Creating Healthy Spaces: BioGeometry and the Creation of Optimal Healing Environments

*Michael J. Maley, Ph.D.
CreatingHealthySpaces.com*

Over the last few years, there has been an increasing interest in defining and creating “healing environments”—spaces in which people can find solace from the suffering and pain of life, begin to recover from injuries and illness, and environments that, by themselves, add to the vitality of the inhabitants. The temples, healing centers, and sacred power centers, both ancient and current, all had and have that role—places where people could come for recovery and rejuvenation, and learn the skills necessary to create and maintain optimal health. Modern day spas, natural/alternative health clinics, and even hospitals are now seeking to provide those services to their clients. In general, the focus has been on the two major aspects of such environments—the activities that take place there, and the physical design of these spaces.

This model follows a very ancient tradition of the use of sacred space in cultures, in that the goal of a ‘healing environment’ is to utilize a given space/environment to create an opportunity for the users of that space to transform and transcend their usual states of consciousness (associated with illness and despair), and move into a more optimistic and healing attitude for their health and well-being. Historically, there have always been three important contributions to creating environments that are vital, and help the inhabitants achieve consciousness and remain balanced and healthy: (1) the users themselves are seeking vitality and balance; (2) relationships and interactions between the users of the space are healing and regenerative; and (3) the space itself is alive, free of sources of negativity and toxins, and provides energy qualities that support aliveness and balance. These three factors create the ‘healing energy matrix’ that becomes a fairly permanent feature of the space. In the use of ancient sacred sites, the participants have primarily been

seekers of alternative states of consciousness or healing; the rituals and interactions that were done on those sites were themselves directed toward healing and balancing; and the sites themselves were chosen on the basis of the natural energy qualities they possessed. If all three of these contributions are present and consciously pursued, the space itself becomes and stays alive and vital and becomes an ‘agent of healing’. If any one of these is not attended to, it detracts from the effectiveness of the remaining practices.¹ In current day locations like clinics, hospitals, spas, and healers offices, where the benefit of the natural environmental energy signatures are not available, these energy qualities have to be instilled into the sites, the healing rituals have to be learned by both the staff and the clients, and the clients/patients have to be taught the skills necessary to participate in self-healing and regeneration.² Most modern healing environments have to be created from the ‘ground up’ and consciously and intentionally formed from what we have learned from ancient cultures, and what we know now about effective healing practices.

Optimal Healing Environments

The creation of healing environments focuses on how healing can be most effectively and lovingly facilitated. Such environments are now called “Optimal Healing Environments” (OHE) and in 2005 a conference was sponsored by the Samueli Institute dealing with this subject.³ Other conferences have presented data on how to create an OHE for specific clinical conditions.⁴

In general, the current OHE literature concerns itself with 4 different ways in which such optimal healing environments are formed:

1. An OHE would focus on the development of the client/patients skills in self-care; help clients make lifestyle changes that support healing and maintain health; and aid clients in learning about the states of consciousness that facilitate healing (including how their own belief systems, expectations, awareness levels, and intentions can affect body functions, stress levels, and recovery outcomes).
2. An OHE would facilitate patient-healer interactions that develop a strong therapeutic alliance, and create settings in which health care providers can become ‘healing presences’⁵ for those who require their services.

3. An OHE would provide a mix of conventional and complementary practices of medicine and healing, and give clients more choice in how their healing could proceed.⁶
4. An OHE would include a physical environment that fully supported healing, considering how physical spaces are formed to support all the above goals, as well as understanding that what is added to the environment can facilitate healing—specifically, the conscious use of color, light, sound, design and shape, and the effects these qualities have on the energy system of the clients.

