Press review and letters to the author on the first edition:

"Initiation to Dowsing"

Hardehot Plage (Letter).

(Pas-de-Calais) June 24, 1935.

"..... With great interest, I read these pages, full of common sense and knowledge. You knew how to develop many floating theories and you indicated with precision the contacts of the dowsing with the known scientific laws. No one had hitherto penetrated so far into this vast and promising field. We enjoy reading you, we feel the man who has his subject and masters it. Of all this be proud, of all this be thanked Deign to accept...

A. BOULY,
Bachelor of Science.

The future of Puy-de-Dôme (Article).

"Initiation to dowsing..." Under this title, a booklet full of interest has just been published. Reading it, one easily realizes that the author knows very well how to capture the waves that emerge from water, minerals, metals, etc., even hidden underground or made invisible by distance; and that he excels in interpreting the reactions recorded by the human body, amplified by the rod or the pendulum.

Those who are interested in dowsing, but who are not used to picking up waves, will find the most useful information in this work, in particular the series figures, obtained by various authors. I strongly praise Father Marie-Bernard, for citing other dowsers than himself. This fact is rare enough to be noted.

Those who are already initiated into dowsing find **notions** no less useful there. Among those who easily handle rods and clocks, how many are unaware of physics, chemistry, geology... If they read this booklet, they will understand the importance of these sciences and will take a liking to reading the special works.

To the dowers already able to prospect, this work will not be useless; they will find there warnings which will enable them to avoid many errors.

With regard to the work on the plan, which arouses very passionate disbelief, Father Marie-Bernard, known and esteemed by many inhabitants of Clermont, gives explanations which have the merit of being understandable.

Will dowsing which is highly appreciated today be useful to society? I am convinced of it... Doesn't it present serious disadvantages for those who deal with it without prudence or measure? The future will tell. »

Marc DOUSSE, *Clermont University
Library.*

8, rue Lagarde, Paris (Letter).

"My Reverend Father... Thank you... I enjoyed the first part a lot... I would have liked to see the second part more developed (*this gap is now filled*).

Anyway, it's a beautiful and good book that will help beginners.
With my respectful respects. »

A. FIRED,
*Doctor of Science, Laureate of the Institute,
Honorary Director at the Ecole des Hautes
Etudes
(Museum.)*

A Superior of an important Religious House (Letter).

"A real little masterpiece... your work!"

There, in this attractive brochure, there is a real treasure trove of ideas, unforeseen horizons, suggestions... and in a stylish presentation that makes everything easy... In your way, there is - Stone l'Ermite, by the Abbé Moreux... *with the added bonus* (pardon us !) of depth... we must push — *ad majorem Dei gloriam* — this science.

The pamphlet is on the reading table and our Fathers, deeply interested, send you their congratulations with me."

JJ

La Croix, April 30, 1956 (Article).

" Many people these days take great interest in the experiences of dowisers. They will therefore enjoy and profit from reading this abundantly illustrated brochure, in which the author *succinctly* and clearly explains the conditions for success. The method of the dowiser shows us working in the laboratory, prospecting the ground, studying the subsoil, the waters, the ores, the metals, the caves and underground caverns.

Conferences

Here are now some echoes of the many conferences v. on dowsing"
given by the Author, across France:

Avignon..., La Louvesc..., Gap..., Lyon..., Annonay..., St-Claude..., Toulon..., La Seyne..., Everything..., St- Malo..., Le Pouliguen..., Riom-ès-Montagnes..., Vals-les-Bains..., La Bourboule..., Saumur..., Baugé..., Angers... , Mazé..., Givors..., Belleville..., Ligny-en-Barrois..., Gondrecourt, etc., etc...

Gap, March 25 , 1934.

" Sunday evening, March 25, in the Salle Jeanne-d'Arc, in front of a large and chosen audience, a conference on ray thesis was given by Father Marie-Bernard.

The subject, of undeniable scientific interest, had taken on, due to certain circumstances, a topical character.
The attraction was great.

Scientific interest and curiosity were fully satisfied.

The speaker posed the problem scientifically and in his presentation distinguished between certainties and mere probabilities. In front of his very attentive listeners, eager for details and eager to see some experiments, the speaker made known **to** which studies he had applied himself and **the** conclusions

that he had learned from them in the field of chemistry, geology , hydrology, botany and also agriculture, etc.

Monseigneur J'Evêque chaired this conference. He made a point of thanking the speaker and the audience. He highlighted the disinterestedness of the RP who does not hide his secret, but on the contrary divulges it and who knows how, on occasion, to use his art for the conversion of souls or for the benefit of charitable works . A collection made during the session was assigned to the free schools of the city of Gap.

The Little Courier (Article).

November 29, 1934.

Sautnur... Under the honorary presidency of the General Director of the Cavalry School and in the presence of a large number of Senior Officers and Students of the School.

