant and hasn't come out, you don't find him dead; this is what led to research into the concept of fractant. The fractant appeals to concepts which are in the non-rational C. de C. but in the usual representation, we find the index of the fractant: people who disappear and reappear and tell after what they have "lived", planes, boats which also disappear in curious circumstances; finally we could cite multiple anecdotes, cases for example where a fractant's entry is on one continent and the exit on another continent.

Authors in novels have sensed fractants. This is the case of Mircéa Eliade with [3] by René Daumal with [4]. We could also find it in science fiction, although the author often brings it back to stories of other dimensions and parallel worlds.

Some "UFOs" may be fractant gates, but most "UFOs" do not form in fractants. In general a mimoid is not related to a fractant. On the other hand, certain miraculous springs that we discover a few days after an apparition has taken place come out of these fractants and if we went up the spring we would close the fractant. By carrying out an experiment, by looking for a proof in a C. de C., we can destroy what is in another C. de C. We must not forget that a C. de C. when it is sufficiently developed becomes a kind of alchemist's retort: it engenders itself and this when it is rich enough. This is why the usual C. de C. gives complete satisfaction to the RBB who find themselves in it completely; they get trapped themselves. The very dense C. de C. fabricates proofs of certain hypotheses, themselves corresponding to tendencies of overlocalization in the realization of the phenomenon. This does not prevent instabilities in the usual C. of C. as has already been pointed out above.

Books like the Bible contain emergences at different levels. It is necessary to attach more to this point of view than the historical presentation given everywhere. And this is not true that for the Bible, a little less strongly all the same, these emergences also intervene in the histories of nations. The point of view of historians has generally distorted everything, first because they are not aware of psychology and politics, then because they

want to make History an exact science^{^*} lastly because the chronological unfolding, in spite of the cause-effect system being associated with it, does not account, not for the connection of certain facts, but for their unity.

In the past time scale, emergences at different levels can be in transfer due to the emerging form and the degree of emergence; we can thus have this: the emergence of forms $F^{\wedge}$, F_2 , $F^{\wedge}$ at times $t^{\wedge}$, $t?$, t_q is in reality one and the same form and separating it into F_n , $F_{,,,}$, F_q is a ^J (***) 123
view too narrow. We are then faced with a macron (a macron of a particular type holding a little of the so-called form "containing its time").

In a fractant, it can happen that two people don't see or hear quite the same thing. This is what happened the first time at Trianon where the two Englishwomen, after having confided in each other, realized that details differed in the story in the story of each. This is not due to a lack of observation nor to memory loss, but to the question of the internal coherence of the fractant.

Fractants may well have no output; this is the case with what is happening in particular at the "Bermuda Triangle".

Macrons can turn into fractants.

Fractants can be empty and filled with what the person who enters them puts. This can lead very far, because at that moment we manage to enter the fractant that everyone carries within and which is the brain.

Now let's see a halo associated with a plane or a surface. This halo will be obtained, for example, by parallel bands drawn on a white page. The halo, when one is aware of it, gives depth to the surface. The drawn parallel bands become a kind of punctuation, or a support for a story that can be linked to a text. (We created an atmosphere). This story can be followed by an observer. Instead of

(*) Naivety of historians which keeps people in ignorance.

(**) Reincarnation can be understood in different ways: We can have

transfers between	a person P and	a person P_2 who	lived at
different	periods,	transfers between Gen $P^{\wedge}$ and Gen P_2 ,	
an	overlap	and P_2 , this	
of P_2 by P if	P lived before $P_{,,}$,	, an equimsey between $P^{\wedge}$	

which entails that $P_{,,}$ and $P_{,,}$ are the emergence in a sheaf of a delocalized form.
We can also have the case where $P_{,,}$, $P_{,,}$, $P_{\sim}$ behave in a certain past
of a living being $P^{\wedge}$ like forms that are not very localized, but these forms $P^{\wedge}$, PP
constituting another form as we have seen. seen above and $P^{\wedge}$ being in transfer

bands on a sheet of paper, these may be signs. The First Tables which could be "read" as well from one side as from the other, where the same text appeared, that of the Torah, could be in such a halo. The reading time intervenes very little, since the story takes place for the Obs. The signs are on lines that serve as a support for a representation

• • (*)

which is placed in the mter-lines . But we find for (lines, page; natural arrangement, landscape) a halo. Here again we will find fractants, which is another explanation of their reality.

The word fractant was made from that of Objet Fractal. About a hundred years ago, on June 20, 1877, the German mathematician Georg Cantor, sent a long letter to his faithful confidant Richard Dedekind. He admits to her his concern about the meaning, even the validity of the concept of dimension, because it seems to him that he has shown that a square does not contain more points than each of its sides!

Dedekind is quick to demonstrate that the concept of dimension survives this attack. However, in an article published in 1890, as brief as it is striking, Giuseppe Peano delivers a new assault. It describes a sequence of polygons that look quite innocent, but happen to fill a square in a progressively tighter way, so that their limit passes through any point of said square.

Thus let us return to the qualifier fractal: its intuitive meaning is: applies to an object whose shape is extremely irregular and moreover (possibly) interrupted, fragmented, whatever the review scale

Fractal dimension is dimension in the sense of Hausdorff and Besicovitch; it is a number used to quantify the degree of irregularity and fragmentation. The fractal dimension is rarely an integer, it is a fractional or even irrational number.

The fractal object is a natural object that it is good to represent mathematically by a fractal set [6]. The Object_Fractal is built by

(*) Hence the expression "Read between the lines" takes its exact meaning.

(**) The masculine plural is fractals (modeled on navals). It seems good that the corresponding nominative is feminine: fractales.

(***) We will adopt as abbreviation O.F.

steps. It takes an infinite number of steps to achieve it. It is interesting to „

note that these OFs — . , 4.5 emit th -th , : if?
 at step 4.5 emit at des, 4 ,C. by T. By computer
 • a% th ■■*■■■ ■

it can be done up to step 25; the eifs will then be very powerful. We can combine one or more shapes with the shape made by an OF at a certain stage and then we go up to very high C. of T.. In the construction of 1'0.F. we can keep several steps on the same drawing at the same time, which amplifies the eifs.

If we apply the principle of transport of structure of coherence to that of OF in another C. of C., we can try to find with the pendulum or the rod places corresponding to OF; we find these places at given times. We will say that they have an OF character

Consider (Object, OF; step of OF, Objects or places with character OF); we will have a halo: this will be the fractant. If we transport in a region (land with clutter of grasses and shrubs, a forest, certain rocks ...) a shape with an OF character, we can give to these places, shapes, an OF character Hebrew is a language with OF character Certain images, mists are fractants.

In fractants can form minoids as minoids can be gates for fractants. The "UFO" type formation can have several processes. We are going to try to present one that will take us off the beaten track, such as those found in the many books, reviews that have absolutely wanted extra-terrestrials; Among the authors who contributed to this literature, some turn around feeling the absurdity of their explanations and for this finally cite John Keel, (although they ignored him for 25 years) who from 1955 had advised in several works to bring the "UFO" phenomenon closer to fairies, apparitions, etc., in order to see a semblance of theory appear in its inconsistency. In the same way he had indicated that the UFO (which is for us a particular case of minoid) should be put on the same footing as parapsychology. J. Keel was from the beginning considered as a wacky by the "saucerists" and these same saucers now take up his ideas sometimes without quoting him, which seems quite natural to them!

The minoids are attached to the theory of forms and concepts that we have built. But a religious apparition, a fairy, an elf, a "UFO" are not in the same process of localization. We already have

saw a possible explanation for fairies, pixies; religious apparitions use other approaches in the concepts we have constructed; we will not present them here and all mimoides of a religious or pseudo- religious nature are not necessarily healthy for human beings. It is not because there is a miracle and that we cry out for the extraordinary, that we must throw ourselves headlong into the phenomenon.

In the formation, everything happens as if we were entering a story, whereas in everyday life, we are installed from life to death in a . (*) story

(*) Perhaps, at times, we are not quite settled?

On the other hand, let's say right away that the Shroud of Turin has a form attached to it (but of course not at all of the kind associated with UFOs - this can easily be seen thanks to the eifs and states). We are in front of a form which emerges. It is absolutely gigantic that Christ, when he "imprinted" his form in the shroud, created a process that started. Did the disappearance of Christ in the tomb take place in the midst of a violent and luminous flash [11]? This is an assumption due to recent research into "memory" in the shroud but this memory contains a dynamism. The dynamism is transformed little by little into evolution (which is its localization) by the scientific studies that are done on the Holy Shroud; they bring confirmations on the body of Christ, and the flagellation, that is to say his martyrdom. It is also necessary to understand that the discoveries by the studies on the shroud are only the marks of stages of a localization. For example, the experiments involving the electron microscope on a small piece of the Shroud were a process of localization . Each new study brings another more particular detail. In this memory left by Christ, a form is created which therefore emerges little by little.

Testing the photos of the shroud shape, there is no vital field or shin on the head. On the other hand, we find eifs at high C. of T.; there is the fundamental form of life and a psychic field (for the latter the answer is rather weak). The form gradually emerges from a channel. As already mentioned, the channel is different from the shifter. The concept of channel, discovered by Samuel Franeric in 1976, is a way of localization or delocalization which is attached to the portion of space located between two emerged forms; let us consider, for example, on a sound box two stretched almost parallel strings; in the - interval comprised between the two strings, a channel can be detected. (This does not mean that on every stringed instrument, this is true; perhaps on David's Harp, this was done?) there is no more concept of flight. The leak has disappeared, the mark too

The Christ who emerges from the shroud is not identical to the one who *disappeared* , the memory contained the whole story of Christ made man, but there is at the same time a bit of what the story suggested: the memory of the story. And a being appears little by little localized by more and more advanced technology. It is a reminder to the human being, a wink, to make him feel that what he discovers through his rational technology is the enrichment of his C. de C., that is to say that discovery is creation.

The human community has a halo; it is the human being in relation to all human beings, at a given time. It is thanks to this halo that people will feel the interest of a new idea which can be a way (while to be convinced of it they will try to make statistics which is not necessary), the halo giving them more assurance of the path to follow.

In the study of mimoids, progenitors also intervene: progenitors of one or more TOs, even of a multitude of identical TOs. of living systems, progenitors of aureolar ones.

Consider a possible scheme. Let us return for this to the dynamic duality

(A emerging from B) I -----< (B emerging from A)

which we simplify in the form

1 " -----<II.

We will see later what A and B could be.

Either a Obs. who is not aware of the dynamic duality

I I -----' II but who unconsciously is going to use it, and let's place a in A . Let b

an OT for example or a set of OT or even living beings. Let's also place b in A . If a chooses I, that is to say places himself in A, emergence of B and looks at b, he will therefore see what we have put in place. If a moves with respect to the system I, that is to say supposes B emerging from A , it will end up with a' , a' facing b' where a' and b' belong to B emerging from A . This displacement is possible thanks to the dynamic duality

I ' -----* II (which a ignores) goes from b to b' and will give features which will be put on b become b' , more or less localized functionalities. A and B are two polarors and let

(C) be a progenitor. Say that a moves, that is to say that a corresponding to a portion MN of (C) passes by correspondence

single serve dance Q outside of MN , still on (C) .

the dynamism of A and B will go to a MN is the beginning of (VS) who is progenitor of MN

QP is on (C); E , E' are the two polarors such that $MN/(C) = E$ and $PG'(C) = E'$

(O progenitor of PQ

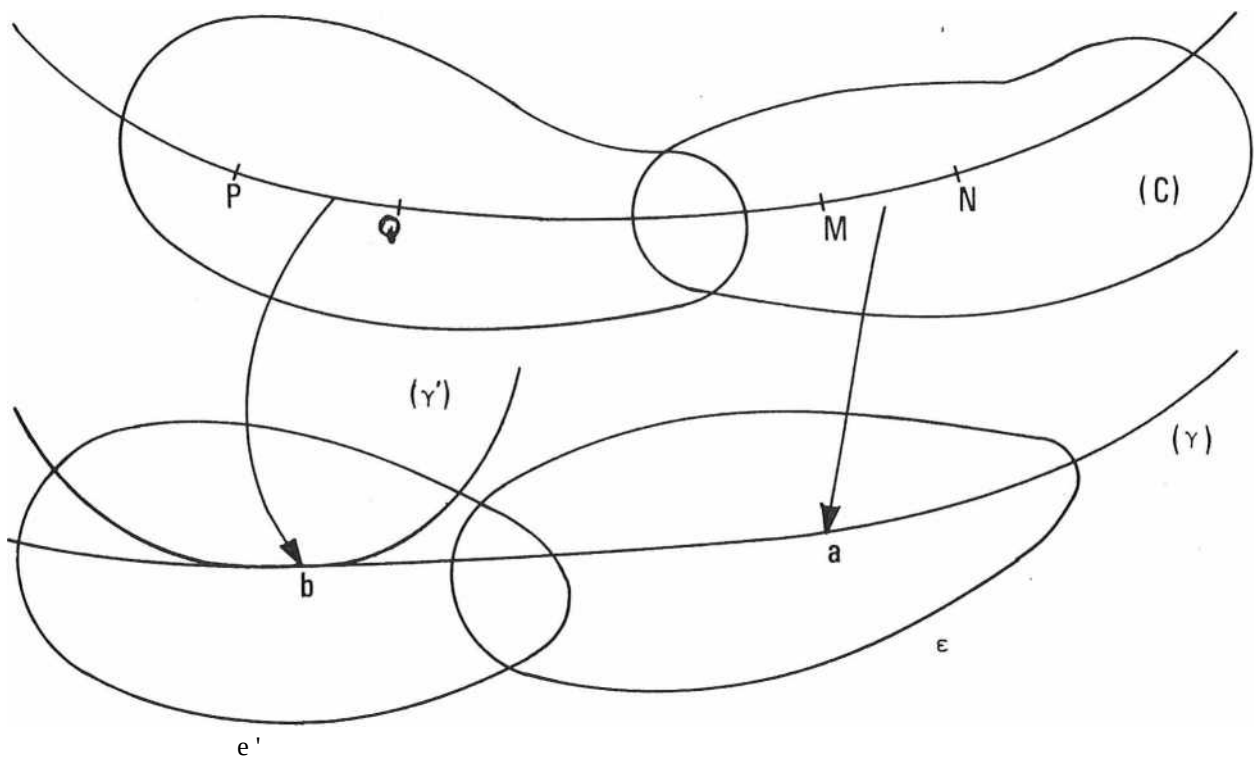

$(MN, PQ; a, b) = (y); a/(y) = e$

The human being projecting himself onto all human beings results in an aureolar o

The human being in dynamic duality with all human beings constitutes an enel τ o acts on (y) , open form, to give (y') another open form such that b and (y*) are in equimsey: $b/(y^*) = e' r$ places ϵ IN DYNAMIC DUALITY and $E' (E, E^* ; \epsilon, \epsilon')$ has a mimoid as aureolar: $1'0.VNI \epsilon i \rightarrow \epsilon'$ creates a formation S .

S will unroll the formation and $1'0.VNI$ is this unfolding

In summary :

- The same is true for cattle mutilations in the USA.
- Here ϵ emerges from e' and ϵ' emerges from ϵ
- ϵ and ϵ' are respectively the preceding A and B. We see on this model that the UFO phenomenon can only take place if (y) passes into (y') such that (y') is the parent of b OT or set of OT, or something else.

- As in the model described for sprites

related in different ways.

Other schemes are possible; they are multiple.

An important notion is that of the "harmonics" of forms. Before tackling it, let's see a few additions relating to prehistoric objects .

Consider the statuette called "The Venus of Lespugue". Many such **female** -looking figurines were called Venus, which is somewhat derogatory **as** it is usually assumed by RBBs that prehistoric men were more boeotians than human beings. Let's see one of these.

Lespugue is a small town in the department of Haute-Garonne, **France** . The region is hilly and harmoniously composed of crops, meadows **and** woods. There is only one harshness in the landscape: the notch dug by the Save, a small river with cool waters born on the nearby plateau of Lannemezan and which will flow into the Garonne.

Lespugue was made famous by a statuette discovered in 1922 by a prehistorian, the Count of Saint-Périer. It is mainly thanks to his wife that the discovery could be made. Indeed, she went deeper into the cave in which her husband, themselves and helpers were digging and she noticed a mound covered with grass. She made a superficial sounding there and found that the very hard ground in this place had not been disturbed like all the rest of the cave.

Following his remark, the workers begin to cut the topsoil, which is 25 centimeters thick. Below appears a layer of hearth ashes, in which there are some flints. A rock is dark there; the workers free it. One of them suddenly brings back an object which is at the tip of his pickaxe. He is immediately examined; it is a prehistoric female statuette, from the Aurignacian period in ivory, comparable to the Venus found at Brassemponty, in the Landes. The blow of the pickaxe broke the object into two pieces; the left arm is missing as a result of an old fracture. The object is so fragile that light scales stand out from its surface.

This statuette will remain incomplete, but regardless, the symmetry of the forms is so remarkable that it is easy to make a perfect reconstruction. Mr. Boule paleontologist, with whom R. de Saint-Périer is very close, is enthusiastic.

The statuette is small: 147 millimeters high by 60 wide. It is carved in a fragment of ivory from a mammoth tusk and the artist has succeeded, despite the extreme hardness of the material, in a work that denotes both an admirable sense of sculpture and an unparalleled technical skill.

The head is small, ovoid. No feature of the face is marked, (one can suppose that the nose and the mouth were represented by lines of color). The hair, indicated by parallel notches, extends back to the spine of the shoulder blade and covers almost the entire face in front. The thorax is flat, but the breasts, set very low, swell and spread out gradually until they form enormous skins, resting on the stomach, itself framed by prominent hips. The legs are short, the feet barely outlined.

HP Eydoux remarks: 'A singular garment, made up of narrow bands and resembling a kind of loincloth, covers the back of the legs'.

He adds: "seen from the front, the statuette is made of a superposition of spherical masses assembled with a keen sense of rhythm and balance, according to a refined play of volumes and patterns. The anatomical reality is deliberately - distorted in the benefit of a true abstraction".

Eydoux asks himself the question of why such a shape; he does not find an explanation but feels that it is necessary to think outside the box to manage to grasp the motivations of prehistoric men. He wonders: "Was prehistoric art art for art's sake? Admittedly, it could have been a simple game, born of the forced leisure of long cold periods, during which man decorated the walls of his shelters as well as his everyday objects. But there is also no doubt that religious concerns or magical rites have, to a large extent, inspired his works".

Why is the Venus of Lespugue said to be of opulent forms? Concern for realism say some. But then, in this case, wouldn't the artist have represented the features of the face and indicated the arms and legs in a less schematic way? It is very voluntarily that the sculptor gave to the breasts, the belly, the hips a disproportionate and unreal importance, while giving to the other parts of the body only an almost schematic value. He highlighted with systematic complacency the attributes of femininity". He ends his article thus:

"It is difficult not to see there a work which symbolizes motherhood , fertility. The Venus of Lespugue is the ancestor of the mother goddesses; she exalts procreation".

This last point of view had been pointed out many times by the palaeons.

tologists, the magical character much less. The two points of view can also be associated. The magical character was nevertheless sensed by prehistorians • Chaumery and Bélizal who worked in the field of eifs from 1930-1935 have, in a book, [7] pointed out the importance of the arrows drawn on the profiles of animals painted in the caves. We find in this work: "Bold explorers, like Norbert Casteret, discovered roughly carved in the caves of the Pyrenean basement the proofs of this magic which allowed the hunters of the prehistoric time to first paralyze the game to be able to capture it more easily later. To achieve this goal, they drew on the walls of their underground dwellings the shape of the coveted animal and previously spotted in one of the hunts , , (*) .

precedentes • , then a stylized hand usually placed on the side of the beast, marked the will, the power of man over his victim" and Chaumery and Bélizal report what Carteret writes on this subject "The Aurignacians and Magdalenians, essentially hunters, sought to promote the success of their hunts by preceded by ceremonies whose meaning appears to us more and more as prehistoric discoveries are made. They represented the animals they wanted to kill, then, during the sessions of magic spells, traced wounds on these drawings, thus killing the animal in effigy, to ensure, on the day of the hunt, the real capture. of the beast, previously bewitched".

"Thus are explained, continues Casteret, the holes, the arrows, axes, clubs which are seen on many drawings of animals. Sometimes the intention of the primitive hunter is even more explicit; the animal is represented falling into a trap, in a net, succumbing to stoning. This theory seems above all indisputable when one considers the lions and bears of the Montespan cave who were targeted with blows of spears and arrows aimed with precision in the vital parts and with so much violence and of determination that, sometimes, the statues collapsed". Chaumery and Bélizal then speak of the "command baton" which was quite simply a pendulum.

This pendulum had the particularity of carrying animal drawings engraved on its walls. Usually constructed of antler or reindeer bone, the command stick was a perfect witness detector for hunting the animal.

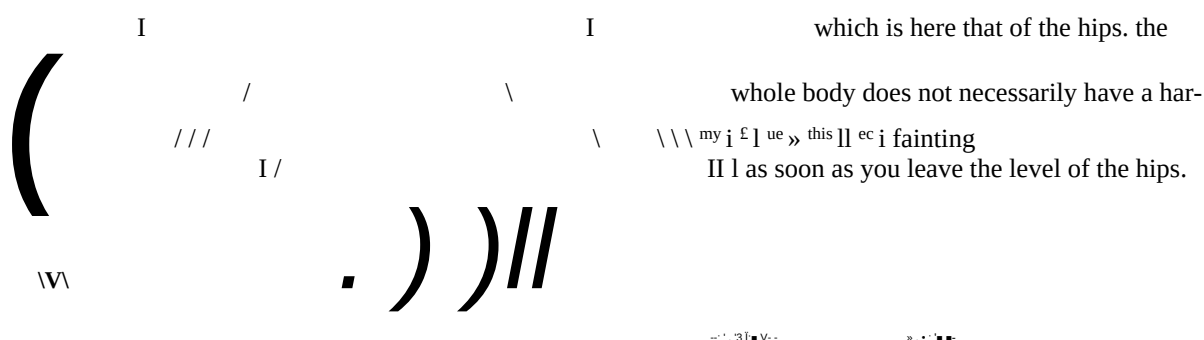

(*) Note that they also used splitting, which saved them unnecessary outings.

upper part with a hole used for the passage of a cylindrical wooden or bone rod. stick-pendulum would revolve around this support as soon as the hand of the other arm, forming an antenna, picked up the reindeer radiation (if it was a question of pulling a reindeer) and this regardless of the distance where the animal was .

To locate a game, the Magdalenian had only to eliminate in his brain all the drawings of animals finely engraved on the stick, to keep only the one that was the object of the hunt (mental solution)"

Note that there is no "reindeer", "mammoth" or other radiation. The hand, in the human being, has an intense character of localization. Features are mostly localized. But the human brain, by its character of fractant allows to make a "monkey" of these functionalities and leaves by the drawing of the hand on the drawing of the animal or close to this drawing; one may be in contact with the enels attached to the animal-entities. This statuette called the "Venus of Lespigne" like the Venus of "Willendorf", the hips are very widely suggested. These statuettes, one might think, followed magic ceremonies. They could even be in transfer with the female Enel.

The human beings of these prehistoric times were no doubt sensitive to delocalized notions. At the level of a woman's pelvis, the rounded shape of the hips (seen from the front) is reproduced approximately 3 times a few centimeters from the skin, as in the diagram below. We will call these delocalized forms harmonics of a form

The role of the so-called "Venus" statuettes with outstretched hips was, thanks to magical manipulations, to amplify the effects of these manipulations by using the harmonics of the form and to do this, the

or even the second harmonic.

We find one of the harmonics in the form which is the violin, this for the table of the instrument and in its widest part. The viola, the cello can have harmonics, but it is rarer. A man's body at the hips has no overtones.

Let's come back to the concept of form: a painting for example: The work, already ambiguous by its function, is even more so when we try to remove it from its original atmosphere, from its primitive function (which is what every collector does). Indeed, what was it used for and what is it used for now? But it is ambiguous when one tries to analyze it as an isolated object?

Were we to fully describe this certain order found in a painting, we would still have no guarantee, either that this order is the primary cause of our emotion, or that we could, with the help of this order, our turn a beautiful painting.

But consider the ambiguity of forms. What is a circle: a moon, a sun, a flower, a head, a plate, an ellipse seen in perspective?

What is a square: a section through a plane passing through the axis of a double cone of revolution, an axial section of a cylinder, the projection of a trapezoid, some view of a parallelepiped, etc... ?

A rectangle with its two diagonals is both a pyramid seen in the axis, hollow, in relief, or a railway track, and a roof a letter envelope. The ambiguity of any elementary form is all the greater the fewer lines, points and colors it contains. (Here we fall back on the simplicity defined by Ulham). We can say that it then contains all the virtualities. Indeed, it is often enough to give a name to the form for the ambiguity to cease. The game of hollow cubes in relief stops as soon as it is decided that they are hollow or in relief. The spectator, then, projects certainty into the ambiguous form. [8]

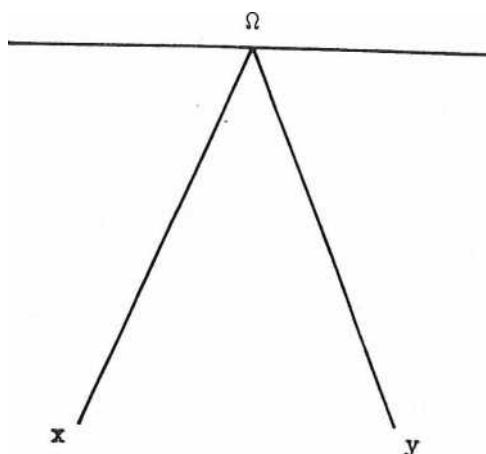

Let us deal immediately here with these cases of several interpretations of a form

given. The detected eifs can change according to the representation that we give ourselves of the form. But then what do we detect? : ex:
does the program exist before its meaning is given?

The EH is a sorting system; it creates its fields of Understanding and these interpenetrate in the fields of coherence. The eifs are from the moment there is representation whether it is coherent or not.

Consider a perspective on a plane;*it will be realized by two Labatchevsky parallels which will intersect at the vanishing point located on the horizon line. This figure in a plane can be seen a priori as a

(**)

line intersecting at the two half-lines at a point fi . If we think in perspective, particularities appear. The point fi responds to KShPh as a state. We can accentuate the response by a y circle (central in fi) from which rays leave, that is to say a naive representation of a setting sun. If we pierce the plane at fi , the KShPh disappears; the same if we put a small point in this same fi . If we send by a wire an eif in fi , we can recover it at any point of the angle 'xfiy'. The human being detects the eifs which are attached to his representation as in the case of a house where one can choose between the house as the reunion of its rooms or the house as a whole.

Maurits-Cornelis Escher, born in Leeuwarden in 1896, in Holland, led a discreet life, all dedicated to hard work in the arduous discipline of drawing and graphic arts.

The graphic techniques he practices are classic: wood engraving with a penknife, lithography, engraving on linoleum. His skill is noticeable in the engraving in several irreproachably repeated colors, which, generally, is only within the reach of professional engravers without artistic ambition. The great event in Escher's life was the discovery of his work by men of science. Following his participation in a congress

(*) We find ourselves in front of what we called a Representation.

(**) This is another representation.

of mathematicians at Cambridge, an important publication in the journal "Life" was dedicated to him. In 1954 he had an exhibition in Amsterdam and another in Washington. All of Escher's thought revolves around the idea of reducing space to the plane. Indeed, in this operation which consists in flattening the objects and nevertheless making them stand out as if they were in volume, there are a number of possibilities of establishing different links between one object and another from the moment when it is amputated by one dimension.

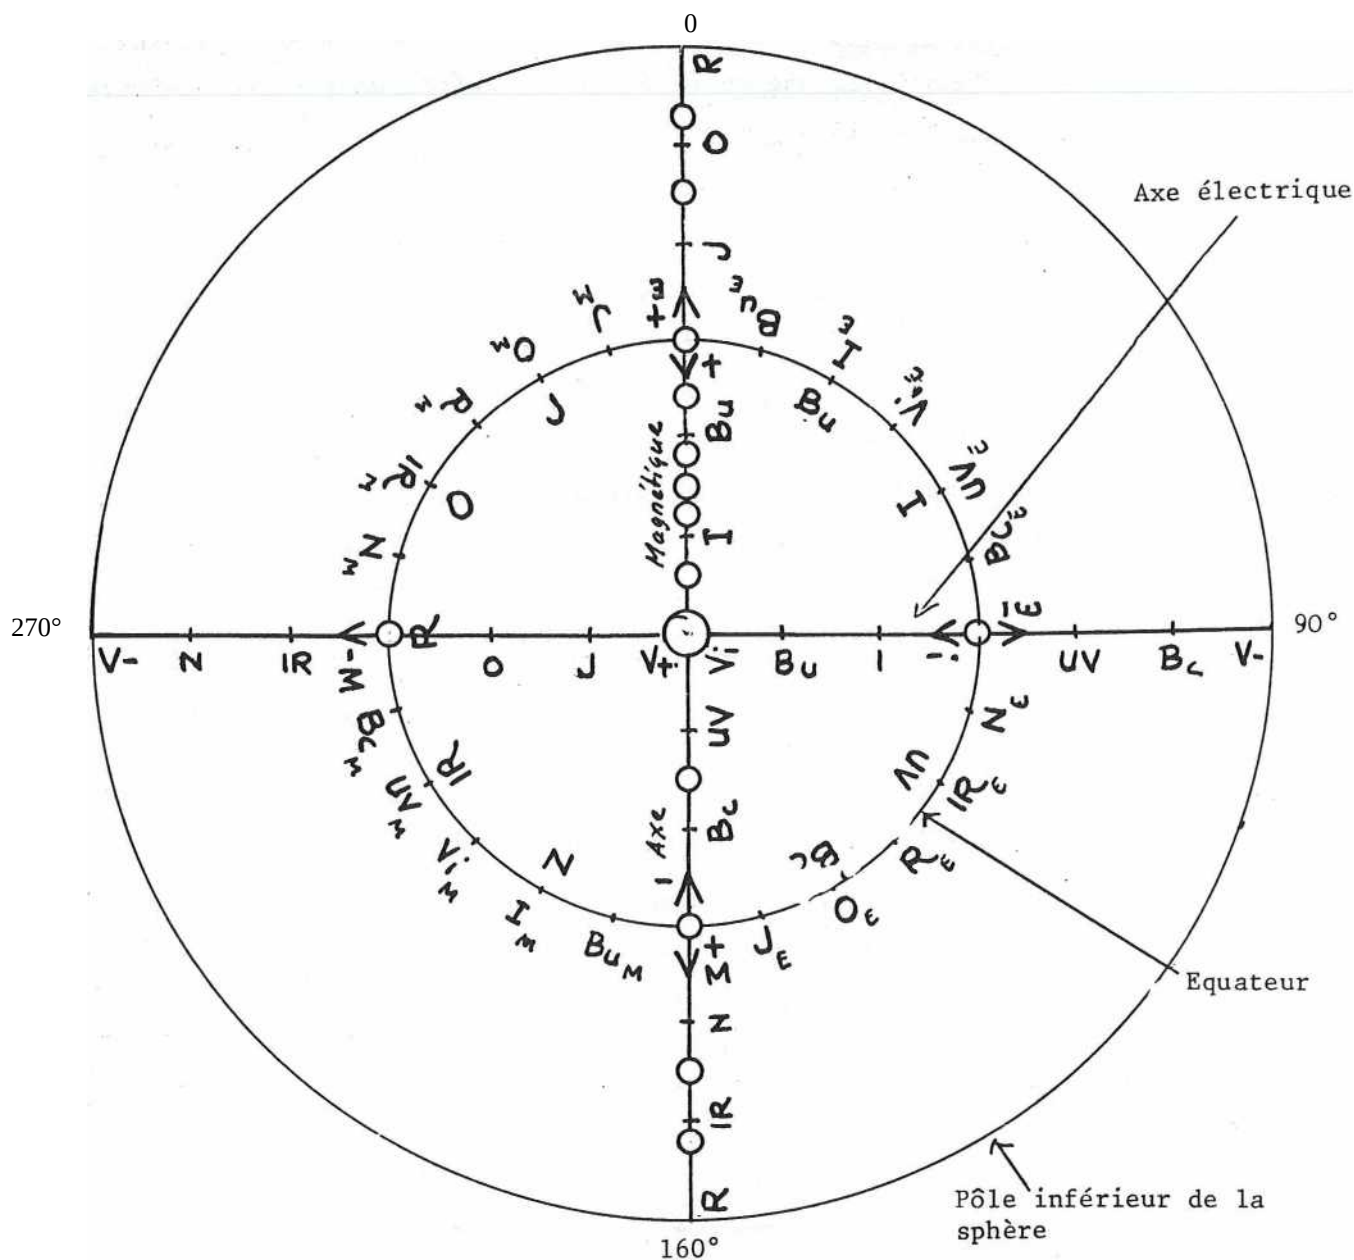

In perspective an object in a given environment itself rendered in perspective will not have the same eifs nor the same states as in direct vision. One can wonder if there would exist mathematical transformations. 3 moving from K to the plane that would retain eifs and states. We do not yet have an answer to this question. One can for example associate with the sphere pierced with holes of Chaumery-Bélizal a figure on a plane which has the same eifs. We give the diagram below.

About drawing using perspective, we will turn to Escher. Albert Flocon met Escher who described this to him in particular about his engraving "Ordre et Chaos" from 1950 [9].

"In the center of this engraving is a starry dodecahedron partially enclosed in a translucent sphere, a symbol of beauty ordered according to mathematical laws. In this shiny bubble is reflected a collection of heterogeneous debris, bits of string, broken glass, broken pipe , cork, etc... It was difficult for him to find debris that was both at the limit of the still recognizable object and whose appearance he should still be able to render. the informal by approaching it from the side of the form; indeed, what can be the state of destruction of a yogurt pot lid so that we can recognize both this one and its destruction?

In the plate "Tetrahedral Planitude", the painter has done in such a way that we accept the possible existence of this micro-world where the buildings are superimposed in a dizzying pile. Whichever way you look at this board, it is always straight. We could also speak of the "Three Spheres", engraving from 1945.

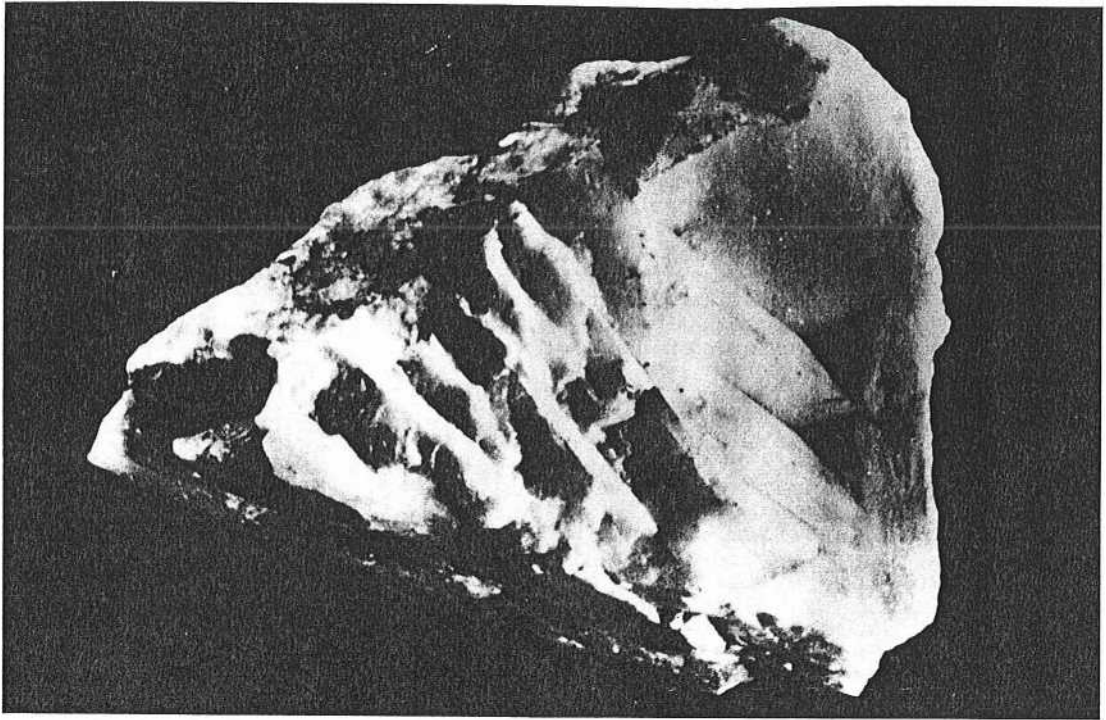

Escher drew crystal lattices, regular, unbroken fillings of the plane; we have disturbing compositions. Here, the notions of form and content disappear because they both fulfill these two functions.

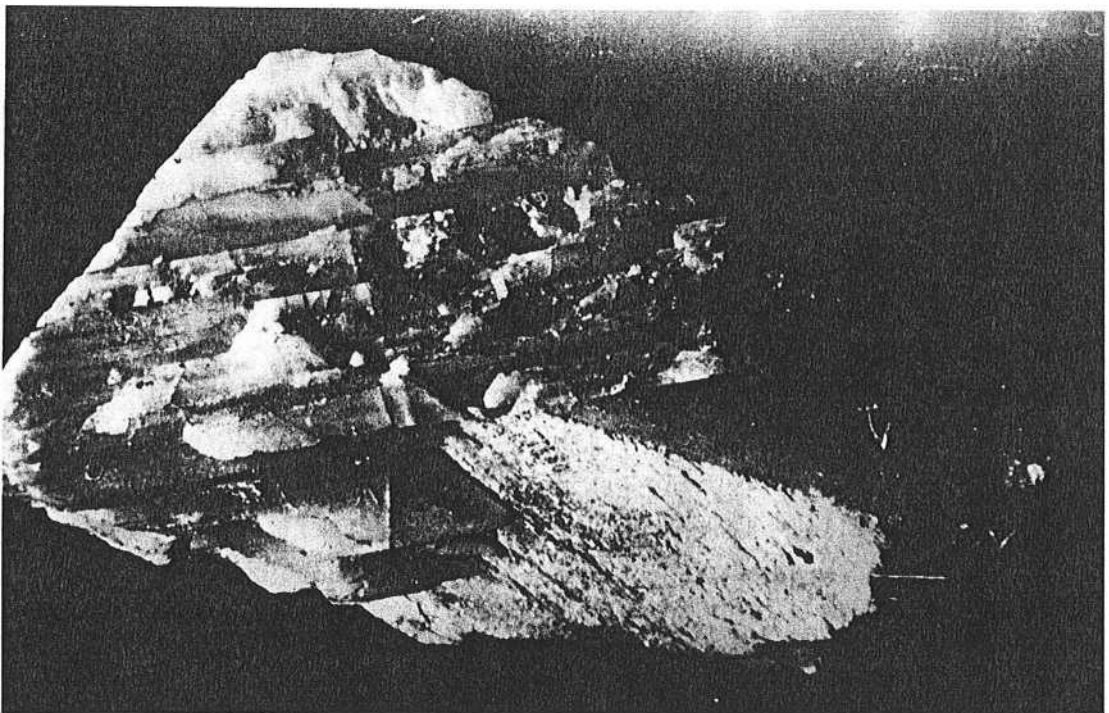

Transposition in plane of the sphere; CHAUMERY-BELIZAL (Realization by J. de la Foÿe) 0 = hole right through
 -----= groove

By moving a cylinder over the disc, the emission at the surface is detected in the form of a vertical emission or detected at 180 . We find the spirals, geometric places of "colors". A needle in the center emits in the extension of the V*, the colors of the aura figured on the exterior of the equator . A needle focused on the RV hole, directed towards the center will cause M to emit the undifferentiated R along the V axis, in 180° •

Quartz Pieces

We find on this piece of C. of T. and the polarities

We don't find a C. de T. but there are polarities

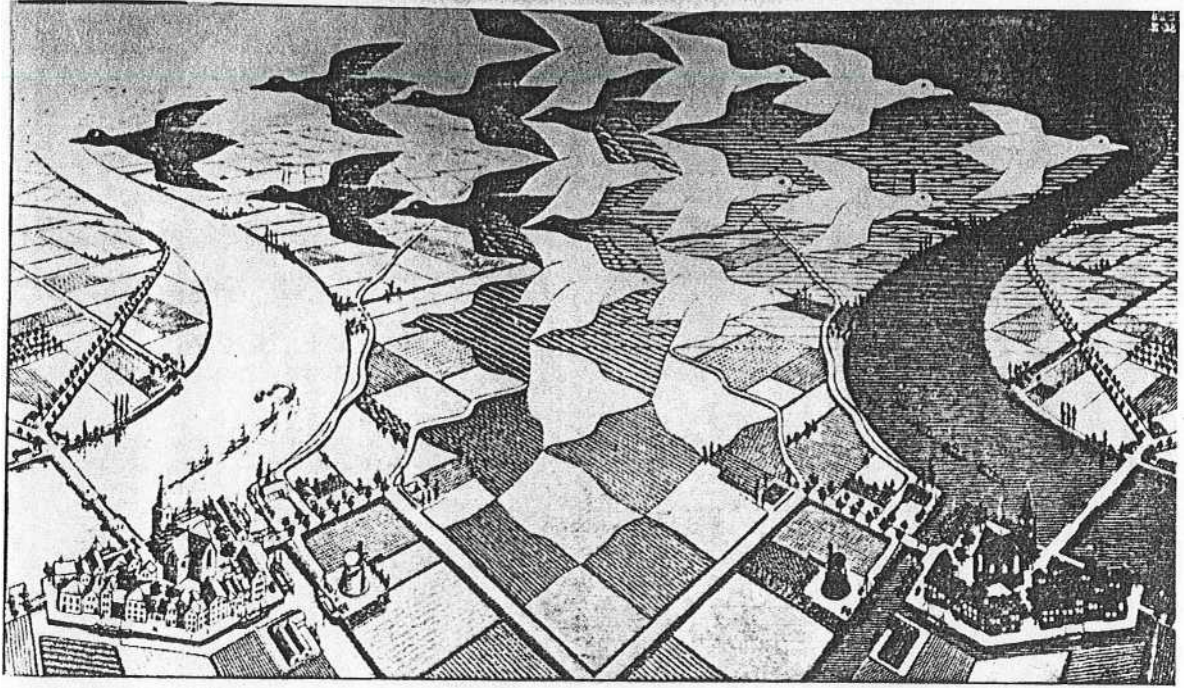

successively: for example, the black riders that fill the sheet are transformed into white riders on a black background when one fixes one's attention on the void that separates them. As a result, any line drawn on the sheet as Flocon writes, or any limit given to a form belongs at the same time to two different figures.

A number of Escher's prints are called "metamorphoses". We see how vague forms (shapeless forms) are converted into well-defined and known forms and vice versa. A grid becomes a chessboard whose squares are transformed into black and white lizards, which are reduced to hexagonal cells, which become the cells of a hive; the continuous pattern with bees emerging from these cells; these bees in their steady flight cut out words that take the shape of oncoming fish. But the black background that supports the fish is transformed into a flight of birds which, in turn, freeze into a formless network which little by little becomes a cubic network, and this cubic network becomes a city with a Mediterranean look. Towers of this city advance towards a chessboard; it transforms again into formless black and white shapes to gradually become squares and everything begins again [10]. It is interesting to note that in these descriptions taken from [10] it is mentioned that easily recognizable forms, but that formless forms are neglected; although the author recognizes them as fundamental, since Escher used them.

Escher's technique is very interesting; because it clearly expresses the emergence of a form based on formless forms. If we test for example an engraving like "Day and Night", we find, if we do not try to look at either the day part or the night part, a KShPh state. This state is KShfh not to express total incoherence but a lack of understanding.