The majority of research and efforts in this last aspect of healing environments have been directed toward understanding the effects of *physical* changes and the impact these changes have on the physical, psychological, and emotional states of patients. One of the studied outcome measures for these changes has been the effect on the immune systems of patients and whether or not the changes reduce stress and promote recovery. There is a growing body of research that supports the principle that changes in the environment can have a powerful effect on healing and recovery, and that you can markedly improve healthcare through building design.⁷

When creating healing environments, there is another level of potential changes that can be done that has its parallel in modalities of healing. Physical healing modalities like pharmacology, nutrition, surgery, massage, and chiropractic intervene on the physical body and measure their outcomes by changes in the physical structure or physiology of the individual. Increasingly, however, healing systems that work on more subtle structures in the person, like the energy fields around the body (e.g., electrical, magnetic, or subtle), the chakras, or the meridians, are finding a place in healthcare. Practitioners of homeopathy, Healing Touch, energy healing, and Qi Gong assess the effects of their interventions by systematically looking for shifts in patient health through self-report and assessments of the energy system of the person. These healing systems look for not only quantitative physical changes, but evaluate *qualitative* shifts in the energy systems of the body. Qualitative shifts are most often sensed intuitively by the healer, but represent an important part of the feedback about how a treatment works. It is more difficult to measure and assess the many qualitative shifts that occur in balancing and healing work, but they represent the deeper dimensions of change and healing that are not, as yet, quantifiable.

Environmental Balancing

In the field of environmental balancing, there is a parallel movement toward working with the *energetic qualities* of a space. It is this area that this paper is concerned with—specifically, is it possible to go beyond the physical parameters of a space and introduce certain qualities into an environment so that the qualities of that space not only support healing interventions of an emotional and physical nature, but the energy qualities themselves evoke balancing and healing? The response to that question is an emphatic yes, and there have been a number of both ancient and modern solutions to creating environments that contain qualities that contribute to healing and the rebalancing of human, animal, and vegetable energy systems. The discussion that follows covers some of the ways in which the energy qualities of the natural world, and energy signatures associated with spiritual realms can be used to enhance environments. It also is an introduction to the environmental science of *BioGeometry* and its applicability to creating optimal healing environments.

Churches, meditation halls, prayer rooms, alters, and places of worship, all have energy qualities in them that assist the spiritual seekers to achieve the goal of connecting more deeply to the divine. The activities that occur in those environments make a huge contribution to keeping the space clear, balanced, and free of negativity. These positive energy patterns can be found/imprinted in the walls and structure of these places and are created by the songs, chants, sounds, thoughts, prayers, and activities of the users of the space. All physical objects can be “impregnated” by the vibrations that occur around it. The beautiful water crystals photographed by Masaru Emoto and formed by the prayers and phrases of people are examples of the permeability of water.⁸ The shapes of many other physical substances created by sound vibrations⁹ shows the powerful relationship between the physical world and the vibrational universe that forms it. What happens in an environment leaves an imprint and can create an energy field that remains in the space and affects everything that inhabits the space. The human energy system is totally ‘open’ to these energetic patterns and environments affect us immediately and deeply.

The natural beneficial energy qualities that either transform consciousness or provide the balance needed for healing have always

been present in areas we now call sacred sites. The energy signature of those locations has always been 'different' from ordinary places. Historically, they were the locations in which people went for healing, places of worship were built, government institutions were located, or ancient rituals were performed. Ancient cities often reflected designs that closely followed the energetic patterns of earth energies.¹⁰ There are thousands of these megalithic sites, ancient ruins, and temples in which one can feel something special, sometimes transformative, often healing. Measurements of energy patterns at those sites often show unusual levels of radiation, stronger electric and magnetic field strengths, shapes that created specific energy patterns, or the beneficial qualities of energy associated with underground streams of water. The power of the site was further enhanced through the activities that took place there, and there was an interaction, a resonance, between the user and the environment that facilitated healing and transformation. The users of those sites appreciated the way in which natural earth energies combined with structures built by man, and practice rituals that facilitated conscious awareness, could be blended to produce shifts in consciousness and healing.

There are a number of ways and reasons why beneficial energy qualities should be introduced or enhanced in an environment. In balancing or clearing environments, there are generally two major goals - removing toxicity and adding beneficial qualities. Any healing environment must be free of toxicity or the beneficial effects of healing interventions can be easily erased. Most complementary medicine approaches, especially those that work with the energetic system of the client (like homeopathic interventions or healing protocols that address chakras or meridians) are very sensitive and vulnerable to environmental factors and can be neutralized by electromagnetic fields, toxic emissions from carpets, bed linens, furniture, mold, and detrimental energy radiations from the earth (geopathic stress). When clients are treated or taught self-healing practices, the quality of the energy in their homes will often determine whether or not the treatment holds or is erased by the exposures that follow the treatment. In the same way that a trauma or negative emotional interaction can affect the efficacy of an energy treatment, exposure to toxins, allergic substances, EM fields, and geopathic stress can undo attempts to balance the body. Healing procedures require support from the environment in which the person plays, works, and sleeps.