"Tuesday evening, took place in the archi-full village hall,
- a conference on dowsing by the RPM-B.

We see how much this increasingly popular science finds credit with the public and how many private individuals are keenly interested in it.

The PM-B talk. moved his audience and captivated him with all the unexpected he discovered to his neophytes and for so much dowsing is only in its infancy.

We are trying to free it from its medieval superstitions, to modernize it, to give it a scientific look. Now we can no longer confuse sorcerers and dowsers, because these two words are far from being synonymous.

Tuesday evening listeners are therefore once again enlightened on this art of the rdbomancer full of promise for the future and we do not know where this science will stop which, every day, leaves its empiricism to comply with rules. scientists.

It was therefore an instructive and captivating evening. »

At *Angers*, a lecture on the same subject was given to Catholic gadzarts.

At *Tout*, hall of the Hôtel de Ville, there was the same enthusiasm.

Noted alongside the lecturer: Mr. Jacquemin; battalion commander Ragonnet, vice-president and in the seat

Mrs. and Mr. General Pichot; Duclos, commander-in-chief; Mr. Miller, mayor of Toul and many civil and military personalities.

In *Saint-Malo* the presentation of the speaker was made by Commander Joly.

In *Avignon*, *Lyon*, *Le Pouliguen*, etc., numerous and chosen audiences everywhere revealed the growing interest in dowsing in intellectual circles.

In *Lille*, initial center and cradle of scientific dowsing, an intimate meeting, bringing together the best elements of society, brings together, for an intimate chat, all the professionals of the rod and the pendulum of the city, around the Speaker. We exchanged useful and hopefully fruitful ideas for a more judicious and more unassailable practice of this art.

Press Review (Continued).

As we go to press we receive the following review:

Initiation to dowsing, by RP Marie-Bernard, in collaboration with Mr. Varagnat.

"In a brochure of a hundred pages, the author makes accessible to the layman, in a simple form, the general principles of dowsing.

The book also recalls various practical notions of hydrology and geology and gives, gathered in tables, useful indications based on the method of - colored rods and pendulums specific to the author, known under the name of Color-Detect.

As its title indicates, this book is above all intended to give the uninitiated a foretaste of a science that many people wrongly consider mysterious and reserved for specially gifted people. »

Father Vincent.

In the Conquest of the Waves

COMPLETE MANUAL OF RADIESTHESIA

Illustrations and collaboration of Claudius VARA6NAT

“Science is a herald of the infinite, a messenger of mysteries; it is evocative of mysteries and not explanatory, it is full of enigmas, insoluble for the most part, but which are not obscure enough to be indifferent to us and which seduce us by the penumbra, strewn with sparks, where we see lee moving.”

(P. TERMIER, of the Academy of Sciences,
The great enigmas of the Earth, Flammarion,
_____p. x 5.)

LYONS
V Printing of the African Missions
150, Hearts Gambetta, 15th

ADVICE TO THE READER

In 1935, we published a booklet entitled: "*Initiation to dowsing*", its modest format, its reduced price, its observations, of a technical nature and meticulously controlled, immediately acquired the favor of the public and especially that unappreciated. before a competent jury.

A provincial inspector of University and Public Libraries was not afraid to write: " The work of PM-Bernard ... caught the attention of the library staff, who asked me to include it in the program of forthcoming conferences and on the official lists. ... Very willingly, I will recommend this *remarkable* work... I have no doubts about its distribution" (g January 1936). (Belgium).

The benevolent reception given to our opusculum determined us to continue the task undertaken and to enlarge **this** volume. From now on it is presented to the reader under a new format and title: " Complete manual of dowsing... To the conquest of the waves. »

To better preserve its scientific value, we refrained from mentioning certain assertions, certain experiments which, in the order of current sciences, would rather seem to take the form of charlatanesque revelations. If ever the scientific dowsing, after a meticulous control, judged opportune to annex these discoveries, we would always be in time, by making them ours, to

incorporate into this manual. Currently, it seems to us risky and premature to do so.

I will even add that in the experiments mentioned here, controlled by competent men, the percentage of successes is far from being fully convincing, however satisfactory it may be all the same.

This did not prevent us from delivering our research to the public. May other emulators in good faith, with us or without us, continue and strive to control our work, using of course our methods and our devices, the only rational condition for real control. We sincerely hope so.

Our joy would be at its height, if by the union of the efforts of all and the competence of each, we managed to shed a little more light on this science, promising so many marvels and so attractive (1).

Easter 1937.

(1) The forward Cardinal Lépicié, in his remarkable work entitled *Le monde invisible*, wrote:

- How marvelous are the forces of the vast universe, spread out before our eyes, and how great is that part of the field of human energy which has not yet been explored. In reality these forces and this energy are so great that it would be unscientific to always have recourse to the action of invisible and spiritual agents to explain all these phenomena . We can maintain with truth, that some at least of the phenomena attributed to spiritism, can very well be attributed to the latent and still “unexplored forces of Nature” (quoted by Deltheil).