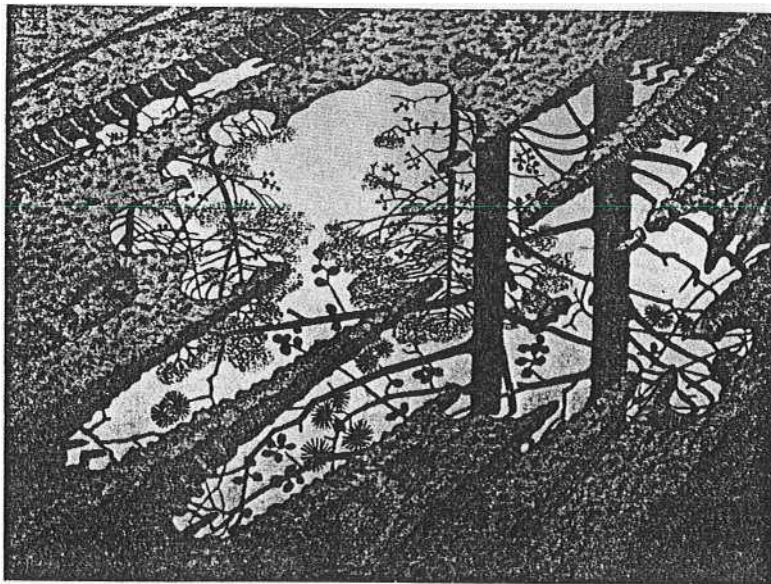

Consider another engraving by Escher: "The Raindrop". The drop of water can be a support of reality and the leaf, variations around this support, or the leaf is the support and the drop of water is supported (this is the usual view - the drop is on the leaf, the form is in the Universe). It is the same for the engraving "La Mud". (*)

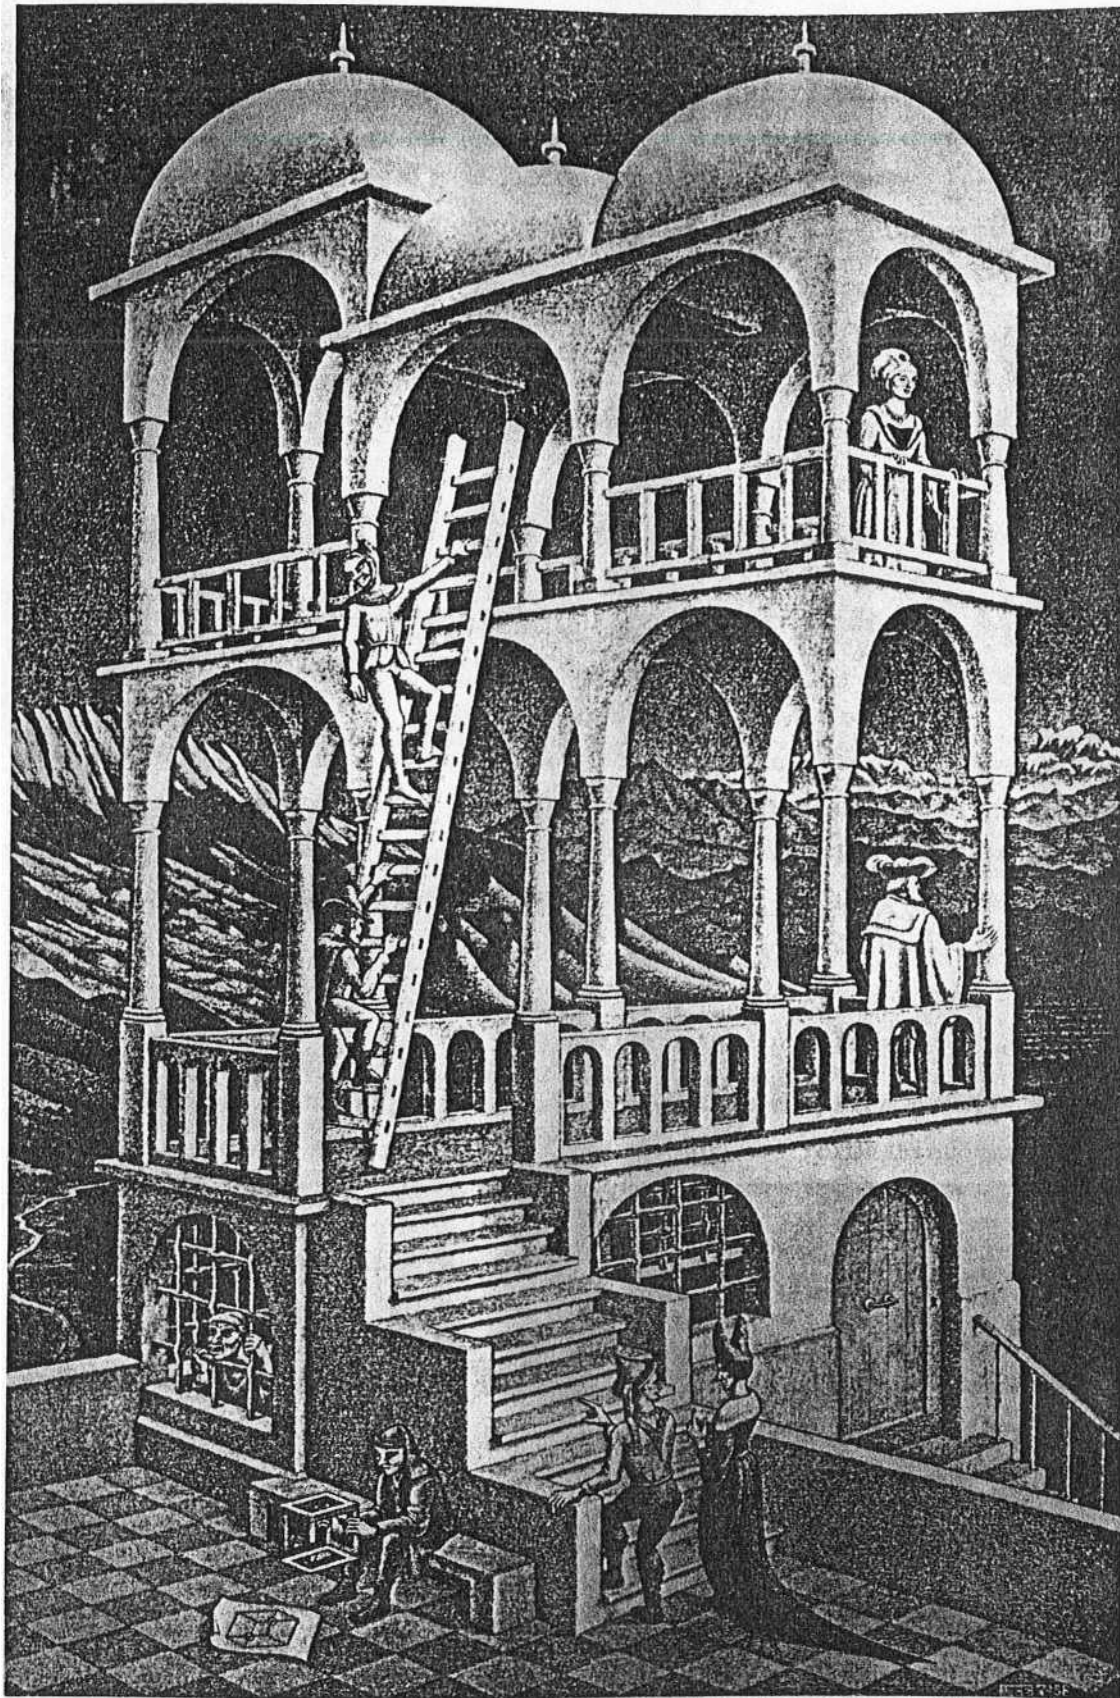

(*) But the other point of view is: from the drop leaves the leaf. The drop closes the depth of the decalaire, as well as the emergence. If we want to consider the two points of view, we will say: The leaf is the support of its emergence or the drop is supported by its extension, hence the local is the support of its emergence and the global is supported by the localization.

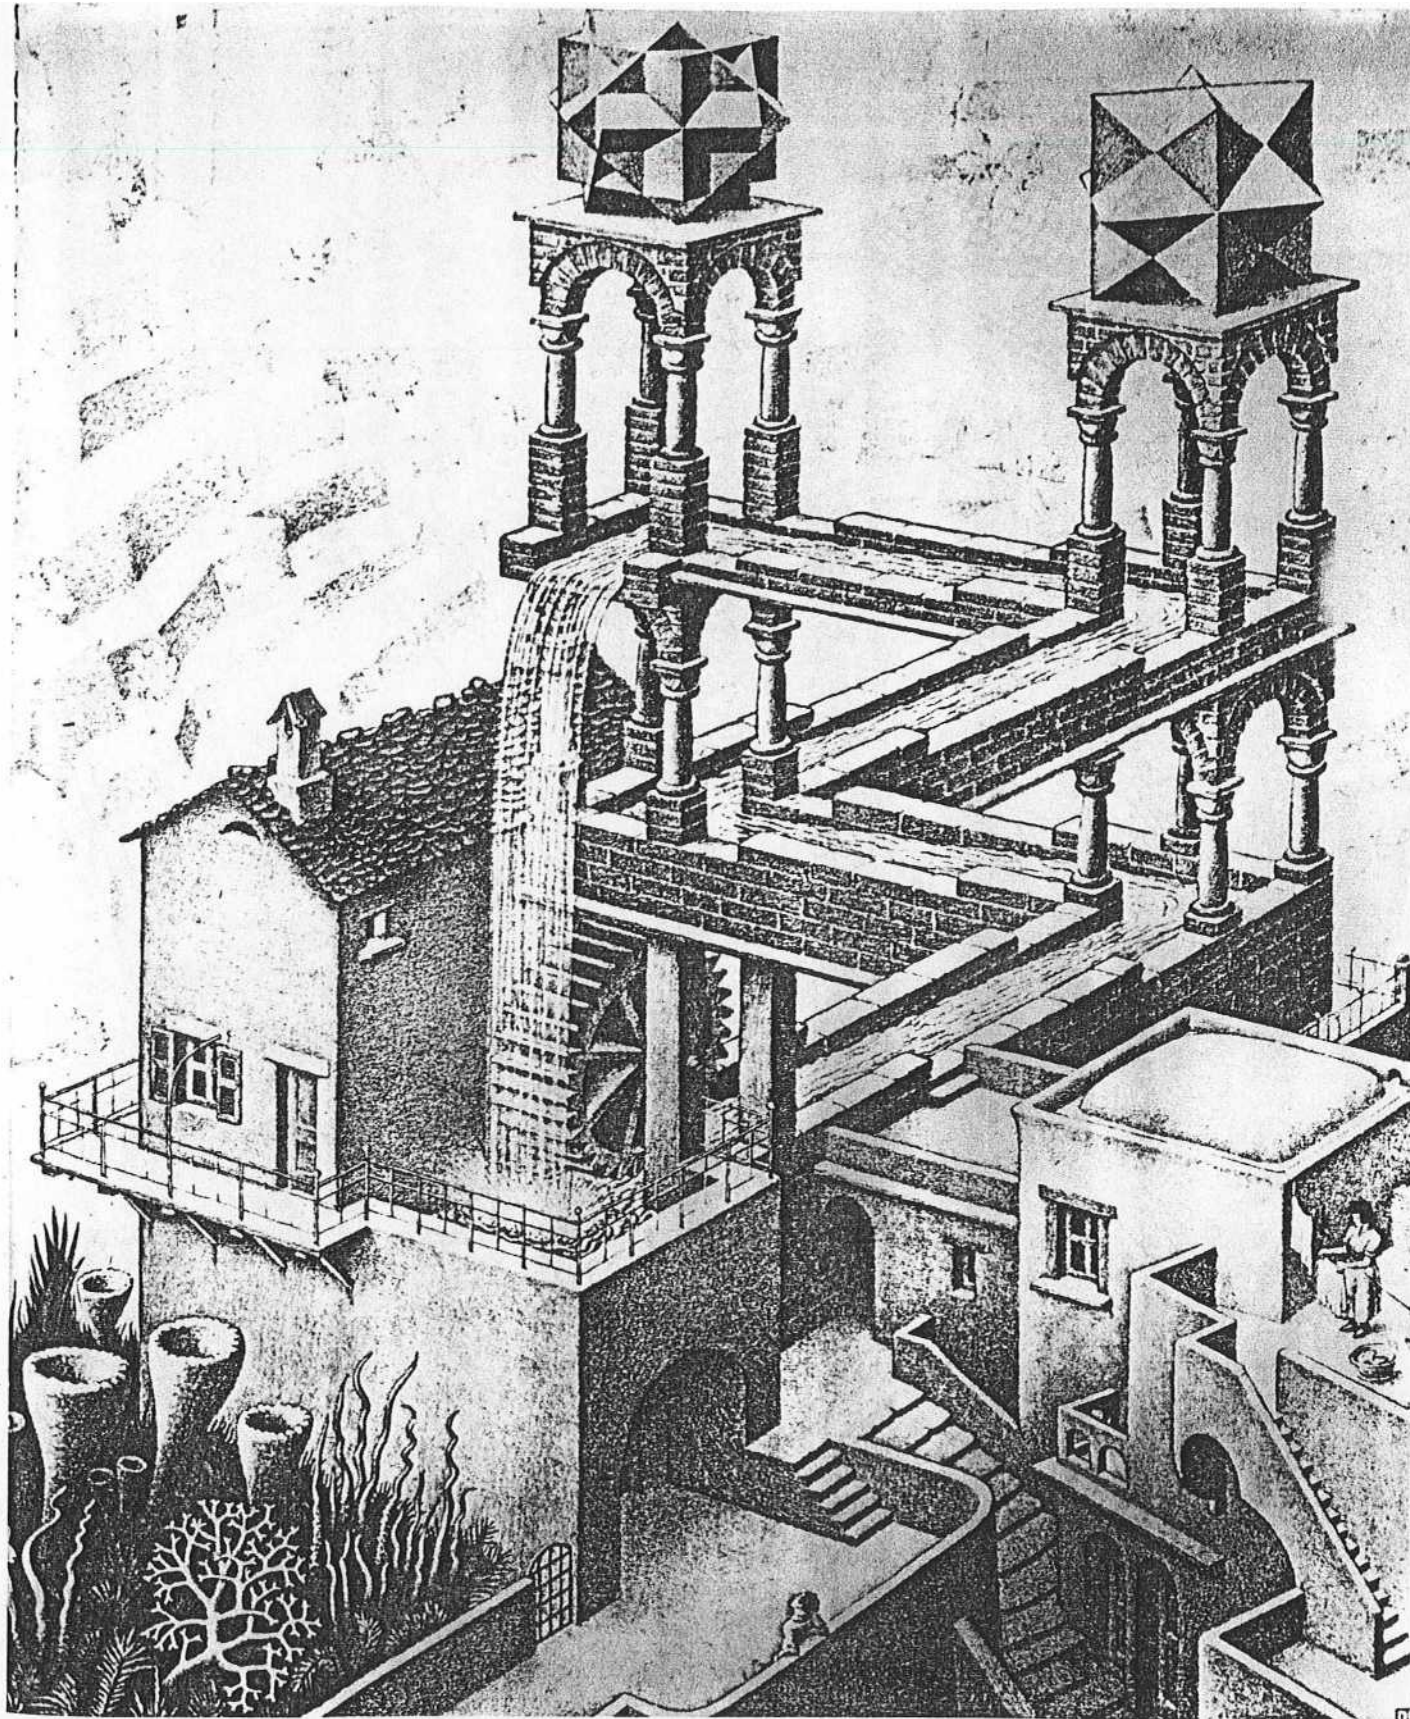

Day and night

Rain drop

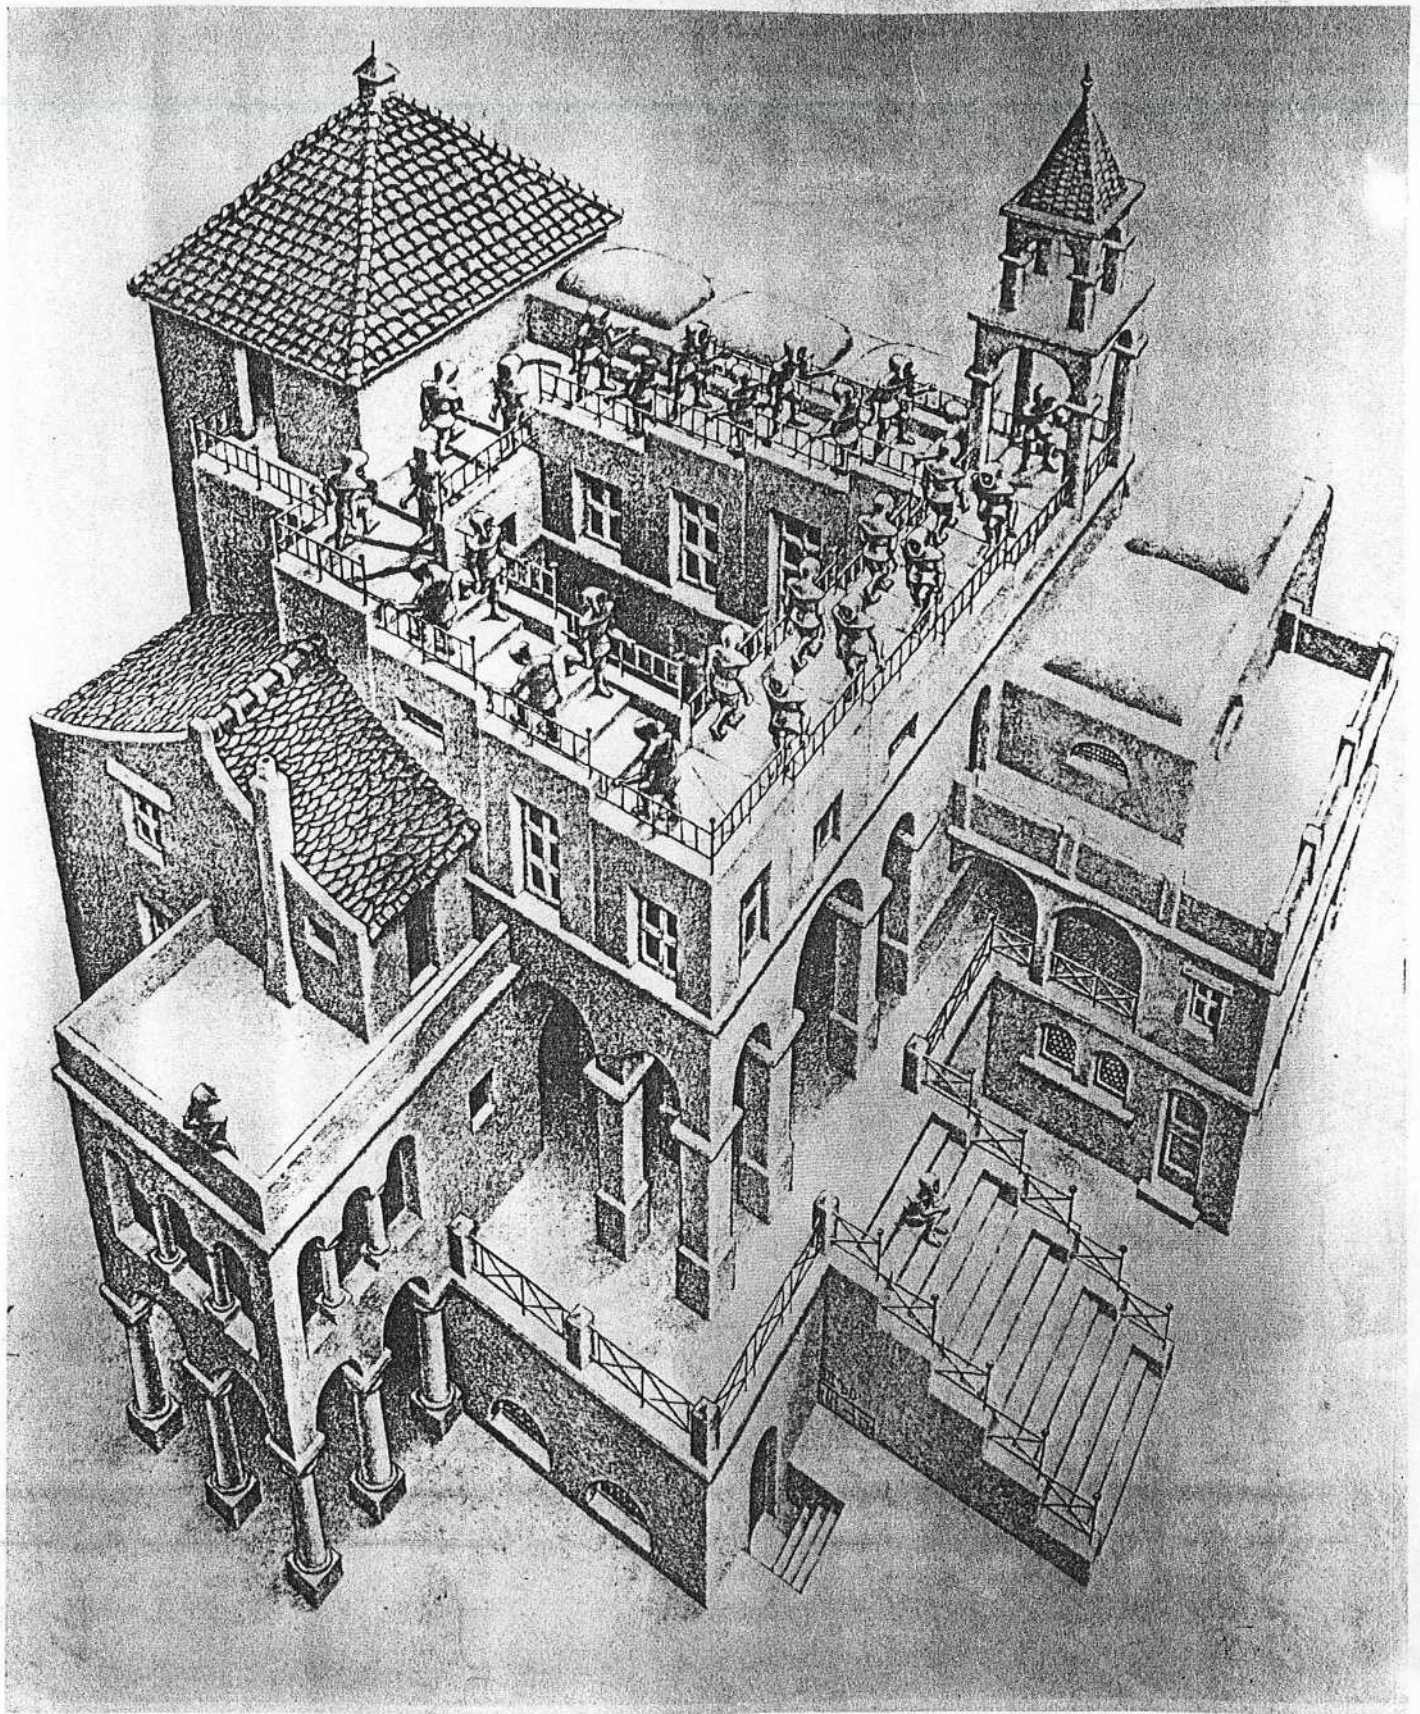

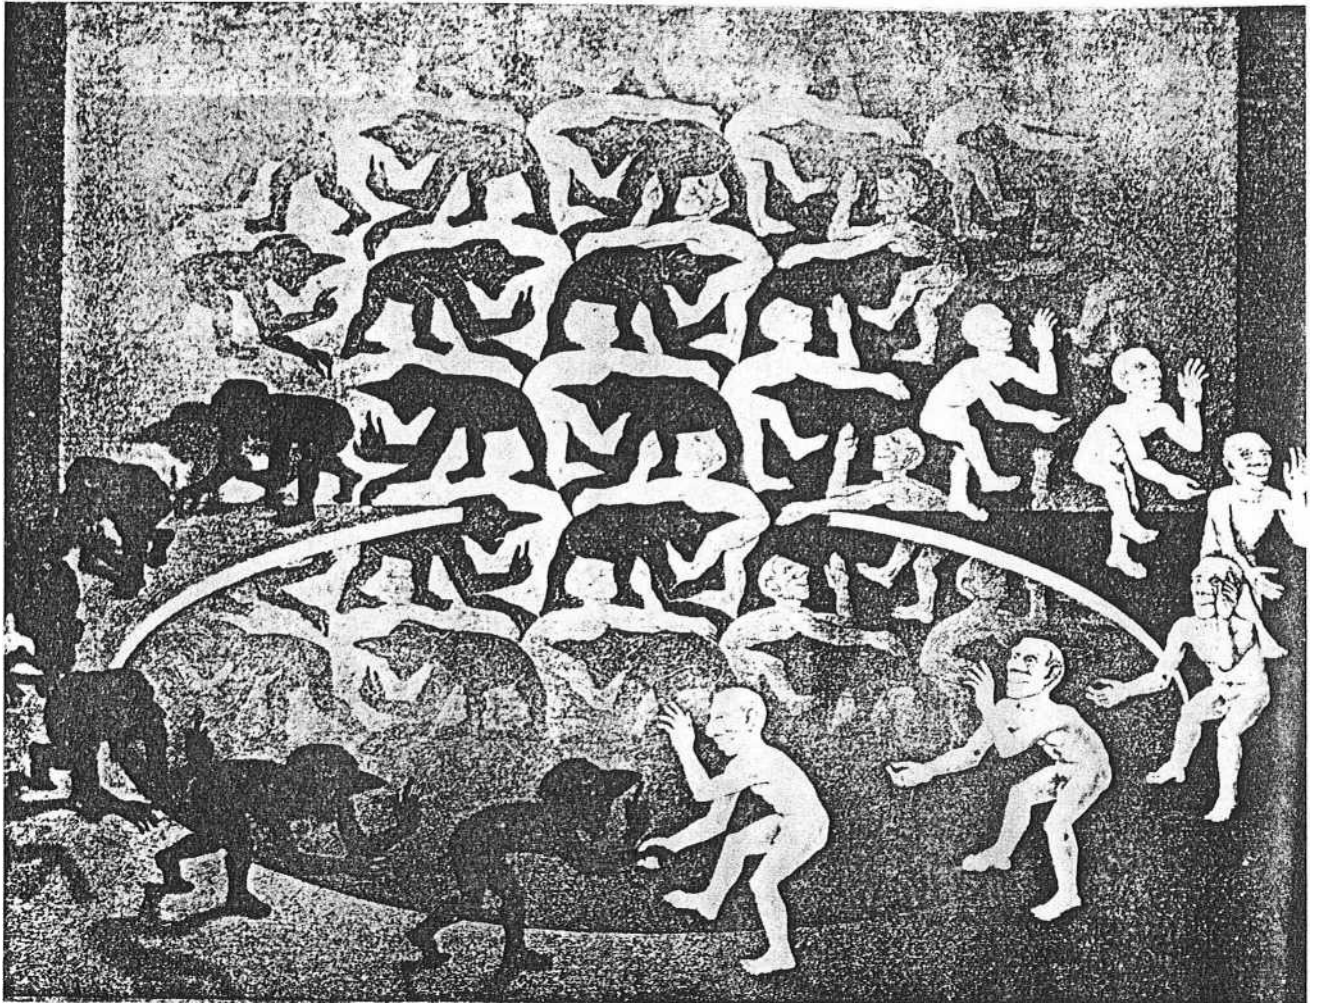

Belvedere

Perpetual motion

Ascent and Descent

Meet

reptiles

In Escher we find representations of emergence, **of** the **escape** of landmarks through the passage from recognizable form to formlessness.

In Escher we find a duality; it appears between pieces of the same painting. For example: in "Day and Night" A (everything relating to day) comes out of B (everything relating to night) but B comes out from A . So .

'.

and

(A comes out of B) to realize A

(B comes out of A) to realize A

Two sets A and B are evoked; they are not really drawn, and A is evoked because B is felt and vice versa. We are faced with a dynamic duality between A and B[^] but for that we must place ourselves in the case where we have the KShPh state (which absolutely does not mean that each time we have a dynamic duality , we will have a KShPh state.

(**). „

ant A and B .11 remains the incomprehension of what was felt before in relation to what one wants to perceive afterwards. We have the same thing in the lithograph "Ascent and Descent" in which a staircase is a closed route; it constantly rises to the right and similarly descends to the left.

3 Obviously this staircase

cannot be realized in R but on the plane, with the Escher technique, if we consider the dynamic duality realized, the plane image can be used.

The "Belvédère", "Perpetual Movement", "Up and Down" lithographs are of the same type. On the other hand, in the "Encounter" and "Reptiles" lithographs, the concept of emergence is rendered. [12],

The deepening of chapters I, II, III is done by reading appendices I, II, III and problems and exercises with answers at the end of the volume. (*) (**)

(*) In reality the dynamic duality is between (A comes out of B) and (B comes out of A).

(**) We can also consider that A is to B what B is to A , that is to say (A,B;B,A) which has a halo, but this halo is not the dynamic duality.

Appendix I. Qn considers again the portion of curve MN on curve (C) . We know that we cannot know (C) in full. We can shorten MN to M_0N_0 where $^c MN$, without the curve (C) changing. So switch from MN to $M^{\wedge}N^{\wedge}$ such that $M^{\wedge}N^{\wedge} \subset ^c N$ is not the same process as passing from MN to $M'N'$ which is supposed to contain $MN \setminus A$ part of MN leaks when we want

enlarge it like the curve (C) for that matter. But if we give each other MN, we don't oo can pass to MN without M_0N_0 partially disappearing and (c_0) then progenitor of MN .will not necessarily deform into (C) progenitor of MN but into $^{\circ} \circ$ (**)
a curve (C)
oh

Back to MN; we know of (C) a little more than what there is between M and N . We can therefore place the points P and Q on a single side of M or on a single side of N

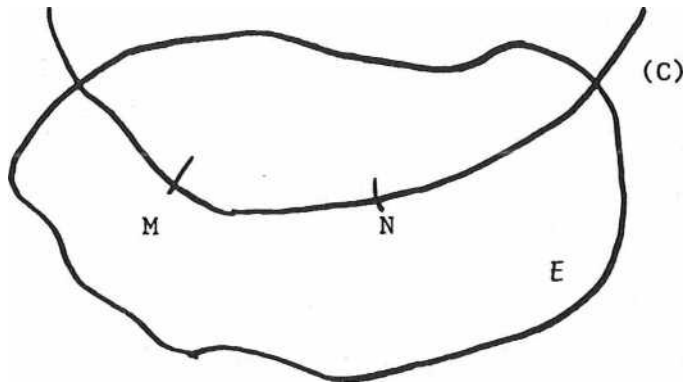

To speak of a curve and of points we must speak of an affine space E . But here we will not be able to consider the space E defined a priori; the curve (C) in this space MN and (C) are in equimsey and E will be the equim- sey. Therefore the primer, the progenitor, the primer-progenitor equimsey cannot be $(*)$ (**)

(*) We cannot therefore consider too large a portion of (C).

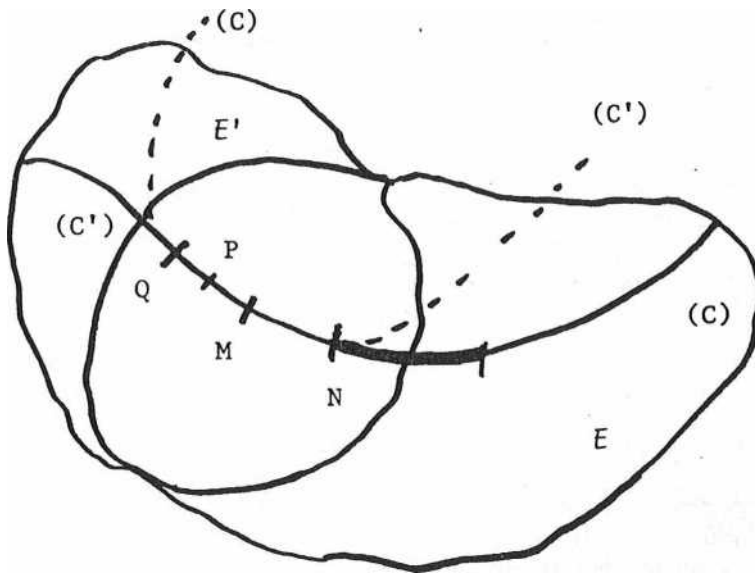

(**) One could suppose that M_0N_0 is generated from a point. So that everything that was said about the passage from M_0N_0 to MN would be valid for the passage from point to M_0N_0 . If we could do so, we would fall into the usual flattening of rational representation, into the "scientific pseudo-objectivity " of which we spoke at the beginning of this study, and the laboriously introduced concepts would turn out to be useless. If we come back to the concept of curve, we represent the curve, we see a piece of it; on this rapid representation , intuition can swell and open up new views whereas too hasty axiomatization encloses thought in rationalization (it is moreover a security for the researcher - the rational world is reassuring; it is self-stabilizing). If we have in mind the notion of curve, its axiomatization from that of the point is not useless, yet we will only use this axiomatization as a support (which is the role of any axiomatization) for the abandon a little and impose a new view that better corresponds to our intuition.

defined separately. It is a ternary obtained by an equimsey between two concepts.

E serves us to feel what a curve is and two points on this curve. E contains what generates it because it is obtained from the equimsey. (C) is only really known in E . (C) is called "open form" ¹.

Move MN or PQ ; a part of (C) is deformed and (C) passes into (C') . (C^{-1}) and PQ are in equimsey: This equimsey is a space E' .

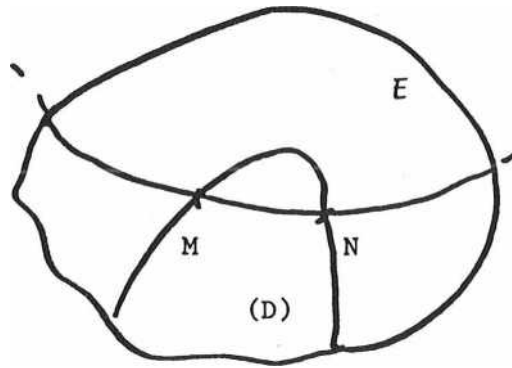

(E and E' have a common part but it is only an appearance due to the representation on a sheet of paper). Besides, returning from QP to MN would not necessarily give (C) as parent to MN , so we will no longer have space E . (*) (**)

(*) That is to say that by moving on (C) one can leave (C) ; the -intuitive idea is that (G) does not retain what it contains.

(**) We have thus moved to a "memory" of (C) .

Let's start from MN , (C) and E , we can pass another curve through M and N ie (D) . (D) will be treated as in ordinary geometry.

There is no equimsej between (D) and MN which means that we must be very careful about the way in which the problem is posed. 2 secant curves are not equivalent - one can be known totally while the other only partially.

E behaves like a polarization in the usual space-time ET.

We will call E the "Polaror" of ET. ^{J.} _ From where

$MN/(C) = E$ is a Pol ET.

$PQ/(C') = E^{-1}$ is another Pol ET.

We see that we can obtain a multitude of polarors. The set of all E's constitutes the aether. This may constitute another definition of $\mathcal{A}$. . In summary:-MN , its progenitor (C) and the polaror E are given simultaneously" '.

-We can extend MN a little or move it slightly without changing the polaror.

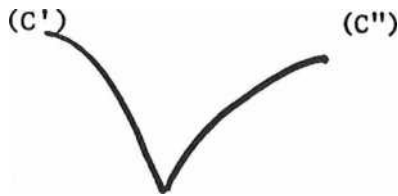

-If we pass from MN to PQ (P and Q outside MN), we pass from E to E' but there are not necessarily intermediate positions between MN and PQ which give an E" and if we seeks a limit position which characterizes the passage from E to E' , we will deform (C) which will create a (C'') if we start ^(*)_(**)

(*) Abbreviation for Polaror : Pol .

(**) What is the case here is not always true. The name can be an operator on the progenitor and the Creator Word in the Bible, which is even more powerful than the name, can create progenitors of forms. In the Creative Word there is the idea of form. However, the Creator Word may not be enough and an additional concept has been overlooked or deliberately omitted. But by naming the animals (which God allowed Adam to do), Adam could act on the progenitor.

from PQ to go towards **MN** (everything depends on what was asked at the start); in conclusion (C) open curve cannot support a search for details.

- Going from MN to PQ or from PQ to MN is not the same; one goes from (C) to (C'), the other from (C') to (C''). This leads one to think that one can reach (C') or (C'') at from a relocation:

(C) , (C') , (C'') are possible emergences

More generally, when we do not find a very clear separation between two or more forms, these forms suggest that they are possible emergences of a completely delocalized form. The continuous deformation that we usually follow is only a localized view that hides the phenomenon of "sheaf" emergence.

Consider for example a geometrically simple shape, a solid cube, made of a malleable material. He generally does not have high C. of T. eifs. If each face is pressed slightly, the C. de T. appear: from 1 i—¹ 1 up to 28 i—i 28 and even ⁰⁰ »—>“• . This passage from the cube to the volume with 6 sunken flat faces, can be seen in a continuous way; from the cube shape we tend towards a more shapeless shape. This approach is a choice but if we ask ourselves the question of knowing from what form, the C. de T. appear, we cannot answer with precision. It is here again a localized approach (mental experience of the unfolding of a deformation), and we will rather substitute for it the other point of view, already mentioned, which is that of an emergence in a sheaf from a delocalized form which will lead on one side to the cube and on the other to a shapeless form emitting C. of C. By emergence, we will only have on one side the cube and on the other side one of the formless forms which have the property of emitting C. de T. We could have sheaf emergences for other properties.

—(C) is a progenitor, therefore it has, as a “progenitor” curve, particular properties that other curves of E will not have.

-In E there can be other curves (C) open shapes.

— PQ is not both in E and E' because $MN/(C) = E$. But PQ is in E if we place ourselves on MN .

But if we place ourselves in PQ , then (C) becomes (C) and $PQ/(C') = E'$.

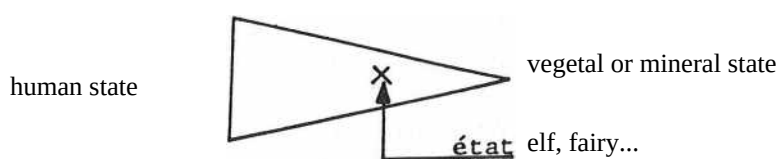

Everything depends on the position of the Obs. when talking about MN and PQ . Either we place ourselves in MN and we look at PQ , then PQ is in E . Either we are in PQ , then PQ is in E' .

—We must not forget that the concepts of space and time are representations of what has been called globallance and etallance.

—A MN and PQ placed as they are on the progenitor (C) of MN , let us respectively correspond the state human being a and the plant state B seen by the human being, i.e. such that it is thought of in the usual C. de C.. Consider (MN, PQ; a,B); we have a halo which will be the equivalent of (C) that we write (y) . (y) is a form (completely delocalized, like the states a and B moreover) which will be opened by structure transport from (C) onto (y); a and (y) are in equivalence; $a/(y) = \epsilon$ (e matches E) . If the Obs. is placed in B (that is to say if it is imbued with the vegetable kingdom), (y) passes into (y') and $B/(y') = c'$. But then is formed $(E, E^* ; \epsilon, \epsilon')$ which has as its halo a little elf, a fairy. We thus arrive at a possible explanation of the generation of these entities. The aureolar is delocalized, so what we see is an unfolding of this aureolar following S where S is the passage from e to ϵ' .

Other explanations are no doubt also possible because these localizations can occur along multiple paths.

From the human state, considering the plant state, we have created a sort of intermediate state. The same could have been considered with the mineral state. We will say that we have made a "conical filling", which we will represent

— Let's go back to the beginning of this chapter where it was announced that the Obs. launches his C. de C. and gets into it simultaneously. Let's take this approach a little further. One is oneself an observer or $Obs^\wedge$. $Obs^\wedge$ has in its radius of coherence (which is an open form) an observer Obs_2 which is with respect to $Obs^\wedge$ what PQ is to MN that is $(PQ, MN; Obs_2, Obs^\wedge)$. There is no halo; we mean that we have between Obs_2 and $Obs^\wedge$, everything we have between PQ and MN , but in the character Obs. In reality we did a trans

structural port. The curve (C) is replaced by a radius of coherence ($p^\wedge$)

$$\text{Obs}^\wedge/p^\wedge = \text{C. of C.}$$

If we consider the usual C. of C., then its radius of coherence is itself.

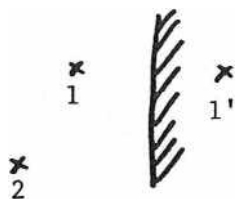

Suppose Obs_1 in the rational C. of C.. Obs_n considers $\text{Obs}^\wedge$ on its ray which is a non-open curve (in this C. of C.), he replaces to $\text{Obs}^\wedge$ for argument instead of .

But $\text{Obs}^\wedge$ has passed into Obs_2 and for Obs_2 we had $\text{Obs}_2/P_2 =$ the other C. of C. (P_2 is a ray of coherence from Obs_2).

This, $\text{Obs}^\wedge$ in position 2 denies it by its structure of C. of C. hence ignores the new C. of C., so will try to explain in the usual C. of C. that he appeared again from the fact that he deformed a model by his reason rational. (Naturally $\text{Obs}^\wedge$ and Obs_2 are not supposed on a curve but on a ray of coherence), $\text{Obs}^\wedge$ can only replace itself without committing an error. The problem is that it replaced Obs_2

in his reasoning (what we say to put himself in position 2). $\text{Obs}^\wedge$ could only think of itself. An interesting point of view is that as in optics

rectilinear line of the object and its image in a plane mirror: object at 1, image at 1'.

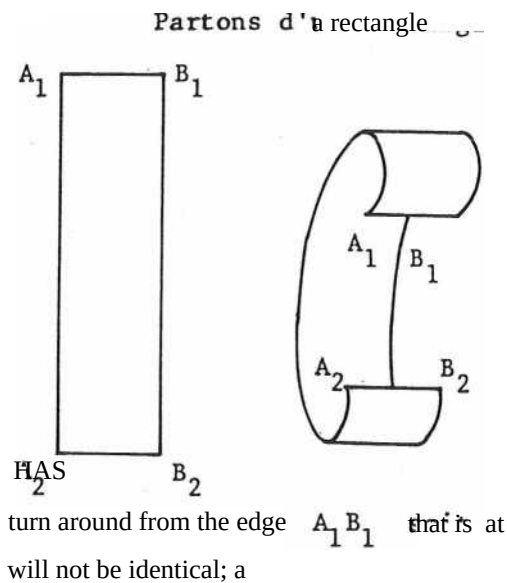

If 1 is $\text{obs}^\wedge$, we will say that 1 can only take cognizance of 1', by passing through 2. Position 2 can be any in the half-plane containing 1. The passage from 1 to 2 is done under - have the least awareness of it. (*)

(*) This is what we find in the Bible concerning the much discussed, controversial question of Adam. Let's do a coherence transport. Adam is in position 1; Eve in position 1'. For 1 its reflection is 1' but it does not look at 1' because it contains 1'; it is in this sense that it is endrogynous. Eve is the reflection of Adam and they don't look at each other initially. But if 1 seeks to see 1', that is to say seeks its reflection, it puts itself in a position such that 2; the endrogyne is no more. When Adam wanted to contemplate his reflection, he was no longer Adam. This is what happens in rational representation; we place ourselves by thought in positions in which, to examine 1', we find ourselves in a position 2, because the fact of seeking our own reflection obliges us to move (we must not forget that there was transport of coherence therefore that it is not a question of a physical displacement but rather of a change of state of Obs_j). Adam contained his reflection before the fall. According to the Bible God contained humanity, his "Selem" and he created the Man "Selem". Thus, we have: (God, Adam; Adam, Eve) which has a halo. This halo will be designated by E (this is a concept that was related to the First Tables which were broken by Moses). A. Sabourdy leaned towards E being the Serpent; it is not quite that because the serpent is linked to the 2nd Tables, but we have (E, Serpent; 1st Tables, 2nd Tables) and this involves a new halo which is II. We will say no more about E and H.

Annex_II: Study of the Moebius Strip.

AF Moebius (1790-1868) is a German mathematician who was the first to deal with the surface which bears his name and which we are going to describe here:

$\wedge 1 \otimes 1 \otimes 2 \wedge 2 * \circ n$ May confuse edges $A \wedge B \wedge$ and $A_2 B_2$ in several ways : _ -

- 1) Either we put $A \wedge$ on A_2 and on B_2 in which case the figure is a cylinder.
- 2) Either we make a twist of a half-turn of $A \wedge B \wedge$ before putting it on $A_2 B_2$, that is to say that $A \wedge$ comes on B_2 and $B \wedge$ on A_2 . Then we have a so-called one-sided surface, it is a Moebius strip.

By holding the vertical strip, you can do the right or left. The 2 Moebius strips are the image of each other in a mirror.

The first strip will be called Moebius strip on the right (R) and the second Moebius strip on the left (L).

We have discovered applications of Moebius bands (D) and (G) to eifs and of this in agriculture.

Let's see the Moebius strip D. A shape in the center (we take for example a small hollow cylinder, a ring), causes the strip to emit in its plane all around it.

Inside the band we find the vital field without any artifice and the N does not have to be imposed, r

On the vertical passing through the center of the small cylinder, we find above the plane on which the band rests the right shin, the UV. and Char- + eif . $\text{---}^x E (*)$
very Z. Under the plane, still on the axis, we find Z

Instead of making a half-turn, we can make 3, 5, 7,... We will call these bands 3~Moebious, 5-Moebious respectively and to the right or to the left. The even numbers of half-turns would give us back two-sided surfaces. If we redo the same manipulation with a 3-Moebius D or a 5-Moebius D, we will have the same results a little more amplified. The $UV \wedge$ will be detected above the plane at a distance a little greater than that found previously in the case of the 1-Moebius.

(*) See problems at the end of the book.

Let us now take a 1-Moebius G or 3-Moebius G. On the axis of the cylinder which is placed inside, we find no more UV., , no more Z^+ nor of

zXE

Z. The shin is reversed. The vital field is totally disturbed.

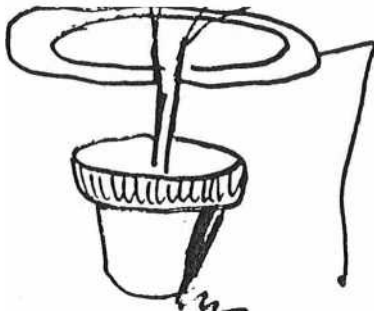

Inside the band, we this Moebius strip G by another the same.

no longer has a life node. If we surround which is also on the left, all will be

If around a plant that the plant behaves like

pot puts a Moebius strip D, is se can transported at the tape level. With a strip

of Moebius G, one must remove from him vitality.

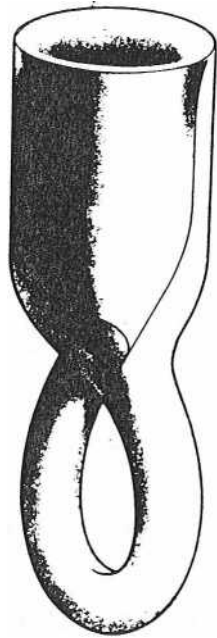

We saw that we could amplify the effects by increasing the number of half-turns, always in an odd way). But if we arrive at 13-Moebius or 15-Moebius, the intensity of the phenomenon decreases (it can even increase again afterwards for $n > 15$). It is as in the case of the multiplication of identical forms. When amplification processes, from a certain rank, we no longer amplify from everything and it decreases only to be reborn afterwards.