If modern healing centers are to utilize these powerful and ancient understandings, then there needs to be ways to introduce natural beneficial energy qualities into environments to complete the matrix of healing. These qualities would be maximally effective and beneficial if they could both mitigate some of the energetic toxicity in most homes and buildings, and also provide energy signatures that enhance the balance and vitality of the body. There are approaches that serve both of those goals, and other systems that do either one or the other.

The most established system for approaching the problems of toxicity is the field of Baubiology.¹¹ Practitioners of this science have established protocols for dealing with electric and magnetic fields, chemical toxicities, off-gassing of man made materials, mold, and air quality. Baubiology would be called a *physical approach* in that the corrections deal with quantifiable interventions, measurable field strengths, known standards for the various pollutants, and physical alterations in the sources of pollution. These approaches are very effective in the removal and reduction of many forms of harmful exposures, and are recommended when toxic materials, toxic air, or excessive electromagnetic fields permeate healing environments. In addition, you *know* when the intervention has been successful – there is a reduction in field strength, an absence of mold, or improvement in air quality. Baubiology is based on quantitative measurements with known standards. They differ from some of the approaches to be discussed later in that they do not introduce beneficial energy signatures into the environment. They operate on the principle that the removal of harm can be highly restorative as it allows the body to naturally rebalance and benefit from whatever healing procedures the patient is receiving.

Environmental balancing approaches that go beyond just making physical changes in the energy fields (e.g., reducing the electric and magnetic field exposures; reducing the levels of mold; improving air quality, etc.) are known as *energetic approaches*. These systems of working with environmental quality will look for the presence or absence of either *natural or spiritual qualities*,¹² and attempt to bring these energetic signatures into an environment. Since they deal with qualities and, in general, are difficult to measure quantitatively, the effects of these corrections are often only sensed intuitively – the feeling of the space changes and people act differently – all qualitative changes. Those who cannot sense such changes often don't and have a harder time

relating to the shifts in energy. What is gained in addressing the whole person is sometimes lost in precision of outcome. The one exception to this is BioGeometry, a system of energy balancing to be discussed later, based on radiesthetic assessment of energetic qualities.¹³

The cosmology of energetic approaches includes an understanding that: (1) environments, like any other energy system, have a consciousness and are alive; (2) environments include vibrational levels from all the planes – physical, vital, emotional, mental, and spiritual; (3) people, as a part of an environment, interact with the environment continuously at all of these levels, and (4) changes can be made in the quality of an environment by working with any or all of these levels – i.e., as with the healing of individuals, you can affect the physical impact of an environment on individuals by altering the emotional, mental, or spiritual dimensions of a space. So, the color of a room could be changed and affect how it impacts people emotionally and physically; sounds could be introduced that calm or stimulate the brain in such a way to affect states of consciousness; or spiritual qualities could be enhanced in an environment and transmute negativity, relax the body, and facilitate healing. The levels of our own human energy system are also characteristic of any environment, and immediate and powerful resonances occur between ourselves and the spaces we inhabit at all these levels—for beneficial or detrimental outcomes. If ‘higher’ vibrational levels are not present in an environment or a space is deficient in the natural qualities present in nature, it is experienced as being somewhat flat or dead to those who can feel those qualities. Clutter and stagnation in an environment can affect those who work or live in such places, just as a history of negative emotional interactions in a home can make sensitive residents ill.

In environmental clearing work, working with natural and spiritual qualities has a long history in ancient cultures. In China (Feng Shui), India (Vastu), and Egypt (BioGeometry), systems of working with earth energies or vibrational qualities that enhance consciousness have been a part of the everyday life of their citizens and are a part of the design of their buildings and temples.¹⁴ All of these cultures have considered these qualities necessary to the health and personal development of their peoples. Many of our current procedures for balancing environments come from these traditions and involve assessing modern environments from the standpoint of whether or not these qualities are present, absent,

require balancing, or need to be introduced and maintained. In general, there are several sources of these energetic patterns:

(1) *Natural earth qualities* like Earth, Air, Fire, & Water. These ‘elements’ or natural qualities can be found in all living energy systems, are a requirement for the vitality of biological systems, and need to be in some form of balance for a biological system to sustain itself. Traditional Chinese Acupuncture and energy treatments based on the meridian system are based on the balanced presence of these qualities throughout the body. Some schools of Feng Shui as well as current design schools address the presence of these qualities in environments and restore balance by introducing them into the space. These are the foundational qualities that make any environment feel more like the natural world, and the human body resonates powerfully with these qualities. They can be introduced directly by having running water, fireplaces, plants, moving air, natural materials, and natural sounds in a space. The response to them can also be elicited symbolically through art and photography, music, & earth colors. Even a simple thing like the opportunity to look out into nature through windows has been shown to have a facilitative effect on healing and recovery.¹⁵ Natural earth frequencies, when absent, can also make a space difficult to endure or produce illness. Buildings that are constructed from cement and steel can block the Schumann resonance pattern associated with natural environments and become ‘sick buildings’.¹⁶ Environments that introduce and sustain these natural qualities always feel better to people and are more likely to feel relaxing and vitalizing – the body feels more ‘harmonized’ in their presence. In any healing center, where the primary directive is to restore balance to the body, these qualities become an important aspect of the environment.

(2) *Color and the qualities associated with color* (the aspects of color that go beyond the physical/observed color) are another natural system for treating environments. Color and color qualities can affect the physical systems of the body, the psychological and emotional states, and are a part of many systems of spiritual awakening. Color is a vibration that has harmonics far beyond just what we see as physical color and is used in many forms of healing. The presence of color as well as the placement of color can produce energetic qualities that are balancing to the body and go beyond the psychological and emotional effects.

(3) *Geometry and sacred geometry* have a long history of being used to create spiritual energetic patterns in environments. The ancient designs

of Egyptian temples, the cathedrals of the middle ages, and the astronomical designs of megalithic sites, demonstrate a knowledge of how spatial arrangements, angles, proportions, and alignment with earth energies can create a deep resonance with the human energy field and alter physiology and states of consciousness.¹⁷ Many forms of environmental balancing come out of these traditions and different shapes can be powerful emitters of spiritual qualities that can change the nature of a space. The energy flow patterns that occur in the natural world can be replicated or corrected in inside environments through design and can make a big difference in how a space is experienced. One of the basic principles of sacred geometry is that every angle is an “angel”—that is, every angle, shape, and proportion has its specific energy quality, a natural law, that can either facilitate or interfere with balance. The relationship between angle, shape, color, and musical notes as windows into divine experience was well known in ancient cultures and is being rediscovered today.

(4) *Certain ‘emotional’ states* can produce powerful spiritual qualities that can alter environments. Meditations and expressions that contain the qualities of compassion, love, acceptance, and gratitude can affect environments, the shape of water crystals, patterns of heart rate variability, and brain function.¹⁸ The energetic fields produced by the heart are quite strong and are capable of being broadcasted far beyond the personal space of the emitting person. These same qualities can be used to balance and bless environments, and make a powerful contribution to the energetic feeling in healing centers. Shaping the presence of these exchanges within and between staff and patients will in turn enhance the quality of the entire environment. Blessings and prayers can also be instilled in physical matter, recorded electronically/digitally, transported to distant locations, and create emissions of beneficial energy that can alter the energy of a space.¹⁹

The primary advantage of adding an energetic approach to environmental balancing and healing center design is that the introduction of certain natural and spiritual qualities can both mitigate the effects of detrimental energy patterns and provide energy patterns that *resonate with the entire energy system* of the residents. If the goal of any healing center is to address the ‘whole person’ and facilitate healing by creating the complete matrix of contributions to healing, then having an approach to the physical environment that supports *all the dimensions* of the healing process is important. Balancing interventions that not only clear

the space of toxicity, but also provide an energy signature that, in itself, can balance the body, would support healing at all levels of the person.