And elsewhere the same cardinal, in the same volume pp. 469-492. “Many of the phenomena considered as telepathic” “have a completely natural reality” . .

FOREWORD

*Halfway through the reader, you know that waves **are** circulating around you: light and sound **waves** first of all.*

For example, you are on a walk; suddenly the storm breaks out, a lightning crosses the clouds, you count the number of seconds that elapse between seeing the lightning and hearing the thunder and you reassure yourself and say the storm is far away, because it so many seconds passed between lightning and thunder. For what ? The light of lightning travels 300,000 kilometers per second, while that of sound only travels 340 meters. One goes faster than the other. All you had to do was multiply 340 by the number of seconds you counted to get the distance of the storm.

Now on the water you look at a stone being thrown into it. A whole commotion occurs on the surface, circles form and move, these are still waves .

*Instead of looking down, look up to the telephone and telegraph lines; you see metallic threads stretching out and wiggling like ocean waves...until everything calms down. This agitation, these are still waves **which** are produced by these vibrations.*

Moreover, on the bell the clapper strikes, tunes resound. These are waves that escape.

So it is with everything. The whole of nature seems to be but a perpetual undulation, an incessant agitation; even the water molecule, which, under the ultramicroscope, appears in an intense whirlwind, is agitated.

It exists in broad daylight and also in darkness, Rekindle your memories. Perhaps you had the misfortune to undergo an operation painful for your body - and for your wallet too - before you may have entered a dark room. There, without anything detecting your presence, suddenly a ray left, penetrated your body, illuminating your bones, your digestive tract and the doctor, on a photographic plate, without your knowledge, recorded all the mystery of your organism. interior. He discovered your hidden evil. Radiography is the effect of waves.

Even more mysteriously and from a distance, you spoke in front of a microphone which recorded the characteristic vibrations of your voice, your song, your speech. These vibrations were transmitted to an antenna crossed by a high frequency current. Your voice carried on a wave travels through space. The ether transmits it faithfully, more faithfully even than the metallic line of the telephone. It is received by all the antennas of the world which record it. So what a joy for you, in your spare time, to be able to sit down in front of a radio station and hear the most illustrious musicians, singers, orators in the world in their finest repertoires.

They are always waves. Here are more mysterious - ones: dowsing waves.

How to design them?

They are emitted by Ions the bodies. They radiate

ode all objects: water, minerals, photos, treasures buried in the earth, microbes, animals, men, etc...

They allow matter, already solid, liquid and gaseous, to be considered in a fourth state: irradiation, radiation.

^{us} both perception is a 6th senses and their manifestation is no longer of a luminous, calorific, olfactory, sapid, sound order as for our other senses, but it is of a mechanical order with, as external revelation, a rectilinear or gyratory movement amplified by the rod and the pendulum.

But let's not anticipate... (i) To better study this phenomenon, let's go to the dowser who, in his own way, will put us in touch with this unknown world and; new.

Don't be begged. Let's enter.

(i) From the beginning of this study we like to make our own this reflection by Pierre Termier: " Most men of science have, during their lives, only fleeting flashes or pale reflections of this superhuman joy (the joy to know). The truth they pursue eludes them; they glimpse it through the mists, they cannot grasp it; and it is at most, if it is given to them to specify, here and there, a few details of knowledge. All the same, let's not pity them! It remains for them to have coveted great joy, to have lived in enthusiasm, in hope, in dreams, an infinitely disinterested dream . (P. Termier., *The Joy of Knowing*, p. 18, Desclée de Brower and C*«).

This ambition, modest and sober, was ours during the composition of these pages.

FIRST PART

THE SOURCER. — HIS METHOD.

RULES OR CONDITIONS FOR SUCCESS

— Excuse me, sir, I may be disturbing you. Excuse me.

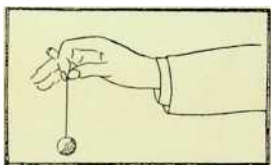

•— At all, my friend, delighted to see you. I was just in the middle of wave work. No doubt you have heard of my research. I will tell you a word about it. Please follow me carefully, and even if it pleases you, operate with me.

Not everyone succeeds. There are strict conditions for success.

Previously, learn to hold the wand. Here are the three positions of it, at rest, at work.

As for the pendulum, it will suffice to let it hang between the thumb and the index finger, along the suspensory thread

(i) Many dowsers no longer need rods or pendulums. They perceive the waves, at their fingertips, so to speak. These receptions result in tingling sensations, hot, cold, lukewarm currents revealing the state of the people and things prospected.