Consider a Chaumery-Bélizal transmitter disk and send an eif through the output wire to V_M . Let's put a Moebius strip D or G in the same plan than the disc. North shape of the physical field is no longer taxed for the system. If the line V^* V^+ is perpendicular to north in natural form:

$V^+ E +$ close to the band of bring the lead wire to the $V_{..}$ on the outside M cons inside Moebius D or G, nothing is detected even with artifice is following the N_r eifs are detected. If the line V^+ , V^* Sp , we detect inside ME emitter, on the other hand we outside the eif sent by the disk If inside, we put a pencil no longer detects anything even with artifice parallel to the N_p - Sp , we find the eif. It is not the same as the one sent

by the disc and if from D we go to G , it will not be the same either. Then every 30° in relation to this direction we find the eif, but between there is nothing.

Escher was very interested in the strips of Moebiusj he does not seem to have made the distinction between right and left. On the cylindrical bands he created drawings that interpenetrated. It would be interesting to study.

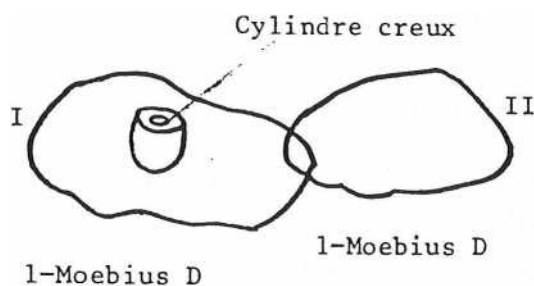

Another interesting shape of the single-sided surface type is the Klein bottle.

” v . 3
It gives something like this in R . If we want to represent it completely, we have to embed it in R . Well combined with other forms it can load liquids at high C. de T..

From this beginning of study on the Moebius strip, we see that it is a surface of delicate manipulation. We will say no more about this.

Annex III

Some authors have spoken of "regulatory lines" in painting. **It** is a question of arranging the painting (characters, landscapes etc...) by means of networks of lines which will constitute a skeleton which will help the painter to place his ideas. This first compartmentalization is all the more necessary as the surface to be covered is larger.

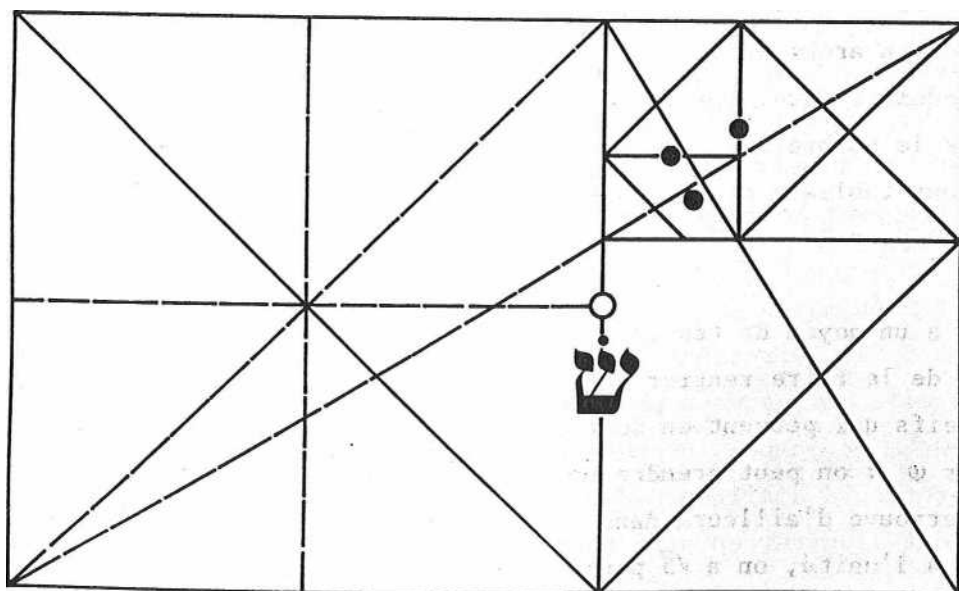

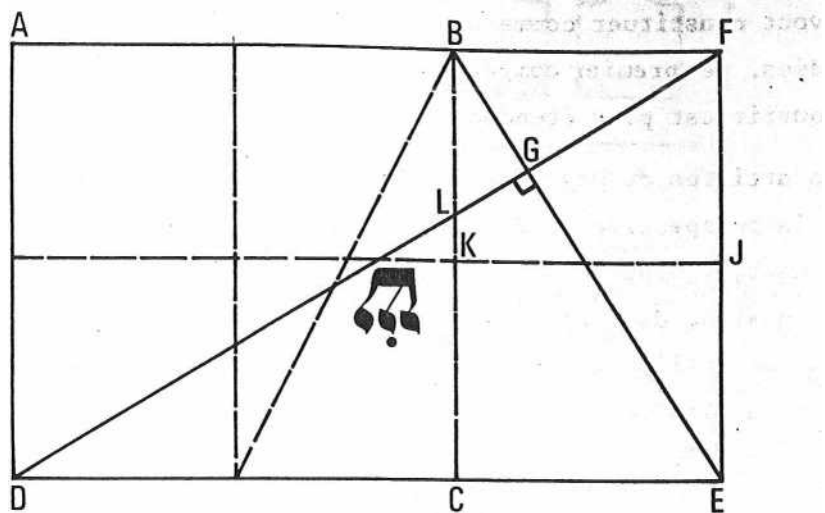

If the artists of the Middle Ages readily used polygonal canvases, the invention of perspective, so decried today, brought a new style. Tiles, pavings, equipartitions of colonnades, windows, doors, arcades, figures diminished in a constant relationship towards the vanishing point. The painting, like the eye itself, made visible the distance of the objects from the space that contains them.

Note that the most exact perspective includes lateral distortions that disturbingly call into question the harmony of the perceived objects. There have been many regulatory lines according to the Golden number where a designates the average and the extremes by $a+b$ and b : we often ask to reduce to 1 unit — $= x$). b

The golden number can be represented by a simple construction from the ruler and the compass.

That we discuss for whole days on the Golden number and application in architecture, painting, sculpture, that is pro happens and still happens. Mathematicians are no longer interested in these discussions . Moreover the Golden number often appears as "far-fetched" in many tables and elsewhere. Other proposals have been made by the architects to replace it; many of these have passed into oblivion.

There is a way to test a number, it is to show it in a report and to fit it in a planar form or in volume. Then, we test the eifs that can come out of it and the states associated with it. For the Golden ratio ϕ : we can take an isosceles triangle with a base equal to the height (which we also find in the so-called "Luksor ^w " form). By taking this height equal to unity, we a /5 for the side coming from the vertex. When testing, think of this triangle as being associated with $i\phi$. In reality, the triangle serves as a support for the representation of $i\phi$. We can also draw the hyperbola in the quarter of planes of positive x and y , $y = 1+ i$ and cut it by the

line $y - x$; in a system of rectangular axes. By carrying the unit on the abscissa axis, by orthogonal projection on this axis, we have ip . We impose more $\angle p$ on the axis by the intersection of the hyperbola with the first bisector.

We can also construct the square ABCD with side length unit.

Point E is such that $DE = \angle p$. I and J are the respective midpoints of sides AD and FE of rectangle AFED. At the intersection of BC and IJ that is K, we detect the reversed shin! We have KShPh and the Chaumery-Bélizal equator is reversed.

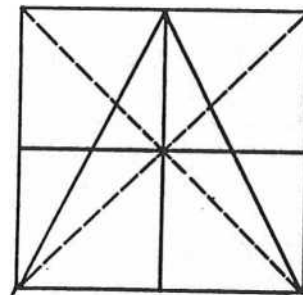

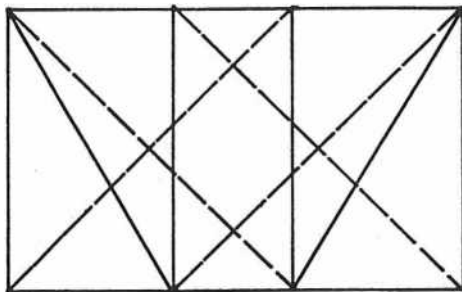

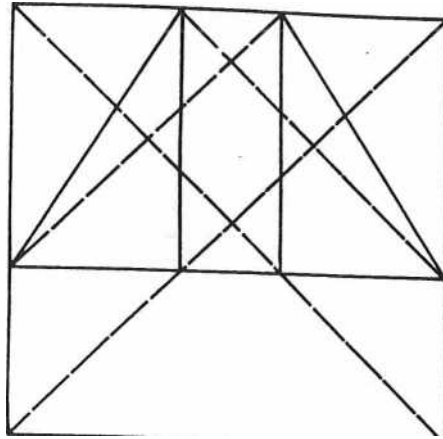

If we trace AC or DF, or drill a hole at K, the reversed shin becomes straight again; which means that the Golden ratio (p must not be separated from the square which allows it to be constructed. We can also put the preceding rectangle parallel to a plane mirror; the shin becomes straight again. DF intersects BC in L. The rectangles AFED and CBFE correspond to each other by a similarity of ratio if we pass from the first to the second cp . The inverse similarity has the ratio $= \angle pl$ therefore we can take CE for unit then $DC = \angle p$. We construct the spiral $\zeta^* \cdot 90^\circ$, center G intersection BE with DF. The ratio between 2 consecutive sides of this spiral is ip or according to the direction of travel of this spiral. As we have constructed for $\angle p$ the rectangle of side $1+cp$ and $2 \angle p$, for ip , the Radian number, we will build the rectangle of side $1+ip+tp$, $2 \dots$.
 $ip+tp$. By similarities of ratio ip we build rectangles nested in each other according to the diagram below and we obtain a spiral

90° , whose center is at the intersection of DF and PE. In Q one detects the right shin without any drawn diagonal or marked point; by similarity we should detect the shin elsewhere but we must not forget that the drawn spiral does not extend over the whole plane but over a portion of the plane. It has a beginning at a finite distance from its center by necessity of construction. The ratio between 2 consecutive sides of the spiral $\wedge 90^\circ$ is ip or $\dots$. We could also draw a 60° spiral. The ratio of 2 consecutive sides is still $1 ip$ or $\dots$.

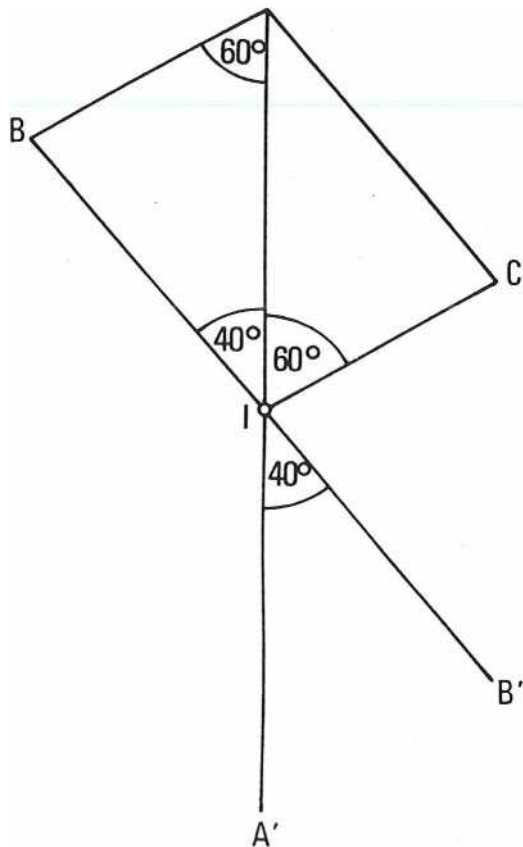

Another construction is possible: that of a $6-40^\circ$ spiral ($0 = Zip$) and this because of the triangle $\angle p$. We would also have a spiral (*),,,
 $ip \times 0 \ll 60^\circ$. Its study is left as an exercise. By drilling in the center we na
 than the right shin above; we have no polarities or differentiated spectrum, or vital field. The triangle ip makes it possible to generate the physical field.

(*) Let's remember sequence of tetrahedrons of which an extreme tetrahedron is AMNB; he

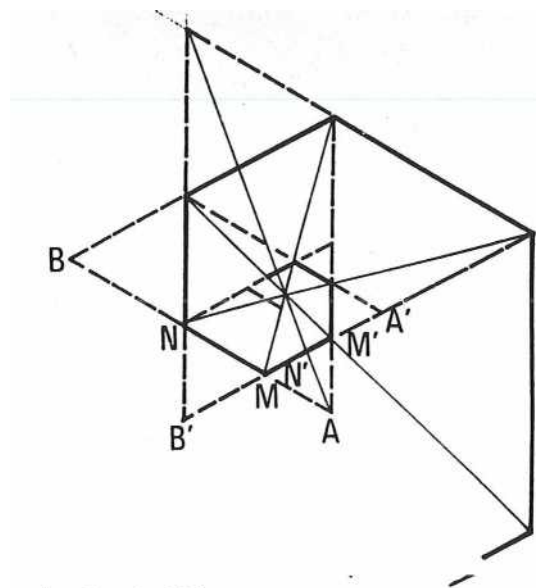

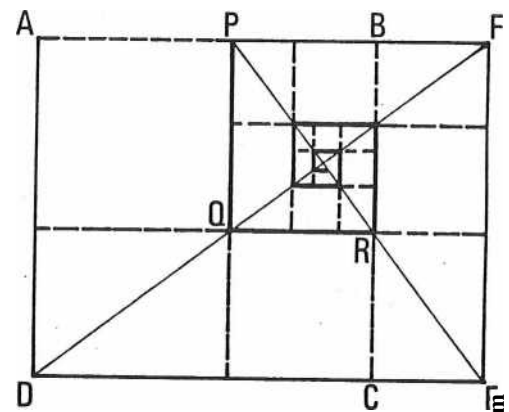

Egyptian harmonic tracings
(after M. Ghyka)

Physical field generated at $IB = IB'$ from the triangle ip . You have to drill in I. If we engrave this figure on a board, we impose the physical field on a form placed on it (*).

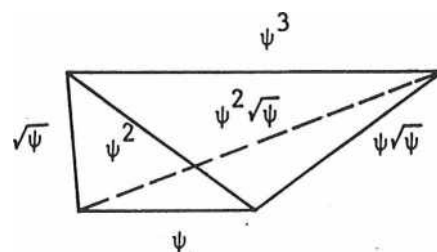

Spirale $\psi, 60^\circ$

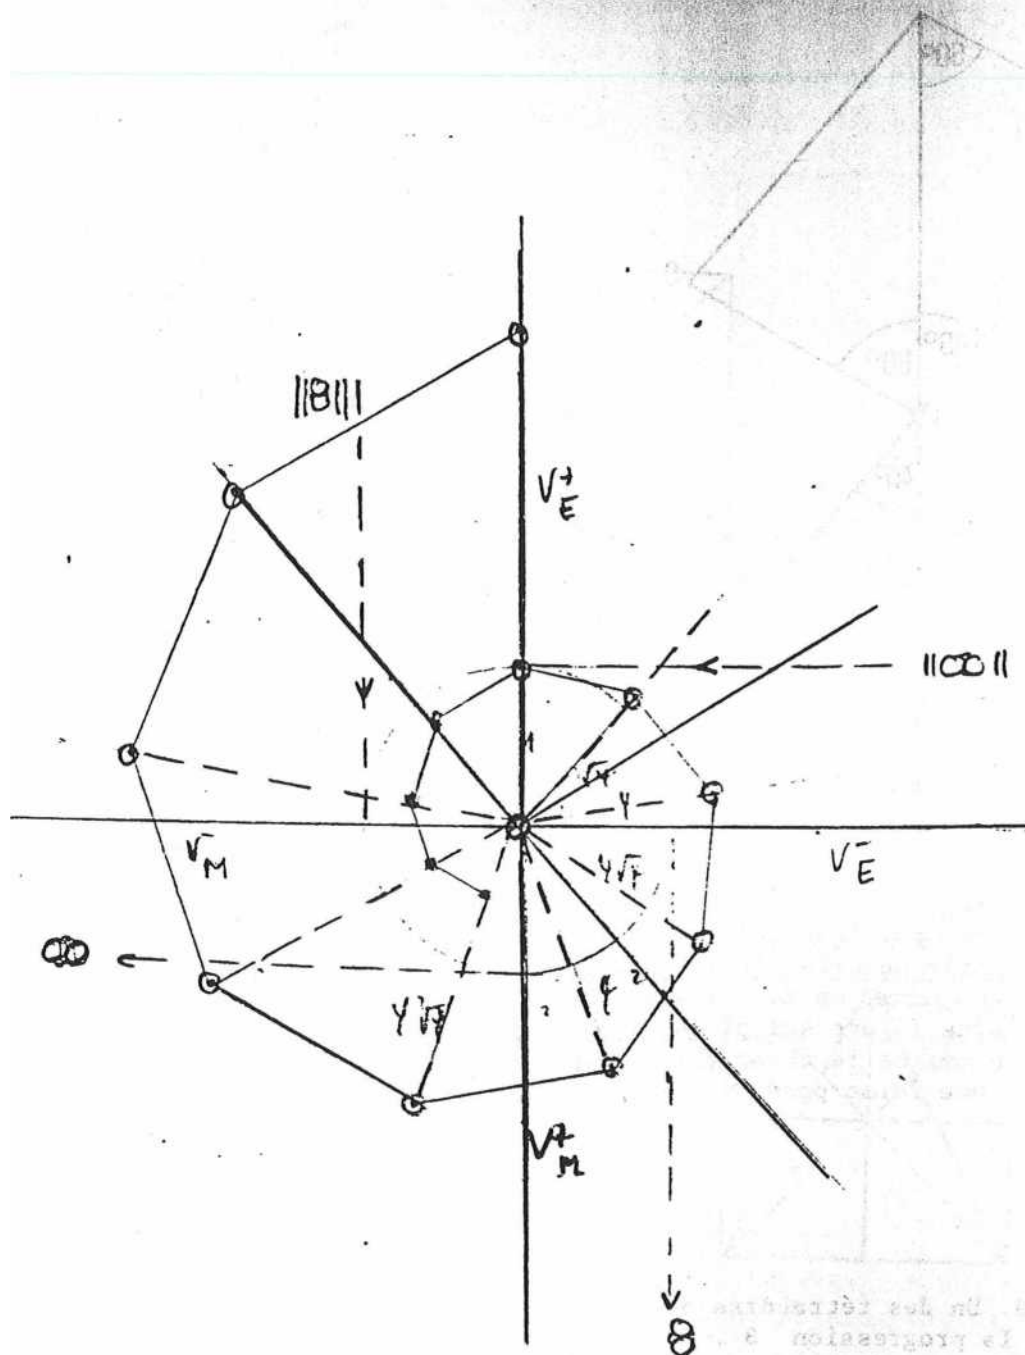

Spiral $ip, 90^\circ$

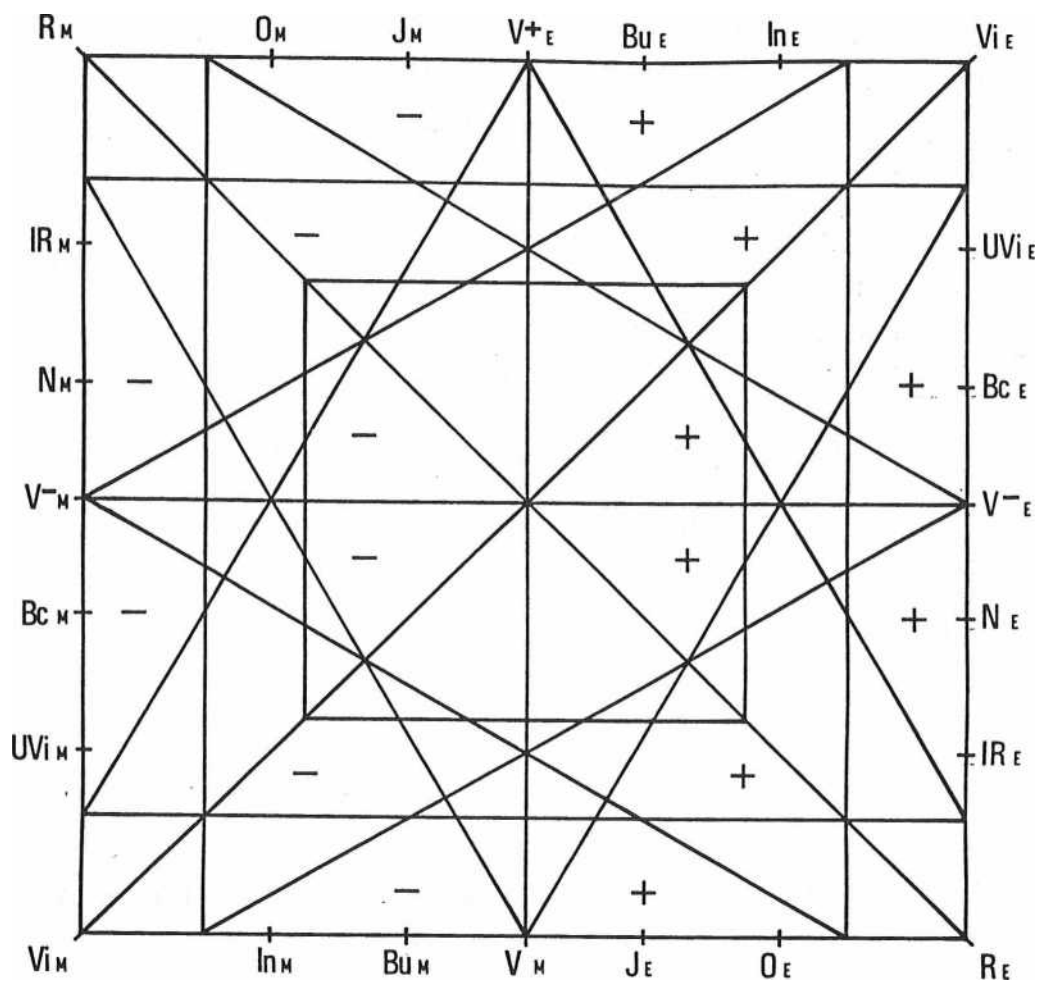

is degenerate. One of the tetrahedra in the sequence has three successive trirect-angle edges with the progression 6.

(*) Some supplements are necessary. See problem at the end of the book.

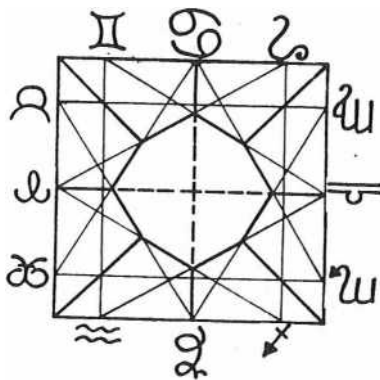

Spirale 0.40°

Emitter square

Jéan Richer in [1] cites in a rapid study a plate with stamped reliefs found at Delphi in two fragments, one part between the Athenian treasury and the wall of Témenos, the other against the wall of Témenos and which is thought to be c was part of the coronation decoration of a small votive aedicule. He then supposes a complete reconstruction of the crowning of the building and perhaps even of the shape of its roof with a probably octagonal summit.

The reconstruction of this roof according to Richer is reproduced below: around the drawing are the zodiacal signs: centaur, goat, satyr, ophion, sphinx, gorgon, two lions, crab, horseman, boar, ram, bull

The plate found corresponds to the signs: two lions, crab , horseman

We can take inspiration from this ceiling, which may or may not have existed, and try to obtain the transmitter giving the differentiated and even the undifferentiated spectrum, which be square instead of circular. The center must be drilled right through to eliminate the RWcH equivalence level. You have to draw the diagonals; of plus it is necessary to draw four equilateral triangles arranged as in the figure. Their intersection is an octagon. It is necessary to draw the line y at 60° to the right of the line V* , V* , and the line at 40° to the left of this line. By plotting h M

the homothetic square of the first square (the homothety having for center the first square and of ratio y) the differentiated spectrum is generated on the circumference of the first square, the colors being on radii which are 15 in 15° and the undifferentiated spectrum being on the circumference of the second square.

We have the polarity

+ right of $V_{-}, \circ E_{-}$ + the line $v M$ everywhere except inside the small square and the polarity - symmetrical by relative to this line. The figure in the center is the convex regular dodecagon.

Bibliography

[1] Jean Richer, Delphi, Delos and Cumae, Edit. Julliard, Paris (1970).

A few additions to the forms :

We have seen previously that forms can be testable, untestable (some, but rarely, respond to both qualifiers), they can be overlapped, in equimsey (We can have both overlap and equimsey, overlap and equimsey can be in dynamic duality, or themselves in overlapping or in equimsey etc.). We have seen a class of forms which we have called open forms: we are going to see a few other classes without exhausting all the cases. Others will certainly come up during the search.

Now we're going to talk about time dependent shapes, non-locatable shapes, strikethrough shapes, variable eif shapes, decal shapes.

Let's first look at the so-called "time-dependent" forms. J. Ravatin had noticed while working on certain forms that their eifs and states were not identical if these same forms were reproduced identically, in the same place at different times. Does this mean that they depended on the moment? No, and the word moment was chosen because it depends on the context, the turn of the sentences, the atmospheres in which they are inserted. This means that if we take the word moment in all possible situations and project the concept of the moment onto this multitude, we have the halo of the moment, which is completely delocalized and which we will also call "moment". It is this new concept "moment" that we will use in the expression "forms which depend on the moment". The living is composed of forms that adapt to the moment. It may even be that there are forms which are recreated at every moment. Some shapes like the Ark of the Covenant were thought about in timing, the first Temple in Jerusalem has some of these dimensions that were thought out in timing, and a unit of measurement in a given direction can be thought of with the moment. This is why if we redo the same shape by thinking it in the three dimensions of space with the same unit, for example an Egyptian cubit , it may happen that it is no longer operative at all. A form that depends on the time can be preserved and exists at other times for other forms, but it must not be reconstructed at these other times. In al chemistry it is necessary to take account of the moment; so many grimoires are useless. They have only a historical value and by another way which will perhaps not be alchemical moreover (way which will belong to a super-alchemy), one will be able to feel what was the moment when the grimoire expressed the different stages;

■ 'f' in the teaching of certain initiates, thoughts of these initiates could not be taken up by other people at any time; as forms these thoughts depended on the moment. The disciple is the one who is with the Master, formed and chosen by him, and to whom the Master gives the power to take up the teaching again, at another time perhaps, but keeping all the "substantial marrow" as Montaigne would have said. Is a form which does not depend on the moment a degeneration of a form which depends on the moment in spite of the fact of feeling not constrained by the moment gives an

impr

ession

tion of greater freedom? One must be wary in this domain of the forms of what one thinks one is gaining, one can by gaining too great an adaptation, as in rational science, lose a fundamental essence; in a sense, a form that depends on the moment is more an emergence than a form that could be called ^{kJ}.

Examples of shapes that depend on momentum :

Consider a square of side length c and a circle of diameter $d = c$ having the same center as that of the square. There are 8 points of intersection between the square and the circle. Drawing these two figures in this way means that

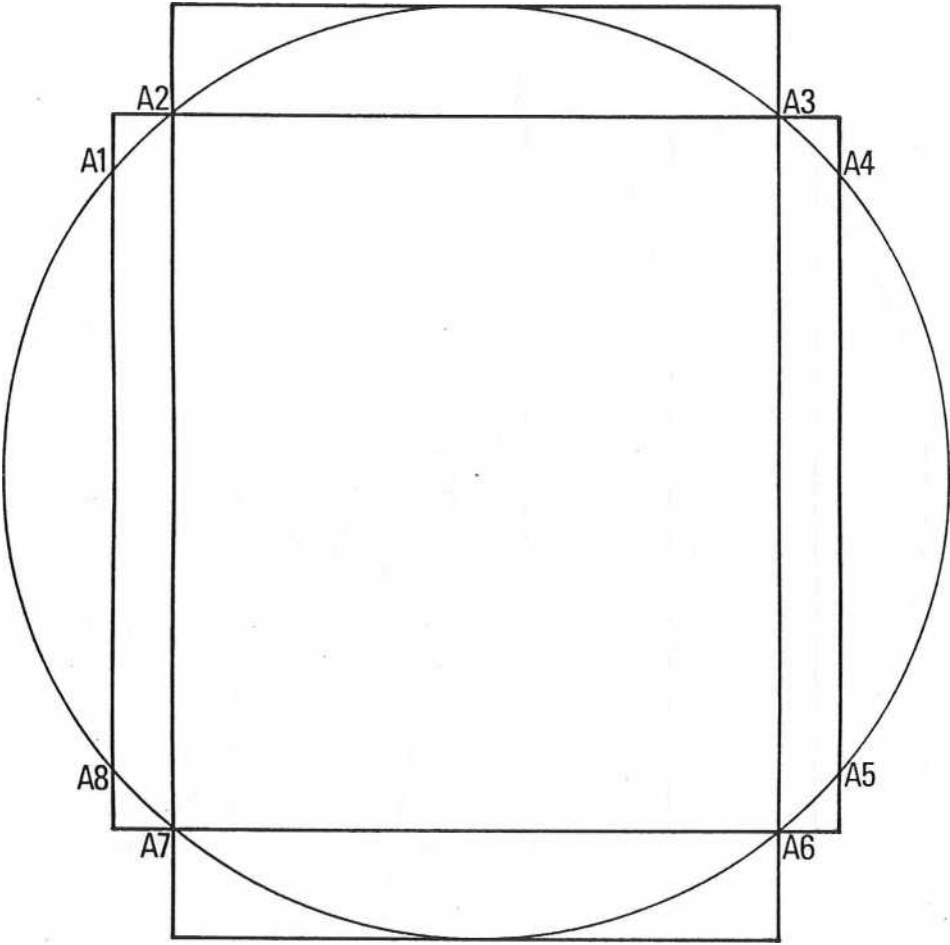

they are not located at the same level if we think of them separately, that is

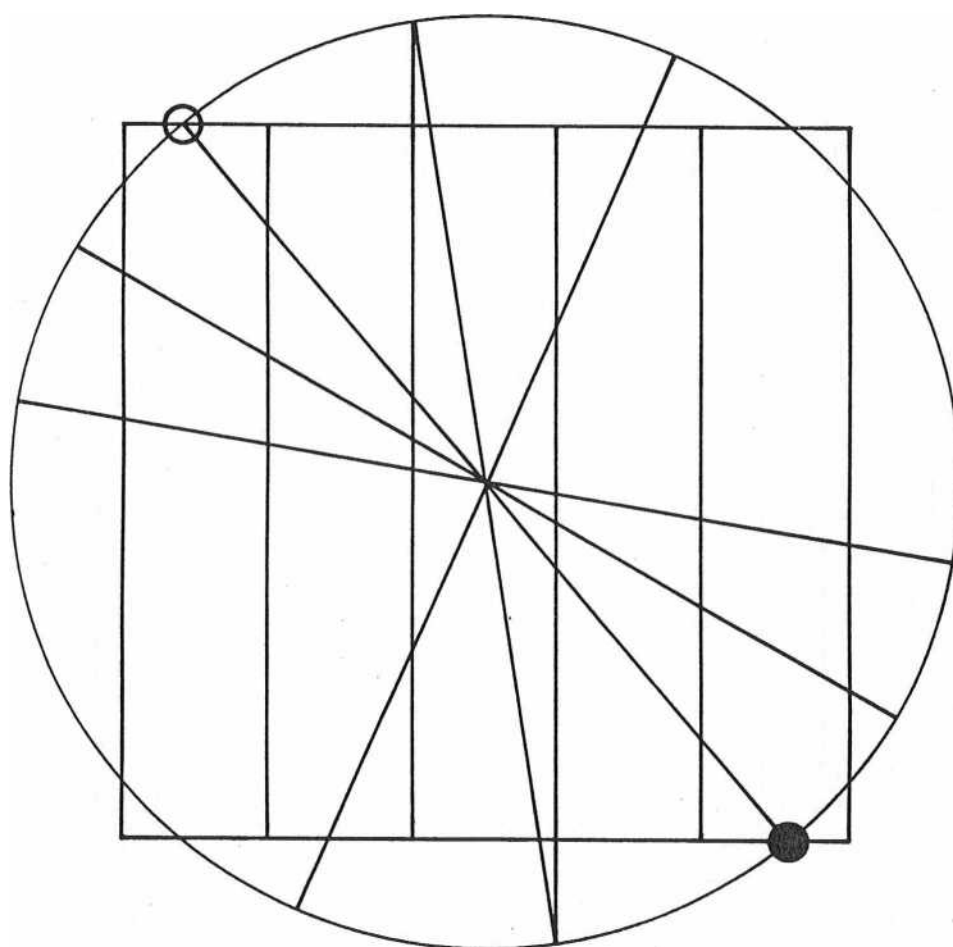

that is to say when they are drawn one on top of the other, if we think of the total figure as the reunion of the circle and the square. If we do n't think the definitive figure as composed of two figures, it turns out that the form is moment-dependent.

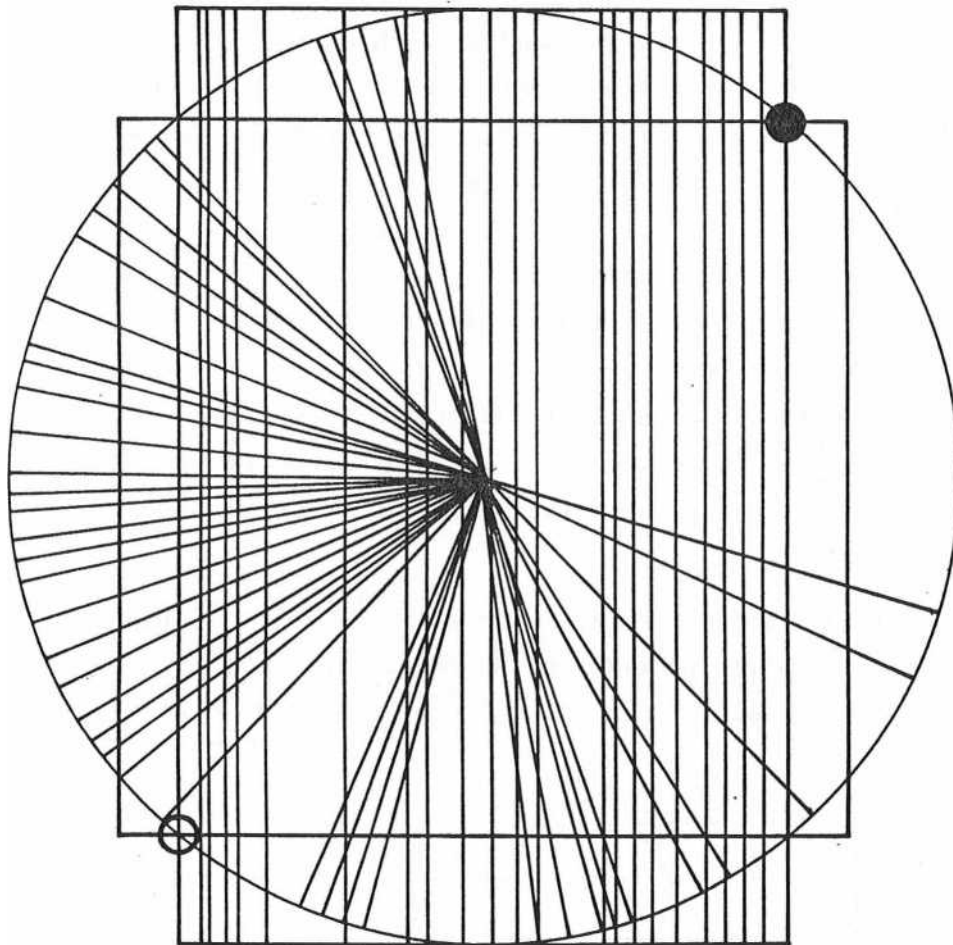

It responds neither to RWCH nor to any KShPh, but the eifs after a certain time will no longer be the same, or if we use this form to rebalance from a witness, this role will gradually disappear. to reappear perhaps a long time later and reappear again. It is not a form of variable eifs. If we want to fix this shape so that it keeps the eifs, states at the time we drew it, we must drill one of the 8 holes (this will not be the same depending on the moment) and put a outgrowth at the diametrically opposite point (what will be called an anti-hole). After this operation, this form will no longer depend on the moment. Such a form can emit C. of T i Si C“vc S . you

..“.|

(*) Which does not mean that a free form is not in certain cases as delocalized as a moment-dependent form.

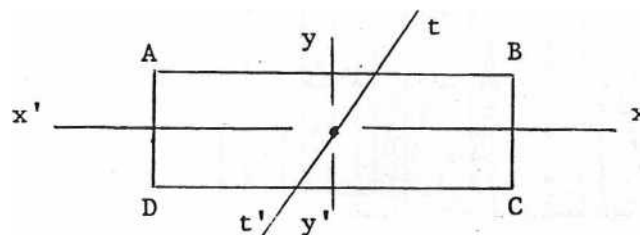

Legend .

Two other shapes inspired by the previous one. The holes and anti-holes are marked but they must be replaced because the reproduction process does not freeze the fixing necessary if we want these shapes not to depend on the moment.

"Non-locatable" forms are forms of which we only *have* an index, which will generally be located. It is this index that will be used to use this form; it will only be accessible to us by this more or less localized index. A non-localizable form is itself more or less close to localization; it seems to "oscillate" between relocations. An example of such a shape is that obtained by planting in the ground, vertically, two stakes of the same height (from 50 cm above the ground) of circular section for example, a certain length apart, so that that the plane formed by these two stakes is oriented roughly north-east, south-west (this direction is very approximate, you have to find it with the pendulum and soak up the concepts). When this first is carried out correctly, we find the non-locatable form in the pendulum. There are eifs with high C. de T. and which reach several tens of meters if the form-index is composed of fairly high stakes and for example in iron or copper. This shape can serve as a good external balancer-transmitter. Do not connect the stakes with a wire.

To further increase the range of the eifs, you can place a piece of quartz on the ground between the two stakes (not all minerals have this effect). Another example of a non-locatable form is boron hydride (so we are (*)) in the microscopic range) of formula . The formula hydride is an index-form, localized here. The enrichment of the usual C. of C. also enriches the other C. of C.

barred forms were discovered by Alain Férault and Jacques Ravatin. Let's see an example. Consider a rectangle ABCD in a horizontal plane with larger sides AB and DC. At its center of symmetry 0

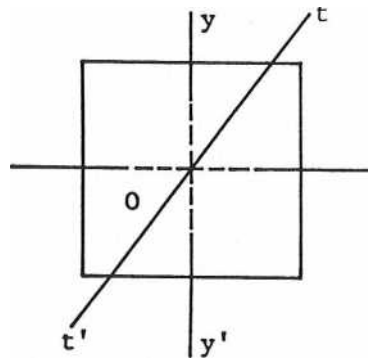

let's draw the two axes of symmetry $x'x$ and $y'y$. Let's draw the line $t't$ going through 0 and making -23° (or $-22^\circ.5$) with Oy . After this construction, let us keep of the figure only the rectangle and the line $t't$. This figure emits at high C. of T. It will be called a "barred form".

(*) It is found in the usual C. of C. by filling in the AND structure.

If we had plotted $t't$ at $+23^\circ$ from Oy , there would have been no high C. de T. . If we had plotted $t't$ at $\pm 23^\circ$ from Ox , there would have been no high C. de T. eifs. If the rectangle had been in another position in the plane with respect to the observer, it is the side of greatest length and 0 which would still have imposed Oy and the angle would have been approximately 23° . We are therefore faced with a construction that does not respect the symmetry of the figure: it breaks the symmetry.

If instead of taking a rectangle we had drawn a square in the horizontal plane, the axis $y'y$ being drawn from bottom to top - in good shape by the axis $t't$ which makes an angle of about 23° with Oh .

In this case it is the position of the observer that takes precedence. We must keep the $y'y$ axis in the figure.

A form north is imposed in the case of the rectangle by the longest side; in the case of the square for which the symmetry is greater, it is the observer who, by the choice of the layout, imposes his form north. If the square was symmetrical with respect to the vertical of the sheet which represents the horizontal plane, then the choice would be made (and the shape would depend on the moment). So an observer in front of a form will make it depend or not on the moment. To avoid any ambiguity, we can impose the shape north (it cannot be put anywhere; it must be made for this figure, for a specific purpose).

If we draw a circle, we can also cross it by imposing the form north by $y'y$ which passes through the center of the circle and we draw $t't$.

The central angle of the regular convex polygon with 16 sides has the value $22^\circ 30'$. By drawing a $y'y$ axis passing through 2 opposite vertices, we immediately have the $t't$ axis which makes it a barred shape. This can be used in mounting a high C. of T. generator using electrical voltages. Ravatin has

deposited a patent [1], generalizing the assembly of L. and MT Sprink, in which now intervenes a vertical frame of which one of the components is a polygon with 16 dimensions, regular, convex out of wood; this one can be barred. But being in a vertical plane, two positions present themselves (because one can be on one side or the other of the vertical plane of the polygon). Depending on one or the other, the $22^{\circ}30'$ angle will be positive or negative. A choice must therefore be made at the time of assembly. The environment in many cases will decide and the form will not depend on the moment. Otherwise, it will depend on the moment.

Forms have their eifs which vary in intensity or even in nature without, for that, being in the presence of a level of RWcH equivalence or of a KShPh state. An example of such a form is the following case: we draw a pen

regular stellate tagone. In each vertex we carry a segment of constant length and making the same angle α with each tangent to the circumscribed circle (which is not preserved) in these respective vertices. We then have "intensity" eifs

variable and whose period varies with the angle. These forms are found at eifs

variables that emit an eif for a period of

h another eif for a

time *etc...* and this on a periodic basis.

Another class of shapes is that of the so-called transfer shapes : Let us consider a shape. Let's impregnate or dilute this form in a bath; it will give. Let's map $F^{\wedge}$ on a support, this will give $F^{\wedge}$.

Suppose the result of impregnation followed by plating causes $F^{\wedge}$ to evolve into $F^?$. We will say that this process of passing from $F^{\wedge}$ to is of the decalco type.

q and F , in many ways. We can _____ (*)
in particular confuse them, which creates an atmosphere. We then have a TAG system. This is what makes it possible to test on a photograph. An example of a decal shape is given by Asturgia where a Magfeu_-M is associated with a decal process.

The types of shapes that we have described above do not cover all possible types. It just turned out that in the course of research these particular genres appeared. There are certainly many more to report.

(*) The notion of confusing is imposed by the Obs.

G. CALLIGARIS (1876-1944)

by LJ DELPECH

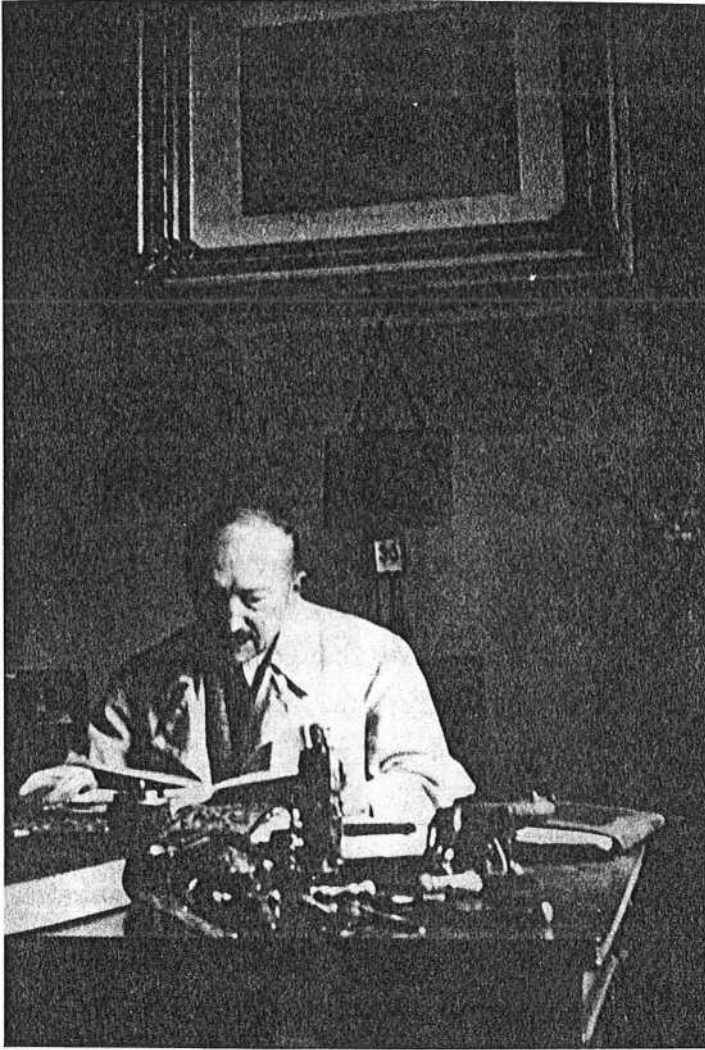

Honorary Professor at the Sorbonne

(Paris)

G. Calligaris was the son of a doctor from Udine in the province of Friuli; he had two brothers, one of whom was a mathematician; he took the same career as his father, that is to say doctor, and pursued studies in Rome with the famous doctor Mingazzini. When the academics had to take the oath of allegiance to fascism, he refused, and retired to the clinic his father had in Udine. One of his brothers took care of the material part of the establishment with his daughter. He himself was helped by his faithful secretary Nucci Toppani, a former patient whom he had saved from lethargic encephalitis when an epidemic of this disease had invaded Europe. Doctor Calligaris read French perfectly: his favorite authors were E. Zola and P. Loti; although he understood our language, he was unable to speak it and our dialogues were each expressed in his own language. During the 1914 war he fought courageously and then published his memoirs in a book "A doctor and the war". After the war he was appointed Privat Doctent at the Royal Faculty of Medicine in Rome. After he had left Rome under the conditions mentioned above he devoted himself solely to his work. Experiments followed endless experiments and the large works published on his behalf exceed twenty. I received a letter dated the day before his death in March 1944, in which he specified that he still had seven completed volumes in manuscript; he died at the end of March of an attack of diabetes.