BioGeometry

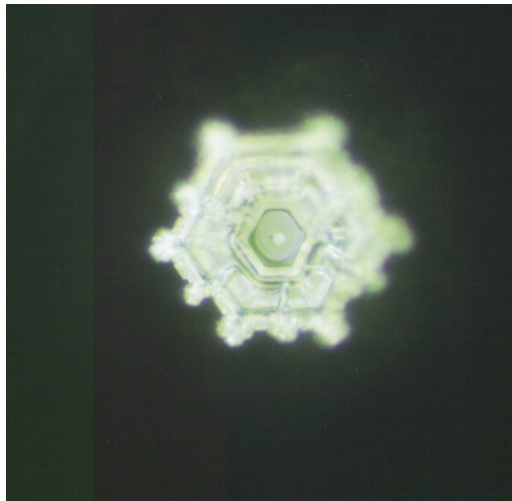

The Egyptian energy science of BioGeometry, developed by Dr. Ibrahim Karim, D.Sc., provides an energetic approach to altering the qualities of environments.²⁰ Karim is a well known architect, Egyptologist, scientist, linguist, spiritual scholar, and lecturer, who, over the past 23 years, has developed a qualitative science of spiritual energies. Based on his knowledge of both ancient and modern design principles, sacred geometry, geomancy, vibrational physics (Radiesthesia), and spiritual evolution, Karim has developed a holistic approach to environmental balancing that includes:

1. The discovery and development of a subtle energy quality that interacts with the earth's energy system to balance and harmonize biological systems – this quality is known as the BG3, or the BioGeometry 3, referring to the three vibratory patterns that comprise it. This subtle energy quality is created by and is found in any 'Center' and act of centering. The *Center* is an archetypal form around which all natural systems evolve and develop, and is a source of powerful beneficial energy qualities.²¹
2. The development of a 'physics of quality' in which these subtle energetic signatures can be measured, created, and used for a host of applications including environmental balancing, healing and maintaining health, agricultural projects, and spiritual development. That is, any biological system can be enhanced by the BG3.
3. A 'toolkit' of shapes, processes, and design criteria that can be used to create environments that are balanced and provide balance to their users. Since the BG3, as an energy quality associated with Centers, is found in all natural sacred sites, the utilization of BioGeometrical shapes can be used to create a "sacred site" in any environment.

BioGeometry utilizes spiritual qualities to balance biological systems. In the last two decades, there have been a number of interesting applications of these procedures and the impact of the BG3 on living systems, including projects in agriculture (enhancing the growth of

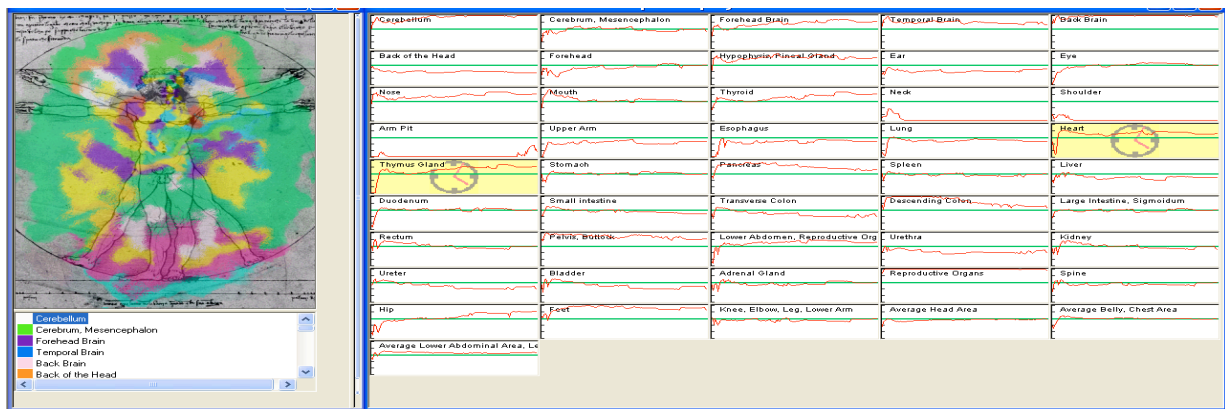

apples, chickens, and potatoes), electropollution (mitigating the effects of cell tower transmissions in the town of Hemberg in Switzerland), and architecture (designs of resorts and apartments).²² The subjective reports from individuals experiencing harmonized environments always include a feeling of relaxation and calmness, and a sense that the environment is clear, lighter, and more spacious than it was previously. There have been a number of applications to health, including a Hepatitis C project in Cairo in which BioGeometric shapes placed on medallions²³ and worn by patients, effectively reduced the symptoms of this illness and facilitated greater recovery rates than many medical drugs and alternative treatments. Other health applications included placing BioGeometrical shapes in the intensive care unit to reduce post-operative problems, and mitigate the electrosmog and earth radiation problems that can be present in those environments. Anecdotal reports include the observation that in the virus C project and in other instances where persons had a low platelet count due to chemotherapy in cancer cases or interferon used for virus C treatment, the platelet count would rise in a few days with the BioGeometrical shapes.²⁴