Know that the movements of the rod and of the pendulum are of three kinds: *oscillations*, *gyrations*, *beats* or *jerks*.

Oscillations, that is to say rocking on a vertical plane, reminiscent of the comings and goings of a seesaw. It is a series of sustained impulses. These oscillations are not always symmetrical; the pendulum, drawn away from its fixed meridian, pulling sometimes to one side, sometimes to the other, seems as if carried away or driven back by an invisible current. Sometimes it even comes to a halt, as in the presence of a barrier wall, and crosses across, parallel to the obstacle encountered.

The amplitude of this movement depends both on the mass of the radiating body and its radiant power, on the proximity of the source of radiation, on the precision of the adjustment and on the fluid power of the operator himself.

Girations is a rotary movement of the pendular ball around a suspension thread. For the rod, it is a whole turn, around the fingers, of the ligated strands, with or without sleeves, because some dowsers let the rod move freely between two tubes that they hold in their hands (these tubes are called sleeves).

The circumference described by the pendulum at the end of the thread has the shape of a cone. The fingers that hold the wire form the top.

The direction of rotation is from right to left (negative —) or from left to right (positive +).

Beats, jerks. Pendulum and rod sometimes jump between the fingers, it is the beat , very clear indication that one is close to the field of radiation or that one has just left it - absolute immobility would be the index that 'we work outside the radiant field.

In addition to these well-characterized movements, there are other more curious ones, *deviations, bizarre* curves of the rod and the pendulum as if to match the shape of the objects sought, the direction of a current . A skilled dowser keeps an eye on all these movements, revealing many secrets.

To complete these pendular notions, here again are the observations, collected in a very scientific book, recently written on this subject . (*The pendulum, by Doctor A. Lacour*).

The author first noticed that on a horseshoe magnet the pendulum had five characteristic movements:

1° An N.-S. above the North Pole (positive +); maximum point of influence;

2° A gyration on the South Pole (negative —);

3° An E.-W. on the center line of the magnet, or neutral point;

4° An oblique swing in the intermediate zone between the North Pole and the median line. — This is the minimum point of influence;

5° An ellipse between the South Pole and the median line .

The author has also noticed the renewal of these same phenomena on the hand placed

field or vertically, and along the entire human body.

On the dorsal part of the hand as on the dorsal part of the body the pendulum oscillates as well as on the North pole of the magnet (swing N.-S.)

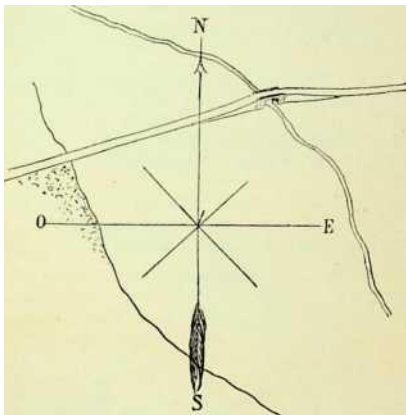

On the palmar part of the hand as on the front part of the body, the pendulum swings (negative South pole).

In front of the middle finger or on the midline of the body the swing is E.-O. The rod also reacts in the same direction as the pendulum, so that one can conclude: rod and pendulum seem always charged with positive fluid and to behave in front of the bodies like the ball of the electroscope... oscillation N. -S. on positive bodies, gyration on negative bodies — - balancing E.-O. on the neutral median line — the obliquity reflects the minimum of positive influence — the ellipse, the minimum of negative influence... Always charged with positive fluid, the pendulum discharges negative fluid through the pendulum - sant, which forms a line of land.

You now know how to hold the rod and the pendulum, you know their various movements , will you be a good receiver of these waves? - Yes, on one condition is that in addition to the gift, you scrupulously observe all the rules required for success. Here are the most important:

Orientation (i)

Please take the *compass now and orient yourself* . In order to perceive more easily

(i) We call these requirements of the dowsing *rules* rather than *laws* because several do not yet present a character of absolute universality. Their rigorous necessity seems subordinated to the personal power of the dowser, to the value of his pendulum or his rod, to his psyche.

Nevertheless, these conditions, properly applied, will help the - neophyte and average dowser to detect the radiesthic waves faster and easier. Thanks to them the initiation will be more complete with the secresies of the rod and the pendulum.

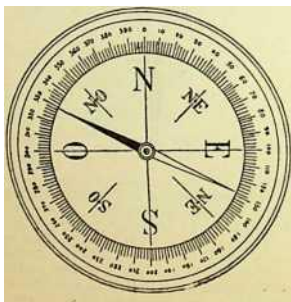

the wave of the hidden bodies, of the waters, of the ores, of the metals..., it is essential to place oneself in a *good direction* and, as one might say, in their *trajectory*. This is the reason for the TSF frame which is oriented in the direction of the source of the waves.