The two sources of the system :

Calligaris was led to his discovery of the linear chains of body and mind by two routes: A) The pathological route. As early as 1905 he noticed that it was difficult, almost impossible, to include various forms of - anesthesia having a peripheral, radicular or medullar origin in the diagrams of classical neurology. One of the first in Europe he published in 1910 a case

Doctor Calligaris in his office

Study on a patient
in his clinic.

by Professor LJ Delpech.
They are taken from the collection of
documents he has on Doctor
Calligaris.

root-type anesthesia caused by cerebral lesion: this observation was to be followed by several others and was completed by experiments carried out on the distribution of anesthesia in patients suffering from hysteria and syringomyelia. This was supplemented by considerations on medullary metamerism, which led him to a unitary conception of anesthesia ; he came to admit that there are no strictly defined zones of anesthesia in relation to the various seats of the lesion which produces them; but that their causes are characterized by a specific topography to know that they are always located on straight lines, longitudinal, transverse, oblique, to the right or to the left. These lines he will call linear chains of body and mind. B) He had a confirmation drawn from the examination of normal subjects. After multiple experiments, Calligaris noted that there were points on the skin of the human being, like hyperaesthetic lines to pain, to heat, to cold, and finally to the stimulation of a slight faradic current. Curiously these points were located on lines similar to those which corresponded to the disorders of the sensitivity.

The psychic cutaneous system :

The system of linear chains is as follows: starting from the hand going to the shoulders, to go down again along the body and to finish in the feet. These lines correspond to organs and sensations.

- 1°. Lateral line of the body, cerebrospinal system, mental dissociations.
- 2°. Axial line of the thumb, intestine, love.
- 3°. Axial line of the index, sexual and vesico-urinary organs, memory.
- 4°. Second interdigital between index and middle finger, liver, hatred.
- 5°. Axial line of the middle finger, kidneys, mental association.
- 6°. Third interdigital between middle finger and ring finger, spleen, pain.
- 7°. Axial line of the ring finger, pancreas, pleasure.
- 8°. Fourth interdigital between ring finger and little finger, lungs, sleep.
- 9°. Axial line of the little finger, heart, emotions.
- 10°. Interdigital line between thumb and forefinger, stomach, oblivion.

These lines are the major landmarks of the psychic cutaneous system, but Calligaris went further by determining specific patches 6 to 13 millimeters in diameter. These plates are either resonant, - we discover them by standing next to the subject - or consonant, we will stand in front of him; in general the two plates are symmetrical. Plate excitation is produced

by the application of a copper cylinder (at the beginning Calligaris used a very weak faradic current). Each plate is specified by a number of reflexes. Thus a heteroscopy plate produced in a state of charge:

- 1) A little hoarseness.
- 2) A slight pain in the right parietal region of the skull.
- 3) Sensation of hot current along the upper limbs to the neck.
- 4) Frontal paresthesia and the external part of the right leg.
- 5) Neck paresthesia.

The making of feelings on the body of the man.

This is our author's most important book (1072 pages - 1932). In the first part, we find the making of memories and forgetfulness in relation to the organs. Feelings are love, hate, pain, peace, calm, emotion, confusion, heart and dreams, sympathetic system, intestines. Next comes the making of feelings on the skin of man. It is a question of compressing certain areas of the body to observe feelings and this by virtue of two general reflexes or cutaneous splanchnic and psycho-splanchnic reflexes. The third part studies the antagonisms in particular. The fourth is a return to linear chains. The fifth is devoted to the reading of thoughts on the skin of man. Calligaris multiplies the observations. He studies, for example, excitement, selfishness, generosity, willpower, concern, patience, curiosity, modesty, courage, attention, prudence, etc., etc. The seventh part studies the reading of the thought on the cutaneous plates. The eighth part is devoted to sleep and dreams according to sensations and feelings, etc. The whole constitutes, to our knowledge, the deepest investigation into the resources of the human body in relation to the psyche. From our conversations with Calligaris, it appears that he has always been haunted by these questions and that it is to see clearly that he has done all his work.

Autoscopy.

In 1933 the marvels of autoscopy appeared. It was about a particular mental aptitude which consists for the human being of having a representation of his own person. This can be from the outside and this vision takes on the aspect of a double as perceived by Goethe and Musset. "That stranger dressed in hoir who looked like a brother to me"; it's autoscopy

external, the subject's vision of one or more of his own organs constitutes internal autoscopia. This phenomenon was first described by Aristotle in *Meteora*, book 3, chapter 4, then by Wigan, Michea, Brierre de Boismar, etc., but it was at the beginning of the century, in 1903, that Dr. Solle systematically studies the question in his little book "The autoscopic phenomena". Bain: "Autorepresentation among hysterics", thesis 1903 Gomar, finally two articles in the review of neurology 1912 and 1917. The first chapter of Calligaris deals with the external autoscopia and the means of inducing it. The second part, internal autoscopia; the third part, of the autoscopia of the foreign bodies which are in our own body. The fourth part, automicroscopia of the viscera. The fifth part, human radiation. Part Six, Fundamental Questions Concerning the Cell of Man. The seventh part, autoscopia, microbes residing inside our own body, finally X-rays. The book, very important, of more than 602 pages, includes a considerable opening on the knowledge of the man by himself. The images of the living and the dead evoked by means of their own works. In 1935, Calligaris published a work which corresponds to what has been called psychometry and of which there are numerous examples in metapsychiatry: see in André Malraux's work "Hôte de passage", where a seer with a fabric of fabric evokes the death of Alexander the Great. The distinction between the work of Calligaris and that of an ordinary medium is that he gives the means to act by his reflexology and that one thus obtains specific effects; a second point is that as a witness we can take the works of the subjects, that is to say structures that have not been in direct contact with him. In a first part are evoked a great number of authors, approximately 200, then their parents. A particular study is devoted to the life of Horace with the production of a panoramic vision of his life; then comes various scenes of his life. But, the reader will ask, what proves to us that we are not in the realm of fiction? Calligaris says that we only have to verify his method on a character on whom we have a lot of information, finally on a living character. The last part of his work is devoted to the mechanism of knowledge in particular with "human rays", to the development of the image, etc. Once again with its method of reflex knowledge Calligaris renews a fundamental aspect of parapsychology. In a somewhat similar perspective we find the work on "Infectious diseases" in which Calligaris makes a prodigious discovery, namely that he succeeds in projecting onto a patch of skin 7 cm by 8 located on the back of a forearm a magnified image of germs, germs or

signatures in any case figures that are both photographable and significant. He will later project various figures (cf. metapsychic). Continuing his obstinate work, Calligaris published in 1938 a book entitled "The wonders of metapsychiatry, volume I; mental phenomena. It is dedicated to Charles Richet. The first part is devoted to generalities, but the second, entitled "Artificial metanoggy and provoked" treats, among other things, of the fabrication of clairvoyance and of reading through opaque bodies; the reading of thought, automatic writing. The third part entitled "supernormal vision", after having indicated the research methods, includes profound reflections on metapsychiatry and medicine, physiology, neurology, psychiatry, etc., then the problem of survival is tackled. previous ones with in particular indications to produce phenomena of xenoglossy. The following part which deals with clairvoyance in space at a distance and according to all the possible modes with the way to achieve them. The sixth part studies retrocognition considered in all its near and distant aspects as the means to achieve them and an appendix on retrocognition in the service of justice. The seventh part deals with the future or measures the difference with the research of De Rochas and Lancelin. Calligaris is led to considerations of fate and he is shown to be rather deterministic. Among the novelties of this book, there is the alliance between mental vision and the projection of images on the skin of the subject. A second volume was to be devoted to the physical phenomena raps, materialization; I had endeavored to help him thanks to a famous dowser Ch. Voillaume. The mechanism of the raps' provocation had been discovered, when Calligaris died.

The Universe represented on the human body.

Taking up the traditional idea that man is a microcosm corresponding to the macrocosm, that is to say to the universe, he postulates according to his research that the skin is the common sensorium of ancient thinkers and that the elements are related to linear chains. Corroborating his hypothesis he finds experimentally a correspondence between the first chain and the universe; the second with the stars of our solar system, the third with things, the fourth with water, the fifth with air and light, finally the sixth with sounds. Among the various aspects of this projection, let us note the meteorology with the correspondences between points of the plates, lines and the snow, the humidity

aid, drought, wind, etc. there is a plate for the weather forecast
 the end of the book goes further allowing the subject to see the system
 f his conscience as that of his subconscious. Calligaris speaks of an admirable experience ,
 amely the cinematography of the past, because everything remains in the
 orld. Everything is preserved there, nothing is lost. And there Calligaris joined Lakhovsky
 whose work he knew perfectly well and whom he quotes: "All the phenomena
 at we perceive on earth are only phenomena of vibrations and
 sonances within the universion, cf. Universion 182- 185. As he says in the
 igrapgh of his book: On this high body of 8 palms is contained everyone:
 he Buddha.

. he television of the stars.

At Christmas 1938, during my visit to Calligaris, he had shown me a file declaring to me: "That is the
 vision of the stars, but we cannot
 talk about that in about half a century. Nevertheless, starting from the notion of representation of the Universe on
 human skin, he did not hesitate to try the adventure and publish his results in 1942. The work has two parts: the first
 titled "To Other Worlds"; general considerations where the astrocutaneous reflex and the astral-photocutaneous reflex
 are brought to light. A series of plates are then studied, the stimulation of which makes it possible to see various
 planets, their different aspects, inhabited planets, animals, anthropoid plants , meteorology, etc., finally in a very
 important chapter entitled: "Crucial experiences", Calligaris gives 40 reasons that prove the objectivity of his analysis.
 The second part deals directly with the moon with its mountains , its plains, its atmosphere, its light, even its former
 inhabitants, its

• , , . s . . . (*)
 underground, etc., a whole world revealed to Calligaris by his investigation One can say to oneself after the lunar
 exploration, so limited by the Americans, that one is faced with fantasies! perhaps, but another hypothesis is possible:
 the existence of non-material beings, of structures like human beings

(*) Editor's note We find visions of the same kind as those obtained by sensitive clairvoyants. R. Réant saw by doubling
 on the moon, human beings without diving suits, walking, behaving as if they were on earth. Several cases arise:

- Either the one who duplicates alters his vision by phantasms belonging to the society in which he finds himself.
- Either he is faced with symbols that he cannot decipher. •
- Or he has access to fractants.
- Either we have a mixture of two or three of these three possibilities.

corns, or the phantom members, finally the phantoms. In a letter of March 15, 1944, Calligaris fifteen days before his death, let me know that he had in his manuscripts a book on the stars: Mars and Venus.

In conclusion we can say that Dr. Calligaris is one of the unknown geniuses of our time. He has made prodigious discoveries regarding human nature; starting from the idea that the subconscious is not only in the brain, but has its roots in the human skin. "What is deepest in man is the skin", once wrote Valéry, in a fixed idea; he discovered the linear chains of body and mind (1908); then starting from this architecture, he constituted a sort of psychic acupuncture that could be manipulated like reflexology; he therefore studied the human body in terms of affectivity with a book on the fabrication of feelings, but also he *scrutinized* the representation of the human body either from the inside: autoscapy, or from the outside: heteroscapy, then he discovered dermatography and reflex telepathy; he then generalized the problem and brought to light the existence of an experimental metapsychy still based on reflexology and able to go as far as clairvoyance of the stars; on the other hand, from the medical point of view, we must remember his books on cancer, mental illnesses and especially in a work on "Infectious diseases" the projection of microbes on the skin of man (photographable, therefore indisputable). Why has this research had so little success? In our opinion for two reasons: the first because one of their popularizer Dr. Leprince did not insist enough on the difficulty inherent in experimenting with these phenomena, many have tried and, faced with non-success, have concluded to fraud or illusion. Another cause of difficulty is the problem of freedom. Calligaris like Pavlov did not believe in freedom, yet he admitted a reflex going from the skin to the cortex and a reciprocal reflex; therefore there was a margin of uncertainty which can in certain cases disturb the phenomenon. Anyway, Calligaris was a prodigious researcher and certainly, one day, his works will be taken up.

APPARATUS BY J. COUTELEN

by J. RAVATIN

MAVE

(Paris)

The philosopher Raymond Abellio once participated in a rather astonishing experiment. Here is what it was about: around the 1950s J. Coutelen, (*) former laboratory assistant to Georges Claude, had installed an experimental assembly in his cellar which had been designed in the past by this physicist. G. Claude claimed to have demonstrated a phenomenon of production of radioisotopes from sand and by means of an old Crookes tube.

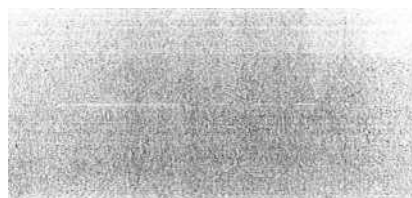

A few years later, the assembly was installed in Courbevoie in the former Rosengart factories.

Some physicists, made aware of this phenomenon, said that it was a sham, and there were even some who refused to bother and nevertheless concluded that it was a sham. Here again we find what happened to pcurKeely, Moray, Reich, Hendershot. The argument of these physicists was that X-rays cannot cause nuclear mutations, numerous results, both theoretical and experimental, confirm this. Naturally, they had never thought about the importance of form in a fitting.

The lab assistant continued to pretend that he was acting in good faith and asked various people to participate in the experiment and to verify by means of Geiger counters the production of radioisotopes from sand, the test being done before and after experience.

The businessmen who sponsored Coutelen even had the product analyzed by the Polytechnicum of Zurich, which found in the first analysis that it was natural decomposition products present in uranium ores and in second analysis, that there were thorium decomposition products (about ~~Y-90~~). Coutelen's explanation was this: he captured, thanks to

(*) Georges Claude (1870-1960) is the author of numerous works on the liquefaction of air (one of the liquefaction processes bears his name), the thermal energy of the seas, the synthesis of ammonia and fluorescent lighting.

his device, cosmic energy by means of chokes. Soleau folds were filed by Mr. Loyer, then an industrial property consultant engineer and director of a patent filing firm. Loyer himself took part in the experiments. He could discover no trickery; the same applies to Captain Maurin of the Army, but a mission by this officer to Algeria interrupted his investigation. The experimental assembly was reinstalled in another room and the Crookes tube was broken during the move and the experiment was able to give positive results.

It turned out that by replacing the older Crookes tube with a more modern Crookes tube, nothing happened; it was the same in some places where the apparatus was mounted even with the old Crookes tube.

From Abellio's point of view, Coutelen was not an impostor, although the latter's behavior was that of a very nervous person. Abellio remained convinced that Coutelen, without understanding what he was doing, had more or less roughly reproduced certain experiments carried out by his former boss, experiments which G. Claude had not spoken of, and these experiments were going to highlight a new phenomenon. What should be noted is that the builders of the old Crookes tubes often added impurities and in particular thorium to the glass to increase the efficiency of the tube.

Messrs. Loyer and Abellio were able to give very precise information on the experiments that took place in Courbevoie. :

Crookes' old tube was attached to the ceiling of the room; it was supplied with alternating current 50 Hz at a voltage of 10 to 15 kv, by means of
of an old type transformer, one of the poles being grounded. The flow was
of 5 r A. On the table was placed a winding of 12 turns inside which was a second winding of 10 turns, of opposite
direction
at first; these windings were not connected to the electrical conductors supplying the Crookes tube, at least during the
experiment which was to provoke
the effects of radioactivity. The first solenoid ended with 2 small metal spheres S[^] and " in front of the sphere S[^] is placed
at a distance of about 1 to 2 cm a sphere from which a wire leaves constituting a dead strand, this assembly forming a
capacity. Under the windings was (*)

(*) R. Abellio was very interested in the work of Sprink and his wife. He had also helped L. Sprink to file one of his patents. He knew that all these unorthodox devices relied on another reality to function.

a cup filled with a specially prepared powder. Before irradiation, a Geiger counter indicated 30 counts per minute, in the various parts of the room and in the immediate vicinity of the powder. The powder subjected to irradiation consists of crushed chalk, sand from the factory yard and an activation product from previous experiments. But the powder had to be placed overnight above a crystallizer in which there was bromine water; sodium amalgam was added to this bromine water. Two electrodes connected to a dry battery were immersed in the crystallizer (*) and left plugged in overnight.

This, of course, must have seemed very suspicious to all around Coutelen. But this water which stays all night takes on quite special properties. You certainly had to take into account certain seasons, for example spring, and the phases of the moon because of the polarization of the light. It is a process which is well known in Alchemy with potash which is sprinkled with such water. This gives the crystals very special properties. Note that the powder did not take an ext; she was neither mounted nor even in equivalence by this process; nor did it take Taofel fields.

At-one experience, Captain Maurin was present • He asked the (**)

(*) The hydrogenated material is placed on a glass plate and this material is irradiated by the beam emitted by the Crookes tube for 5 to 7 min. The best results are recorded when Crookes tubes with nickel anti-cathode are used. Regarding the high-voltage source, it is advisable to take a coil powered by a mercury turbine. The current must be rectified by a kenotron • It would seem that the points in the curve of the tensions supplied by the reel, following the interruptions of the mercury turbine, are favorable to allow the emission of the EF and C. of T. But the shapes of the solenoids, the number of pitches, the connection points of the wires on the turns, the pitch of the turns, the preparation of the product to be treated are also necessary.

(**) Information provided by Colonel Pierre JG Maurin. Colonel Maurin was at the time Captain and assistant to Colonel Ailleret in the Nuclear Weapons Group of the Technical Section of the Army. He was competent in nuclear physics: he had worked at the Collège de France with Francis Perrin and in the team formed by the engineer Chanson who was at the origin of research into the military applications of nuclear energy around the 1950s.

At the request of another officer, Captain Maurin was brought to attend in a room of the former Rosengart factories, in Courbevoie, an experiment by J. Coutelen, in the presence of Mr. Palenski, then Minister, and Mr. Anscionnaz, Secretary of State for the Navy. These personalities had been warned by gentlemen

CEA to analyze the products but the results were not communicated to it; however he still learned that the transformed product contained only natural radioactive elements and a few days later, he was informed that there was something else there, but he was never able to obtain the report.

(*) ...

of analysis. A temptation to explain this work was presented by two engineers whose names we will not mention because they simply wanted to make themselves interesting in the face of an experience that was far beyond them. On the other hand, they spread their title in all sufficiency. Their conclusion was for Coutelen and therefore for Georges Claude absolutely deplorable "Let's not forget that he (Coutelen) could very well be an impostor?"

This speaks for itself?... Another experience also took place. Coutelen connected the chokes differently and made the radioactivity disappear. When we test the entire apparatus we find when it is in operation all the Taofel Fields are present, which suggests that G. Claude Coutelen's apparatus is not the work of a forger either. [1] ,

Bibliography

Rosen and Boistel, two businessmen eager to exploit the invention of Coutelen (especially invention of G. Claude). These two businessmen patronized Coutelen. F. Perrin, convinced that Coutelen was more of a conjurer than a - researcher, did not bother to attend the experiments.

At the end of an experiment, one of the personalities present asked Maurin to follow the case and the latter gradually received the order from Mr. Pleven, then Minister of National Defence. At the experiment attended by the Minister and the Secretary of State for the Navy, precautions were redoubled. Captain Maurin was accompanied by one of his collaborators, Captain d'Anselme, a specialist in transmissions and methods of measurement and nuclear detection. The two officers brought with them equipment from their laboratory apparatus which they had carefully checked and calibrated. The room in which the experiment was to take place was examined in all its corners. Coutelen himself was thoroughly searched before the experiment and watched during the course of it.

(*) Colonel Maurin was then suddenly sent to Algeria and the affair was buried. But at that time Colonel Maurin considered that this assignment in Algeria was not unrelated to the "Coutelen" affair.

Victor SCHAUBERGER and his discoveries

by J. RAVATIN

MAVE

(Paris)

Victor Schauburger is Austrian. He had started his work before the 2nd World War. He was very discreet and worked alone in his small laboratory .

Despite his discretion, the Nazis during World War II heard of his research and they summoned him to ask him to work for them. V. Schauburger was very reluctant. Faced with very specific threats from them, he had to give in, but his work was never exploited by Nazi Germany. At the end of hostilities, his laboratory was ransacked and his work scattered between Russians and Americans.

Schauburger's work focused on the implosion engine. It is the opposite of the internal combustion engine. While the combustion engine uses the pressure of a fluid which expands very rapidly by an explosion in the medium, in the implosion engine suction forces due to an implosion are used .

In the implosion, part of the energy is transformed into heat; this can be very high even in a short time. In the implosion there is no heat, and on the contrary cold is produced by a spiral contraction of the moving medium; there is a vacuum which leads to suction. There is therefore little resistance in the vortex, whereas if there is an expanding gas, the resistance to movement is much greater.

The implosion as V. Schauburger produced it creates a decalair. The vacuum consists above all in a delocalization on the molecular scale of the fluid, that is to say in an impossibility of stability of reference.

Schauburger considered, in his representation, that there was a force which he called "universal" and that this force could be divided into two forces opposed by their nature: one compressing, one of the suction type. Nature - expressed these two kinds of force in its polarities. Each of its two forces

manifested by different movements

and the secret of life is a happy

mix between them. The compressing component **is the centrifugal force in a**

circular motion; it leads **to** friction, **the appearance of heat** and the attraction **of** gravity: The **suction component leads to the centrifugal force**

farts in a spiral movement, and in this case, there **is no friction, it** appears cold and levitation.

Schauberger therefore built devices showing the suction component, but a device using both components is still unknown.

We will use Schauburger's terminology; there are 2 phenomena: a centrifugal type phenomenon which creates in particular an increase in temperature and a biological deterioration and the other centripetal type phenomenon which on the contrary causes a lowering of temperature and an improvement of the biological processes. The second would thus be constructive while the first would be destructive. For V. Schauburger the "centripetal" phenomenon generates diamagnetism. Diamagnetism was sensed by Faraday already in 1845. Based on some personal observations, Faraday classified the elements into paramagnetic and diamagnetic; the paramagnetics are attracted by the magnet and the diamagnetics are repelled. It is more correct to present this according to the more modern theory of induced magnetization: a body placed in a magnetic field generally takes on an intensity the magnetization which has the same direction as this field. The intensity and the field are linked by a multiplicative coefficient χ called χ magnetic susceptibility of the body, χ can be positive (paramagnetic body) or negative (diamagnetic body).

Iron, nickel, cobalt, manganese, chromium, cerium, titanium, palladium, platinum, osmium and almost all ferrous alloys are paramagnetic.

The diamagnetic group includes bismuth, antimony, zinc, tin, lead, copper, silver, gold, glass, carbon disulfide. Simple experiments show the behavior of these different bodies in a magnetic field.

Some liquids are paramagnetic and others diamagnetic. But Schauburger, it seems, as Leopold Brandstatter [1] had discovered that when bodies like air, earth, water are agitated and dragged over everything in a spiral movement, forces related to diamagnetism are generated. For Schauburger our modern technology had until now only been able to produce forces of paramagnetic origin which disturb the process.

vital processes; while it revealed to him forces of diammagnetic origin which improve the vital processes.

As already noted, the "centripetal" contraction produces a drop in temperature and creates a vacuum which was measured with a manometer. The rate of temperature drop depends on the turbulence velocity of the fluid. Schauberger drew the following remark from this: in certain places one observes wells from which water springs; these particular cases do not seem to be explained by the presence of groundwater above the level of the well or siphon. Old peasants comment on this. However, according to Schauberger, the helix movement of the earth in space makes it the equivalent of a diamagnetic body; the same is true for water while the atmosphere is the equivalent of a paramagnetic body. So he applies the principle of magnets which says that the poles of the same name attract each other and those of different names repel each other. Thus the water from these wells would rise, repelled by the earth and attracted by the atmosphere. When the opening of the well is cleared too much, the sun's rays give the earth a paramagnetic character and the water can no longer rise.

From cutting down the forests, one arrives at the deserts which no longer retain water because entire regions then behave like paramagnetic bodies. Water stays deep in deserts and is near the surface when there are forests.

Schauberger thought of imitating nature and for that reason developed devices which give water the properties it must have under good conditions. He advises against the centrifugation produced in devices such as turbines. The preservation of life requires unpolluted water. And depleted water can be regenerated by Schauberger's implosion turbine process; he realized it in rivers.

Schauberger thinks that diamagnetism is a current of the Aether, fifth of the four basic elements of the Ancients: these four being water, fire, earth, air.

When he places a diamagnetism on the ground, etc... he transports certain concepts of electromagnetism into another coherence. This transport of structure may be valid, but it must be pointed out and not identified as he presented it.

Schauberger had set up a device that verified his statements. A tank containing water was surmounted by a tube of special alloy and shaped

also special. The volume of water in the tube rose as the tank came out full; everything was protected from light. The role of the alloy and the shape of the tube was to give the water the diamagnetic character. The water then drunk tasted better and fresher; according to Schauberger its density had slightly increased. On the other hand, he said that he could draw enormous quantities of energy from his devices. He also added that to sack the vegetation along the rivers and rivers, as well as to channel them between concrete walls removes any diamagnetism in water and it is a fundamental form of biological denaturation of this fluid.

Schauberger passed the fluid through small pipes 1 mm in diameter; these are mounted on a cone and the fluid launched into the pipes can reach 1200 revolutions per minute because they are spiral-shaped and its speed 1290 meters per second. The water is not sent continuously but is blocked regularly by a valve of a special shape and of an equally special alloy, which generates a counter-reaction force but in the same direction as that generated by the implosion engine. Schauberger had also developed a suction turbine that could be used as a family-scale energy generator . This turbine would advantageously replace the compression turbine. There is no longer any need for the construction of huge dams at huge costs and tunnels and penstocks to bring water to the turbine. The power of a suction turbine is 700 to 800 percent greater than that of compression turbines. The water depth of a reserve is then low, so installations on a family scale or a small village can easily be envisaged. This is reminiscent of another turbine; that created and developed by E. Aumont [2], [3].

Emmanuel Aumont was an engineer; he had been trained by the Agronomic Institute and had become a collaborator of Georges Claude who had implemented one of Aumont's patents on behalf of the "L'Air Liquide" company. Mobilized in 1914, he was recalled from the front in 1915 to carry out the urgent production of asphyxiating gases. Aumont developed a process and set up the Boussens factory on the Garonne, which later became state property managed by the SEUB (Société d'Exploitation des Usines de Boussens). Aumont had, it seems, made his first observations on the disadvantages of the scaling of the hydraulic turbine which supplies the factory with electricity and observes how much the rbulences harm the output. Then he directs his research in the field of refrigeration. The company "Le Froid Industriel" exploited his patent. He

set up a small laboratory at Pont l'Evêque in Calvados. There he was concerned to see electricity treated on a more commercial than practical level [4]. Aumont asserted this:

"The recovery of free natural energies has created the need to harmonize the loan with the effort by means of the brake, which transforms the undesirable surpluses into waste heat. However, the discovery of the asynchronous motor by the illustrious physicist Maurice Leblanc created this datum of the magnetic brake, immaterial gear, which, blocking any overspeed, reverses the direction of the current without any loss of energy".

Aumont had launched an interesting experiment at Pont-l'Evêque between 1936 and completed in 1939. It used the low falls which are legion on French territory. (100,000 units, the oldest of which date from Vauban). We could have managed in 1939 to supply 1/3 of French consumption.

Emmanuel Aumont demonstrated by his achievement (which from a technical point of view was to surpass himself thereafter) the possibility of using stockings from his falls. This made it possible to bring the company from the Normandy coast to grant Aumont an advantageous contract likely to enable it to develop and operate, on a private basis, the lower falls of the Touques basin.

In 1946 nationalization was decreed. In 1947-1948 the EDF abandoned the Aumont process. In 1952 forgery made by EDF at the Magnannery. Aumont, on going there, was able to see that this micro-power plant was a carbon copy of his own creation, made at the Floquet factory in Pont-l'Evêque.

Aumont advocated siphoning water from the river to drive a turbine that starts a dynamo. The engineer used an asynchronous motor when it operates a machine tool and becomes a generator when it is harnessed to a source of energy: such as a steam engine, a diesel engine, a waterfall.

A tome of sheet metal to make the siphon diffuser which flares out in the submerged part and in which the propeller will turn, two ball bearings , a transmission by chain and sprockets, an asynchronous motor, a safety regulation system and defusing and fixed guidelines; no moving parts other than the propeller and everything works as expected. Two particularly skilful local craftsmen, Mr. Even, mechanic, and Mr. Boilermaker carried out the sheet metal work and the electrical system on site. Aumont was delighted because other companies then asked him to use the lower waterfalls

or equal to 2 meters.

.. . < v

• J, • ■'

The two micro-power plants produced

- in 1940 143.272 kWh
- in 1941 149,354 kWh
- in 1942 150.852 kWh

that is more than half of the needs. According to E. Aumont, "electricity then shouldn't cost more than the air we breathe", a simple joke to emphasize. . (*) reduce the tiny cost of production

EDF has also built a small turbine on the banks of the Mayenne. There was an asynchronous turbine and generator, a siphon and a diffuser . But the Aumont process was much better: it caused the driving water to take the following route: a water chamber formed by the upstream reach, a distributor, the poles of a propeller clamp, an angled aspirator then a diffuser whose the exit bathes in the tailbay. Naturally we had to imagine the siphon, its shape and the copy of the Aumont turbine, made by EDF, never worked like the original from Aumont. There is the know-how, and the know-how of Aumont did not involve a grain mill but a dynamo therefore could be coupled with the network.

(*) In 1943, following the bombardment of a German weapon tanning workshop, the Floquet micro-power station, on the Column, was badly damaged.

After the war, it is the nationalization of the various companies and moreover, the damage caused to the power station is not repaired; then we remove automation devices from that of Bretteville.

In 1947 E. Aumont regained hope because EDF asked him to prepare a detailed study on the possibilities of applying his process in a region.

In 1948 the management of EDF with technicians and builders visited him. The problem is that the region of Pont-1'Evêque, where E. Aumont had settled, is not retained, because the scraps are considered to be not large enough, whereas the Aumont process allows the use of small scraps. . It is preferred as the Mayenne region. Aumont cannot even hope for the recovery of the Floquet micro-power plant. On the other hand, enormous sums are envisaged for the construction of the giant dams that we know.

On the Column, an insignificant river, there was a course of about 20 km of unevenness. We could have arranged 7 low-falls in steps of stairs and the 7 Aumont turbines would have supplied together 1500000 kwh. The installation is inexpensive, the same for guarding. On the other hand, EDF could buy the surplus not used by the supplier.

Mr. and Mrs. Ozanne, respectively son-in-law and daughter of the engineer E. Aumont wrote a memoir defining his thesis. It can be found in [5].

The siphon, in the case of the Aumont micro-power plant, by the tightness ensured in its neck causes suction and it makes perfectly illusory the bulb which appears on the plan of the assembly installed by EDF at Maignannerie.

At the elbow of the Aumont vacuum cleaner said "water behaves like a solid ". He had realized that his editing had quite astonishing properties . In addition this vacuum tube did not have a circular but polygonal section. We mentioned this device created by Aumont to make known this brilliant inventor and also because its suction process and the shape were reminiscent of Schauburger's turbine from afar.

Schauberger thinks that UFOs generate diamagnetism which would mean that there is no sound barrier or heat barrier. Schauburger sees UFOs as technical objects; they are not such objects. It does not take into account localizations and relocations. But an object after it has localized itself can use physical principles to function and then can be, in some cases, an illustration of Schauburger's work. But many localized UFOs are not related to the realization of this generalized diamagnetism.

THE GREAT GNOSIS AND THE EGYPTIAN FORMS

by J. RAVATIN

MAVE

(Paris)

Louis Boutard

It is first of all a child, originally from the Loir Valley. He was born in 1880. The village priest took a great interest in him, and on Thursdays he took him out for walks in the countryside and taught him to recognize plants by their shapes, their smells, their colors; he also taught him the stories attached to plants, the legends.

Then the village priest took steps to have him accepted at the major seminary of Le Mans; Louis Boutard therefore entered this seminary. He was working on it seriously.

But L. Boutard hid in his desk in his cell lexicons and Greek, Latin or Romance dictionaries, to study them at night, in secret.

Around his eighteenth year he went to the seminary of Kouba, near Algiers. But he remains there for a short time because he is dismissed because of his discussions with his superiors on linguistics and his ideas on gnosis which are not appreciated. In Algiers, he met Marc Aumisier (pseudonym) one afternoon in the last months of 1902. Then, for nearly 40 years (until October 6, 1941, when the friendly relations between Louis Boutard and Marc Aumisier have come to an end) Marc Aumisier took a passionate interest in his work and lent him help and assistance.

Marc Aumisier [1] tells this long story. We will summarize it later.

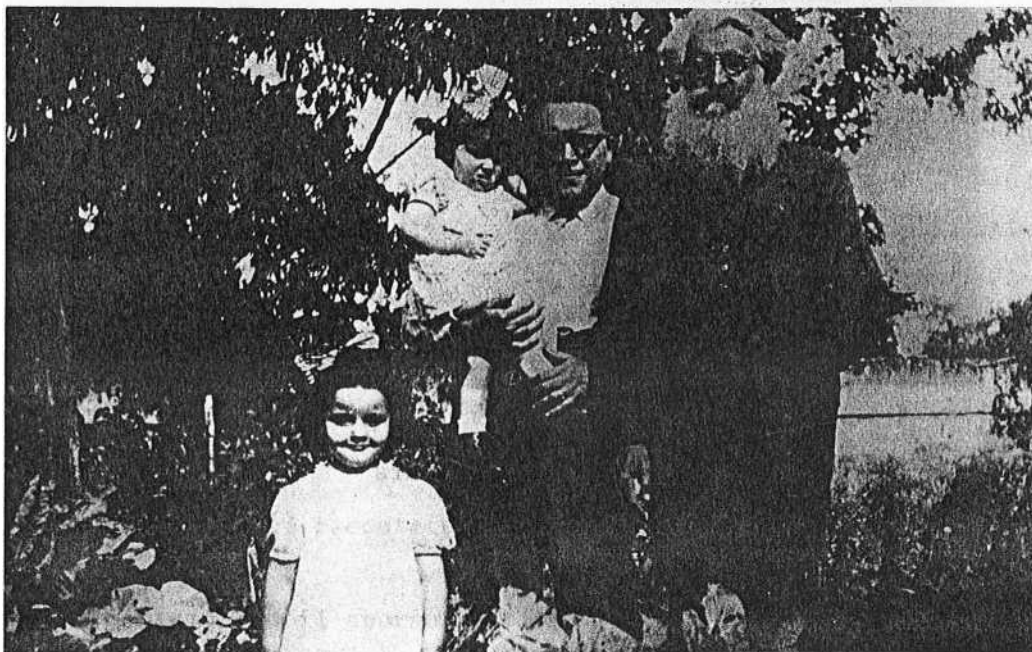

At the same time as he continued his research in linguistics, Boutard carried out his investigations into the series of physical phenomena of nature, for the most part unexplained, using the data that linguistics provided him with.

- Louis Boutard and his two sisters

Photo taken in front of Louis Boutard's house in Poncé-sur-Loir.
On the far right, engineer Armand Hatingais. We recognize Louis Boutard holding a hat and raincoat. Madame A. Hatingais on her right and Madame C. Dumont just in front of Madame Hatingais.

was born. In particular he was intrigued by the electromagnetic field but he was not interested in other fields like the gravitational field.

However, an engineer from Arts et Métiers, Armand Hatinguais had also been intrigued by the electromagnetic field and he met Louis Boutard. The two men quickly became closer because of this common interest. A. Hatinguais intervened in the assembly of multiple devices imagined by Boutard. The first devices were assembled by the hands of Boutard alone; Marc Aumisier says that Boutard proceeded alone to multiple experiments using apparatus of his invention, constructed with skill and ingenuity.

L. Boutard, to devote himself entirely to his research, had left the job he had in Algiers and with some twenty thousand francs, which his boss had given him in recognition of his long service, he had made the acquisition of a small house in the upper Mustapha district of Algiers.

There, M. Aumisier often went to see him. At each of his visits, Bou Tart informed him of the results of his research. Thus one day, among other things, he showed him tiny cubes of starch that he had obtained directly with the help of certain devices and without the use of any organic body .

Boutard thus succeeded in acquiring the certainty that the earth was once inhabited by a race of men who had come to know the origin of things. Mythology, which we consider as a deification of the forces of nature and of man's wishes in the face of this nature, would then be only the allegorical expression of the deep science possessed by this race of men , but of which the Egyptians from 3 to 4000 years ago had already lost the secret. Naturally, this is the opinion of L. Boutard. The knowledge we are talking about could have been that of the great Gnostics of Egypt, 7000 to 8000 years ago. They certainly were. But before the great Gnostics there was the Sumerian civilization. Perhaps it was a very small part of the knowledge of Sumerian priests. Can we consider them as those who would have had a fantastic knowledge? In this return to the past, should a creation intervene?; that is to say, do we not engender these discoveries by looking for certain clues of knowledge in the past?

But this is where it gets interesting; the same goes for the idea of unity_original_of the_languages, a conclusion to which Boutard also arrived.

(*) These are of course francs of the time.

L. Boutard entered a C. de C.; this enabled him to find certain paths which he put in the C. de C., which the C. de C. accepts and that is why we have a C. de C., it is that is to say that it makes it possible to find something whose - consequences will be verified. But it goes even further; it is the human being himself who is defined by this approach; the approach is characterized by this: its truth is given by a way accepted by the C. de C. The truth will be confirmed and will confirm other truths in the C. de C. .,

Does the human being have at his disposal only this only means to discover? This we do not know!

To follow L. Boutard, one must first immerse oneself in his terminology, get out of our intellectual framework and try to rediscover the sacred science of antiquity. For this he used the concepts of death, aether, atoms etc.

But what is aether? If we consult an old dictionary, we find the following definition: "Incompressible, elastic fluid, which fills spaces, penetrates all bodies, and which physicists considered in the 19th century as the agent of transmission of light, of heat, electricity..."

Naturally the notion of aether (wrongly spelled ether) was abolished by 20th century physicists. Let us first see the model that L. Boutard made of it.

The aether occupies and fills the entire universe. It is a limitless ocean formed of small diaphanous and imponderable beings which penetrate all bodies and have the form of small serpents. Little snakes, Boutard doesn't have them (*) . .

not seen mars he thought that the scholars of antiquity had certainly discovered the means of observing them since they meticulously drew them on the abraxas. These abraxas were, as we have seen previously, sorts of cameos, very finely engraved, which the ancients wore hanging from their necks. On the edge of these cameos is engraved a small snake which surrounds Greek letters and drawings representing men, animals, various objects.

Or Boutard discovered that the drawings and inscriptions they bear are the expression of revealing notions of ancient knowledge. The notes thus figured or transcribed on the abraxas that he deciphered confirm those drawn from linguistics and he wrote a very detailed explanatory note to this effect. The explanations and demonstrations by which he justifies his assertions have the character of evidence and are accessible.

(*) It seems by taking up the evolution of his works that he saw them but as he never talked a lot about certain things, we can't guarantee anything!

Finally, L. Boutard applied himself to deciphering the meaning of the tables of Isis, a famous archaeological piece, which until then had remained hermetic. He also annotated the manuscript of Montfaucon de Villars, the first to draw attention to abraxas by noting that they contained a symbolic representation of ancient knowledge.

But back to the Aether. L. Boutard thought that modern scientists would also manage to see the small snakes. But already for 50 years the aether (the ether of physicists) has been rejected by physicists as having no physical existence.

Especially with this aether there are the small snakes that compose it and in addition the composition of the small snakes is itself quite confusing for a Cartesian scientist. Each little snake, for L. Eoutard, is composed of 4 nuclei or atoms, forming the male elements of nature.

- The white atom connected with intelligence forms the head
- The red atom that embodies strength and power
- The blue-black atom connected to gravity
- The yellow atom connected to light and lodged in the tail.

The red atom and the blue-black occupy the central part. The blue-black atom thus constitutes a discreet allusion to the gravitational field. Their respective colors are revealed when they are placed in the presence of metallic oxides.

Each atom has properties and they are linked together by a fluid called electricity which constitutes the feminine element.

Small snakes are relatively fragile and can fragment under the action of various causes (rapid rotational movement for example), but they have a constant tendency to reconstitute themselves in their primitive form. Naturally, we see that Boutard's aether, therefore that of the ancients (because we can consider that it intimately penetrated ancient thought), has nothing to do with the ether of physicists and moreover the atoms of the ancients and those of the moderns have nothing in common either. There is a total misunderstanding of the world of the ancients for modern thought and the same words or almost identical words relate to totally different notions. So wanting to find the aether in the ether and linking the ancient atom to the modern atom are hopeless attempts.

Boutard had therefore come to the conclusion that the elements of the aether

are attracted to metals in general, and more particularly to iron, especially if it is polished and therefore shiny. On the other hand, the passage of electric current (in the modern sense of the term and in the sense of Boutard), causes an influx of aether, which is decomposed into its elements. This is how Boutard explains the production of induced currents and the magnetization of iron and steel bars by the passage, in the near vicinity, of an electric current. In the case of the bars, these attract some of the atoms (in the sense of Boutard, therefore the old ones) set free, but only the steel bars retain them after the current has been removed. The collector metal of the blue-black atom is lead; that of the red atom, copper, that of the yellow atom, brass. Mercury has the property of promoting the disintegration of aether by attracting the blue-black atom. This property, necessary for the functioning of certain fundamental apparatus, has earned it the epithet of trismegistus (three times large). Boutard's goal, in all his experiments, is the disintegration of the aether into its elements: atoms and electricities (in the ancient sense), and their respective collection using appropriate conductors.

If we take into account the preceding remarks, it is necessary, to decompose the aether, to take first of all a metallic -mass (iron for example), carrier of elements of aether.

Secondly, to pass a more or less powerful electric current near this metallic mass in order to divide the aether into its elements. The same result can be obtained by means of an amalgamated strip of lead, placed in contact with the metallic mass, which accelerates the desired effect, or again, by the very rapid rotation of this metallic mass. The shape of the metallic mass is not irrelevant, so the aether is also linked to the shape what Boutard unconsciously used or what he did not say because he never gave the substance of his thought. . It was the same for L. Sprink. Finally, it is necessary to collect (or capture) the atoms and the electricities released using appropriate collectors.

Let us pause for the moment and try to glimpse how Louis Boutard managed to rediscover the fundamental notions possessed by the ancients. It should be noted that the moderns in taking up the concepts of the ancients have - completely deviated because they forgot that there is the fundamental notion of the field of coherence and that the rational world is such a field but that the ancients had had at their disposal. the other field.

L. Boutard devoted his life to the study of linguistics. He knew about 28 languages and also spoke them (well, those whose pronunciation we still know). Let's see: he looked in detail at the shapes of the letters of the alphabets: Phoenician, Samaritan and Hebrew, Syriac and Arabic. He knows these languages. The same for Georgian (Caucasian) Burmese, Bengali, Sanskrit, Armenian, Tibetan, Zend, Manchu, Coptic Egyptian, Berber, Ethiopian. For Arabic he knew the derivative adaptations: Persian and Hindustani.

Boutard, through the study of linguistics, discovered that the letters of the alphabet and the words of the Greek language were forged from scratch by the priestly classes, the only holders of knowledge and always according to L. Boutard, not arbitrarily, nor with a view to expressing sounds, but to represent by signs, or record by an assemblage of signs, either essential scientific notions, or the properties of the bodies, objects or beings that these words designate and designate again.

Thus the letter α , the first of the Greek alphabet, whose form recalls that of a coiled serpent, designates an element of the aether, the letter B represents the outer half of the element α ; the letter γ the inner half of α ; δ , the fourth letter, is the figure of the cone on which is rolled up the strip which constitutes the essential part of the automatic generator which we will discuss later. As for the words, countless are the proofs that Boutard brings of his affirmations, that is to say of their identification with the properties of the bodies or of the objects that they designate.

Example: aether, in Greek $\alpha\eta\theta\epsilon\rho$, the first letter of which designates the constituent element of this fluid, the second η , the electricities, the other letters, the specific properties of the various parts of this element. (*)

(*) This letter α is made up of two tendencies . Boutard considered it as still formed of four curved sections assembled in threes . welding points and this allowed him to give the schematic representation of the principle of universal life (indeed in Boutard, we find the male and female principles. The atoms constitute the masculine element and each of the atoms is associated with an electricity which constitutes the feminine element).

Heart, in Greek $\chi\alpha\rho\delta\iota\alpha$, cardia, means "suction and pressure pump", a function which was discovered only around the 17th century by Harvey (We quote ••, - (*) . here the word heart because after the hypotheses of Doctor Menges, the heart would not have the functionality of such a pump).

So we shouldn't consider that the heart is necessarily a suction and repression pump, but the translation extirpates the operativeness that we need. This, it seems, is where some of the subtlety of the ancients lies.

It is therefore through the in-depth study and the reasoned and subtle interpretation of the signs of the Greek alphabet, the figures, the words, the languages, the texts and especially the abraxas, as well as the architectural motifs, that Boutard managed to identify the principles of the sacred science of antiquity that the priests had integrated into it. His discoveries, he verified the accuracy of them by multiple experiments. Thus for Boutard, linguistics makes it possible to have a positive idea of the civilization at the time on which history has only very little information.

Another confirmation that emerges from the studies and experiences of Boutard is that Greek mythology is the allegorical translation of the essential notions of ancient sacred science. All mythological characters are symbols that correspond to realities. Alcimene symbolizes electricity, Theseus and Hercules plant or animal microorganisms endowed with considerable activity and power.