Another demonstration of the effect of this subtle energy pattern is found in the way in which it creates water crystals. The figure below is a water crystal created in the Emoto laboratories in Switzerland by exposure to the BG3. It contains the same hexagonal shape and beautiful crystal structure of the water affected by prayer.

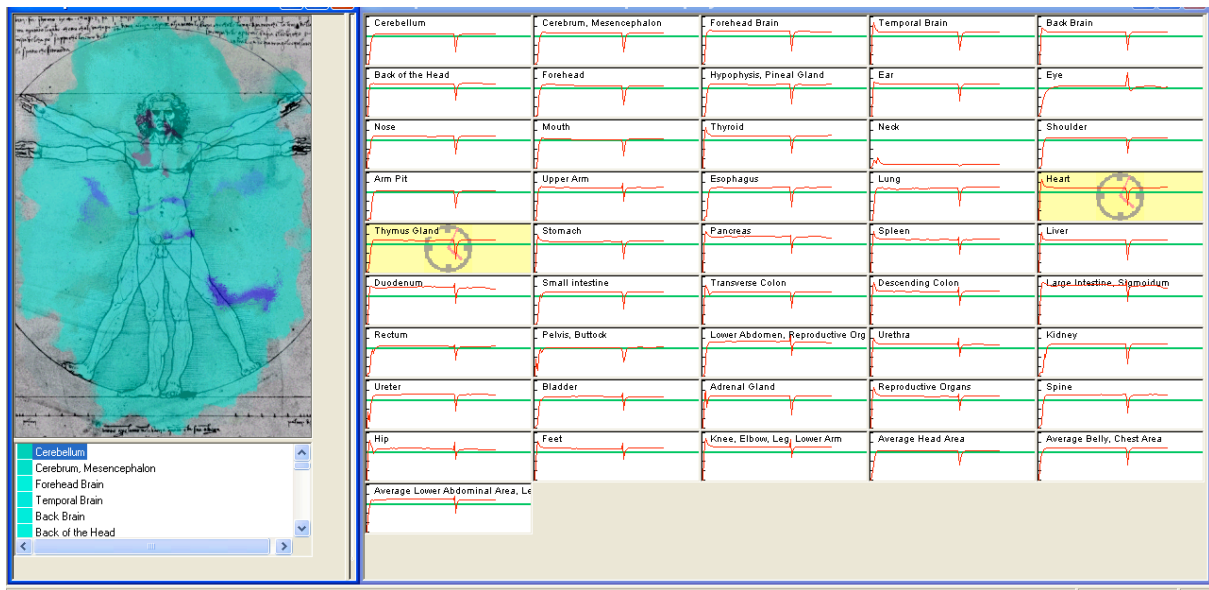

One of the questions that comes up in environmental balancing is whether or not the energy qualities introduced in an environment can balance an individual independent of anything else that they might do in that space. A demonstration of the effect of the BG3 was created in a project in which a commercial aircraft was fully balanced using the BioGeometry protocols (i.e., every aspect of the structure of the aircraft was imprinted with the BG3 quality). Aura assessments were done outside and inside the aircraft and the figure below shows the increased state of balance of the personnel outside and inside the airplane. The BG3 environment of the aircraft itself balanced the body systems of the users.

Test on Crew Personnel 2 Outside the Aircraft

In the above diagram and colour coded image we see the state of the person under normal ground conditions (which are much less stressful on the body compared to standard aircraft conditions). The green line in the graph indicates the state of balance of electrical organ function, and is represented by the green colour around the body in the visual description on the left. Violet indicates under activity, while red indicates over activity. The lower graph, which is a test of the same crew personnel 2 inside the aircraft, shows an ideal state of balance that is rarely achieved even under normal circumstances. It indicates a very healthy environment inside the aircraft.