This is also the reason for the orientation in ray thesis.

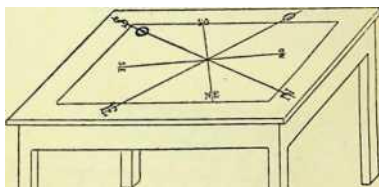

It is strictly required in dowsing to know where one is in order to situate the impressions that one receives, their point of origin or departure.

The dowser, like the sailor, the airman and the artillery officer, is inseparable from the compass .

You see mine. She is there on the table. I even have two, one very simple, the other an alidade compass from General Ferrier.

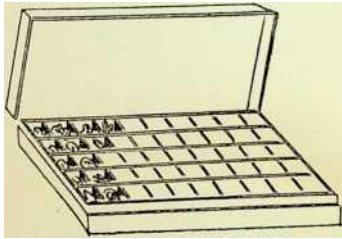

When one seeks the radiation of a body avoid oneself to place oneself usually in the magnetic axis N.-S. (I sometimes recommend it, however, in cases of difficult and rapid prospecting where the operator absolutely needs the amplification of waves by telluric and solar rays, see further p. 28.) Usually we will work better, without fatigue and longer, the operator's body facing West.

I therefore fix on my table, in my room, on the ground that I am examining, the *four cardinal points* and even intermediate orientations (south-east, south-west, north-east, north-west) and I wait for the arrival of the wave.

Witnesses (i) and resonance

"That done, take this *witness*." I call witness the body identical to the one whose wave I want to perceive (2). I have a whole range of them in this box (water tubes of all kinds: polluted water, drinking water, mineral water, ores, metals, etc.) (3).

(1) *Cookies*. — In medical dowsing, beware of witnesses manipulated by others. They easily become impregnated with foreign parasitic impregnations and can falsify all the data.

Also there may be great causes of error in studying the powders of animal organs to seek their suitability or disprovenance in relation to man.

Between the two there can sometimes be absolute opposition .

(2) *Sounder, revealer, tuner* are synonymous with *witness*.

(3) Lei colors can serve as a witness.

Witness in hand, I am going to establish a *resonance* , that is to say that my witness, which vibrates like hidden identical bodies, is going to awaken in space, by resonance, a wave similar to that I look for ; after hanging it, the wave emitted and the wave perceived will stir my pendulum and my wand.

The witness, by his own resonance, seems to make a wave call, just as in the piano, the struck note awakens harmonics or as in the phonograph any unwinding of the disc makes resonate the tunes already recorded or in TSF the transmitter awakens waves in the receiving station.

From the greater or lesser clarity with which the pendulum and the rod will trigger, I will conclude with the lesser or greater similarity of the recorded wave with the body taken as witness; I will conclude with a relative or absolute identification .

This phenomenon of resonance is at the base of all the dowsing manifestations... in fact it is the pendulum and the rod which reveal it but it is the brain which first perceives it, records it and communicates it to the muscular reflex which then translates it mechanically.

Many causes, we will say it later, can articulate or disturb this resonance, either by distorting the cerebral mechanism (vg. - *by distraction*), or by hindering or paralyzing the - nervous triggering (vg... *parasitic radiations*) and creating opposite effects. At any rate,

we strongly advise against all competitions and all dowsing contests, maliciously or clumsily organized by an incompetent jury ignorant of dowsing. Don't let the naivety of our neophytes be taken in, we don't do photography or television, disregarding the laws of light... 'surrounded by a thousand machines with parasitic waves... one does not also do dowsing on a fairground or at any time, and under the most uncertain conditions of success. This, we understand it for the photographer, the wireless operator... it would be necessary that all the dowsers, by their prudent way of acting, manage to make it understood by the public. Even with these essential guarantees, the best dowsers will still record failures. Let them not be discouraged. One does not arrive at a leap at the immediate discovery of a "sezame, open yourself" revealing all the secrets. All sciences had difficult beginnings. Why would dowsing be the only exception to the general rule?

Amplification by solar and magnetic rays

Friend, you were lucky to arrive at the propitious hour; it's noon, beautiful sun, very clear sky, no clouds, no wind, no rain,

clear atmosphere. The waves are waiting for us. They are in full effervescence and agitation.

This is because the wave, whether it is perceived in the morning, at noon or in the evening, does not have the same *amplification*.

We already know that in TSF the Hertzian wave , detected by the galena set, needed many amplifiers to be heard perfectly. Finally, there was the trigrid lamp, usually called “Audio”, it is an amplifier. Already the electromagnetic current of the antenna on which the sound vibrations were superimposed had greatly aided in this amplification.

The dowser also needs amplifiers for the reception of his waves. These are *solar currents* , daylight and *telluric* or *magnetic currents* . (A full day is equivalent to 6,000 candles.)