L. Boutard let those who were close to him understand that the Trojan War is most certainly only a fiction of which the Illiad is the poetic expressior and where a marvelous is involved, but, where the heroes, sons gods are then imaginary and Hélène, the main protagonist is the symbol of beauty which would have to be interpreted. Note however that the gods could be localized by rituals at Delphi for example, and that we are faced with a double reality: the localized gods and the gods symbols of entities or devices. Let us see the Christian religion; its first representatives were initiated into sacred science. Christ brought through his person and his life a whole initiation and moreover he is initiation.

L. Boutard had started writing a book but his death in 1958 did not allow it to be finished by him. But before dying, he asked the engineer A. Hatinguais to continue writing his work. These are important and only 2 books released in very few copies

(*) Private communication.

can be consulted today [2] and [3]. A third is still being written by A. Hatinguais. L. Boutard considered the most important part of his work to be the statement of the laws which preside over the formation of languages, laws which he discovered. There is little chance that in the 3rd ^{book}, these will be explained. Indeed, L. Boutard did not say much; about the devices, A. Hatinguais having worked a lot with him, he was able to transmit a large part relative to them.

The seat of the Greek theocracy was Delphi. There are also Delos and Cumae (in Italy), but it seems that it was in Delphi that the most advanced experiments were carried out. Eg. in the temple of Delphi, a veritable conservatory of sacred science, the priests communicated with distant places using a device called telebios, a word which means: to shout in the distance.

Marc Aumisier cites the story of a centurion, Trope Pompée, in which it is told that a troop of soldiers, attracted by the incalculable wealth that the temple contained, having wanted to seize it to plunder it, was welcomed by a formidable storm of lightning and thunder, accompanied by rain and hailstones, as well as the heaving of the ground around the monument. It seems that not a single one of the assailants returned from this expedition.

Naturally this story (often given in Latin version to children) was considered a baseless story.

But with what we know of the work of Boutard and the of the eifs in general, this story appears to us to be quite authentic.

(*) The third book is in preparation, but it will be less complete than expected. It was to contain the decryptions of the document called "the Table of Turin" as well as those of the abraxas. The death of A. Hatinguais stopped this project.

C*) Jean Richer in his works [6] and [7] has opened a way where transfers appear between the high places Delphi, Delos and Cumae. It involves a lot of the zodiac and its projections on these 3 places. His approach is not that of Boutard who did not speak of the zodiac or of Asturgia^^ Asturgia appears in his 2 works, on vases, the shields of warriors and the everyday life of the people. It is here that the thought that we call

(3)

Magfeu ions [9] • This magfeu structure being a means to arrive at a con
birth, what we will call Magfeu of type M. That is to say that the planets with the signs and their course, the zodiac, allow the human being to probe himself into a field of coherence which can be the usual. The process has nothing to do with what we are looking for; it is simply adapted to the brain structure of man. And this process is extended to places, transfers between places, to objects

multiple etc... This allows individuals doing rituals in these places, or those living near objects and carrying them, for example, to be in states that introduce M-type Magfeu thought.

,*> The manipulation of the 3 zodiacs of which Jean Richer speaks is found at Bignantr who had developed around 1945 devices using 12 capacitors built by his hands (external shape, armature, dielectric were chosen with meticulousness) and this whole system was developed for multiple but above all therapeutic purposes. But Bignan had placed 3 other devices in places far from his home (Dijon) one in Marseille, one in Switzerland, etc... They formed the points of a large triangle and these last 3 devices were regulated by a pendulum in s' pressing astrology. They had to be slightly modified in their internal layout every month, which required multiple trips. But to treat human beings, it was necessary that these 3 devices be made with all the necessary precautions and put in place. These devices were in permanent transfer with Bignan and they enriched his voiloc at the same time as he used the Magfeu type M thought. The forms were equivalent to the rituals used by the Greeks.

(1) Asturgia according to the terminology of F. Marin de Charette instead of Astrology [4].

(2) Jean Richer also extended his system to trees 1.7] by making a correspondence between signs of the zodiac, towns and places and trees: example: Cancer Delos and the palm tree, Virgo, Kalamai and the reed, Aquarius, Elaia and the olive trees, etc... In the same way we can substitute birds for trees... We are in the case where a triple or quadruple correspondence allows in a given country

(indeed it depends on the flora and fauna of the country), to have through rituals an operativity on the places, the meteorological phenomena, the life of the inhabitants, the predictions of all kinds, the spells, and much more thing again.

A A' A" ... signs of the zodiac B B' B" ... cities or towns CC C" ... trees D D' D" ... birds

One could even have still other correspondences, for example with metals and metalloids, compound bodies, crystals, or even overlaps between these bodies. We arrive at an Asturgia-type approach by Magfeu form of type M. It is a means of seeing coherences in a given coherence field. We

(*) For more information on S. Bignand, see the study reserved for him in this book.

' «- gi À Sp • - ■ ■ will be able to detect by pendulum or directly, transfers <
between the elements of
triplets or quadruplets but it is not obligatory that there be some each time except if one posits on principle that the elements of
such systems are in transfer but it is a little abusive and it is better to locate the transfer by the form XD or another form. We
understand that in this way a human being builds a field of coherence, completes it, fills it.

In [8] we find another extension of the sacred geography of Jean Richer, produced by Lucien Richer, where Mont
Saint-Michel intervenes. It is then necessary to bring in Celtic folklore to manage to find the correspondences between the zodiac,
the places, the trees, the birds... And we could also extend Jean Richer's model to other continents. Arriving towards the poles it
would perhaps be a little more difficult and also at the places where fractants are handled .

(3) Magfeu (term coined by Guy Steib and J. Ravatin) is obtained from the words magma and foliation. Concepts will be
divided into layers (foliation) each of these layers being like an oscillating magma and then, by collapse, a new concept will be
born. The letter M after magfeu is there to remind us that this process is a means and only that. We insist a lot on this point which
places us somewhat between the notions of analogy understood in the Western sense and understood in the Eastern sense (as one
can find the latter in the Yi Ching, which moreover has not been understood by Westerners since this last analogy leads to the
concept of halo).

Other devices can be built that Boutard did not have time to make. For example, reports Aumisier, Boutard
often told him that the Magi of Persia had the power to rejuvenate themselves by twenty years , but that they had been
massacred during an expedition for not having wanted to reveal their secret.

They produced nervous substance by an apparatus, and this by the white atoms of the aether. This apparatus, analogous
to the amplifying generator, had for essential organ a crescent whose horns were in the shape of pallets and the belly
very slender. Each of the branches of the crescent carried, coiled up, a small snake whose head rested on the paddle and
the tail on the belly. Under the influence of an inductive current, the white atoms lodged in the head of each serpent were
dissociated and picked up by a suitable conductor.

And L. Boutard pointed out that each branch of the straightened crescent gives the reduced model of the spear of the Tuaregs, and of that which holds in the hand the statue of Minerva, goddess who symbolizes intelligence and wisdom; this spear has one of its extremities pointed and the other in the form of a paddle.

Halpha defibration. This constitutes the work to which Boutard devoted himself from 1920 to 1938. The defibration of the halpha was carried out by two methods; first by the method of plant ferments and then by the action of an animal microorganism, Halpha is a plant that covers 4 to 5 million hectares on the high plateaus of North Africa. However, until that time, despite numerous attempts, it had not been possible to isolate the textile fiber of this plant in a satisfactory manner. Let - us note that only Boutard's processes have made it possible to succeed and no other technique in our modern world, even since the 1950s, has made it possible to achieve what his devices have made appear.

Simply a summary and incomplete defibration allows the use of halpha for the manufacture of luxury paper (in England, it was also used).

However Boutard knew that the ancients used halpha for making fine or coarse fabrics, as well as for that of sails and ropes for ships (these ropes could stay twenty years in water without rotting), and that this fiber had the property of keeping for a very long time.

Let us recall that the Ancients had created two main centers of defibration. One was in Egypt, near Lake Moeris (an artificial lake, created by diverting the waters of the Nile). To the east of this lake, the remains of an immense rectangular palace of 250 m by 150 m can still be seen. The interior consisted of a fairly large number of small dark square rooms, linked together by a tangle of corridors; it was impossible for a stranger to find a way through this maze.

But this labyrinth is reminiscent of the most famous one in Crete, which, according to legend, was built by the Greek architect Daedalus to enclose the Minaurus who devoured children there. The Minaurus was tamed by Hercules and killed by Theseus. For L. Boutard, the Minautaur was the halpha; the little dark rooms were basins in which the halpha simmered. All this was necessary because the defibration of the halpha is not easy. If we deposit halpha in water containing ferments capable of destroying the organic matter which surrounds the textile fibers of hemp, flax, jute,

not only will this halpha not be attacked by the ferments, but these will be killed by the toxins it secretes, which contain arsenic.

Theseus symbolizes a set of plant ferments with which Boutard sowed the bottoms of certain vats where he immersed the boots of the halpha. Among these ferments, there was buckthorn; in the bath was incorporated horn rapure.

M. Aumisier points out, and he learned it from Boutard, that the museum of Naples possesses a sculptural group representing a man slaying a bull which he is holding by the horns. Around this group are objects and even a small dog. Known as the Farnese Bull, this set symbolizes the defibrillation of the halpha by the method of plant ferments.

L. Boutard was gifted with a real genius for interpreting scrap and he determined the role of each of the elements of the group and this sculptural group inspired him greatly for the preparation of the retting baths.

There must have been a legend equivalent to that of the island of Crete for the maze located in Egypt, near Lake Moeris, but it does not seem to have reached us.

The legends created by the Ancients could appear to us as subterfuge. It is rather the use of concepts from one domain, these concepts immersed in another domain which does not belong to them. They often used this process for the location of the gods.

A. Hatinguais [2] points out that sacred symbolism is at the origin of the construction of prestigious monuments that resist the destructive element of nature and time, such as human looting. These monuments have never ceased to amaze and intrigue visitors and archaeologists: there are prehistoric caves with walls decorated with drawings and paintings, gigantic temples with panels engraved in stone; colossal smooth or stepped pyramids, (*) the overturned pyramids of Mongolia, cones and tumuli, cenotaphs, megaliths, menhirs, dolmens, alignments of stones, places like Stonehenge and its equivalent in Senegal which is also in a better state of conservation, obelisks etc. .. This universal symbolism is found in the architectural constructions of old civilizations: Aegean, Chaldean, Mycenaean, Hittite, Proto-Egyptian, pre-Celtic, Etruscan, Maya, Inca... with engravings, bas-reliefs, sculptures, stelae, statuettes, found in the ruins of temples. —

(*) These pyramids are hollow in the ground.

But are we sure that all the decorations were **made with** intention; some actually took shape under a desire **to transmit** knowledge, for others, they are simple copies with no other idea than artistic research; but we must not forget that we are looking at a more or less near but also very distant past and we put ourselves in a certain position in relation to what springs from the launch of our time scale in the past. There are positions that allow creation. And creation, in what interests us, consists in finding in the arrangement, the form, the patterns, the letters, a coherence (not to be confused with a field of coherence) which gives the impression, in our Cartesian field of coherence of a desire to transmit knowledge. For the observer, this point of view of position is essential. It constructs its localization neighborhood and places itself in it.

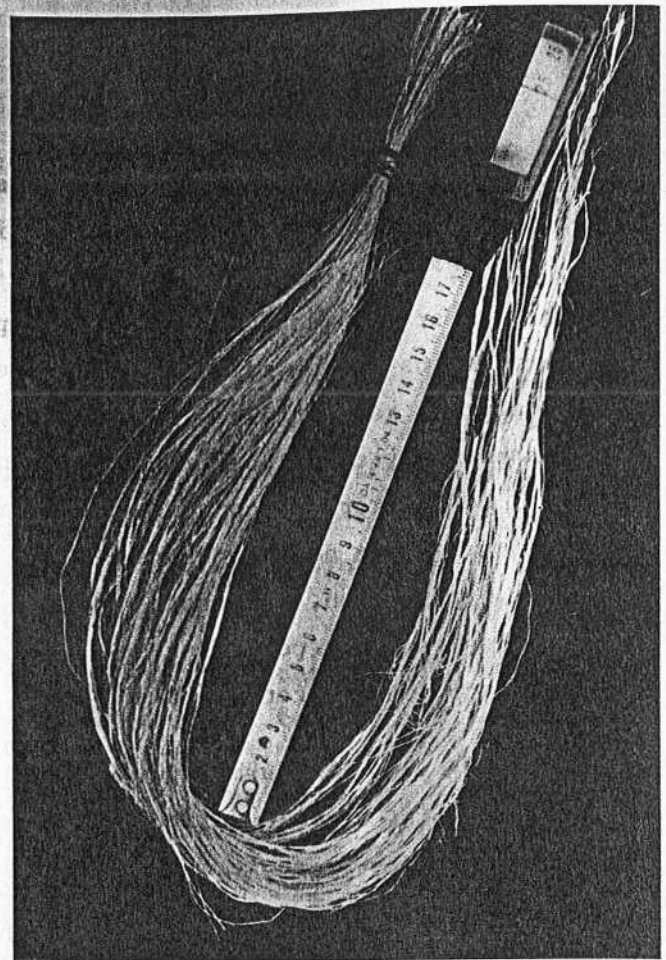

Let us see the generative apparatus of a protozoan. Boutard had obtained complete success in the defibrillation of the halpha but he estimates that one could not stick to this only method which was long and complicated. He then - undertook to build a device generating a microorganism whose activity would be much greater than that of plant ferments.

The metal mass of this device was charged with the elements of the aether to be dissociated, that is to say constituted by large nails with the head of a truncated pyramid driven into a strip of leather, the head protruding from one side and the tip of the other. L. Boutard then amalgamated on the surface a strong braid of silver threads, which he fixed on the leather strip, on the side of the head of the nails but not in contact with them, but separated by a thin cotton ribbon or sheepskin. The role of this braid was what he called 'the induced current collector '.' The strip of leather thus equipped was rolled up on a wooden cylinder about fifty centimeters in length, then wrapped in oakum tight with a thick insulated copper wire which served as a conductor for the current called the "inductor ". device, still incomplete, was first tested at the Domaine de la Trappe, located 16 km from Algiers. This inductor current was the usual electric current (because Boutard obtained after other currents) of 500 volts and 40 amps .

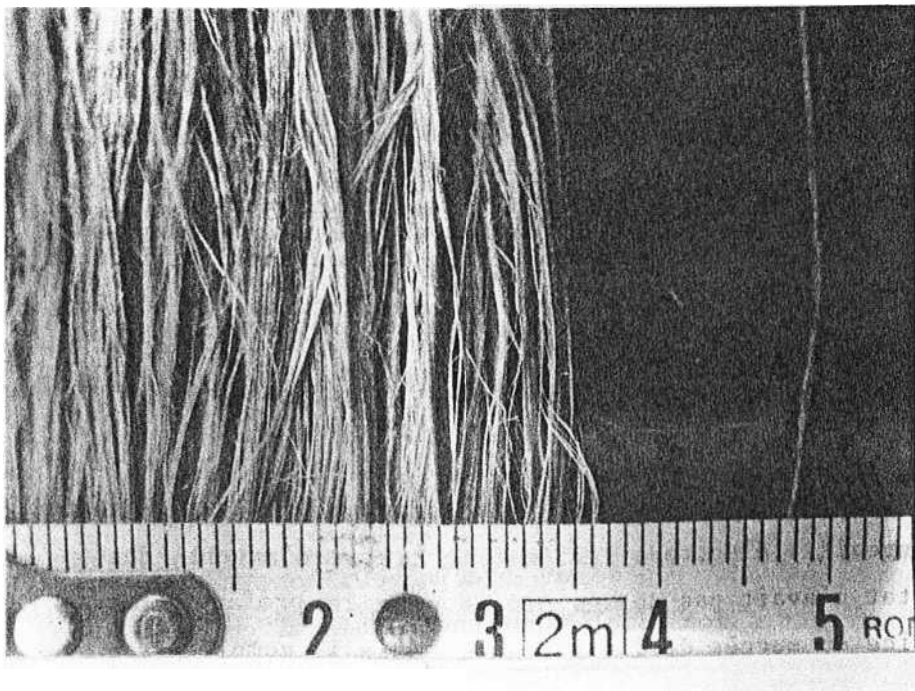

When Boutard switched on the current, volutes in the water were seen to be produced in the glass receptacle filled with water, in which the electrode connected to the silver braid was immersed. This result had no precise meaning for laymen but for Boutard, it was an indication of the success of the experiment. But he completed his

apparatus which resembled a coil, by winding on it a thick iron wire with a square section, which was connected to the container filled with water by a conductor terminated by a metal plate arranged opposite that connected to the braid of 'silver. And we started the experiment again! This was done in front of a large audience but there were no ripples in the water. Boutard then poured porcelain powder and bitumen into the container. A few drops were taken from the contents for examination under the microscope. What was the amazement, for those of the assistance, to see evolving in the field of the microscope an enormous protozoan which had the shape of a club. It was the club of Heracles. It rushed on all the micro-organisms in the drop of water and absorbed them. These microorganisms tried desperately to escape their terrible adversary, but he always ended up digesting them. It multiplied at high speed because it was androgynous.

Naturally all this came as no surprise to Boutard. The club of Heracles was drawn on some of the abraxas; he had simply deciphered these well.

And now, we will be able to put the protozoan in the presence of the alpha. For this, boots of halpha were soaked for 8 days in the liquid in which the protozoan is found. When removed, they are completely softened and refined. The protozoan had absorbed, in order to feed and reproduce, the varnishes and the substances which cover the fibre. Several tons were thus defibered and the tow could be spun, without prior modification, on the industrial jute looms of the Etablissements Carmichaël in France. We begin to see what the bull of the island of Crete was: it is the halpha, the micro-organism is Hercules with his club who defeated the halpha, the bull. Hercules is the son of Jupiter, that is to say of the aether and of Alcmene, the dynamic electricity and of the black atom set free on the silver braid by the current. Hercules achieved other feats. He suffocated the Nemean lion and according to Boutard, the latter was cancer. A fact that goes in this direction is the following: one of the workers employed in the works of defibration of the halpha had in the forearm an ulcer resistant to all the treatments attempted. Boutard applied to this ulcer a handkerchief soaked in one of the retting baths; after about ten days there was no trace of the ulcer left. It was not assured in Aumisier's text that the ulcer was cancerous. In Bomtard's idea, Hercules is born and little by little he takes the form of a club. It follows the "education" of little Hercules in 3 phases: childhood, adolescence, virility. A minimum of 12 is required

days for the complete formation, that is to say that it is in the phase of virility .

A. Hatinguais makes the following remarks about the impotence of modern means in the face of the defibration of halpha.

1) Electrolysis can give nothing, the organic bodies remaining indifferent to the electric current. In addition, varnishes and those of the halpha, with multiple resins and oils are perfect electrical insulators.

2) Alkaline or other caustics destroy the organism which they reduce to mush, more or less saponifying the various parenchyma, formless cellulose paste, requiring the papermakers to incorporate "felting agents". As for the spinner and the weaver, what they need is the integral cellular fibre.

3) No bacteria can ret halpha. The "bacillus amuglobaeter" can only attack the thin outer layer of protective fat, but as soon as it reaches the exposed "keratins" it dies ipso facto, the biological monster that is halpha reacting immediately and immediately secreting toxins which also make handling this powerful abortifacient and formidable sterilizer dangerous.

For the birth of little Hercules and his childhood, you need a powder composed of marble, sea salt, gypsum, porcelain alum, talc. Procreation must take place away from all light.

Some labors of Hercules and interpretation: these are represented on abraxas.

1) Nemean lion fight (Nemean forest). It's the fight against cancer.

2) Fight against the Lernaean Hydra (surroundings of Lerna), monstrous snake with several heads, of which the legend said, they had to be cut off all at once. It is the fight against pathogenic microbes.

3) Fight against the wild boar of Erymanthe (forest located on a small mountain of Arcadia in the Peloponnese). It is the defibration of saw palmetto horsehair.

4) Hunting and capturing the Cerynite doe. In the defiles of Mount Menale in Arcadia, a doe with feet of brass, with horns of gold, born on the

Mount Cérynée, which Hercules seized to carry it alive to Mycenae where it was consecrated to Artemis Diana. It is the oozing of wool.

5) Destruction of the birds of Lake Stymphalus, a lake in the northeast of Arcadia, infested with birds which ate the population of the mining town of the same name. It is the fight against gonorrhea.

6) Triumph over the Cretan bull, terror of Crete, harmless in appearance which ravaged the youth of both sexes throughout the island. This is the defibrillation of the halpha. Halpha is an abortifacient.

7) Kidnapping of the Horsemen of Diomedes: king of the Bistones of Thrace, son of Mons and Cyrene, who fed on the flesh of navigators stranded on the shores, his wild horsemen. There, the correspondence was not given.

8) Fight between the amazon Hippolyte, queen of the Amazons located on the borders of Pont-Euxin, to seize the marvelous belt, emblem of royalty, disputed by Adnète, daughter of Eurystée. The correspondence was not given either.

There are still four well-known works that we will not discuss here.

Let's see other achievements of L. Boutard. The previous device worked thanks to the intervention of a current supplied by an external source. Now the Ancients, said Boutard, had designed an apparatus which functioned by its own means, without the intervention of any source of foreign energy. It is that he then realized the automatic generator.

Boutard therefore had this new device made, which, like the first, was very difficult to assemble. It was necessary to push 1000 spikes of the following shape on a strip of leather. These points were named by the ancients: 9 trucks. A truck should not be made just anyhow.

The half-sphere and the cone were, when assembled, approximately 1cm long, but the weight of the half-sphere is equal to that of the cone and the center of gravity of the truck must be coincident with the center of the circle intersection of the hemisphere and the cone. The heads should come out from one side of the leather strip- and the tips from the other side. A. Hatinguais took part in this assembly which lasted 2 years. The leather and rubber band is 12 mm wide and about ten meters long. Their whole constitutes the metallic mass carrying the Aether which will be dissociated into atoms and electricities.

You have to disarticulate the little snakes. To do this, a strip of lead, previously coated with mercury on one side, is attached to the leather strip. This face is applied to the truck heads from which it is separated by a cotton ribbon. The strip of leather is then rolled up on a terracotta cone 20 to 25 cm high, the lead applied to the wall of the cone. The angle at the apex of the cone is important. L. Boutard did not specify, but we were able to verify that he did not seem to have the best angle. The cone with its winding is itself enclosed in a bag of lambskin which takes the bulbous shape of the cupolas of Russian churches. The whole is placed in a circular pottery vase, which is filled with clay mixed with powdered charcoal. Copper and brass rods, intended to collect the red and yellow atoms respectively, are driven into the clay and connected, together with the end of the lead strip, which collects the blue-black atoms to an ammeter. Another good conductor metal rod, such as silver or cadmium, is also inserted into the clay in order to collect the electricity, and is then connected to a voltmeter. We see that the voltmeter indicates a current of 1, 2 volts, the ammeter from 0.5 to 0.6 amps.

This generator worked uninterruptedly for several years in one of L. Boutard's laboratories, that of Cannes, without experiencing the slightest anomaly; it was simply necessary to moisten the clay contained in the vase from time to time. This has been verified by many people.

The little serpents, elements of the Aether, roll up on the trucks; the head rests on the half-sphere, the tail on the cone. Mercury and lead thus come into contact with the head of each little snake and break them down into their different parts. The electricity spreads through the clay and is collected by the silver rod (we could replace this metal with another). The atoms move much more slowly, and this is the role of the cotton ribbon placed between the heads of the trucks and the lead blade. Thus we separate the atoms from the electricities. It is for the same purpose that the large cone and its winding band are wrapped in a megia lambskin. The electrics are led to the voltmeter. They constitute the voltage. There is a clear separation between current and voltage. The atoms are registered by the ammeter. For Boutard, our conception of electricity produced by mechanical means is not good. For him there are 2 fluids.

Let's move on to another device: the amplifying generator. This new

device is intended to amplify the currents produced by the previous one, both voltage and amperage. By taking up this current and passing it through another amplifying generator, it is still possible to multiply by the same factor and even by a higher factor and so on, and always, without resorting to any mechanical or chemical means.

In this new device, the metallic mass is constituted by the shape which is a crescent. The crescent carries two snakes whose tails are rolled around each branch and the heads applied to the belly of the crescent. Let's go back to the crescent: it is made by two small steel cones, joined at the base and bent by hand. Passed through a bath of amalgamated tin, it is made shiny in order to attract the Aether. Naturally an RBB cannot understand such an approach and especially when it is for him, and in this very specific case, a shine effect to attract the Aether. An RBB sees there only semblances of analogy resting on unfounded concepts. But for L. Boutard, all these results were the consequence of his cogitations on the different alphabets, on the words, on the shape of the letters, their arrangement in the word, on the figures of the abraxas, the columns of temples, the friezes of palace etc... And from these cogitations there emerged, for example, the winding or unwinding of a small snake on a conical shape or other, of colors attached to the different parts of a small snake, of the connection of these colors with the color of metals which had to collect the atoms themselves colored res, of the curve of a crescent and its brilliance to attract the Aether. Thus a language is formed, really emerges from a multitude of concepts which are attached to a field of coherence. We had to press 3000 of these croissants onto a strip of leather. The length of the strip was about 12 meters. The tips came out on one side and the bellies were applied on the other side.

To collect the electricity, three very thin strips of leather (slightly less wide than the strip of leather carrying the croissants) have been perforated in a network using a precision machine. As for the collectors of the atoms, they consist of large threads of lead, copper, brass, imperatively attached and along the 3 perforated strips, one of the strips being fitted with lead wires, the other with copper wires and the third with brass wires. a cotton envelope.

They are placed as follows: the band with the lead collectors flat on the band carrying the crescents, on the belly side; that of

brass collectors on the other side of this same strip (i.e. on the tip side). These two bands are sewn with that of the crescents. This set has the shape of a sausage. Finally, around this set is wound the third metal strip fitted with copper collectors, longer than the other two.

From where, thanks to this device, the different electricities induced are collected by the three perforated copper blades, while the black atom is carried on the lead wires of the band placed on the belly of the croissants, the yellow atom on the brass wires of the blade applied to the points of the crescents and that the red atom is collected by the copper wires of the band wound around the sausage formed by the three other bands.

It is fortunate that Aumisier observed these montages; he was thus able to give a fairly precise description of it so that with the work of Hatinguais, Boutard's thought and his achievements became accessible.

The description of the device continues with the wooden barrel on which the four bands are wound as well as the current-conducting wire. This shaft has the shape of a mushroom carried by a cylinder whose diameter is half that of the outer circumference of the mushroom. This cylinder ends in a cone. This relation is not arbitrary. The cylinder extends a few centimeters below the head of the mushroom.

We can link this form, the shaft, to the plan of Christian churches: the mushroom represents the heart, the cylinder, the axial part of the nave whose aisles have a width equal to half of it, the terminal cone, the bell tower which surmounts the churches. We begin to find in these devices links with the form of churches. Likewise L. Sprink had sensed that the Byzantine and Christian churches were linked, by their shapes and proportions, to a phenomenon on a cosmic scale. In reality, it is a question of a cosmic point of view which is not that of our usual field of coherence, we use the halo of space.

Back to the barrel. On this the windings are arranged as follows: on the cylinder, the roll formed by the 4 assembled bands is wound so that one of the ends of this winding enters under the dome of the mushroom and the other arrives at the base of the cylinder. Each of the copper strips collecting electricity and atoms is equipped with the conducting wires of each of these! Finally the conductor of electricity, consisting of a wire

of fairly large insulated copper, after having been rolled up on the fungus, penetrates under the cap through an opening, to cover with its turns the coil already rolled up as well as the terminal cone of the device. We then have the impression of a large coil about fifty centimeters long, terminated on one side by a cap and on the other by a cone. Hatinguais made the croissants alone and this for 2 to 3 years.

L. Boutard was able, according to his terminology, to separate electricity and atoms, which he linked to voltage and amperage. He gave proof of this by making the following device: an insulated wire of about twenty meters, around which is wound a bare copper wire, the whole thing is then wrapped in tow in which many ordinary nails are embedded. , placed in contact with the uninsulated wire. The set is wrapped and sewn in a strip of cotton, then rolled up on a wooden frame.

One connects one of the ends of the insulated wire to a usual source of electricity (125 volts, 4 to 5 amps for example) and the other end successively with a voltmeter and an ammeter.

Both meters indicate the characteristics of the circuit. But if the current is passed through the bare wire, only the voltage is recorded. The ammeter is no longer influenced, all the atoms being retained by the small masses of iron arranged along the bare wire. Thus Boutard showed a relation between the usual electric current and the affinity of atoms for iron. He calls this device: deamperage device. Note here that this device does not behave like a secondary Ruhmkotf coil at the end of which the intensity of the current is zero because there is an algebraic sum of currents.

Boutard has developed a new dynamo. Let us give a brief description of the classic dynamo. The first machine was developed by Gramme in 1871. It transforms mechanical energy into electrical energy. Its essential elements are: a fixed inductor formed by an electromagnet between the poles of which is located the armature, mobile, consisting of a cylinder or drum of soft iron on which coils are wound. A commutator is needed to rectify the alternating electromotive forces that appeared on the armature coils. The inductor is traversed by a direct current. The electric current produced is linked to the notions of magnetic field and rotating frame in this magnetic field.

Boutard says that, without the notion of Aether, it is impossible to provide

a valid explanation of electromagnetic phenomena. For him, the iron drew the Aether; thus a certain quantity of aether is captured by the mass formed by the armature of the dynamo. Under the action of a very high speed, electricity and atoms are separated from each other and thrown onto the collectors. What comes out of it is the usual electricity; the electricities of which Boutard speaks are before the separation of the atoms (with a male character) coming from the decomposition of the a associated with each of the atoms. One of these electricities, that which goes towards the center of the earth, bore the name of Alcmène, another goes up towards the zenith, two others have directions transverse to that of the first 2 , which is indicated by the cross of Lorraine. What comes out of the dynamo, of an alternator, of the generators of our modern world is composed of at least 4 of these electricities and of the 4 atoms.

It should be understood here that in the case of the conventional dynamo, the rotational movement of the armature displaces the ancron and thus deforms the neighborhood of location.

The Ancients must have known the dynamo, but their machines were entirely different from those now in use.

In our work we have come to realize that the form consisting of 2 cones joined by their base was interesting. That's what we (*J name a rhombus. Or we noted that L. Boutard had used the rhombus in several of his apparatuses and in particular in his dynamo. In old dictionaries, Aumisier points out, rhombe was defined as "magical apparatus of the Ancients". Boutard had had a device made, when he lived in Algiers, in which there was a rhomboidal shape which could turn around a vertical axis.

He had filed a patent relating to the applications of the rhombus. For Boutard and Hatinguais the magnetic field is constituted by the monad of aether put in a state of rupture by the shock, collision or sudden movement, and then making appear two forces, which they called fluidic, opposite and, afterwards, tending to cross, this set of these two forces generating by their description in space a figure of solenoid shape but more precisely of a solenoid leaning on a rhomb. Let us mention a few remarks quoted in the text of L. Boutard's patent which confirm the importance of the rhombus.

When an electric current is passed through a coiled wire

(*) We were consolidated in our convictions to learn that L. Boutard had used it as well as the Q form, that W. Reich had considered this last form as fundamental to life, because we had discovered thanks to the eifs this shape and in addition we had found very particular angles at the top.

on a lozenge, no longer of metal but of wood, whose cones opposed by the bases are symmetrical with respect to the soles plane, that the base, we note by means of under- expanded goes intensity of the magnetic field at the top of the cone through increasing from the to the circle of radius y (if R from y which the current enters is the base radius), then while to the base - where the in- R decreasing the voltage becomes zero, to increase again until i' to the circle of radius y of the other

cone and decrease to the exit vertex. There is symmetry of there curve of in
tensity as a function of height relative to the base circle.

Consider a winding on another wooden rhombus with 2 cones not symmetrical, the highest having a height equal to three times the radius of the base circle, the other a height equal to this radius, which makes it an angle of 90° , or less than this radius from which the angle is greater than 90° . Then the intensity of the magnetic field at the circle of radius y on the small cone is twice that R on the circle of radius y on the other cone. There is no more symmetry of the magnetic intensity curve between the 2 cones.

The same applies if the cone of height less than or equal to R is replaced by a spherical cap with a base equal to that of the other cone. The asymmetry between the 2 intensity curves is further accentuated.

If the small cone is inside the large one, the maximum intensity is
cone. R always obtained on the circle of radius y of the interior

Other forms are possible, for example those above and we have the intensity maxima at D and B .

By taking a rhombe in soft iron rolled up by a powerful inductor solenoid , the above phenomena are still rigorously verified on the passage of a direct or alternating current.

What happens? For L. Boutard, the circles in B and D, seats of the maximum magnetic intensities give rise to currents recalled by him "magnetic fluidic currents" which will have to be captured and channeled so that they flow from the circles from levels B and D towards the vertices A and E and towards the base circle C, seats of minimum magnetic intensities. The cylinder DD'B'B constitutes the separation surface for the directions of the 2 fluids, i.e. the fluid currents will circulate from D towards E or D towards C on the southern pole for example and from B towards A or B to C on the boreal pole. At this flow, it includes a tension. She is maximum

on the cylinder, and decreases progressively towards the axis of the rhombus and the periphery . One can bristle the surface of the soft iron rhomb with a series of points and make this rhomb turn on its vertical axis. We will thus capture the two flui of the magnetics. The axial fluid which will behave as if it were heavy, i.e. it tends to flow towards the center of the earth towards bodies with high density. It generates intense cold.

Channeled on suitable "coherers", placed in appropriate chemical media, it is capable of organizing chemically and biologically, according to the voltage, resistance, frequency of the electric current passing through the solenoid, all the following organic bodies:

- levulose in A
- starch between A and B and beyond B
- dextrin near B
- glycerin between E and D and a neighborhood of D
- glucose above D
- sucrose to E

But it is possible, thanks to the axial flow, to dissociate the bodies above when they are introduced as resistances in its path.

The speed of organization and disorganization is a function of the volume and the magnetic intensity of the rhombus.

Peripheral flow tends to flow towards light, porous bodies. It is red in color whereas the axial flow was colorless. It is capable of organizing all the fatty acids and the colors in the nascent state: we obtain:

- at the Anstral Pole: margaric acids
colors yellow, orange, red
- at the boreal pole: purple color in CC'
stearic acids indigo, blue, black colors

By using the previous remark, we can also dissociate these same bodies.

Now consider a rhombus in soft iron, ridged, or scratched, or even rough and initially suspended, motionless subject to no magnetic field (except the earth's field) and electric current. There is still a maximum of magnetic intensity at the two circles B and D. A. Hatinguais says: this rhombus of

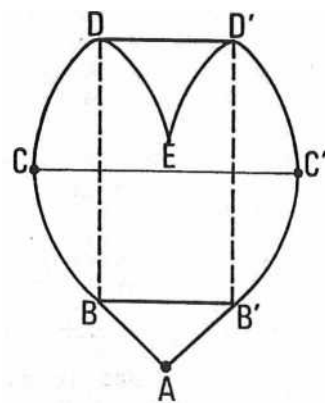

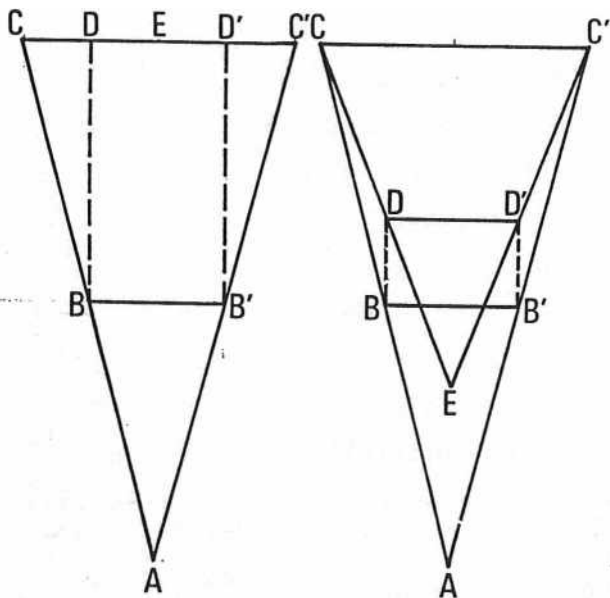

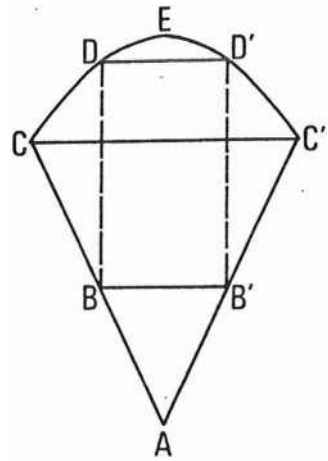

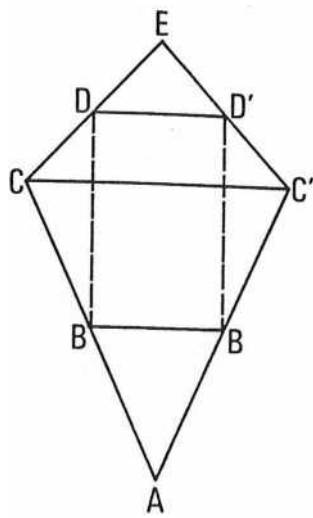

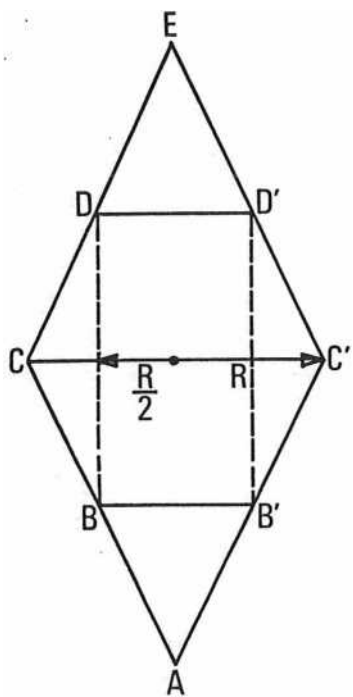

metal creates a magnetic fluid which is not apparent but by rotation of the rhombus will generate two magnetic fluids at levels B and D, one going towards the axis and the other towards the periphery.

Magnetic batteries and accumulators can be made from this: it suffices to replace the rhombus by a strip of zinc rolled up in helical spirals following a rhomboid shape; these spirals are bristling with spikes of paramagnetic material and this form is then plunged into a terracotta vase, the latter filled with water.

For L. Boutard the monads of Aether come to rub the band of zinc which is rough and thus break giving rise to the two fluidic currents, one axial and the other peripheral (if one takes care to place at the surface of the water a crown of corks joined by a paramagnetic conductor, and at the bottom of the vase, suspended, a ball of clay). The axial flow, considered heavy, rushes on the ball of clay; the peripheral flow, considered light, precipitates on the cork and flows through the paramagnetic conductor, the end of which is immersed in a glass of water. This water will become iridescent with all the colors. The conductor and the glass will also be covered with small bubbles which turn out to be composed of oxygen, hydrogen, themselves containing carbon. We can thus obtain colors and fatty acids.

The rhomboid shape seems to be among the best for obtaining fluid currents. It is the envelope of these currents at each point in space. It is again a very good result for Boutard to have found this form and thus to have justified it. Let us see how the study of languages intervenes here: the critical points are found on the circles of radius R. It is on these points that the two currents appear. They were formerly represented in section by the qoppa diagram , which became the letter Q (sup

preceded by the Cadmean alphabet by religious scrupulosity as too clearly figurative); in plan by the schematic sign pi: H, which has become the letter P. the breaking of each monad occurs at this point. Of course, the monad is not localized; there is here rather a localization or an ancron which is R on the circles of radius these being the locus of the anchors. The monads break on the anchors marked by small very pointed hooks, and separate into A-tomes which will go, some to the axis, the others, to the periphery. If the device is surrounded by a copper solenoid, this will then be

Cut along the axis of rhombs and more shapes
general information that can be used

traversed by an electric current. The amount of electricity can be increased by suspending a non-porous mineral under the battery.

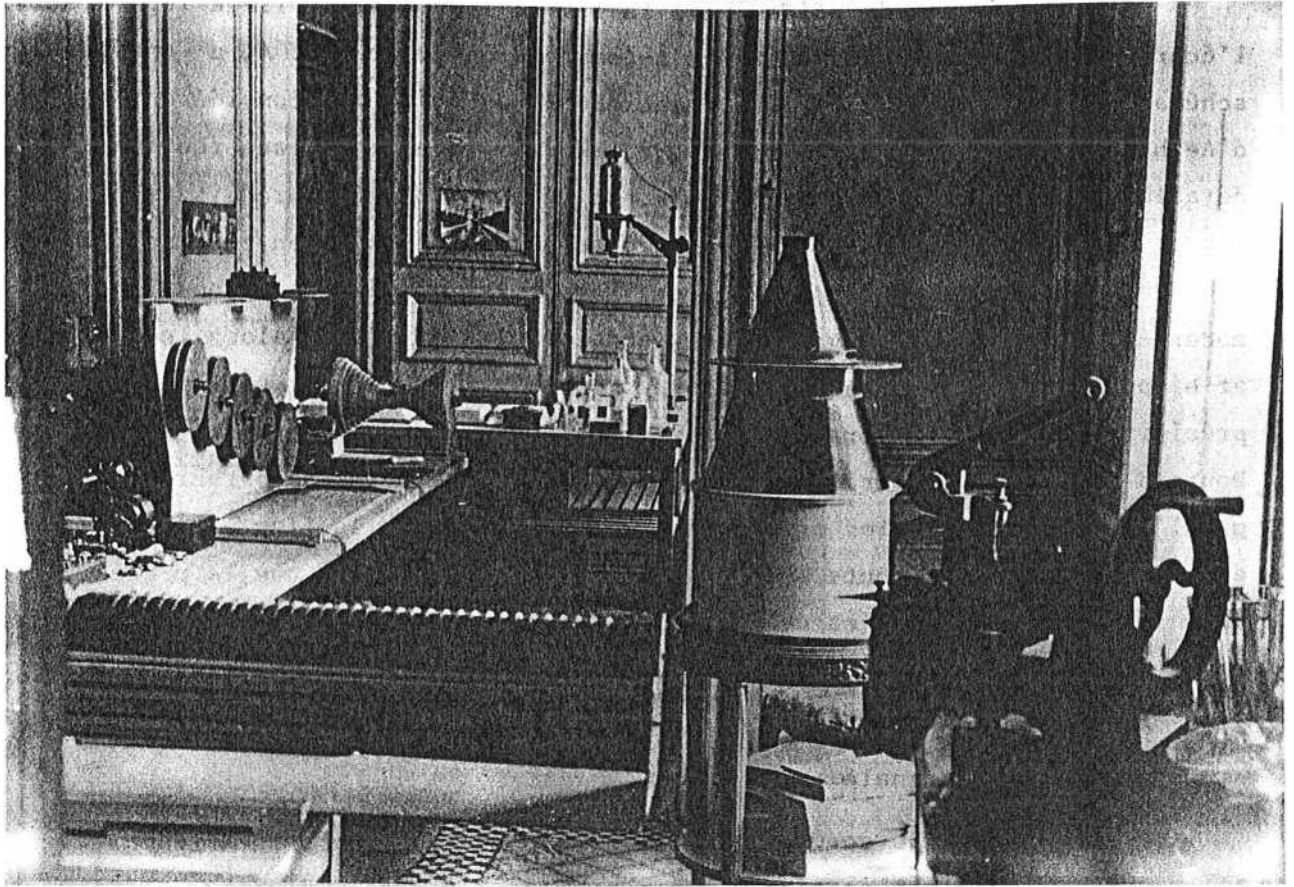

The difference in weight between the heavy stone and the light cork facilitates the separation into its two A-tomic elements of the monad. A, a is the schematic sign of the monad of Aether. Thus Boutard-Hatinguais consider the monad of Aether in balance in the Aether thanks to two faces: the imponderable zenith face and the ponderable nadir face. The imbalance is produced on the points and thus appear the A-tomes, obtained by "rupture in tension" (expression of Boutard-Hatinguais) (and not unbreakable qualifier given by the moderns on what they believed that the old). Then the axial and bi-polar flux separates from the peripheral flux which envelops it. The axial flow rushes following a spiral with a vertical axis downwards, the nadir (and as Boutard says about the nadir: word for word: the one who descends, from the Berber borrowed by the Arabic "ader": to go down, descend) while the peripheral flow, also bi-polar, rises following a spiral on the same axis as the previous one upwards, the zenith (and as Boutard says again: zenith: literally means "with the liberated", from the Berber borrowed by Arabic, through Spanish: c - enit).

Notes reported by Boutard:

1) The shape of the heart is also very good for perpetuating the movement. There would be there a location on the anchors at certain levels of the core and two flows, one descending, the other ascending. This needs to be studied in greater depth .