Test on Crew Personnel 2 Inside the Aircraft

(P.S. The little v drops in the graph are due to hand movement off the sensors.)

The above testing clearly indicates the positive results of the BioGeometry™ energy quality upgrade of the aircraft.

All of these examples show how the creation of a spiritual energy pattern associated with an archetypal source, the Center, can be created and utilized for the enhancement of many different biological systems. The BG3 is an universal subtle energy quality, found in all biological systems, including all the centers of the human body, and is a powerful energy field to introduce into environments—it *resonates with people and any intention they might have to become more balanced themselves*. It is present in all spiritual practices, enhanced in acts of healing and prayer, and when present in an environment, feels both invigorating and relaxing. When part of the ‘matrix of healing’ that optimal healing environments, hospitals and clinics, hospices, spiritual and religious centers, spas, therapists offices, and our personal living spaces, are attempting to create, it fully supports and deepens any efforts anyone might be making to promote balance.

Notes and Bibliography

1. One example of that is how sacred sites throughout the world are being treated as tourist attractions and normal living environments (e.g., Sedona, AZ). The purity of the sites is degraded by the many activities that take place there that are not sacred and the energy of the site itself cannot overcome the negativity being imprinted there.
2. An example of these programs is the Group Health 'Clinicians Coaching Program' developed by the Samueli Institute, and another being taught in the Health Coaching program at the Center for Spirituality and Healing at the University of Minnesota.

12. There are an infinite number of qualities in the natural and spiritual world and each ancient system of architecture and geomancy focused on the ones that their culture felt important. The fundamental natural or earth qualities (earth, air, fire, water) feature prominently in Traditional Chinese Medicine and Feng Shui. Spiritual qualities, often associated with Gods, beings, angels, & saints, were replicated in church architecture and church music. Qualities are the actual 'language' of the natural and spiritual world and all living systems 'talk to each other' through

qualitative resonance. The science or physics of quality, a complement to the more established quantitative sciences, has a long esoteric history going back to Egypt and Pythagoras, and has been more recently developed by the French Radiesthesia schools and BioGeometry. In that tradition, qualities are detected by the human energy system, but measured with calibrated pendulums that resonate with specific qualities. It differs from dowsing in that the pendulums are calibrated to particular frequencies/qualities—eliminating a source of the subjectivity in mental dowsing—but is similar in that the sensitive human body is the instrument of detection. These calibrated instruments offer a way to interact with energy qualities, assess their presence, and study their impact on the physical world.

19. Interesting research work in this area has been done by Dr. William Tiller and can be found on several websites, including: <<http://www.spiritofmaat.com/archive/mar2/tiller.htm>> Tiller has demonstrated that intent can be electronically recorded, transferred to another location, and affect the quality of the distant environment with that intent by activating the circuit. There are also a number of products on the market for environmental balancing that utilize either the

holographic or digital recording of blessings and prayers to change the qualities of environments.

20. Besides the book by Dr. Ibrahim Karim (note 13), BioGeometry has two websites <http://www.biogeometry.com/> and <http://www.biogeometry.org>

21. This is one of Karim's most profound discoveries. He began finding the energy qualities that make up the 'BG3' in his investigations of sacred sites and ancient Egyptian temple architecture, and then found that they were present in all centers and rotational phenomena that implied a center. The Center in BioGeometry is viewed as a doorway to the divine and a source of many spiritual qualities – the BG3 are an example of those qualities. He also noted that rotational forms could be imbedded in architectural design to enhance the environment, and then began creating shapes based on those forms. He researched the many ways in which this energy signature was able to alter the qualities of radiations and bring the energies associated with 'centering' all throughout an environment, and change the impact of the environment on its inhabitants—they, then, become more centered.

22. You can find a paper on research in BioGeometry in the resources section of the website: <<http://www.creatinghealthyspaces.com/>>

23. The patented shapes developed by the BioGeometry Institute can be created on medallions for personal or research use, used on 'emitters' for environmental balancing, or shaped in jewelry for a mix of energetic balancing and cosmetic adornment.

24. There are a number of ongoing projects in medicine to replicate some of these observations. The stability of the results has been shown to depend on whether or not the patients can avoid further exposure to electrosmog or detrimental earth radiation after they leave the hospital. As with many healing efforts, harmful exposures can decrease the beneficial results.