When he works at noon, facing south, the dowser sees the waves increase. He captures them better.

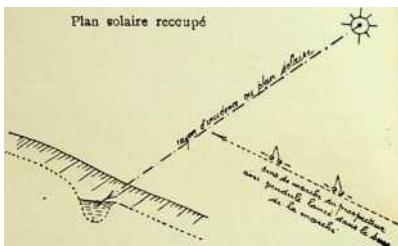

However, at night, a simple electric bulb, lit above the head of the prospector (i), will suffice to awaken the extinguished solar wave or the weakened magnetic currents (2).

(1) No spectral field would appear if the bulb were placed on the work table and illuminated the body under observation from a reduced angle.

(2) According to H. Mager, one could not say that the bodies radiate only in contact with a light, there are also some bodies, the rare gases (uranium, nion, argon, krypton, xenon), which radiate without any contest apparent day and night. “Cf. “A new science, La Radio Physique”, Page 149.”

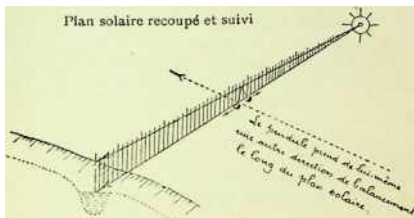

Radius of incidence or solar plane

'You don't suspect that at this moment, between the sun and the body coveted by the dowser, there is a mysterious exchange of real invisible emanations. Let's try to penetrate timidly into this intimacy and surprise the warm caress of the sun on the body we are looking for.

Solar waves bathe the whole earth. Of these rays some stop at the surface of bodies: luminous waves, heat waves, etc., others traverse the earth; few bodies are opaque to them; it is precisely these penetrating rays which are going to touch the hidden bodies that must be grasped. We will do this by cross-checking them. They constitute like a radiant beam, an invisible barrier which connects the sun to these bodies.

I'm there. You see, my wand has turned, my pendulum has swung along this wall in the direction

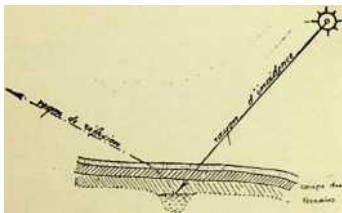

of the sun and the body that I am looking for. Let us turn our backs on the sun and follow the movement of the pendulum; it just leads us over the body.

He stops. It is the dead and terminal point of the radiation.

This ray, this radiant beam intersected, then followed, is like a *ray of incidence* on the hidden body which forms a mirror. It is the *solar plane* that I use so much in the search for bodies. Moreover, many dowzers have already used it, among others, these two remarkable priests who are called Abbots Bouly and Mermet.

Reflection radius or azimuth of bodies

Under the warm and luminous caress of the sun, the body touched manifests its joy and, however hidden it may be under the earth, it throws into space a double radiant beam, one goes towards the sun and it is

his grateful thank you, and the other goes towards another point of space, at an *angle of reflection*. let's call it

"*reflection ray* » although it is most often refracted, according to the density, the weight, the nature of the basements it crosses.

M. l'Abbé Mermet has designated it under the name of fundamental ray.

The search for this ray, characteristic no longer only of the presence of the body but of its nature, is essential to discover.

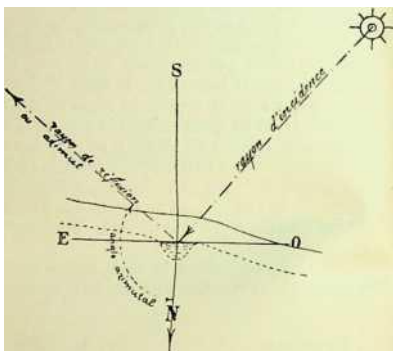

The fundamental ray is a horizontal wave ray emitted by the earth's magnetic field of the body. It forms with the line N.-S. by its spacing or its curve a special and specific angle. It is in a way the result of magnetic energy, exerted on the body, carrying it towards a well determined meridian. It is detected starting from the North either by inclining towards the left or the right, or by following the movement of the hands of a clock or the opposite direction with the pendulum. (*Correnson*).

We find it like the solar plane by intersecting it (i); and having crossed it, descending it

(i) Beats. — Before reaching the vertical of the water or of the bodies sought, many dowsers notice on their rods and on their pendulums jerky oscillations, similar to beats.

Wouldn't these beats be like an interference of two close frequency oscillations, around the coveted body? We know in fact that a beat is the resultant equivalent to the difference of the interfering oscillations and on the other hand that the amplitudes of two slightly different oscillations are added or subtracted at each half-period, giving as resultant an oscillation of frequency equivalent to the difference of the interfering oscillations. Isn't there a similar phenomenon in dowsing?

like a river that will lead us to the body sought.
 The fundamental ray surely leads us to the vertical of
 the body sought. This vertical is not necessarily the
 exact center line that separates the angle of incidence
 from the angle of re

bending. Sometimes the angle of reflection is refracted
 instead of reflected and its curve is not perfectly equal
 to the ray which produced it (ray of incidence). This
 offset must be monitored so as not to falsify certain
 data, in particular that of the depth. In general this
 median line is also distant and from the

line of incidence and of the line of reflection when it crosses homogeneous media. It is no longer so in other circles.