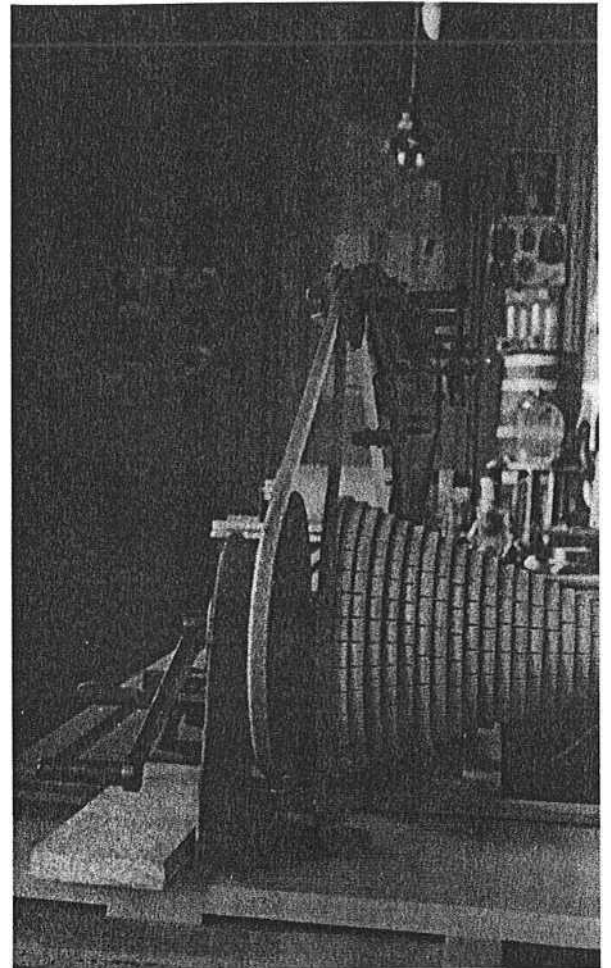

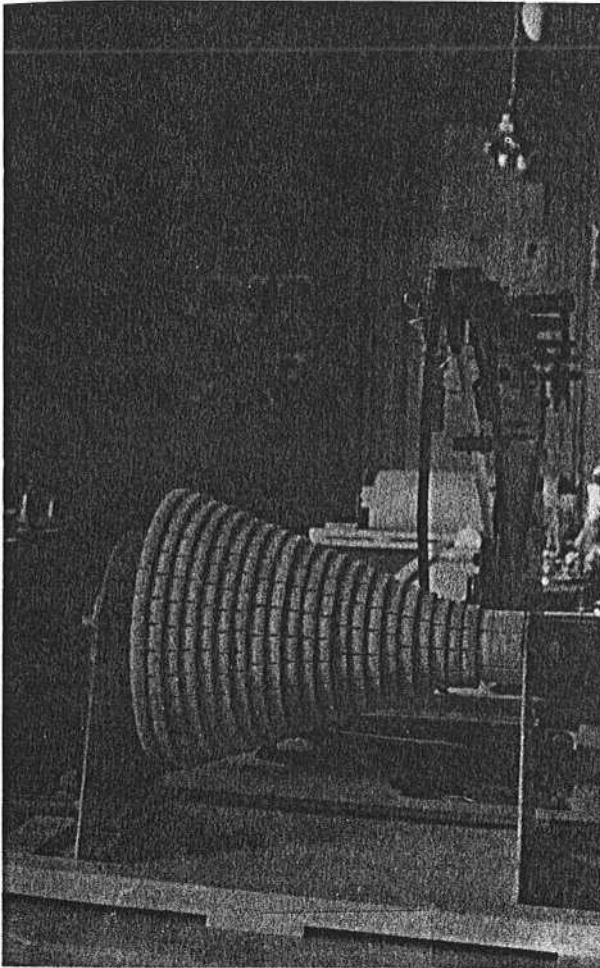

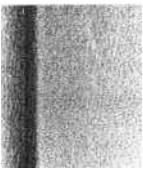

2) We put cats called "in milk" around their necks (that is to say, of which we have drowned kittens) and who can die if they have no kittens left to nurse at all , a small necklace of plugs which attract and stop (on the way from the cerebral sinuses to the mammary ganglia, by the flow of hair) the flow light peripheral, creator of lactic nucleins (at the expense of glycoses) (hence the Latin name of cork: literally with udder). Thanks to this collar (custom of the Mediterranean countries) no cat dies.

3) Let us see the catalysis due to platinum foam. The multitude of monades comes to break there, says Boutard. Of course we don't have the rhomboid shape or heart, but the cavities filled with asperities. There, it seems, according to Boutard, that the peripheral flow accumulates in the platinum. But here many catalysts do not have this porous character, for example in the anhydride passage

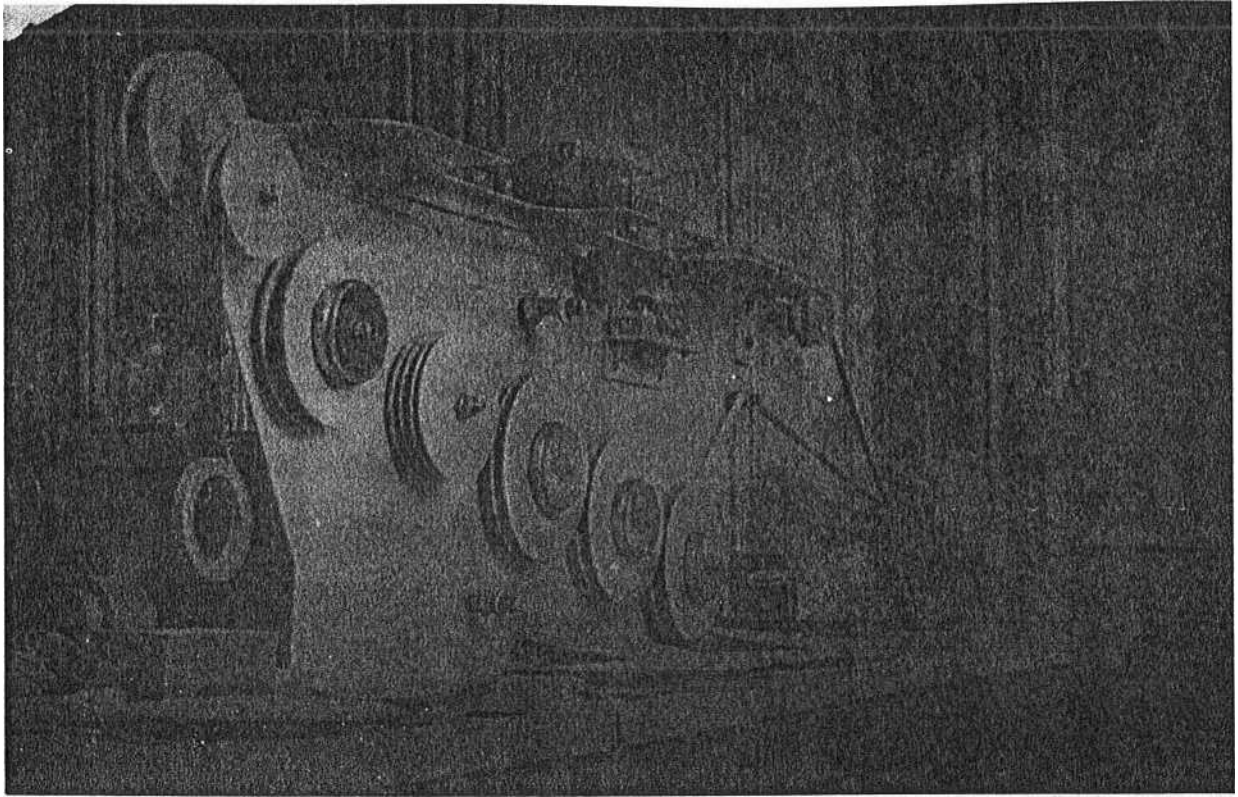

Overview of one of the laboratories installed by Louis Boutard. In the foreground: part of the generator (on the right) and the windings of pins and croissants on their sliding support in a slide (box 0.90m) (on the left).

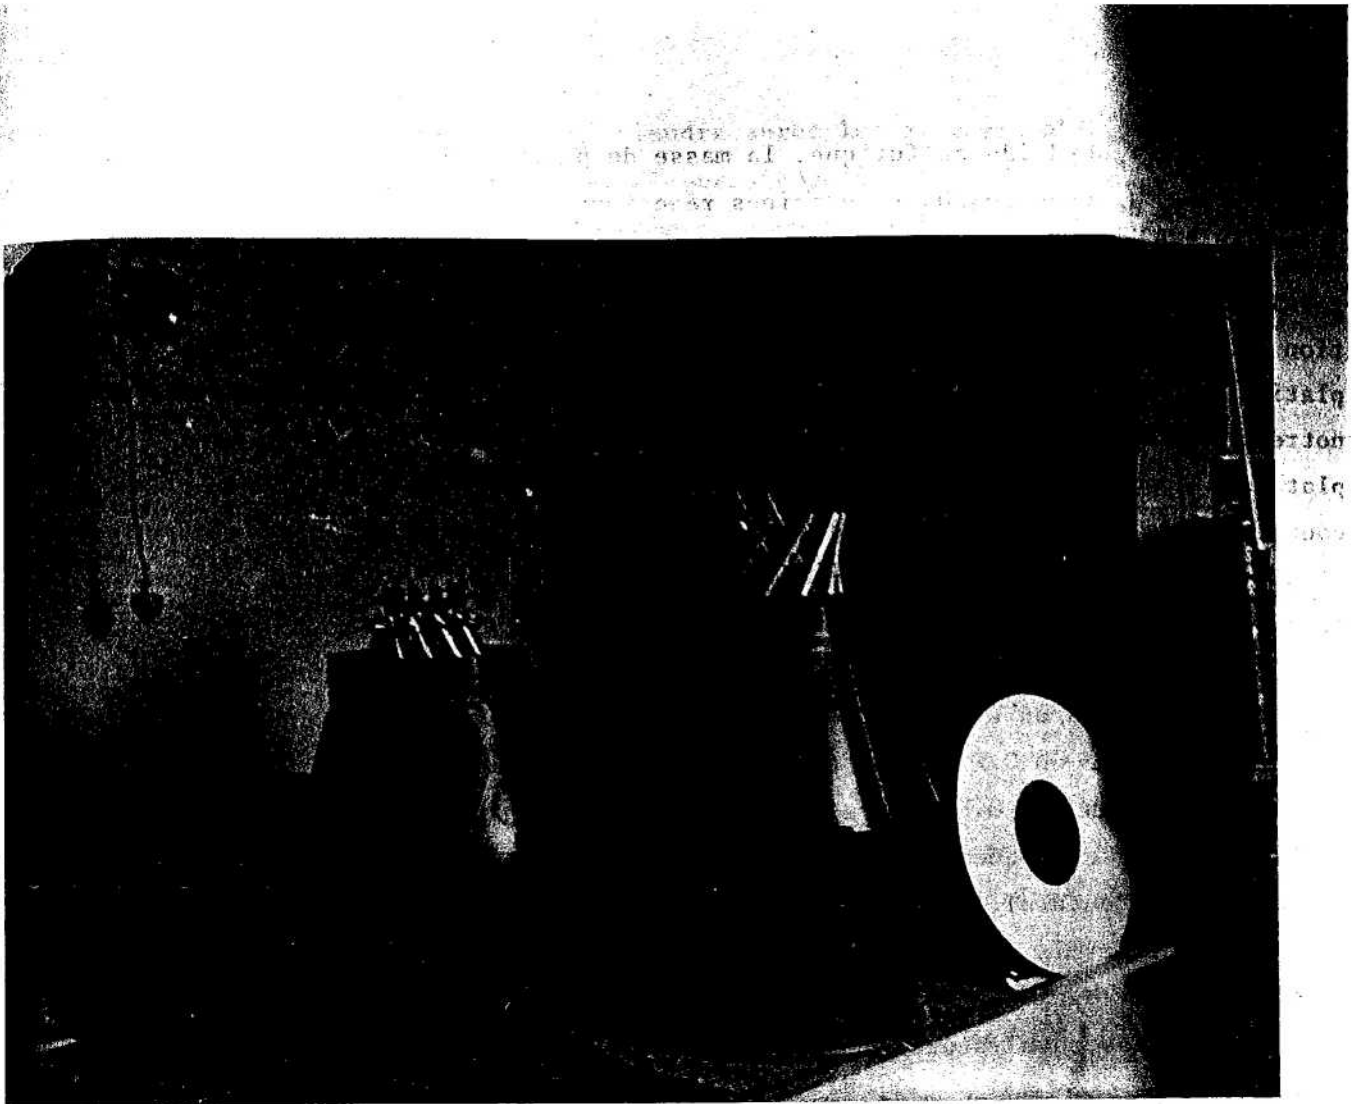

Towards the back: support for the stepped cone, winding template (discs placed temporarily for making notches in progress) (0.40 m box) allowing the alignment of the winding conductors for all possible combinations.

1) Template: stepped cone (27 discs) prepared by first rolling up the casing of the self-generator, with notches for sewing or securing the various parts of the rolling together.

2) Discs placed temporarily for making notches (assembly A. Hatingais).

Generator part

sulphurous to sulfuric anhydride, the mass of platinum can be replaced by vanadium pentoxide. In some reactions , the catalyst is electromagnetic radiation. Lots of catalysis: do' in the area only localized. Oxygen, in the SO - ► SO passage, is taken from the air. Obtaining water from oxygen and hydrogen without a test tube and with platinum foam does not call for location. The whole system is localized. In our usual field of coherence, the explanation of catalysis by platinum foam is based on the mean free path of the molecules which is made very short in the catalyst. Of course, there may be an explanation in the other field of coherence. But there is no localization of elements. Nevertheless, localizations can certainly be obtained from a catalyst like platinum foam ; Boutard reports the generation of organic acids. We don't know if he got them or if he planned it. A catalyst like platinum foam presents itself as an OF in the sense of emissions due to shapes. All the cataly- sors are not OF, it may therefore be structure of OF is not sufficient to explain the catalysis (at least the formation of fractant organic predicted by L. Boutard). Shapes with characters acids built by P.

Godart[Lo] allowed certain catalyses and polymerizations in time shorter than those necessary to obtain them with usual catalysts or even without these catalysts.

It seems that the priests of antiquity had integrated most of their knowledge in the letters of the alphabets (shape, arrangement of the let - very), numbers, architectural patterns of buildings.

For them, knowledge had a sacred character and its popularization or its use for self-serving purposes would have been a profanation. But we must not forget that this knowledge extended to the people who held only a tiny part of it. The people only knew what was necessary, such as the cure of certain illnesses, the manufacture of purple, the quenching of metals, the tanning of skins, the cutting of obelisks in the rocky masæ ses. The people also had the intuitive feeling of the gods but which they could not and should not manipulate. Of course, we must not fall into the view of the "little alchemist" who claims to know and does not want to transmit. and assume that the Ancients behaved like this. In truth, the "little alchemist" does not know much during a whole human life or part of his life to redo in dice hope what others have succeeded many centuries before him, without understanding moreover because he does not have the model which corresponds to what is necessary .

He gives himself a representation of it that is most often obsolete and he does not

i?

- not manufacture a science because whoever comes after him will be forced to start again at the starting point. (If he had understood, he would see that there is not a single starting point and he would know how to immerse his system in a much more operative representation of the Universe). Alchemy is both the proof of a parcel of enormous knowledge and of an equally enormous failure in the face of this knowledge . The mediocrity of these little alchemists is limitless and it is better

(*) a good rationalist scientist than a "good alchemist"

At least the scientist will advance knowledge by building science in his field of coherence while the alchemist will bring nothing more. Exactly like those who make spiri ism do not know more than Plato knew with his ouija board 3500 years ago, with less intelligence than Plato, which is a lot; these spiritualists have not understood that their model is zero and this is the reason why their results are so poor!

In antiquity, it is almost certain now that certain products were obtained by devices such as those of L.Boutard (Aumisier points out purple, the secret of preparation of which has long since been lost). Let us also point out certain coins found in North Africa in a metallic alloy but of which certain component metals are unknown at our time. In Toulouse, starch was made by such processes, which was the basis of bread in the years of famine. There must still exist some of these mills which later used the usual process, that is to say cereal flour.

So here we think back to the manna that the Hebrews ate in the desert. Apparatus perhaps larger than that of Boutard could manufacture it in large quantities but note that the Hebrews seemed to obtain it in the air whereas with Boutard it is in the water that it appears. Small gray cubes form. They can be analyzed by spectroscopy. We find proteins, etc.... But as it is a process of localization, on analysis, many characteristics escape, for example the fields of Taofel, the ext etc..

The Ancients left in the monuments, their form, the decorations, many elements of their knowledge. There are two gigantic constructions in Algeria: the Medracens, whose appearance recalls the exterior shape of the automatic generator; one of these buildings is 50 km west of Algiers, the other 35 km from Batna.

Boutard translated Medracen as follows: "He of those who advance by leaps (*) We notice the superiority of the scientist over the "good alchemist" because the first knows how to recognize the one who has sensed a life while the second knows nothing or wants nothing to feel so as not to say what he has learned or found. One can discuss science or philosophy with an E. Wigner but with an E. Canseliet it is impossible to collaborate.

(*)

and by jumps"? The one located to the west of Algiers has been called "tomb of the Chrétienne". There are some clues that could make one think of a tomb.] "On a square-based platform, a cylindrical drum 64 m in diameter surmounted by a step cone whose current height is about thirty meters. On the perimeter of the tomb, four false doors, at the four cardinal points decorated with molded crosses. Going around the cylindrical part but engaged in this part, 60 non-fluted columns, surmounted by archaic Ionic capitals...

... In front of the east door, a paving in which an entrance has been discovered, below the door giving access by a narrow corridor leading to a vault 2.5 m wide, 5.3 deep, and 3.5 in height. Towards the end of this room, on the right, an opening 2 m high gives access to a narrow corridor. The opening is surmounted by a lion and a lioness facing each other. At the end of this corridor was a slippery slab held in two vertical, lateral slides, similar to the granite portcullis of the great pyramids of Egypt. This slab blocked access to a staircase of 7 steps, at the top of which one reached a curvilinear gallery in the very center, whose radius of curvature gradually decreases to bend abruptly after a complete turn, and lead to a bedroom. vaulted 4 m wide and 1.5 m deep; a new narrow corridor, 0.85 m wide and 1.25 m high, in the axis of the gallery was blocked by another slippery slab, of the same type as the one mentioned above, which blocked the entrance to a new chamber 4 m wide and 3 m deep, barrel-vaulted, in the center of the monument at about 18 m in height at the -above the entrance platform and paving; on the 3 side walls and the bottom are arranged 3 niches".

We will not give the description of the Medracen of Batna; it was done in detail by Hatinguais [2]. Let us point out that in the Medracen of Algiers, the entrance to the central chamber fitted with a fairly thin slab may represent the strip of cotton retarding the march of the masculine atoms of which we spoke in the description of the automatic generator. These medracens can be the representation

(*) To recall, perhaps, the marches of the male elements of the Aether.

(**) Perhaps because it bears a cross in relief on a slab at the four cardinal points.

(***) The slabs no longer exist.

devices of the Boutard type. For the vulgar, these monuments were of an aesthetic character or temples. For initiates, they had the means of reproducing operative devices on a smaller scale. Let us not forget however the possibility that these constructions were also used as temples^ appropriate rituals can trigger fields of Taofel of the type of those emitted by the devices as well as states and if a device exists in a certain place, by transfer, one can obtain an operativity in the temples.

In the Russian part of the cemetery of Sainte-Geneviève-des-Bois (Essonne) there is a cylindrical construction surmounted by a sandstone cone. It seems that this is again a reproduction of a ritual device that was in a countryside where the one who is buried under the monument lived; but this is just a memory.

Apart from the Medracen, certain Russian edifices have retained the forms of the fundamental apparatuses of the science of manipulation of the aether. Aumisier points out the Russian church in Cannes which bears 2 domes in the shape of a bulb similar to the lambskin covering of the cone of the first generatrix. The cupolas are surmounted by a cross with two arms representing the positions of the four electricities and from this cross descend the two branches of a rosary similar to the essential organ of the apparatus producing organic bodies.

Aumisier also mentions the Villa Alexandra in Cannes which has a sort of minaret supporting a column surmounted by a bulb, followed, at the tip of the bulb, by a sphere and above the sphere by a crescent crossed by a stem resembling a lightning rod. This building represents the barrel which carries the windings of the amplifying generator described above, we find the lambskin bag. The sphere and the stem and the crescent correspond to the arrangement and splitting of the a's and the JI's. But we will not talk about this precise description here and let the reader refer to [2] and [3]. In church capitals, we find hooks, volutes, single or double spirals, arranged symmetrically, side by side or separated, assembled in C/O or in g 9 . These are hieratic signs that have been perpetuated through the ages and religious beliefs; even the attributes of the gods of the primitive peoples of Central America, Peru, Mesopotamia, idols of the Maoris, Malays, Black Africans, certain hairstyles, command sticks,... the list is long of all that partially represents the monads of life, the little serpents, their splitting.

It is impossible to make a list of everything in decoration inspired by the aether. Thus, without our knowledge, key symbols are represented, intended to awaken (in support of the letter-signs and the words of the vocabularies) the great fundamental principles, "hermetic" terms, hidden a priori, and this during exposed to the "face of the sky" delivered to the perspicacity of those to come, capable of finding and interpreting clearly the prodigious sense of character at once scientific, religious, artistic, philosophical.

We give here a table taken from [3] which summarizes the technological description and the theory of the functioning of the prototypes of equipment made by the Sacerdotal Castes of Sacred Antiquity, to highlight the entities, elements and phenomena previously mentioned. .

1) The monad A,a (■'a and ^ca: first letter of the Alphagram and of the alphabets, and also first principle, "beginning of all things") and the double entity n ('n and ^cII)

2) The element T,y (second letter of the Alphagram); the Electra E,e and the A-tomes (in the hieratic sense: parts of A , of A,a) S,s and I,i (by splitting of T,y)

3) The element B,S (third letter of the Alphagram, second letter of the alphabets) the electra U,u (upsilon) and the A-tomes (parts of A , of A,a); O,o and R,p (by splitting B,fl).

4) The self-generating device A,6 (fourth in the ritual series) for the dislocation of the elements 1)-2)-3) of A,a, with Electro-Atomic genesis , by conductive equipment and accumulators of the said elements.

5) The fifth device: (II, ^{EVTE} "equipment H") to reinforce the intensity of the electric current (of electres E, U) by inserting the charge II (Jupiter, JUPPITER father of ^cII * , P).

6) The sixth device (seE , ^E with . £) for the union of the elect r ^E, ^E with the 4 atoms (of A, a , united, in KZ = Z, £).

7) The seventh device (selif, e with H) for the union of the electra ^E,^E with H.

\ -.' \$•• ■ ?> • y

8) The eighth device: <j> (diagram of the shape of the induction field) multiplier-amplifier, raiser of potential and intensity therefore of power.

- 9) The ninth devices: accumulators of the flows of
- 10) The tenth apparatus, of bipolar induction, electro-magnetic.

Louis Boutard did not follow the path taken by known philologists to this day; he was able to rediscover the non-local side of languages which supports the local side that they represent and express.

This chapter is completed by appendices I and II which follow as well as by extracts from letters from Louis Boutard to Jean and Christiane Dumont.

APPENDIX 1

Let's see 2 points of view of the same motif engraved in relief on a monument. For that let's go back to the Medracen near Algiers "The Tomb of the Christian". A standing lion and lioness, facing each other, are engraved on the lintel of the semi-subterranean entrance to the vaulted interior gallery, running in a helical spiral from the periphery to the two central cells, separated by a symbolic portcullis (sliding stone blade), symbol of the partition isolating the female fluidic cells E and U, that is to say what Boutard interpreted as the living force of the greatest intensity and power. In [1] it is reported that the monument is actually designated by the expression "tomb of Roumie" and that "Roumia" recalls, according to Boutard, the Greek adjective "Roméa" (from "Romé": face, power of the Lion Rho). It is the virile face of the fluidic A-tome R (Rhô, head element R, split from the caudal part 0; it is the A-tome R which confers the greatest vital force on the fluidic cells. Such is the explanation given by Boutard and taken up by Hatinguais; as we have already indicated, we will not go into the details of this terminology; it suffices to refer to [2] and [3].

Doctor WL Dulière in his work [11] studies drawings, statues, bas-reliefs, ancient texts and in particular stops on the two standing lions, face to face, of the door of Mycenae, in Greece. He sees these lions as protective divine geniuses but according to him they already announce the coat of arms. is the sliding of the dyad towards the decorative element by simple symmetry. The divine will be lost". What is interesting to note is this passage from the divine character, that is to say operative, to the representation with a purely decorative purpose.

The dyad, for Dulière is the realization in 2 sexual or asexual copies, symmetrical with respect to a plane (apart from a few details) of a motif. But the dyad must be surmounted by a third element which will achieve the unity. In the dyad we do not yet have dynamic duality in the Yin Yang sense of the term because at that moment dynamic duality creates dynamism and we have unity.

WL Dulière did not enter into a formalism like L. Boutard, on the other hand he insists more on the character of the divine ternary à la Enel than Boutard did. (It is possible that L. Boutard went through this phase without reporting it because

he spent hours alone thinking and working in his laboratory and in general he spoke very little' ²).

Dulière thinks that the Greeks denatured the theines which for him were Semitic because they no longer understood them well. They would thus have introduced beautiful forms into certain ancient triads and produced hybrid works denoting incomprehension; the harsh and sober style of the first datum being completely transformed in their adaptations.

Firstly, it seems for Boutard that the Semites drew on gnosis that was at least 8000 years old, then that the Greeks nevertheless had moments of very strong operativeness at Delphé in particular. All this knowledge got scattered and groups with small pieces glimpsed new results.

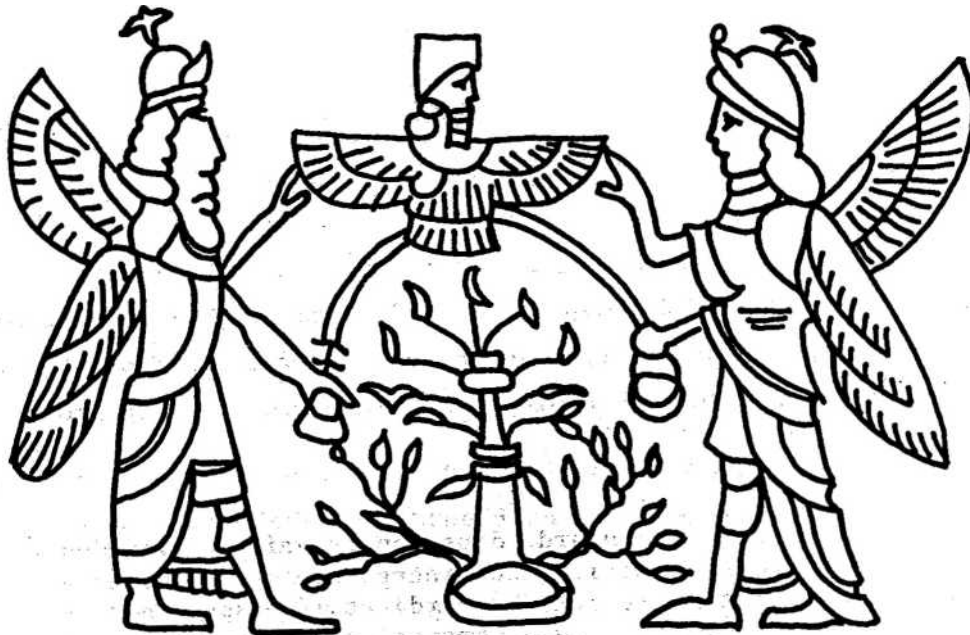

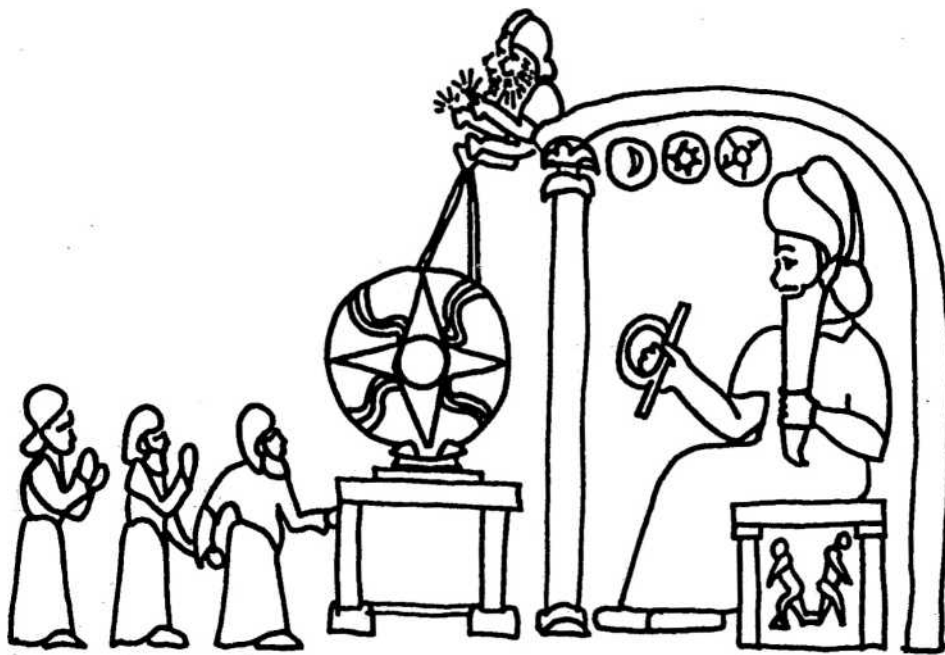

Dulière insists a lot on the forms: elohim, serpents, cattle, rams, etc. even stones with signs (betyles) or even animals made up of several animal parts. We arrive at shapes that will replace the little snakes; they are localized but by counting them, and by creating the dynamic duality, we can also obtain delocalizations. On the Ark of the Covenant, two such forms were on the outside and increasing gender attributes, snake, were perhaps represented in order to amplify the effects of dissociation and recombination of the small snakes, components of the Aether (according to the coherence of L. Boutard).

Let us take another example which is presented by Dulière but has not been studied by Boutard. The god Sippar seated on a throne under a canopy. W. Dulière says this "The divinity (of the god) is attached by four pairs of horns superimposed on the tiara... two small bearded and horned gods (which Dulière thinks of as two cherubim dominated and enslaved in a triad also summarized in the doublet of the three stars. They move a cable that activates a large wheel by means of a pulley placed on a table in front of the god. On this wheel

-----■ ■ ■

Ui,, .?■

(*) Aumisier spoke of Boutard's attitudes, ^ in his ^work and with external relations [1] and [13], and also the "incessant struggle that he himself waged until 1941 (year of the break with Boutard) and even afterwards to publicize the work of Boutard by the governments of the end of the 3rd Republic, the French government during the 39-45 war and just after the war the government at the start of the 4th Republic. Boutard is one of those (the few) who received money to carry out his work. He couldn't finish their garlic; there was no question of ending because the great gnosis is a glimpse of a world where the dream merges with reality and where there is a dream, there is no limit.

Type of an oracle rendered between two already humanized cherubim [11]

are drawn a star and blazing zigzags".

Duliere nevertheless points out that this image could recall a device installed in the Garden of Eden (but not operational, solely for the aesthetics and the well-being of those who were walking in the garden).

If we think of Boutard, we find the horns, the crescents. Boutard would certainly have made an operational device out of it. So in this particular case should we take Dulière's point of view or an approach similar to that of Boutard? The two points of view are not incompatible. The latter can be a necessary interpretation for religious people in order to convey a message corresponding to their belief. It can actually match the description of a device. Let's try a transfer with a device, such as the Boutard approach. There is no Ext but we have high C. de T.. The state is a K Sh Ph with reversed shin.

If we stay at Dulière's point of view, we don't detect anything in particular .

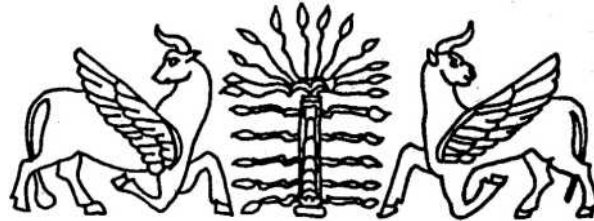

Now we can have a drawing corresponding to a religious belief and which has enabled us to draw a device from it. We can also suppose, according to Aumisier's point of view, that everything that is religious is only a misunderstanding or a disguise of the properties of the Aether. This view is a little . (*) .

excessive because we do not have in a religion an aping but a deep feeling of a notion differently named (which is God), or not named and that the human being launches in his fields of coherence as ultimate hope. After having launched it, he puts intermediaries (these are the hierarchies) by need for scale and also by need to build in a field of coherence an "orchestra" type system on which he will rely to establish the entity supreme.

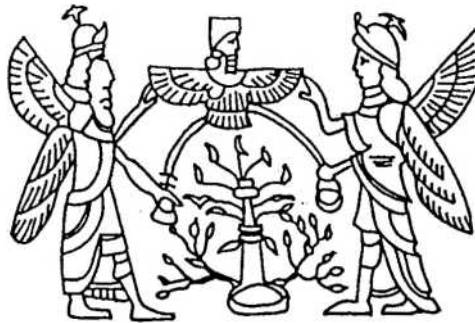

We must think of the Ancients as not separating science and religion; indeed among them, science, religion, art, philosophy were not distinct as in our society. Everything was intimately linked! The origin of the great - religions, their rituals, are the expression of the beliefs and practices of relocation, of the global approach.

(*) Monkeying, on the other hand, appears in many sects.

OF THE TWO CHERUBINS
AND OF YAHWEH BETWEEN THE CHERUBINS
AT ADONAI

A type of cherub pair. The cherubim, often winged calves or bulls, will gradually become humanized by keeping animal parts, horns or even tails [11]

A type of triad by implantation of a dominating third party [11]

The cherubs ousted, Unity remains [11]

Brief Synopsis by varied images typical of the stages of a
type of evolution

Here we find the so -
called
crescent position of
the serpents .
The rest

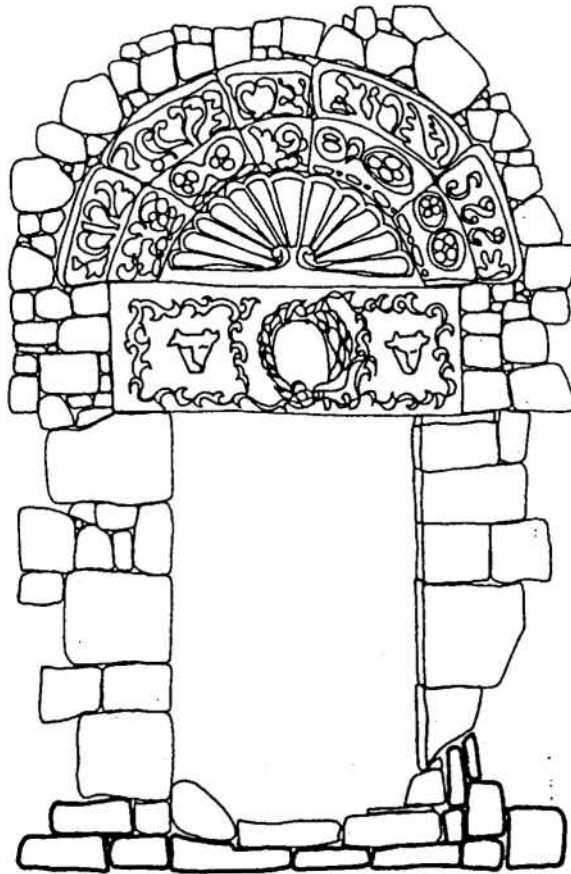

Taken from Layard (Monum. of Nineveh, 1849, pl. 41). Equivalent to a Moses presenting two nehoushtan (brazen serpents or seraphim). [11]

Here, an association
of two snakes. Same
comment as above.

Two nehoushtan reduced to a single snake by the humanized head (Image on a hydria from Chalkidiki published by Sieveking-Hackl in the Vasensammlung of Munich. According to Cook, Zeus, vol.II, p.731). [11]

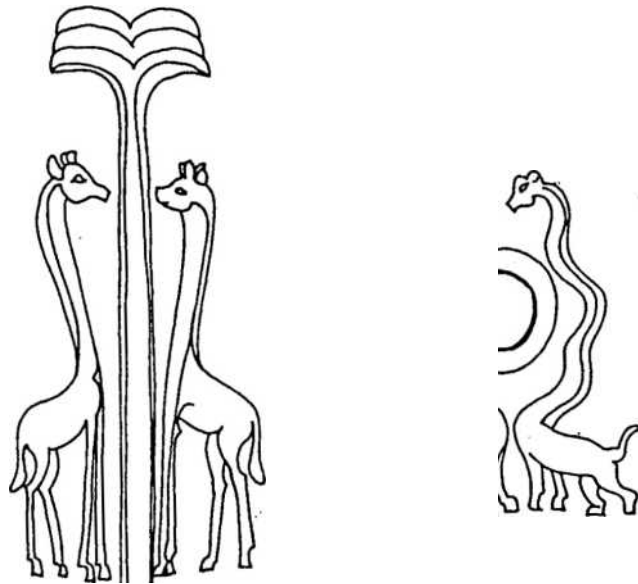

To suggest an understanding of the "brazen serpent" or, better, the "double serpent".

Published by the future Lord Kitchener, then a young cartographer and Arabizing officer (Palest. Explor. Fund. Quarterly Statements, 1878, p.105: Doorway of newly discovered synagogue at Sufsaf). [11]

Survival of images.

The two calves.

Giraffes. Left: F. Legge, *Proceedings Soc. Biblical Archaeology*, vol. XXVI, 1904, p.262.

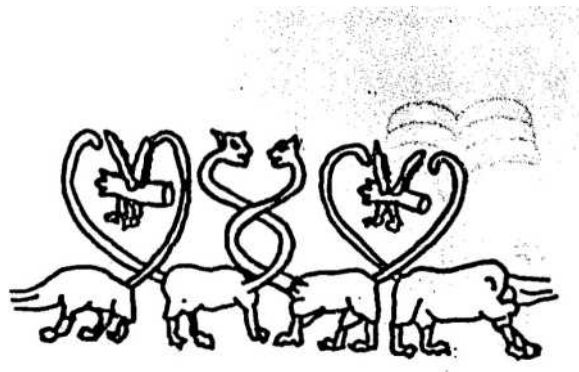

Right: Same author, *ibid.*, t. XXII, 1900. Plate III. From Hieracompolis and elsewhere. [11]

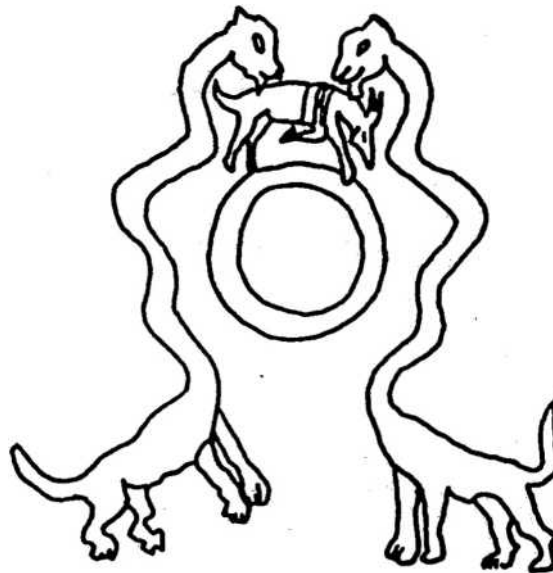

Two Sumerian cylinders (Delaporte, *Catalogue*, A.108 and pl. 64.9, A.41.

The problem: Did Sumer know the giraffe from Egypt? Aren't the images on the right an artificial synthesis of the cherub and the seraph? [11]

In the first 2 figures, we seem to see giraffes as Dulière signals. He writes "We wondered if Sumer, who was unaware of this animal on his soil, had borrowed data from Egypt, which could have had knowledge of this animal from central Africa, although quite far from Sudan ". But adds Dulière "We are not certain that it was always a question of giraffes, but rather of an artificial synthesis of the cherubic element and the seraphim element... [11].

Chaldean caduceus on a cylinder
primitive. [11]

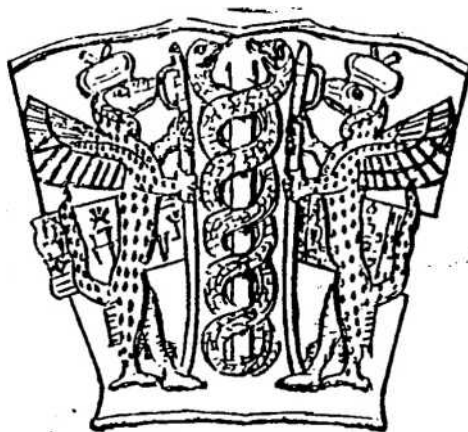

The Egyptian caduceus, on a palette of prehistoric or primitive
ages [11]

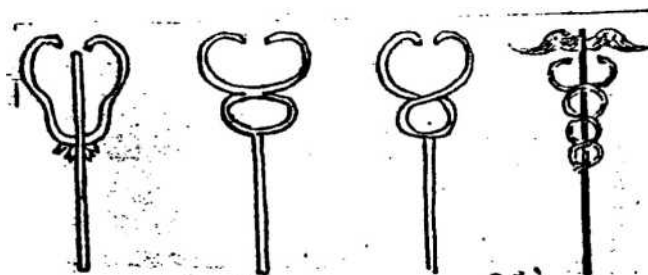

The lower part of the palette, not reproduced here, shows lions pursuing and tearing goats. This palette, as well as pl. VII and VIII, were found by Quibell, at Kom-el-Ahmar, the ancient Hieraconpolis (Cf. Zeitschrift XXXVI, pl. 12-13).

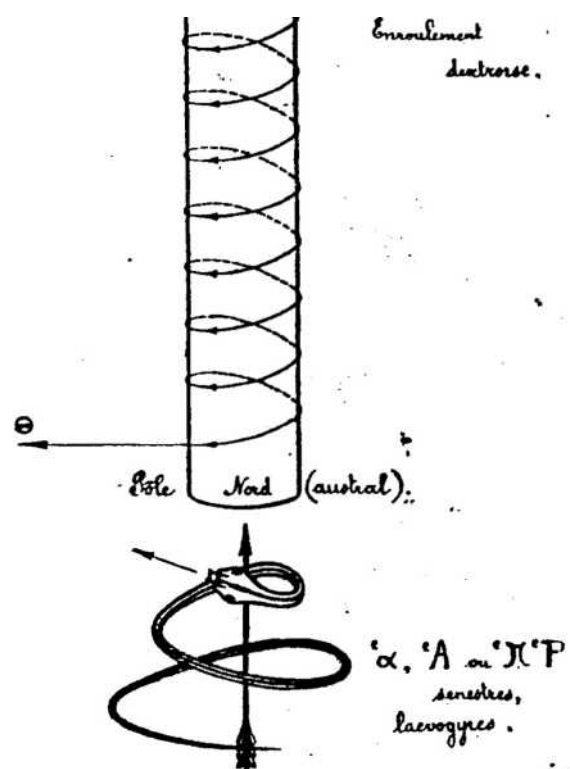

Knife handle from primitive Egypt,
with caduceus. [2]

The Goudéa libation vase
dedicated to Nin-Gish-Zidda. [2]

The classic Caduceus. [2]

[2

L. Boutard presents the top right figure as the Egyptian caduceus. There is also, between the two lions (because for Boutard they are lions and not giraffes) a goat. They are lions chasing and tearing goats.

The lower right image strangely resembles the Chaldean caduceus, as does the Goudea libation vase dedicated to Nin-Gish-Zidda. For Dulière, in this last motif, the two winged quadrupeds are cherubim (evolving towards a fantastic type: the dragon) The caduceus is a symbol that Boutard made explicit in the device he called: the amplifier. He put two windings on an iron cylinder, a dexter and a sinister. We do not describe this device further. We have already talked about it previously. Let's see what Boutard says of the caduceus: "Caduceus: attribute of Hermes (tris-megistus, three times very large) because any mass of steel covered with amalgam (of mercury and tin.: "tin in a hat" of the old technique, whence the petasus of Mercury) is thus protected from the stasis on the metal iron, from the oxidizing fragments of the A , 'A, *A corroding after their rupture, which are then evacuated by sliding on the polished glaxis of the amalgam (of which mercury is the perfect conductor; Hermes herdsman conductor of the herd of males, mystical lambs" [3].

The caduceus is a possible position of the 2 serpents. But for Boutard there are still other positions: spindle-shaped, crescent-shaped, stem-shaped (straight, folded into a ring, folded at right angles, pointed, etc.) [3].

Let us return to Dulière in the light of Boutard's results. The elements Cherubim and Seraphim would each be a small serpent but in the position of the caduceus. The bodies are those of lions. They represent the virile force of the fluidic A-tome R as we have already pointed out. The cherubim and seraphim can also be less fundamental forms than the small serpents and (*) thus more operative

The figure on the left really represents giraffes. But the significance of the giraffe does not appear in Boutard's arsenal.

(*) In the Aether, one must be able to obtain more and more advanced forms. All forms of the local can be found there and the local would then be a process of reading for the Aether. From the Aether, we could thus extract an operative room.

APPENDIX 2

In the case of the extraction of quintescences by Spagyric Art, it is advisable to carefully observe the date on which the plant is picked, in order to place oneself in the desired asturgic signs. In this case, do we only use the M-type Magfeu thought?

In the case of Asturgia everything happens as if we were deciphering a message ; here, in the case of Alchemy, we have as it were an operability due to Asturgia. The choice of planetary positions and constellations is operative on the properties of the products to be obtained. But if we refer to Chinese Alchemy, there are many more stars involved than in Western Alchemy and most of them are not at any known star position: (this does not mean that 'they are at star locations to be discovered; the locations could be found with a pendulum or by clairvoyance, duplication etc...). The installation process was a Magfeu-M and relied on a star field as if to extend this star field. A weft is thus produced which can be (*)

(*) The point of Magfeu-M view is insufficient. We must consider the human being as a shape $F^{\wedge}$. We plate $F^{\wedge}$ in an asturgic system (this will be the support) and correspondence (it is the dilution in the support); he comes out of new things : so it turns out the character, forecasts in life to come from the individual... Appears the form which is richer than $F^{\wedge}$. From $F^{\wedge}$ we went to $F^{\wedge}$ by a process known as 'decalco'. We saw that asturgia is a means, as the chisel is a means for make a piece of furniture, but the piece of furniture realized, the chisel no longer intervenes; It is forgot. In the case of spagiria, we pass from $F^{\wedge}$ F, to F_{-} by decal process that is to say that the date of picking, the treatment to which the plant, are the dilution in the medium.