Also the fundamental ray is almost the only one which is perpendicular to the body and the shortest: The reason is that the dowsing wave does not behave differently than the light which propagates in a straight line and with the maximum intensity. i.e. 300,000 km per second. (Correnson) (1).

Here are the azimuths of some bodies, according to Mager and Turenne.

MAGER

West — Black = Calcium, Bismuth, Arsenic, Chromium, Silicon, Carbon (all positive +).

N.-West — White = Rhodium, Hydrogen (positive +). Mercury, Cadmium, Manganese, Oxygen (negatives —).

North — Purple = Antimonium, Cobalt, Neon and Nitrogen (positive -I-). Anthenum, Cripton, Gallium, Chlorine (negatives—).

BORN. — Blue = Nebulium and Magnesium (positive +). Phosphorus, Aluminum, Sodium (negatives —).

East — Green = Strontium (positive +)• Iterbyum, Sulfur (negative—).

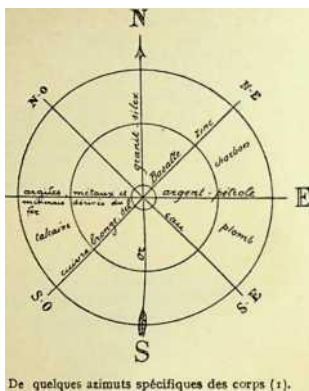

S.-E. - YELLOW = Osmium (positives +). Silver, Zirconium, Iridium, Pelladium, Nickel, Iron (negatives —).

South — Red — Barium (+ positives).

Gold, Zenion, Argon, Ictium, Glucinium, Copper, Lithium (negative —).

Southwest — Gray = Pewter.

(1) We cannot recommend too much the reading of this author, clear and methodical, thoroughly possessing his subject. We owe him a lot in the improvements of this first part . — Correnson J. — Elementary treatise on physical dowsing

TURNNE

$h = 13$ — *Sponge*. — Hydrogen, Helium, *Lithium*, Glucinium, Boron, Carbon, Nitrogen, Oxygen, Fluorine, Neon, *Sodium*, Magnesium, Aluminum, Silicon, Phosphorus, ⁷⁷ • Sulphur, Chlorine, Argon.

$h = 19$. — *Potassium* -, *Calcium*, Scandium, Titanium, Vanadium, Chromium, Manganese, Iron, Cobalt, Nickel.

(1) Lenz's law, known as the law of equilibrium.

A thousand theories have been given to explain the mechanical movement of pendulums and rods. Perhaps we could link the origin of these movements to Lenz's law, which is formulated as follows:

"The displacement of an electric current or of a magnet situated in the vicinity of a closed circuit, develops a

- A «= — *Orange*. — *North* — Copper, Zinc, Gallium, Germanium, Arsenic, Selenium, Bromine, Krypton.
 = 5° — *East-Green*. — Rubidium, Strontium, Yttrium, Zirconium, Columbium, Molybdenum, Manganese, Ruthenium, Rhodium, Palladium.
 A => 55 — *Silver*. — Cadmium, Indium, Tin, Antimony, Tellurium-Iodine-Lesum, Barium, Erbium.
 A.62 — *Blue*. — Thallium-Ytterbium, Tantalum, Tungsten-Osmium, Platinum.
 A.68 — *Indigo*. — Gold, Lead-Bismuth-Polonium.
 h. 80 — *Purple*. — Radium-Actinium-Uranium.

OTHER AUTHORS

According to some authors, the azimuthal angles of paramagnetic bodies would range along the line N.-S. of the disc on page 36, towards the East — and those of the diamagnetic bodies, towards the West. — The gray, black-white colors would follow the radiations of the diamagnetic bodies, (towards the West) and violet, green, yellow-orange, red, those of the paramagnetic bodies (towards the East).

For other authors the line of demarcation of the colors would be, along the line E.-O. the reds would radiate along this line towards the South and would be positive — the violets towards the North (Mellin-Mager), and would be negative. For Turenne and Lesourd, it would be the opposite.

We can only explain these contradictions by the fact of inverted polarities among the dowsing operators, a phenomenon which, by inverting their data, also inverts all the results of their examinations. It's unfortunate. In the eyes of the uninitiated, there are shocking * and disappointing oppositions.