Asturgia as a whole is a Magfeu-M. Seen from the angle of forms, asturgia is a transfer process. This obviously does not mean that Magfeu M is equivalent to the decal process. The Magfeu-M is the adaptation given to the cerebral structure of the operating human being. The decal process is the technique that the operating observer takes to obtain what he is looking for. It is necessary to have two points of view to approach spagyrics.

adapted to each Asturgian or to a whole community.

Magfeu-M thought contains the world of operations. This location directs a positioning of the system to be manipulated and infuses it with dynamism.

It would not be necessary to say that it is the EF and the C. of T. emitted by the constellations, positions of planets ' etc... which intervene. It is that by respecting what is in the Magfeu-M approach, the operator starts a process that will be useful and even essential for the extraction of (***) qumtescences

The room contains images that are used to manipulate, using the coherences of another coherence field [14], (*) (**) (***)

(*) The stars, in Chinese astrology, like the constellations in Western astrology are a support in which the moment will be diluted (as we speak in general, we use the term astrology instead of asturgia) .

(**) The moon sends EFs in certain states depending on the illuminated portion. On the other hand the Earth-Moon system has an ext (but neither the earth nor the moon have one) and transfers can occur between the ext of this system and the ext of living systems. By the exts pass the signatures for example.

(***) It is in this sense that the Alchemist is in the experience.

ENIGMATIC "ABRAXAS"

by J. RAVATIN

(Paris)

The Abraxas are in the form of medallions on which are worn on both sides of the inscriptions and figurines. Some are reproduced opposite. They are symbols of the ancient Gnosis located it is thought in Egypt 5000 to 6000 years ago [1] at least. They are the last signs of a very fine knowledge of man and his possibilities. They are not attached to a local description of the world.

For centuries these "abraxas" have been found by the thousands in Egypt, Rome and elsewhere around the Mediterranean.

They had not delivered the secret of their mysterious symbols and it seems that it was Boutard who understood their meaning, at least a meaning. For this he relied on the work of a French Benedictine, Dom Bernard de Montfaucon; this Benedictine was a famous orientalist of his time, that is to say around 1719; he devoted a vast study to the abraxas in his work "Antiquity explained and represented in figures".

In Dom Bernard's work are reproduced drawings which themselves occupied the six pages of a small Gnostic book which Dom Bernard discovered in Rome in 1699; This curious volume, 7 cm by 10 cm, was entirely made of lead, sheets, binding, hinges and nails. The inscriptions of the first four pages in Etruscan and Greek letters were unintelligible. the 12 hours of the day. The seventh hour is represented by Sapis, a Greek god, who must have come from Egypt, and who was an emblem of the sun. This is Dom Bernard's temptation to understand.

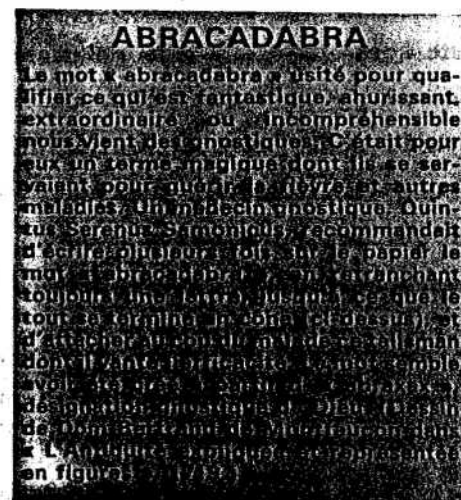

Countless beetle-shaped abraxas have been found. Which is interesting because the beetle responds to decal, which means that the localized vision that we have of the beetle as of everything around us is not good and that the Egyptians considered it other than an insect of such a shape, such colors...

The interpretations usually given are, for these 12 "abraxas":

- Figures 1 and 7: solar images
- Figure 8: In this scene, of great delicacy, where two riders surround a starry figure, symbolic motif of the serpent.
- Figure 3: Angel or cherub, seated on a lotus flower, attribute of the Egyptian goddess Isis.
- Figure 4: Scarab, image of the sun among ancient Egyptians. The ribbon would signify that the amulet was worn around the neck.
- Figure 5: Character whose dress is covered with Greek letters, prayers or formulas of protection.
- Figure 6: Half-man, half-snake creature.
- Figure 8: Lion devouring a bee; the lion is both the solar symbol in the cult of Nithro and a Christ symbol for the early Christians.
- Figure 9: Vase (or canope) from which water flows, topped with the head of Osiris.
- Figure 10: Rooster-headed creature with serpents for legs.

For this pentacle to work, it must be made by a person who has been invested with the power of which Castaneda speaks [2],

: ; . L. Boutard has deciphered abraxa n° 2. This abraxa is the reverse of a obverse which is not represented here [3]. The obverse describes the receptacles which contain the EU fluids themselves constituting the "current" and the reverse enumerates all that is accomplished from the "current". It is first necessary to fortify E and U (cvipiAai) with another fortifier, another covering which gives them the effective power, to accomplish, "complete to perfection" C'avn, 'avexv), 1st sacrifice, in device <j > armed with croissants • c ' est ce

which makes it possible to make the enigmatic apparatus arranged on the right, on the abraxa, at the bottom of the oval, between, on the one hand (on the left) the new vase ^{5>} nNa covered with a petasus (the petasus, x ° Taoos , of the same original meaning as iTcTaAa: broad-brimmed hat, (of Mercury, itself represented on another abraxa), shading the solar radiation) and (further to the right) the crescent , placed on a kind of cushion. This device consists of a square (Kaxnatou, iron), whose vertical branch extends above the salient angle and carries, off-center two concentric circles, while, towards the middle of the horizontal branch, hangs a weight of probe, with degrees, in V , symbol of the "celestial throne" with steps (Opouo^, ° popBqs oupavio/).

We see here, how a reading of Abraxa had to be precise but not in the sense of all possible details, as do those who read alchemical texts where lots of interpretations appear and do not extend because they are only too closely aligned. L. Boutard had reached the stage where he could decipher a text, a drawing, a bas-relief on a monument. The details are for the reader of Boutard's decryption but for Boutard the approach was different, almost the opposite; the drawing was inspiring; it was a bath that allowed him to have access to another reality. His approach was that of Mozart when he wrote:

"The thing begins to be practically complete in my head even if it is long, in such a way that I can embrace it with a single glance like a beautiful drawing or a pretty person; I do not hear it as a success- (*) • . sion, as when it will be interpreted, but in my mind, I hear it as all at once. It is a party..."

And Beethoven:

from above and below, and as I am sure of knowing what I want, the fundamental idea never leaves me; it grows and grows, and I hear and see the whole picture present itself in my mind like a flow of cast iron. There then remains only the work of writing..." Let us return to the abraxa: from the high altitudes of the rhombus of celestial A-ether, 1* ') otpi > \$ divine, ^{ct} ayxov Hvêuya, descends in magical katabase cyclical, by the attraction of iron, (0aüpo^ *'Apny) and "falls" (This "fall" of Iii ^'ayiou, is symbolized by that of the winged insect called "spinning wheel", "turnstile" , "pi-rouette" (pi.rouant), diptera midge which flies by the light of the lamps and, falling on a plane or on any obstacle, pricks itself on its head, central point around which it wheels, pivots by vibration of its diaphanous wings, by describing two small concentric circles with its legs . This nocturnal insect is the ipuxn. , (Psyche), the "animated" breath, the soul, ritually glossed in Hsch. by Il.veupa and by (paXXn ^{ci}ITITEToPEVTi i/)uxn: "breath of soul fallen from the sky", for Il/'aXXn: "TI leaping", or "jumping soul H".), at the angular summit of the square; from there , inductor-coater, it extends towards the center of balance of the square, from which it hangs in suspension like a weight of probe /KctTaxEi paTnp ia z \ for the descent in deep fall to the center of the earth. \ KaOnTnp, < to 0. eTov,/

The name of this instrument is given by the contiguous drawings of a leg and a jackal (in profile and at the end of the meseau), in hieroglyphics the leg is spelled Ba and becomes the sign-letter B that the scribe writes, from Baivtü, to walk, to go; hand, pres. Bay, Baoa, Ba\>, hence Baaij: "base of the walk", leg. The Greek name of the jackal is (0oo^: pointed, acute and, in the figurative sense, thin, cunning), the whole of these two drawings therefore reads: Ba.0oo^: height, depth, of those of the sky and of the ocean of A.ether to those of the oceans and of the terrestrial soil (Meanings encountered in the Scheliast : EÇ TO ^uipo^ TOU oupavou" Cociiri <5 'avmvopaoToy *'E/ Ba0o,î KUKXOU XwpêT, in Aristophanes (Obverse 1715): "in the height of the sky"; ³.HTIT(T)VEV apaioîûp ^z sE< cn0Épo£ Ba0o,s , in Euripides: (Medea 1297): "in the depth of the aither"; Ba0o£ means in the unfathomable depth of the ocean of A.ether, whose constituent element is the ^Ayxov ^{H.VEU}pa , from which this one descends on the terrestrial planet, on the iron thauma turge: (0au ' po ^, ⁵ 'Apn (s), ocean of aither whose constituent element descends on the iron of the square, of the instrument Knena0na . which attracts it and maintains it in suspension (Knena0i/).

P of AuII theme LUP. The simple primitive Aura has remained in Old Latin Lupa, Lupa Rumina, the "Rumine Wolf", (with breasts), from Rūminalis Arber, (ficus, Ruminai), "suckling P,p and 0" (R,p in M; 0 in L,A), Ü before its split into U'/ of R and U"/ of 0 , in two distinct zones M and L,A , when Ô (Ü long, double) still had for parhedra R,p and 0 (the par-hedron of . Ü of II in A was therefore the masculine Atom 0 , whence Lupus, wolf, discarded by Lup.ercus: Pan Lukéen (Lycean), male of Luperca; whence Lùpercâl , -àlis, plural: Lùpercâlis: feasts celebrated in Rome in their honor). square, from which in fact emanates the Atom R,p, f'Pm: "Lion R,p") of II induced, atom with a "haimato-poietic" blood-red blast nucleus, despite the theme AUil properly designates the elect-goddess U/ of 0 of A in zone "Artemis, or Phoebe, companion parhedra of the a.tome 00, 03, (° ApîroKpaTn£, or ' > AtroXXwv) to nucleus-blast . (***) • , golden yellow . U/ of 0 being disjoint U/ of R and the latter being com

parhedra loincloth of the A-tome R,p, blood-red, in zone, that is to say this up

(*) Hieroglyphic sign for the M.eRKht instrument:

1

*

YB, IB, UB for LUB (with B for P of LUP of theme AuII, literally "in A,U of II" /'goddess U of II", i.e.: 'AqpoôiTn; and with deletion of A, as always in Egyptian hieroglyphics, this area L, A of mystery, being to be silenced, to be kept secret, apocryphal, * * 4 5 axopu<pn).

(**) From the theme AuII, XuITai: to have desires (of love, of the heart)

XuxTa: passionate about sexual desires

⁴ eTaipa: companion of love iropvîj: prostitute

(*AA) Artemis, parhedron of Harpocrates, or <j>oi(3n parhedron of <j>ox[k>£ (both also with yellow nucleus-blast), depending on whether the electre U emanates from (ü dexter) or II (ü sinister).

zone M which is cardiac, L. Boutard used documents on the ritual gloss to manage to connect the words, their writing, the argument of the letters. He himself found the sinister or dexter characters by the position of the words in the sentence, or the arrangement of the signs, characters on the abraxas. To decipher an abraxa, he also used others.

The H.vevpaTa, *oipei\$ eels, on suspended weight of the M.eRKhT - Kpepaûa, wait there in static afterglow; but at the passage of the "current" of the two electres EU, which their masculine K accompanies in a helix, the sexual excitation comes into play and, unrolled, under the guidance of Hermès-Anoubis ("Fox morphed into a Jackal", as in hieroglyphics Aigyphtienne), the two anguillular ophidians: (masculine sexual weight that must charge and strengthen the "current": heavy current) lengthen on either side, to the right and to the left of the oval of the abraxa , going up to the two seducing, exciting-inducing goddesses, to be protected and fortified:

- 1) E under the belly of a crescent resting on a forehead
- 2) U enclosed in the crescent, radiant head of the rays, of the "points" through which it flowed.

On the left, the elongated ophis, (IAW, ³ Eiap), is preceded by a small squill, (squille, sea crayfish): the masculine of the petal, in agreement (a.vetKia) with the II qu' he precedes as a guide.

At this attracting call, descends from the sky of A.ether, between the heads of the two attracting goddesses, the divine augural bird ^Æ lepaÇ, symbolizing the winged II, j calligraphed around the beak of the soaring "falcon"; others flying around the goddesses, two of them, dexter and sinister (the one on the right clearly drawn, the one on the left badly interpreted by the copyist engraver) are shown pecking with their wide open beaks, the hair of one -and-the other electal goddess E and U .

We will not pursue further the description of a face of this abraxa given by Boutard and reproduced by Hatinguais in [3] because it is still long. But nevertheless this reproduced part makes it possible to account for the virtuosity of a Boutard and the extent of the Great Gnosis.

Extracts from letters sent by Louis Boutard to Jean and Christiane Dumont

Letter of January 26, 1943

Dear Mr. Dumont,

... It is more and better, infinitely, than with a "philanthropic" work that you are going to associate yourself with in your loftiness and your greatness of soul. You will judge for yourself by the two brief summaries of the immense works which have been the *raison d'être* of the unity of my whole life, as erased as it is unhappy in total abnegation, summaries of which I had set aside copies for you, but whose sending I had deferred in current circumstances, due to their confidential nature.

... Wishing to make a complete turn, and decided to do so, rather than divulging fragments of it, which however would have given me notoriety, it is voluntarily that I have always postponed making anything known of it ; to these endless labors, I sacrificed everything which was for me a small fortune acquired for my bread by the daily labor, the most painful, the most ungrateful and the poorest. So that with the sacrifice of the rest by the very heavy responsibility, a quarter of a century ago of my two sisters, unaware of the greatness of this sacrifice which reduced me to poverty for them, I given everything that I could have possessed in peace and ease, instead of the distress in which I find myself at the moment. You will judge yourself that the sole purpose of my life in the pursuit of these discoveries, in the revelation of what sacred antiquity was , distinct by an abyss from profane antiquity with which it is confused, that there impenetrable and impenetrable by it, was to remake the unity of the ultra-learned and religious Doctrine in God who, from Delphi, navel of the Earth, (Gês'omphalô) had conquered the souls of the men of the Universe. earthly, not by the weapons of violence, by iron and by fire, in blood and in death, but by Persuasion, by the Miracle, in respect for Life, universal work of Truth, of Love and Hope.

The time is therefore near when Science and Religion, one and the same thing, henceforth recast, will reunite all the peoples of humanity.

And as, always, in its inscrutable and unpredictable devious ways and means, Fate is ironic; what is pleasant in this revelation, it is that the starting point begins with the symbol of your

odontological profession, a coincidence as strange as your unexpected intervention , because the whole work begins with the anecdote of the famous "lead forceps", molubdinon *odontagôgon , plumboum dentidûcum , the first sacred object which was presented to the temple of Delphi at the public veneration, etymological key of 'O.dons , 'o.dontos , Tolian (Hippocrates) *E.dons 'e.dontos, whose inexplicable prosthetic vowels 0 and E have disappeared from other congeneric or borrowed languages; lat. dens , dentes , Sancrit dante-s, Lithuanian: danti-s ; Cyriac: dant ; English: tooth ; German: zahn - symbolic and speaking instrument, revealing, of which had understood nothing, without the awakening of a suspicion, the terminal brain without a spark of intelligence of the secular Greek doctor Trasistratus , as reported by Coelius Aurelianus , another doctor lay people, worthy ancestors of the "scholars" of primary school, "modern" materialists and rationalists of our quaternary age of Iron, Fire, tears and blood, an age of ignorance, vain pride, misery and death.

... Despite my painful state of perpetual torture by ringing in the ears, a consequence of the acute "neuritis" of which I am crucified (I hear all my blood circulating), despite my weakness as a famished toothless old man , despite everything the horticultural labor to which I must devote myself with my calloused and bleeding hands, I indeed continue with courage, in spite of the "occupation" and the threat of destruction by the bombardments of war, not only the classification and the finalization of my philological and historical studies of Ontology, reconstitution of the divine monument of Science, of ultra-Science, of pure truth of sacred Antiquity, bequeathed by other equally admirable monuments: architecture and human languages which are the key, but I am still continuing the experimental work by building the appropriate equipment. This is how, thanks to your heavenly subsidies, I am going to have a skilled wood-turner (the only one in Cannes) execute a Greek! the mathematical "form" or, astonishing columella of winding (the architectural "column", "colûmna - co-lûmina " with the lights"; neutral plural of the singular co-lumen, co-lûminis , which constitutes the "field-of -force" fateful of all electro-magnetic induction devices exactly represented by the plan of the Romanesque Church with choir or dome in "cul-de-four" explaining the famous inexplicable gloss of Papias "Forma-s-choro "; "opus pistorium" Form-with-chorus; machine for pounding: pestle and its mortar . to construct it, no longer in reduction, but in the large

hardness it must have, thanks to the three thousand elements that he prepared and made for me for three years, with his own hands and tools, with admirable technical science, my enthusiastic collaborator for 19 years, also honest than discreet, Mr. Hatinguais engineer, husband of Mrs. H. named after the disaster, director of the Ecole Normale Supérieure de Sèvres, to raise the level with the spirit - 3000 pieces of meticulous precision (gramma or scruple in the weight of antiquity, whose strange etymology is thereby revealed) that this friend, also very devoted, was able to bring me himself last Christmas all mounted on chucks, with the approval of the German Institute in Paris, which, very politely contenting itself with the verbal declaration that it was not an engine of war, gave the order to let it be transported without even asking to see it or wanting it presented to him...

The whole body of Experimental Doctrine is reconstituted and almost everything recorded throughout in a "Memory"; if need be, the engineer Hatin - Guais could replace me. But simply to give disciples the key to the Philological Doctrine or rediscovered discipline, I would need another ten years of life to devote to it, solely, for the sole putting in order of the accumulated demonstrative documents.

The work undertaken is therefore immense, and the ideal immense.

Alone capable of renewing the minds of men, it can have incalculable consequences, spiritual and material, political, economic and social. It demonstrates that only the form of theocratic or hieratic universal Government, of religious men holders of the True Science, of the Truth no longer affirmed as Mystery, but demonstrated, replacing both Plutocracy and Ochlocracy or Demagogy, is likely to give back to the world, this golden age of humanly possible happiness, of Truth, Justice and Peace, which was that of universal sacred Antiquity, Peace of peoples and peace of souls, "the 'eternal' consolation!

Excerpts from the letter of Sunday February 28, 1943

Fixing the era of Sacred Antiquity

Like the current Christian and Catholic Papacy, this Antiquity had two phases:

1°) that where she exercised both temporal and spiritual, civil and religious power, where having discovered everything and founded Ultra-Science, the foundation of Religion, in all that is accessible to human intelligence , and spread the Universal Civilization, alone, it was everything: golden age, like all happy times, without any history... than that left, thanks to a brilliant idea, by the ancient monuments and the languages of the terrestrial universe issued, deformed, from a single mother tongue, and without which one would deny the very existence of this civilization and of this religious Ultra-Science. What is impossible to deny thanks to the genius who entrusted the deposit of this Knowledge, of this Science to the languages which are the Treasury of ancient superhuman Knowledge. Thus any man, whoever he is, denier or not, of the fact that he expresses himself in any of the "modern" languages, the shapeless remnants of the ancients, thereby pays homage, without to doubt, to the historical and ethnic truth, to the very existence of this Knowledge, of which modern "Science" has neither made the experimental discovery, nor discovered or even suspected that religious Antiquity had made it the discovery . Two terrible facts that are doubly serious and damning for modern "scientific" ignorance! What a hilarious irony!

2°) phase where reduced to spiritual Power, that of Religion, it was only coexisting with profane or secular Antiquity which owed everything to the first, which had borrowed from it, through public worship, a few shreds of Knowledge (Gnosis) and its "civilization": exploration of the entire Earth, sciences, arts, agriculture, industry, therapeutics, etc. etc...

The first is lost in the infinity of time, not in the "night of time", a time not of spiritual darkness, but on the contrary of dazzling and radiant clarity, that of the divine Light. Because Evolution (pure imaginary chimera of "materialist" invention without any proof) was not "progressive " but "regressive ". The proof is in the morphological and semantic ruin

"

languages comparable to the debris of the architectural ruins of the monuments of the past. Immeasurably ancient itself, coexisting with profane antiquity with which History only begins: political, economic, social wars; domestic and foreign; civil wars: assassinations for Power, etc... etc... The second phase of this sacred Antiquity is known and patent by all by the pomp of its "Mysteries" which have remained impenetrable and impenetrable (even for the "scientifism" of nowadays), its "Rites", its "Temples" (those of Delphi in Greece, like those of Karnak in Egypt or those of Angkor in Indo-China); its "Feasts" and its "Public Worship" (Liturgy). Thus the Egyptian myths and mysteries of Isis and Osiris had disturbed the recent Plutarch (our contemporary) to such an extent that he compiled a famous heap of legendary or real sayings.

All this borrowed antiquity is not "antique" but recent. The Egyptian "Civilization", that of the "sacred-engraving" hiero-glyphs, error of the sacerdotal castes having nothing more to learn and to do, than to counteract the divine, brilliant and sublime Work of their ancestors, is not ancient, but recent, and the transposition of the Knowledge of Dorian Gnosis infinitely prior to the infinity of time. Likewise for the Assyrian, Persian, Hindustani (Sanskrit) "Civilization"; Indochinese and Chinese, which, although "antique" "very old" are nevertheless recent (relatively) and borrowed. Borrowings proven by the study of monuments and philology (without which the study of monuments is impossible and illusory, linguistics being the very key and the only one). Now, Philology demonstrates that all these borrowed languages are deformed and to such an extent that they are sometimes reduced to monosyllables like Chinese, or unrecognizable like Egyptian (Coptic), Malagasy or Aunamite. according to laws of deformation specific to each people, which had to be discovered and codified, which gives the irrefutable demonstration of the very ancient borrowing of Knowledge from the language which is its treasure-deposit.

As for the Hebraic religion, popularized by the Christian Bible and Christianity, the Torha or Tourha of the Jewish the people, a la "Holy Book" faith and the "Law", it is itself only a loan as its system of languages and as the phonetic deformation of the Greek neuter plural Teùkhas, Teùkha, from

I^0^W^Instrument in itself, the Book par excellence, hence Penta-Theùkos (meaning Biblos), the Penta-Teuque , the five Books of Moses.

This is how Philology, a science of irrefutable meticulous method, is the Science of sciences, the scalpel of History. It demonstrates without reply, and reduces to nothing forgers and deniers.

[The Penta-Teuque, the five books of Moses - with inflection of eu into o-ou , like that which from the Latin filicaria , felicaria , made the French felgère , fengère , faugère , fougère ; from Greek pneumon, Ionian and Attic pleumon , Latinized with metathesis pulmo , pulmone , French pomon and lung (same stem as Hagios-Pneûma , the Holy Spirit, Saint literally P-Neûma , Latin P-Nûmon : mutant deity P^ , whence neûmo du plainchant, pneumo , etc.); and the guttural aspirate Kh(Z) lapped from the throat (rasurà gulae) following Saint-Jérôme's realistic expression - like the Spanish jota, in rh-r. Note the difference in pronunciation of this difficult guttural aspirate between the Semite Turha and the French Teuque tracing whose true "form" inflected from en to or , exactly as in Hebrew, in the "meaning" of "vase", "vessel" by excellence, remained in the French Touque , vase in general; "vessel", dishes of any kind; container for all uses (the touque of the maritime vocabulary, widespread in all the colonies); on the English Channel: touque , special boat for herring fishing].

... But, as already said, archaeological and architectural studies are useless without thorough Philology. Now, etymological Philology || Egyptian does not exist, any more than in any other language, even the mother tongue || Hellenic , whose laws of morphological and semantic formation are unknown: fl why the root I means "to go" (Latin ire, franc, future■ ir-ai) and STA || (ST- "to be at a standstill", in a "state" of "station" "static" . cover. fl

Am I surprised by saying that the hieroglyphs have never been deciphered? fl "But ... Champollion" Champollion, admirable in true method, fl > -of which I am only the humble and distant disciple,~ did not decipher the .fl hieroglyphs . He discovered and showed how some drawings, among fl the thousands of hieroglyphs, had been chosen by the priests of the hieratic castes to be substituted for the old signs of Kuriological Writing fl (Clement of Alexandria) and form a new alphabet of letters replacing the an- ^fl cien - but he did not discover, and could not discover, what was the meaning , the mythical,

drawings-engravings, nor even of the twenty drawings-engravings taken for the use of new letters replacing the old ones.

For example, if he has demonstrated that the sacred "Hand", " Hiad ", Hied" (also called the Kadmean "Hand", from the mythical Greco-Phoenician Kadmos, the Cadmus "inventor" of the letters of the Alphabet : Alpha, Beta , Gamma ... but originally: Alpha , Gamma , Beta etc... as I demonstrated by the study of the origin of the digits or signs of the numbers, was substituted as the new sign of writing to the old D (Delta) and also T) to transcribe this one. He did not discover and could not discover, what meant , represented "semantically", the drawing of this open "hand" extending its 5 fingers. Neither what meant and represented the design "Lion", nor why it replaced the old sign R. However, when we discovered the laws of deep radical deformation of the Khamitic languages (Egyptian) as well that Semitic (Hebrew, Arabic, etc.) we realize that hiad, hied, (contracted hid) of both Kamitic and Semitic languages, is none other than the regular formation of Classical Primitive Greek kuàth-os (Latinized cyath-us): "hollow of the hand" holding the cyathe (joined, handle) with u becoming y, as in Modern Greek and modern languages (y Greek) and the dental aspirate th becoming £ and soft d , the initial hard guttural K being reduced to an aspirate ti: hyath for Kyath exactly as in the ancient Germanic languages! ! !

hart Greek Kârt-os and Krât-os, strong; hun-t English houn-d , Greek Kun-os , Latin can-is , can-es , dog; cyn- ic modern decal , cyno-cephalus , etc.; Sanskrit cyân , gén: cûn-as .

harz English heart , Greek Kard-is , Latin cor-a, cord-e : heart; hrock , Low-Latin hrocc-um , rocc-um , Greek Krok-on pebble; English rock , French roc , roch-er ; hrock Low-Latin hrocc-us , rocc-us , Greek Krok-os weaving yarn, yarn cloth, French roqu-et , roch-et .

The Germanic "Aryan" thus obeys the same rigorous laws of deformation as the Semitic Jew and the Khamitic Egyptian. Like their deformed languages , their Knowledge is therefore borrowed. Laugh a little at the human stupidity plaything of a false Science, "scientific" Ignorance.

... In this regard, I will simply give you the following response from Maspero, in Lafaye, History of the worship of the divinities of Alexandria outside Egypt, (Paris 1884) p. 332: Isiac Table, known as Bembo or Pignori:

This curious monument, to which Egyptologists today deny any scientific value, has for many years been the subject of commentary by Champollion's predecessors. Mr. Maspero, whom we consulted on the meaning of the figures, kindly replied as follows: "The ancient engraver was a Westerner, who reproduced, with the justified intention of being exact, an Egyptian original today. hui lost. As far as can be seen, the Isiac table represents a series of scenes of offerings to various gods by a king or a queen whose cartouches can be seen here and there, but are illegible. They are bas-reliefs of great banality, as one sees by the hundred on the walls of temples or religious shrines. Also the moderns have not made any interpretation of it. It would be both Very-easy and Very-useless"! ! !

What could be the teaching given by such "masters"; such so-called Egyptologists"? It's up to you to judge and conclude.

Extract_of one_letter_sent_by_L. Boutard_at_J._and_vs._Dumont

Letter of January 14, 1944 .

. - _ on the one hand, and secular or profane on the other... The superhuman Science of the first and ignorance of the other, of which contemporary , "modern" scientifism is the descendant and direct heir... of to clear it, and to sow therein the first seed of the germs of Truth. In short, to deliver to the youth... the two keys: Historical Linguistics and Experimental Doctrine, allowing a noble, ardent, enthusiastic and disinterested youth (an-argyre)... determined to put an end to materialistic scientifism. ..

... Unfortunately it is Pandora's Box : all good and all evil can result from it, depending on the state of hearts and minds. It would be necessary, as a preliminary, to educate the spirits towards the ideal, during several generations, to divert them from the materialism enjoyer. But is it possible? Sacred Antiquity must have concluded negatively, since from the depths of its superhuman Knowledge , it made the foundation of the divine Religion, refusing to put them into practical material applications, other than in the ritual ceremonial of the published cult, posing as axiom that use excludes respect . Which is obvious and undeniable.

Who then in all the herd of human beasts is likely to understand the sublime grandeur of the generative sexual forces, invisible other than by their luminous, powerful or creative effects, to understand that the Electres (Electricities) are female, Holy Women, who take birth in the throes of two pains:

1°. breaking or rupture into 4 bisexual atoms of a fluidic and diaphanous slow worm or eel, invisible called Alpha and represented by the sign of this letter *a*.

2°. Sexual separation of male and female in each of the 4 sexual pairs of these 4 atoms (A. terns: cut of A).

An infinite number, alas! superior men, whose brain and soul can rise to the first Cause, this Jupiter (of which I am only the infinite creature) from which everything emanates from what is Force, Light and Life.

Also, you write it admirably, like the hieratic Antiquity of the Mysteries, and like Jupiter, I too hesitated all my life to launch this Thunderbolt, that is to say to bring out the first glimmers covering the world infinity of the invisible which governs the visible worlds, of the invisible which is everything whereas the visible is nothing, only the appearance of which our senses are victims.

The colossal "protozoan" that you recall which is generated by the fertilization of the Holy Woman "Electricity" in an "induction field" of determined fateful forms, enclosed in a follicular sac in the form of a "club" (Rhopalon) impermeable torpedo and invulnerable, formed of mineral elements, is none other than Herakles (Glory of Hera or Juno) Latinized Hercules. It is the invincible "Lustrator arbis", Expurgator of the Globe. His action, which you foresee so excellently, from one mouth to the other of the nutritive and digestive system, is figured in his "12 great Works" by the total expurgation of the kopros' Augeioû (the excrements of Augeas) (Augias means "which has day, which has a light" usual antiphrase to the Greeks, to say the Coecum meaning the Blind gle) vulgarly become "the stables of Augias". It purges in the same way oidium, mildew and cryptogamic diseases of the vine; but it is only an amusement for him, which does not count among his "12 great Works" whereas the destruction of the "Dragon of the golden apples of the Hesperides (cochineal with smokehouse infesting orange trees and aurantiaceae, whose nothing currently can rid them and save) is his last "Work" of benevolent colossus of which the "Nemean Lion" (Lion of Nemea): cancer and cancroides, is the first of all...

... But will I still live long enough to sow this first seed? Time flies, and I wait helplessly. Our very days are uncertain . It is to believe that the jealous "gods" (Theei, whence theagenia, theology) these immortal Entities A and two coupled AA, represented by the letter pi TT, emanating from Zeus, Deus, God, do not want to be revealed and forced to suffer...

**Explanation of the "Palette de Narmer" according to some letters of Louis
Boutard**

Notes on Herakles - in Latin Hercules

Letter of October 16, 1946

I have just finished the deciphering, down to the finest details, of the two beautiful lithographed plates (face and reverse) of the famous "Narmer palette".

It is not a "pallet" but the famous Sâkos (𐤊𐤍𐤏𐤔) of Herakles: Scutum Herculis, shield of Hercules - the "pallet" having moreover exactly the shape of the shield (Scutum: shield) which should have struck the attention.

N-armer "of the almighty" destroyer of evils, is simply one of the nicknames of Herakles, whose Egyptian name *X du V z X of the fos* is in one of the two small shields of the hieroglyphic coat of arms, at the top, on the right and on the left of the face of the Sakos.

The follicular sac (𐤆𐤏𐤍𐤏𐤔 *X.k.or* is for <T'<*</< oS, Latin saccus: sac, itself for & *Jok cr* ^{xos} : with skin, in skin, in pellicle, of" <5" K o ç . ou tre, skin bag or club (*pb* 𐤏𐤕𐤏𐤔) is there first

place of honor at the top of the obverse and reverse of the shield - with the complete device of the procreation by Alkmene of Iphikles (glory of the force I, the little twin brother of Herakles (who is next to him) with his own weapon:

b 𐤏𐤕𐤏𐤔 *p o 9* (rhoptron) instead of 𐤏𐤕𐤏𐤔𐤏𐤕𐤏𐤔 *û V* (club) with, next to it, its actual form of microscopic sea anemone. What wonders! What wonderful intricate details!

The "works" represented (*p o JC 0 J*) are: on the face:

1) those of Heracles Georges (𐤏𐤕𐤏𐤔𐤏𐤕𐤏𐤔) cultivator, worker of the Earth, giving fertility to the Earth, whose name Thet is in full hieroglyphic letters next to his figure.

2) the reduction of the terrible sexual sterilant "White Bull of Crete". Halfa,

savage

3) The destruction of the "Nemean Lion". In the middle, on the front field, the 2 frightening (i<cx. p << i \T oS) Cancroid cankers, sent by Juno " ° 'H f'cX-7. A) y io<." to suffocate at birth Hercules, YO'doj (nothus: bastard) and strangled, strangled, one by child Iphikles and the other by child Herakles (with a black frizzy head, son of black 5 -c atoms).

On the reverse: the destruction of the "Lion of Nemea" (cancer) whose head is knocked out with a blow of a club, with the adjacent name, in full hieroglyphic letters (X îV OSA £ V; le terrible lion).

4) The destruction of the "Hydra of Lerna" (malarial fever) eel tripanosome) of which all the detail of procreation by a mosquito is exactly engraved, with the pathogenic eel of malarial fever.

5) Pursuit in rout of pathogenic larval Centaurs of all putrefactions, with the epigraph TTütñ^..0v'; pus, putrefaction) in artistic ancient Greek letters, and ancient hieroglyphic letters, as on the famous frieze of the Parthenon.

Essential Works for Egypt

by Jean Dumont

Notes on Herakles

In the popular sense, Herakles for the Greeks, Hercules for the Romans, was a demigod, son of Jupiter and Alcmene - the latter was the daughter of Electrion, king of Maecenas.

This hero was represented as a giant, never separating from his terrible club with which he performed many wonders. He is famous for his 12 labors, labors which were ordered to him by Eurystheus.

If we transpose the popular theme into reality, Herakles is the famous giant protozoan that Louis Boutard creates, or rather recreates, with the last of his sacred devices. As indicated in the Summary of the Works of Louis Boutard, this protozoan, placed in a liquid medium, destroys all that is pathogenic parasitism, in other words, it devours all the micro-organisms.

bes pathogens, even those that modern science has not yet clearly defined but which in any case it cannot overcome and which, other than by Herakles, it will never be able to completely overcome.

Because, is there a chemical product which, in the space of a few moments, devours the microbe without even the appearance of resistance on its part?

The finest experience, even achieved on an industrial level, was the defibration of the Halfa that Louis Boutard carried out in a perfect way. We know that Halfa is a plant, an extremely hard grass, because its fibers are enveloped in a kind of keratinous screed.

In modern times, we use this plant to make paper pulp, but we are forced to crush it, yoke and fiber and use it like this, not managing to isolate the fibers from their envelope. Now, this work, Herakles realizes it easily, because, reproducing itself ad infinitum, it constitutes an innumerable army of conscious and conscientious workers, able to carry out the imposed work.

So, having immersed halfa in vats containing Heraclean water, Louis Boutard quickly obtained beautiful skeins of halfa, Herakles having seized the shell to feed himself, because, like any living being, he cannot live without food.

It should be noted that Heracles is male and female and reproduces ad infinitum. Under the microscope it appears in the form of a club, sparkling like a diamond and it is by its most slender part that it works (like a plane); the other part being used for its reproduction.

Herakles accomplishes many other works than the defibration of the Halfa. If I mentioned this one, it's because it's the only one that Louis Boutard had him do on a large scale. This work is that which is designated in • Mythology under the name of Taurus_White_of_Crete. Indeed, it is said there that Herakles seizes the bull by the horns; this is very significant since it is by the horn, the keratin, that the protozoan seizes the Halfa plant.

I would add that at that time, Crete was covered with halfa as are the Algerian Highlands and part of Spain today. By this process known to the High Priests, Crete was not only rid of this accursed plant, but also the fibers thus obtained

a very useful use (beautiful fine fabrics).

I said cursed plant because, absorbed in a decoction, it makes you sterile and that, Kabyle women still know it well.

Other Works of Heracles .

The most terrible disease that man knows and which is called Cancer is quickly curbed by our indefatigable Herakles. It is not surprising that the ancients represented this evil in the form of a lion, the famous "Lion of Nemea" - to the queen of the most terrible diseases corresponds the king of the most terrible animals. He cures malaria. It is the Lernaean Hydra . He comes to the end of Blemorrhage , they are the Birds of the Lake Stymphalus . He fights eruptive fevers victoriously , it is the oxen of Géryon where it is mentioned the word Trythie which means "redness". The Garden of Hesperides , these are the diseases of the vine, olive trees, orange trees, etc...

's stables represent the caecum he purges. It was enough to absorb a few drops of Héraklèen liquid to be instantly purged, Héraklès penetrating into the smallest folds of the intestines and carrying out a cleaning in order.

The healing of Tuberculosis, Tetanus , diphtheria and all diseases originating from the oral, nasal and pharynx cavities were child's play for Herakles. But there is a disease that gives him great difficulties but which he overcomes all the same: it is leprosy ! After accomplishing this feat, all he has to do is die. This last fact is well rendered by the story of the Tunic of Nessus ; can we give a more beautiful and more vivid image! This skin reminiscent of the most disgusting skin disease! ♦

Louis Boutard had recreated Héraklès, around the 1930s, at La Trappe de Staouële, near Algiers. But in 1935, he had to return to France, to Cannes, to undergo a serious operation there and the negligence of those who should have taken care of the tanks containing Herakles, was the cause of the death of these giant protozoa, for lack of food. .

Excerpt from a letter sent by L. Boutard to J. and C. Dumont

Letter of July 27, 1947 .

I understand your astonishment in front of the "Narmer's Palette" - indeed, it is difficult to find the Alphabet except the uncial letter A in the crest, reason perhaps which caused it to be attributed by "scientific" ignorance the romantic name of "pallet". There are, however, a good number of letters, very large, paleographic Greek and hieroglyphic. There are also, indeed, very tiny, on the strips fringes of the gonarium or singulum of athlete of Héraklès, relating undoubtedly its greatest exploits, but they are illegible. For this decipherment, it is necessary to know thoroughly the Heraklean "legend" and fifty years of preparation... The tied up "robbers", with the decapitated head between the shackled feet, are the formidable "microbes" which kill the draft animals and sum: horses, mules, donkeys, camels including snot and farcin and all their derivatives (botulism, "modern") , (It : it is written in all hieroglyphic letters; whence , name of Herakles among the Amathou-ses (farming people). After having tied them up and taken them off, Hercules (&u> t/5 in Egypt) will devour them in a "horrible feast". It's also engraved...

... The unfortunate Egyptologists and other "pawns" sought in this inexplicable and undeciphered "palette", in the drawings of primitive natives, the first gropings of the signs of writing of the honest-beast becoming aware of itself (sic)! ! ! You will sneer with a sarcastic, incoercible laugh! You can imagine what effect it will produce when it is demonstrated to them what was the origin of these hieroglyphic drawings, and what immense, stupefying anterior science of innumerable centuries it concealed, intelligences immeasurably superior to the pretentious poor in spirit who have presumptuous to believe oneself something and to issue such nonsense of ignoramus.

Narmer Palette

Classic explanation by the scholars of the 20th century: Horus, in the form of a falcon, equipped with a human arm, delivers six thousand captives to King Narmer, who immolates the leader of the vanquished. 1st Dynasty around 3200 BC. JC

Georges LAKHOVSKY

by J. RAVATIN

and P. SMIRNE

(Paris)

The works of G. Lakhovsky were presented on April 2, 1928 by d'A., onval, at the Academy of Sciences. These were the experiments carried out in 1924 and 1925 at the Clinique Chirurgicale de la Salpêtrière in Paris with copper circuits surrounding potted Pelargoniums, some healthy, others affected by induced tumours.

On May 26, 1931, Labergerie communicated to the Academy of Sciences the results obtained in the garden of the School of Agriculture of Montpellier with copper, aluminum, nickel and lead circuits, surrounding seed potatoes and this during three consecutive years.

Attempts at an explanation have been given by G. Lakhovsky himself as well as by multiple other researchers. These explanations have been overlooked. G. Lakhovsky launched the so-called theory of the Universe (we will not develop it here; the best thing is to refer to his work [1], of which a 2nd edition was produced a few years ago, to attempt to explain the operation of his multi-wavelength oscillator. Indeed, many multi-wavelength oscillators which have been made by manufacturers other than those working without the circuits of G. Lakhovsky did nothing. And Lakhovsky had noticed that his multi-wavelength generator had no effect on living systems when enclosed in a conventional Faraday cage. But EFs had to be taken into account. The shape is important and also the nature of the material Some alloys

(*) can be even more effective

(*) Joseph Salvat in a long article on the experiments of Lakhovsky and Labergerie tried to give an explanation at the quantum level of the observed effects. He uses what he calls biodynamotherapy or

Let's see Lakhovsky's basic experiment. We take a copper wire of 2 to 3 mm thick forming an open circuit 25 cm in diameter This thread is fixed to a piece of waste wood in the ground so that the wire surrounded a pot

solid copper wire.

G. Lakhovsky experimented on pelargoniums and injected them with bacterium tumefaciens, the bacillus that causes plant cancer. On each plant a tumor formed. After a few weeks he observed that the plants without circuit withered because the tumor developed and they died. The plants with circuit remained stationary or their bad state increased further then, at a certain moment this state diminished and disappeared; it r

electromagnetic energy absorbed by quanta. An experiment that was carried out by him for about twenty years would have enabled him to conclude that the human body directly absorbs electromagnetic energy by quanta and that this absorption is essential for the maintenance and development of life. Salvat has repeatedly experimented with circuits of copper, silver distributed in different places of the human body (head, neck, forearms, arms, waist, hips, thigh, just above or just below the knee, ankle); i was also varying the number of circuits in one place and sometimes some were twisted. He intervened with effectiveness on retention of urine, chronic constipation, impotence of the erector nerves, blockage of food - from the stomach to the duodenum (in this case he applied alternate circuits of zinc and money), accidental congestion of the respiratory organs . In summary the explanation of the effects of the circuits, for Salvat, is placed at the atomic level, remains in the usual field of coherence.

only a scar remained on the plant. You can reproduce this experience at will and the result is always constant. Lakhovsky gives the following explanation : The circuit is the seat of alternating currents induced by variations in the ambient magnetic field. This magnetic field is composed of the terrestrial magnetic field and that created by the alternating currents which appear in the circuit by the effect of the electromagnetic waves of the radio stations and of all the "background noise" generated by our industrial society. Lakhovsky replaced the copper wire with a rubber tube filled with sea water. Every day he brought carboys of sea water from the Channel taken at different tides (colorless glass carboys) and filled them with this water his rubber tube to which he gave the appropriate shape; the effects with this last assembly are even more convincing. Copper solenoids were also tried. Let us now look at Lakhovsky's second hypothesis "The living cell consists of a nucleus bathed in a liquid (protoplasma) surrounded by a membrane. However, the nucleus is essentially formed of tubular filaments of insulating material containing a conductive saline liquid inside . These filaments, twisted on themselves in the cell, are therefore veritable small oscillating circuits comparable in all respects to the circuits, windings and windings of the receiving devices.

The living cell can then play the role of a transmitter or a receiver of radio-electric waves of short lengths, which determine in the circuits of its core very high frequency electric currents. However, the vibration of an oscillating circuit is maintained by radiant energy and one can wonder where the energy comes from which makes the animal and vegetable cells vibrate.

For Lakhovsky, "the microbe is an oscillating circuit which, by coupling with healthy cells, forces them to oscillate at a frequency different from their own frequency of oscillation, or else stifles their oscillation by - introducing resistors into the circuit. electricity (toxins) or even emits parasitic radiation which blows by interference the radiation proper to healthy cells". [2]

Variations of this assembly have been tried by isolated researchers; they replaced the open, conductive circuit with wooden circles with square, rectangular or lunula-shaped sections; these experiments were carried out outside in all weathers but the humidity of the air and the rain could

make the wood slightly conductive, which meant that we fell into the case of the first circuit. The results that have been known are not as good as those obtained by G. Lakhovsky.

From 1926, Labergerie launched a series of experiments on seed potatoes at the School of Agriculture in Montpellier and in the garden of the Société d'Horticulture de l'Hérault. In 1931, he made known his results to the Academy of Sciences, results relating to the annual observations from 1926 to 1930.

Each potato stalk is equipped with an oscillating circuit. All the conditions are identical except for the nature of the metals: copper, aluminium, nickel, lead.

With each metal, the results are different:

- With aluminium, there is a net decrease in production.
- With lead there is an increase in tuberization and a tendency to rot rapidly after uprooting.
- With copper none of these disadvantages and in addition total absence of tuber destruction by rats,

Then the potato crops in various treated plants and control plants were placed in paper bags. This has been observed:

- With copper, the potatoes survived and could be replanted for several years in a row (indicating a marked reduction in the degeneration common to potato crops in low-lying Mediterranean regions).
- With nickel and lead, conclusions could not be drawn that underground pests caused depredations.

Another well-known study is that of Gustave Jaguenaud which relates to the influence of the nature of the soil and of radiation on the degeneration of the potato [3]. This study was presented to the Office Agricole du Tarn.

Regarding the work of G. Lakhovsky, it should be noted that in addition to the experiments carried out by himself and his son Serge, Professor Antonio de Pereira-Forjaz, who was permanent secretary of the Portuguese Academy of Sciences and professor holding the chair of Chemistry at the University of Lisbon, himself made experiments which led to multiple applications; these

were the consequences of numerous observations relating to the physico - chemical actions of the Lakhovsky circuits and related to the speeds of reactions, to the refractive index of mixtures (remember that L. Sprink had also observed the variation of the refractive index of the air around his device in operation, in Brazil), to the phenomena of etherification (Sprink had obtained in saponification complete modifications of the reaction equilibrium) or even to the degree of acidity of liquids such as wine, beer , the oils (*) etc... .

For Pereira-Forjaz, there was no doubt that it was electromagnetic waves that had an influence on chemical statics and dynamics, or else they were, he also admitted, oscillating circuits picking up cosmic waves. (electromagnetic waves coming from the universe or even cosmic rays). All these people did not know the EF and they tried to explain with the "means at hand".

Considering the EF and C. of T., we note that these emissions are different depending on the metals used.

G. Lakhovsky has built a device called a "multi-wavelength oscillator" which creates an electromagnetic field, in which all frequencies from 3 meters up to infrared are found. This diffuser is composed of a series of concentric circular oscillating circuits, each of them suspended from the others and at the same time isolated from them. Each circuit transmits with the fundamentals, the harmonics. He could thus make, according to his idea, oscillate each cell. The device gave no effect on a patient when put in a Faraday cage. It would have been necessary to think of a special Faraday cage which generates EFs with the oscillator and even if possible which amplifies the effects of the EFs emitted by the device alone.

Wave train spectra were made in 1982 by P. Smime, S. Lakhovsky.

Let us give a non-exhaustive table of the names of researchers who have approached similar work experimentally.

(*) G. Lakhovsky had obtained notable improvements in the quality of the wines and the circuits had made it possible to obtain aging without any chemical, thermal or agitation input.

RECENT RESULTS OBTAINED FROM LAKHOVSKY DEVICES

by

P. SMIRNE (*)

CRAVE
(France)

1) Plants .

(**)

May 1979 : Testing of oscillating circuits on vine plants whose leaves have been eaten by escaped animals. A suitable metal Moebius strip coupling is made with all oscillating circuits. In September , the vines under circuit (and practically without leaves) gave grapes in normal quantity). Realization at Mr. Michon in Beaujeu.

June 1979 : Installation of one hundred copper oscillating circuits on a chestnut plantation in the Cévennes area of Novis-Haut by Vabres at Mr. Philippe Noël. The trees have not supplied for a few years. The harvest was normal on the treated trees, the other trees did not yield more than in other years. In 1980 and 81 the number of circuits was increased on almost sterile trees which gave a normal harvest.

2) Animals .

April 1979 : Installation of appropriate devices on a small chicken farm in Beaujolais, Mallevai area (Rhône). The hens have not laid eggs for a few months. Ten days after the devices have been put in place, the laying returns to normal production. The start-up having begun three days after the installation of the equipment, simple and inexpensive.

May 1979 : Installation of polymetallic oscillating circuits on a small herd of goats whose fragile state of health improved without further treatment and remained stable in 1980-81.

(*) These experiments were carried out by P. Smirne.

(**) These are the Lakhovsky oscillating circuits.

1981-82 : In Brittany, installation of oscillating circuits on a herd of sick sheep by a veterinarian who notes the improvement in the state of health of the sheep, the other treatments having not given positive results. (For exact references, contact Laboratoire Colysa).

3) Man .

June-September 81 : As early as 1933, Dr. Ch. Hulin, odontologist at the - Salpetriere surgical hospital, had noted the progressive ossification of teeth affected by alveolar pyorrhea under the effect of a wave-length oscillator Lakhovsky multiples.

We thought it was possible to obtain an improvement in the ossification of a broken vertebra. In June 1981, tume MT, head midwife at Châteaudun hospital suffered an accident during which a spinal x-ray showed the fracture of the L1 vertebra. After being cast, Mrs. T. applied herself to ten-minute daily sessions of wave trains emitted by the multi-wavelength oscillators in a crossed arrangement (which had not been achieved at this day). The radio control taken in September 1981 of the ossification does not show any trace visible on X-rays of the fracture of June 1981.

June 1981 to May 1982 : It was coupled two groups of oscillators with multiple wavelengths in device in cross by taking account for their space orientation of the general direction of flow of the electro-telluric currents and the terrestrial magnetic field, of which the pulsations can be associated in a spherical model with the natural electro-telluric currents.

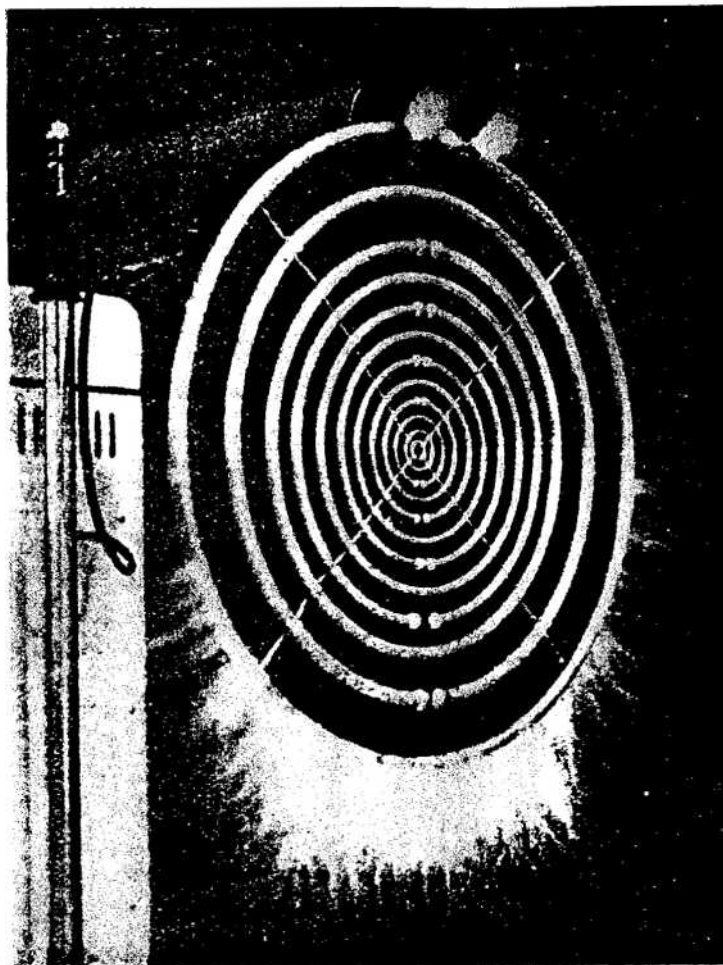

During this one-year period, several doctors have observed either on themselves or on various people the regulation of blood pressure (hyo or hypotensive) when people are placed in the center of the device for 12 to 15 minutes. .

The heart rate is also regulated.

The complexion of people who have applied several sessions becomes more rosy and gives a "healthy glow" appearance.

The effects remain stable for a few weeks after repeated actions for five to six days.

The following views were obtained from polaroid slides taken on the screen of the "Hewlett-Packard" frequency analyzer, the radio-cellulo-oscillator (RCO) and the multi-wavelength oscillator (OLOM) being successively in operation with the various types of filtering and settings. These results are taken from experiments conducted by S. Lakhovsky and P. Smirne.

Effluviation obtained by means of the multi-wave oscillator in operation.

ABOUT WEIRD DEVICES

Part I

by J. RAVATIN

MAVE
(Paris)

Multiple bizarre devices of which fairly detailed plans remained were examined by multiple researchers who, unfortunately, could not make them work again; it also happened that their creators, like Sprink, could not put them into operation at will. It was necessary to wait for a fairly precise temperature, likewise the humidity of the air, positions of the stars, and even very specific places seemed to be necessary. That's not to say that these devices never worked; their builders had had either intuitions, or a message through a dream, or even access to documents lost in libraries or attics. One such case is the Hendershot device. The story of Hendershot's engine (as his device was named) is told in one of Charles Fort's books "Wild Talents", in the pages of the Detroit newspaper "Free Press" and the "Times" of New York. In the magazine "Fate" an article signed by Gaston Burridge appeared in January 1950. Burridge 's article insists on the novelty of Hendershot's camera but also on the negative side of the attitude of many people opposite of his discovery and this went as far as fanatics who accused him of causing earthquakes, floods and famines.

L. Hendershot recovered electrical energy since when he placed a lamp at the exit of his device, it lit up but, sometimes he waited a long time, and there was only a luminous flash. As his sound device was a system containing capacitors, coils, magnet, the flash of light could have been explained by the discharge of the capacitors (these can take a charge in the open air) but sometimes 75 watt lamps remained
(*) lit long enough.

(*) He was even able to light 300 watt lamps at the outlet.

If we test its assembly, we find the fields of Taofel up to 23 i 1 23 which shows that we are not in the presence of electrical equipment usual nic and that Hendershot's device is more a Phenist object than a technical object. In addition this device corresponds to a channel. We realize, by looking at the assembly diagram of the device, that the shapes of the armatures and capacitors are important. Hendershot also had in some of its coils capacitors with cylindrical armatures, which were embedded in paraffin. These coils were called "basket weave coil" because on the circumference was a copper wire twisting around the small wooden sticks (there were 57 of them).

Some of his equipment was purchased by him from radio equipment stores. He had a strong enough intuition to choose himself (*) what was needed for his editing

But other devices were made; we will only report them without going into descriptive details.

There was the Laithwait device (Imperial College of Science and Technology, England 1973) in which two gyroscopes intervene. When they rotated, a decrease in the weight of the device was observed.

There was also Townsend Brown's apparatus: Brown in his youth (he was born in 1905) had fun with radio assemblies and he procured hot cathode tubes for the production of X-rays (Coolidge tubes). Brown was passionate about space travel ideas. He developed an experiment trying to prove the existence of a mysterious force produced by the radiations of the Coolidge tube. For this Brown mounted a tube in a very delicate balance and noticed that each time the tube was in operation , it moved spontaneously. He spoke about it to Millikan around 1922 (Millikan was awarded the Nobel Prize in Physics) but the latter was absolutely not. ,(**) convinced by Brown's ideas on electrogravity. On the other hand, he met a few years later Paul Alfred Biefeld, a professor of physics and - astronomy who had been a fellow student of Einstein in science. Biefeld, unlike Millikan, looked with interest at Brown's discovery. They continued,

(*> An attempt at a rational explanation was given by several researchers and summarized by Ed. Shilling; we do not report it here since many points remain obscure, because such an attempt at an explanation is not enough. It can be found in [1].

(**) For more details see the work [2].

Brown and Biefeld, the experiments and led to the statement of a principle of physics which one called effect "Biefeld-Brown". This principle can be summed up as follows: A strongly charged capacitor tends to move in the direction of its positive pole .

Brown completed his studies and worked in different laboratories and in his spare time devoted himself to studying its effect. He was interested in the UFO phenomenon and thought that he was on the way to propelling UFOs Naturally he absolutely did not envisage the notions of delocalization. But T. Brown was apparently on a path of antigravity. Indeed he settled in 1952 in Cleveland and there he managed to increase the power of his "gravity" which finally proved capable of lifting more than its worst weight. He financed all his research. He still pursues them today in California but like all researchers in the non-Orthodox field, he is quick to arouse interest but it gradually fades.

Another device thought to levitate was made in England around 1952. It is called the Searl disc. The principle of operation resembles that of the old electrostatic machines of Wimshurst.

There was also a US patent filed by Ecklin which describes a device using strong magnets.

Other isolated researchers have been cited in [3],

Other equipment composed of a combination of diodes and capacitors was made by researchers such as Zubris, Gray, Baldinelle; we cannot go into the detailed descriptions. It is preferable to refer to the works of Gallimore [3]. Some devices have even been designed using the results of Gallimore, Tesla, Schapeller, Keely, Frogstein. These devices may not have been made, but diagrams were made of them. Some montages used the golden ratio in some of their proportions and the Fibonacci sequence (eg Keely) and this is found in these devices and combinations of devices.

JG Gallimore in [4] takes up the work of K. Von Reichenbach, W. Reich, J. Keely, H. Blavatsky, E. Cayce, de la Warr; it presents diagrams of various forms linked to electrical circuits, to magnets, and also attempts at explanation and experiments to link parapsychology and gravitation; he also studies the eifs which he calls geometry-related energies. He himself built devices and as he - intensely leaned on the "UFO" case, he tried to understand the functioning of UFOs as that of a technical object.

ABOUT WEIRD DEVICES

Part II

by J. RAVATIN and P. SMIRNE

(Paris)

Here we report some attempts to detect moving water under the ground.

Mathias was the first to notice that the magnetic declination presented anomalies at the meeting of large breaks, deep valleys. Several devices have been built to apply this principle: first Mansfield's device which is composed of a magnetic needle suspended on a pivot, the whole placed in a box carried by a tripod. If there has been a mass of moving underground water below, the needle moves all the more strongly as there is more water.

Next, we find Abbé Fortin's device. It is a compass needle placed above a coil of annealed iron wire rolled up on a glass cylinder. The towers of whorls were isolated which from the magnetic point of view is not justified. The coil rested on a base with a double bottom, containing a capacitor formed of sheets of tin folded together and separated by an insulating substance; (perhaps beeswax as in Bignand's capacitors?) the coil corresponded at one end with an internally placed gold foil and at the other end with the large s' capacitor. cface which was itself in communication with the earth. P. Smime points out that the role of the gold leaf here is neither electrical nor magnetic. The capacitor has a large surface area, but its shape is undoubtedly important. (Bignand and Henderghot capacitors had very special shapes).

Above the reel was placed a dial divided into degrees and above this dial could move an unmagnetized needle suspended from a bracket by a copper wire 25 cm long. Everything was covered with a

glass bell. Moreover in the work of H. Mayer [1] it is even specified about this needle - non-magnetized magnetic needle. We can assume that the needle in magnetic material has not received any magnetization, such is the interpretation of P. Smirne. Subsequently Fortin had suppressed the communication between the capacitor and the ground; for that he had followed the following reasoning: this communication had appeared to him as useless since he was looking for a magnetic action and since magnetism knows no resistance and passes through all bodies. He had then removed the capacitor itself, so that his device had only one active member: the coil of annealed iron rolled on a glass cylinder and as an indicating member, a dial with a needle. of pure copper. The wire length is not indicated, the needle as before is not magnetized because it is made of copper. Now this last point is in contradiction with the opinion that terrestrial magnetism passes through all bodies and with Fortin's conclusions which were these: his apparatus enabled him to grasp the manifestations of terrestrial magnetism and to know by these modifications the modifications probable time.

P. Smirne adds that what seems important is Fortin's starting point, which takes meteorological conditions into consideration, but his conception of magnetism appearing or disappearing does not apply to physical magnetism, which is of a powerful character. unless there is something else...

By testing this device, we realize that it eliminates the V and the N_h at the place where it is, if before the installation of the apparatus, one detects these emissions. It amplifies the V,, . and N_h are not transformed into other ME emissions, they are simply eliminated. This device has a pure ext, no int. We are therefore not faced with a technical object. A merchant from Berne, who died in 1910, Adolphe Schmidt, who, in his spare time, was involved in researching underground waters, had thought, around 1903, of using Fortin's apparatus, on the one hand to study atmospheric variations, and on the other hand, in search of underground waterways. He filed a patent in Switzerland, the application for which was : particular way in the vicinity of sources and underground watercourses by rapid oscillations of the needle, (*)

(*) Patent filed November 21, 1903.

oscillations whose amplitude reaches up to 50° .

This device was a copy of Fortin's. It consisted of a coil consisting of a hollow glass cylinder with a horizontal axis surrounded by paraffin paper, and around the latter were wound 5000 turns of annealed iron wire 0.3 mm in diameter (the turns of a same row did not touch and the different layers were separated by paraffin paper. From distance to distance the envelope of paraffin paper separating two consecutive layers of iron wire contained a sheet of tin; note that again here the winding of the iron wire was not connected to any source of electricity and formed an open circuit.

The coil was covered with a graduated mirror with a point in the middle on which a 30 cm long, weakly magnetized needle could oscillate. We are talking about the friction due to the pivot but not the friction on the glass; we can therefore assume that the needle was perfectly balanced.

Several cases can then arise:

- 1) The needle moves slowly to one side only; this movement should not be attributed to underground waterways but most often to heating of the coil caused by the sun's rays.
- 2) The needle vibrates from time to time - it is not clear enough to ensure the existence of a tablecloth under the device.
- 3) After a few minutes, the needle changes direction, oscillating abruptly around zero but with low amplitude. The author concluded that water was present.
- 4) The needle oscillates immediately or after some time following oscillations large amplitude ranging from 10° to 50° . The author concluded in the certain presence of water and one should only carry out a drilling at the place where the needle of the apparatus had shown the greatest activity during reiterated experiments.

Schmidt gave favorable hours for the detection of groundwater : from 9 o'clock in the morning until 3 o'clock in the afternoon.

P. Smirne remarks that Fortin's and Schmidt's apparatus considered in the classical sense present

- 1) The principle of construction of a magnetometer.

2) Their resemblance to old devices for measuring ionization in a vacuum...

These two principles being in a way coupled in the 2 successive devices of Fortin and Schmidt, the devices have for concern:

- 1) weather observation
- 2) The search for sources.

In both cases the behavior of the physical fields varies:

- 1) in meteorology: function of time (sunshine, ionization)
- 2) channeling by moving water of the electro-telluric field (the streams of water channel the ions in the ground and are thus conductors through the earth's magnetic field whose variations (inclination, declination, residual of the total field) are linked the behavior of layers in the upper atmosphere.

The devices of Fortin and Schmidt are thus presented

- 1) a winding with a double characteristic: magnetic and electromagnetic
- 2) a needle whose points are made of a material of low magnetic susceptibility (pure copper at Fortin, material not specified at Schmidt, but not very magnetized).
- 3) a capacitor in the base at Fortin.
a capacitor overlapping the wire winding alternately at Schmidt.
- 4) a bell or closed container.

With the notions of Ext identified above, it is necessary to add the - overlapping of materials and further accentuate the Phenist object character of these devices.

A device was also made by an Englishman, Mansfield; one example was studied by Hay of Guelph, Ontario. It presented three modifications compared to Schmidt's apparatus.

- 1) inside the coil is a hollow fiber core
- 2) the number of coils of wire is increased to 10,000
- 3) the magnetic needle had 2 north poles, one of which was slightly stronger

than the other (it may be a known form): N | IN

IS

The device was manufactured in 4 sizes. The hours of use are (*) killed between 8 a.m. and 12 p.m., and between 2 p.m. and 5 p.m.

Mayer practiced for 3 years with the devices of Fortin and Schmidt; he built a new device that was more manageable and more sensitive. His main idea is this: a mass of soft iron (the coil of the device) carried in a magnetic field (here he confuses a hydrodynamic flux to the effect of telluric currents in the terrestrial magnetic field with this same magnetic field) must channel the lines of force which, passing through the coil, influence the position of a steel needle placed above. This device could, according to its author, operate between sunrise and sunset and even during the night. But it was only necessary to operate

- 1) on open ground,
- 2) if the soil surface was dry
- 3) on a clear and calm day.

The device remains inactive in still waters and above the water pipes it does not work; it has to be a natural watercourse. The needle has oscillations of average amplitude 11°.

Let us give a final remark: in these assemblies, we have dense materials (metal) in a wooden box (lighter materials); it is reminiscent of the orgone boxes of W. Reich. The observations of users, Mayer in particular, indicate a threefold rule:

- only operate on open ground on very dry ground in clear, calm weather.

An environment modifying the ionization of the air. Thus Fortin-Schmidt-Kayeï seem to have coupled in their measurements the double effect of ionization

(*) The question of favorable hours is linked to magnetic drift (read on a magnetometer), electro-telluric activity (read on a mirror galvanometer) and variable ionic emission (read by gamma-gamma radiometry) .

closed vase or box by the sun (clear weather) and magneto-hydrotelluric variations.

About the ionization of the air in a closed receptacle, one can refer to [2] and [3]. hanging gold. It can be seen that the ionization in a closed vessel is amplified by the walls (surface and nature). E. Rutherford and Cooke in: "Penetrating Radiation from the Earth's Surface"[4], and Wood in: "Spontaneous Ionization of Air in Closed Vessels and Its Causes " indicate that a screen of recently prepared bricks nearly doubles the closed-cup ionization. Wulf demonstrates that a screen of ancient bricks does not have this effect. Wood indicates that the increase in closed cup ionization increases with wooden walls and screens. All other materials: earth, (*) metals, screened, reduce 1 ionization of the closed vessel. We observe with metals a maximum ionization with tin, minimum with aluminum (the coils were made of iron wire - Schmidt's capacity contained tin!).

To these differences are added irregular variations in the box containing the coils, capacities etc..., reaching 50[^] as well as variations linked to the electro-jet on the maximum upper atmosphere between 9 p.m. and 11 p.m.

- maximum between 9 p.m. and 11 p.m.
- minimum around 2 p.m.
- secondary maxima between 8 a.m. and 11 a.m.
- secondary minima around 4 o'clock.

Leakage losses reach 100 times the loads to be measured. Grounding the electrometer varies the rate of discharge.

Research using Mayer's apparatus was crowned with success; the wells giving water were discovered. What should we conclude?

P. Smime remarks that no author thinks of using the effects together: magnetic, ionization, radiation, electricity. There were recording charts . Mayer remarks that near masses of iron, iron pipes, the needle may show a slow movement, but not the oscillations which he observed above the currents of subterranean waters; with a magnetometer one obtains under the same conditions, by a profile perpendicular to a cast iron pipe for example, a characteristic curve; therefore Mayer's apparatus does not

(*) There is no mention of wax or fatty substances.

not behave like a magnetometer. If we compare the measurements between a point on the ground without a source with a point on the ground with a source, at the same times, the results seem to exclude any possible correlation as will be the case between what is called a base and a measuring station. simultaneous hydrotelluric currents. On the other hand, if we go back to the description of Mayer's apparatus, we would think we could see it corresponding to a primitive magnetometer. However, such a device, with horizontal declination, is only sensitive to a field of 40 to 50 gammas. A source, an underground water current causes anomalies • (*)

of some gammas of the vertical field. In reality, it is necessary to use a nuclear precession magnetometer based on the Abragham-Hauser effect to detect the real variations of the earth's magnetic field disturbed by dtu sources: this variation is of the order of a tenth of a gamma.

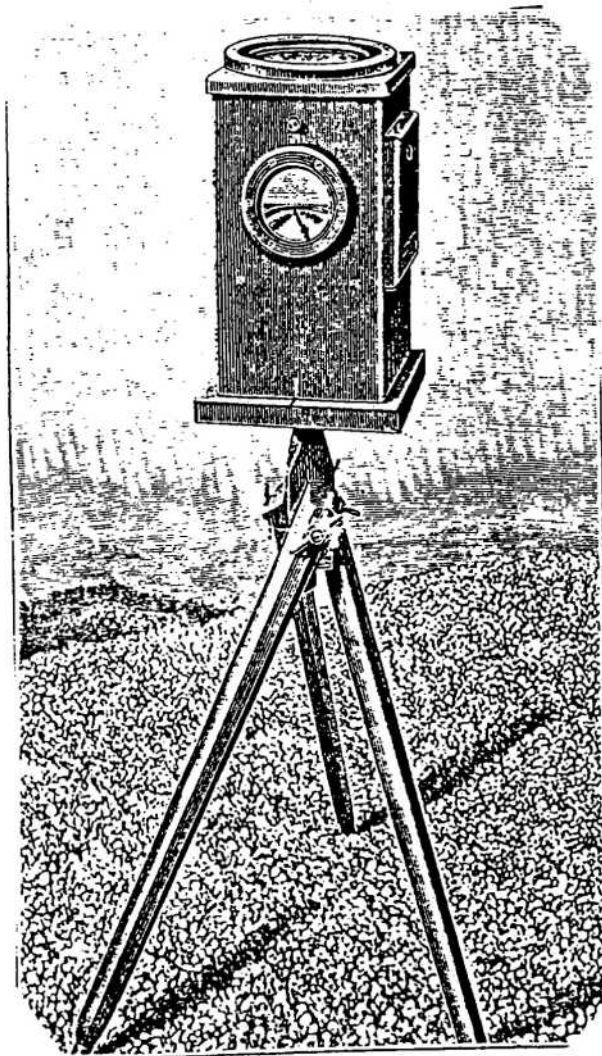

Nor can the ionization variations alone explain such variations (of a pulsating nature) in the position of the needle, which in the Mayer is weakly magnetized. We can suppose that Mayer "forced" his examples or results of the apparatus whereas very good dowser and dowser he could give in advance the result (his indicator of underground waters in movement being then only an asset justification). However, the elements described: heating of the coil, intense tremors are not understandable by an isolated effect of the field measurements briefly described in [5].

The question of mechanical friction is not addressed for any of the devices described. However, if the displacements noted by all the manufacturers and users could reach, by the needle, from 2° to 55°, it must be admitted that the associations of elements composing the devices cause a form of "amplification" of something n having no link described with the explanations of the authors. The very fact, by Mayer, of naming his device "Indicator of underground waters in movement" could make suppose that Mayer being unable either to explain or to make explain his device in a satisfactory way, he preferred to be satisfied to use it with profit by leaving to hear that a form of explanation could be given through terrestrial magnetism. We therefore return to what we found and above all that these devices have an ext which excludes a usual explanation of operation [6].

(*) measurable only with a Ruska or Askania balance (with quartz knife and thermal compensator).

RESONANCE VESSELS

by J. RAVATIN

(Paris)

Example of cumulative obtained by resonance vases in metal or clay pottery placed under the tiers of ancient theaters or in churches .

An inventory of acoustic vases can be found in the study by René Floriot [1]. Form, nature, position are examined in turn. Some , . ■ • (*) of these vessels were of brass. Few have been found because collectors stole them; in many places the niches which sheltered them were destroyed. It was the same for the clay vessels. Fortunately in churches they were often placed in the nave around the choir, which made access to them difficult. On the other hand, they were barely apparent. Holes of 10 to 15 cm in diameter at most indicated the opening, or the opening of the niche in which they rested. If they were steps, the entrance height of the niche did not exceed 7-8 cm. Vitruvius and others like the brothers P. and C. Perrault [2] have given attempts at rational explanations to justify the presence of these vases. Each of the vases was tuned, according to them, according to one of the keys in which the human voice can extend. "In the middle niche, we placed the vase which gave the "fundamental sound", and on each side, those who gave the chords".

After the 17th century vases were no longer inserted into the walls and choirs of churches; we don't know why!

Apart from the churches of France, we find some in England, Sweden, Denmark, Germany, Russia, Italy... When we examine the position of the vase, set in its niche, or placed on the bottom of the niche of in a precise way, we

(*) René Floriot points out that according to Vachez [3], citing Vitruve[4] the Greeks were the first to place bronze vases in their open-air theatres; in addition to the actors' masks, they housed along the walls of the stage or above the tiers of the hemicycle, ... bronze vases to strengthen, soften the voice and the harmony".

notices that the acoustics intervene. In the case of churches, the vase is in the thickness of the walls, the opening flush with them. It seems that in the churches, the vases are, in general, posterior to the construction of the building. But Floriot points out that some vases have a less obvious acoustic destination. Cloquet [5] and Béchet [6] report the existence (retaken by Cloquet from reading Béchet) of a kind of underground brick dovecote "but instead of cubicles where the pigeons coo, there are hemispherical vases in terracotta, superimposed in circular stages, the opening facing the center of the vault. The vault is finished with an open grid..."

René Delbrel [7] in his study on Asclepius and the Secrets of Epidaurus considers Latin and Greek theaters. He gives a diagram of a brazen vase under a step in a Greek theatre. He evokes the magical effect of sounds, chants, invocations during festivals, plays, and even the use of this magical effect for the healing of the sick (in Epidaurus the theater is next to the sanctuary where crowds came the sick), the magic effect being due to the presence, under the tiers of the theater of Epidaurus, of cavities containing (*) each a pot

(*) R. Delbrel writes "... The cavity receiving them (these are the vases)

had much larger dimensions (than the vase) and a special shape . The almost flat floor contrasted with the domed roof in a well-shaped curve. finished" (These are the bleachers in the amphitheatres)

What is interesting to notice is that we have characters of relocation as soon as sounds, songs, even murmurs are emitted, appear. The vase-niche set takes an ext and high Taofel fields are in the whole church or in the whole theater following that the pots are in churches.

(**) Note an important remark by R. Floriot [1]. For this he cites Mackeprang, a Danish scholar. Mackeprang thus gives his thoughts on vases in Danish churches "The usefulness of these small and often few vases, placed at a relatively great height, has always seemed to me more than problematic; but as I lack sufficient knowledge in acoustics, I submitted the question to H. Kroman, professor at the University of Copenhagen...

Here comes the opinion of Kroman "From this purely theoretical point of view, there is something true in the belief in question, in the sense that a sound is reinforced when it vibrates above a cavity the depth of which - corresponds to the wavelength of that sound. But the reinforcement is so slight that in practice it escapes observation, and we seem to have proof in this fact that a very large many of these acoustic vessels have remained open. Indeed, singing being composed of a set of sounds, to reinforce it, a whole system of pots of very different depths would be needed. If this were not the case, a single sound would be reinforced, and then the song would become so intolerable that one would hasten to carefully fill the cavities.

"And after these relevant words" adds R. Floriot, Mackeprang opens the way to the definitive explanation:

"It cannot be denied that there was at the base of this prejudice a correct observation in itself, absolutely as behind the ancient belief in the virtues of the famous Volta cross, there was the observation of the therapeutic properties of the current electric".

its or under bleachers. But also a cumulative is detected in these places. What is interesting is that it is the sounds that create the cumulative, the ext, the fields of Taofel; and we fall into what occultists call the "ether of sounds". This cumulation attached to the sound, allows these sounds to be relocated and to be realized, therefore to write powerful, multiple sound effects and to increase the part and to give an impression of simultaneity in different points of the place in which the sound occurs. phenomenon; everything happens as if each point in space became a sound source [8],

LES BOVES

by J. RAVATIN

(Paris)

Let's first see what it is: Nicolas Germain [1] did a search to try to identify the word bove; he remarks that this self is not found in the usual dictionaries, but that the etymological Dauzat of 1938 gives the following details:

, . (*)

Bove: regional word already known (in the twelfth century) by Guillaume de Tyr, means cave, back-cellar.

. . . - (** (**))

Bove would come from the combination of two words: 1) Gove: this is the Cauchois word for the cave. 2) Baume: cave of the hermit.

Many of these boves are listed in the work of Maurice (****), . Broëns L2J. We were only interested in the boves - and in particular the one that seems the most beautiful and which is in Neuville-sur-Touque, in the Pays d'Auge, in Normandy. It is on the so-called Jaunière property which belongs to Mrs. E. Chaudet. This property was purchased in 1935 by Doctor Robert Chaudet (now deceased) and his wife. He visited the bove immediately and at that time it was more complete than now, as collapses occurred. Despite this, it is remarkable for its state of preservation, and for its form it is one of the most beautiful. There was a stone table, seen by Commander Mouton, but it was destroyed by

(*) Historian of the Crusades.

(**) It would come from the Germanic Gaupa, meaning hollow of the hand.

(***) U would come from the Gallic Balma in the Ville siècle.

(****) Mr. Broëns is Honorary President of the French Society for Underground Studies. He describes in his previously cited book the unusual structures existing in Europe: tumuli, lions in the rocks, underground structures including the boves.

vandals. This is one of the reasons why Mrs. E. Chaudet forbids access; however, it is not just vandals who are dangerous in such places; archaeologists who absolutely want to restore for good conservation, not understanding what these caves could have been used for, risk scratching and deforming signs or shapes engraved in hollow or in relief; for many of these researchers, these boves are troglodite dwellings (they scratch to find traces of hearths), tombs (they still scratch), food attics, refuges, caches.

We visited this bove and found a few meters after the entrance of the very high Taofel Fields, which are found everywhere in the bo^e. P. Smime noticed the beginnings of hollows, lying in the vertical planes in the entrance corridor and thus was able to verify the effect of the change of state on a human being who entered the hole quite slowly. Because it was necessary to go through this corridor at a certain speed to already obtain certain effects and prepare the one or those who were going to work in the rooms located further back. Sound evocations, repeated at length and songs made in the circular rooms were necessary to obtain the triggering of sound and light phenomena. We fall back into the kind of manipulation and effects produced by J. Breyer between 1947 and 1951 at the Château d'Argini, commissioned (*) . . . dene Templar close to Mason. It was following this work that he wrote "Terre Omega" [3]. J. Breyer worked with several people (they were three at the start) in this commandery; a lot of information was given to them. They first created a transfer with the Enel generated by the Templar movement, then they were in contact with other Enels. Indications on alchemical type manipulations, on details spanning several decades to come (they were largely realized), on other places where it was also possible to work, contributions of objects miscellaneous etc. . ., all this took place in Argini. The beings who manipulated were gradually transformed psychically. They had made a shrine. In a high place, there are high Taofel Fields and decalaires and cumulaires; the place takes an ext. States can appear which will not be the same for those testing whether they are outside observers or whether they are among the operators. There are also phenomena of overlapping and the physical appearance of the operators can even change during the experiments and remain for some time.

(*) This Commandery is no longer operational.

afterwards, which is normal, because we obtain the instability of parameters and functions . Some fractant can open.

Thus in the boves, ceremonies led to such phenomena.

The bove of Neuville-sur-Touque is now surmounted by a wood which had perhaps (*) been cleared 4000 to 6000 years ago when the bove was in use. Concentric earth circles appear in the wood. Some probably come from the collapse of other underground rooms that should be sought. Others were made for operational purposes, perhaps to amp up effects in the bove for a ceremony in the open air, during a full moon for example.

Graffiti at the entrance to the bove served to block the appearance of certain harmful states, or even to purify the officiants as soon as they entered the place. But some of these graffiti could be followed by hand by the person entering, using a stick, so as to force him to restrain his impatience, and thus, by imposing a fairly long stop, to prepare him for calls measured inside, when the ceremony began. In the domain of approaching another field of coherence, halts on acts are often useful to preserve the operant and increase the power of operability.

(*) P. de Montgrand detected Emissions in this box which he calls Mass Emissions. Let's summarize his report:

(Private communication)

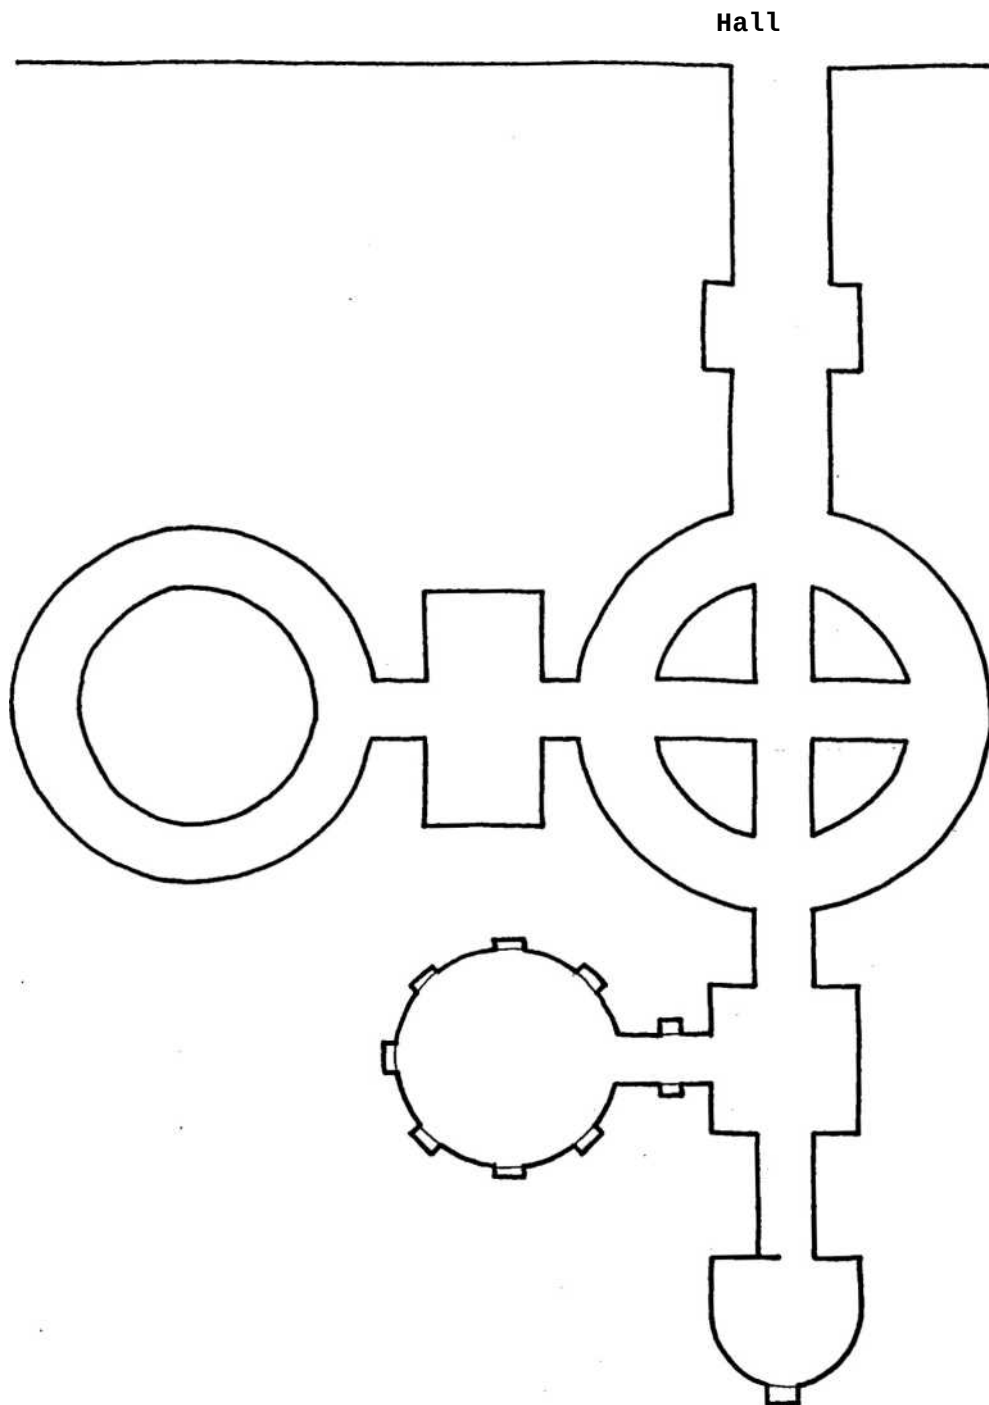

"In my opinion it is a religious center. It has two Emissions (Mass) different:

- one is a PH whose origin is in room B and whose PCS is in room A.
- the other SPH has its point of origin in room C and its PCS in the center of the cross". (PH and SPH are abbreviations of Montgrand which have nothing to do with Hebrew.)

He thinks that it is necessary to avoid going to certain times in these places.

For the notations of P. de Montgrand, see [4].

Mr. de Montgrand adds: "We find here a complete mechanism of what we find in temples and megaliths. Above all, we must not dig!!"

Scale 1/100 (1 cm per m)
Average depth 2.5 m
Vertical grooves of 10 x 10 cm
Total length 18.6 m
Total width 12.5m

Drawing by N. Germain [1]

Spiritualism is a process of the same kind, but much less advanced and which is most often watered by a rather poor Enel, that of the deceased imagined as an aping of the living.

The message that arrives depends very much on the folklore (and its tacit knowledge) of the operators. Within the framework of spiritualism the result is very poor because the model is childish; in what Breyer did, there were precise and interesting indications for a community because the EF and C. de T. of the place, its ext, the Enel were carried out and the ritual of approach was long.

In the boves, the rituals were certainly very long in order to trigger the phenomena. It took several people who succeeded each other so that the bove was never empty and who, during the time of presence, worked in order to give the dynamization of the characteristics: emissions, (*) ext, which leads to a kind of crystallization of the Enels. It can also occur that the veil of the observer is filled with folklore that is within the knowledge of this same observer. From the local, through each one's anchor, there are transfers between these different voilocs, and we thus have a process of rnagfeu and amplification.

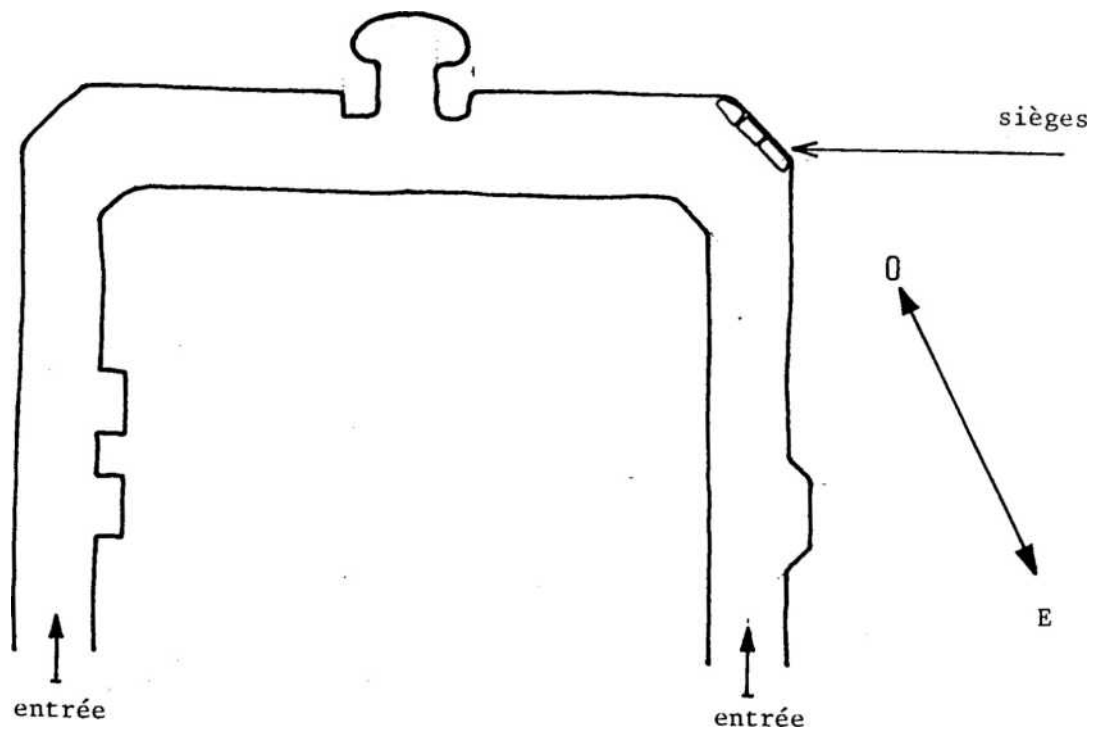

D. and S. Franeric found a bove in Italy which was apparently - unregistered, dug into the side of a hill; peasants use it to store tools at the entrance, but the interior is empty of all objects and clean.

By the study of the Emissions due to the forms, one can attach to the boves, certain constructions which are in Sardinia (at least 6000) and which are named: Nouraghes. These are amply described in a book by G. Niel [5]. We find high fields of Taofel, an ext in these monuments and we can suppose, that in Sardinia, where the ground is quite rocky, therefore diffi cult to dig, it was easier to raise these stone constructions cut than to dig caves. Niel even describes associated nouraghes in very large groups, sometimes a hundred. Could they also serve as a refuge and defensive position in the event of an attack? This is quite incompatible with the hypothesis of sanctuaries, only those who are there can enter them.

(*) There is no ext in all boves. That of Neuville-sur-Touque has one, due to its rather elaborate form, but the other boves whose sections are reproduced here (sections taken from the work of Broëns) have their ext weak or non-existent. On the other hand, when an adequate ritual is executed, the ext

officiate, without this the hooked phenomenon is lost very quickly.

About the boves and nouraghes, we will say nothing more; for fuller descriptions it is necessary to refer to the works of M. Broëns and G. Niel as well as to the bibliographies cited by these authors and which we do not reproduce here.

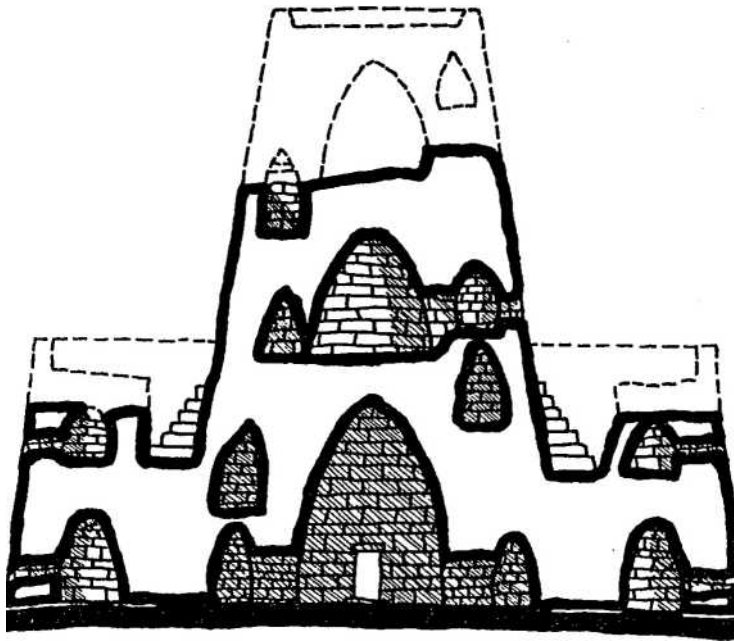

Bove discovered by D. and S. Franeric in Italy