Induced current in the opposite direction to that which would have been capable of producing this displacement, in other words a current which tends to oppose the movement produced. » The reversed reactions that we indicate in the table p. 33 would they not be of this order, that is to say a return to equilibrium? The dowser's body here plays the role of a closed circuit.

The harmonics of the bodies (i)

— If you don't mind, dear Friend, having already discovered some planes of influence of the waves, we are going to enter others... do not forget the first two planes discovered... one in the direction of the sun... you have intersected it... the other in the particular direction of an orientation with a more or less pronounced angle deviation from the North-South line. Here are others that I will call the *harmonics* of the body... It is a whole series of awakened planes around the body or parallel to its banks and which will be points of reference for the research and the characteristic of this body.

Some bodies have many harmonics, 7, 8, 10 very strong and easily identifiable planes, others have only one or two, very weak, which must be grasped, going slowly.

What characterizes these harmonics is that the radiation perceived on them, in contact with them, is the same as that of the original and real mother vibration, that is to say that of the body. There is, however, a more attenuated intensity... the radiations of these harmonics gradually die off as one moves away from the body.

It's like a network of iron wires that encircle or run along the body, constituting enclosures for it.

(i) In TSF there **is** also the antenna **fundamental harmonic or very low frequency oscillation, and higher harmonics.**

What is called the ray of *sympathy* or *union* is only the bond uniting the harmonics with the fundamental ray and the harmonics between them. When one has once found it at the pendulum or at the rod, it suffices to allow oneself to be led by it. It allows us to join them. On our “*super detect* » the sinuosities of this line appear very clearly.

Other planes of influence

— You are amazed at all this agitation of waves. It is independent of you. Here are two other manifestations that you can create yourself.

Recalling the law of resonance issued above, you know that all identical bodies vibrate in unison. Place therefore at a point in space, not too far from the body that you believe you have found underground, in a plane distinct from the two planes already located, a fairly large mass of a body identical to the one you are looking for in (a water bottle for example, if you are looking for water). Place it in the east if for example the sun is in the south and the azimuth of the body in the north.

Barely, wand or pendulum in hand, you will have, towards the east, intersected the line which joins the water bottle witness, with the hidden body, that your wand will turn or your pendulum will oscillate, also

although if you were on the solar plane or on the azimuth plane of the body.

Proceed as before and you will discover both the location of the body and its nature. Facing the sun if your concealed body is identical to that of the witness, you will have a clear triggering of the rod or of the pendulum; if the desired body is a little different, you will have a shift to the right or to the left.

If now in the place of the canister witness, you place a person sensitive to the reception of the waves, that is to say a more or less dowsing person, you will discover between him and the hidden body another plane of influence; by matching it you will have found a new plane of influence which will lead you like the others directly to the body.

The body sought is at the very intersection of all these lines or *planes of influence*.

It is on the basis of this theory of the planes of influence that we have been able to speak of the *triangle of union*, fertile in sensational discoveries.

Imagine two 20-franc coins on two different planes, at a distance... a bond of sympathy is established which binds them together. On this line of balance where their radiations counterbalance, oppose or unite, there is a dead point. The pendulum swings. At this point, if we place another piece of the same nature, the pendulum instead of oscillating, will swing...

It is this phenomenon of oscillation and gyration that will help us find a hidden body...

So create a line of sympathy between two known bodies. Find the dead point on this line. As soon as on this line and on the dead point a resonance is born, follow it, it will lead you exactly to the hidden body, which will reveal itself by a gyration of the pendulum.

The colors (i)

— You are surprised to move like this in a world of invisible waves. Wait, it will turn out to be absolutely luminous to your eyes.

The waves of the bodies captured by the human being are revealed externally on the rod and the pendulum only according to a scale of colors which goes from red to violet; thus iron radiates red, granite violet.

It is this property of the waves to irradiate at a color corresponding to the range of the spectrum which makes it possible to detect them with rods and pendulums of the appropriate color.

So take your red wand, if iron is around you, its wave will impress

(i) Let us therefore not forget that the conditions stated here, more particularly that of color, are not absolute. — Hence the many differences among the dowzers. You shouldn't be alarmed. Only one thing remains true: the use of color, despite the shift that can occur in the range recorded and revealed by the dowser.

your red rod which will turn — the same for the pendulum — and you will conclude: there is iron, there, very close.

The yellow wand will give you the clay, the white wand, the gold, the green wand, the copper, the silver, the bronze, etc...

In a summary table, we classify below, in synthesis, the bodies according to their color (i). (*See table opposite*). The color corresponding to the wavelength of the bodies therefore helps a lot in their search. (2)

(i) According to M. Mellin (quoted by M. l'Abbé Wehrlé).
 Violet indicates Nickel and radiates North .
 Blue indicates Y Silver and radiates North .
 Orange -yellow indicates Copper and radiates to the South.
 Orange-red indicates YOr and radiates to the South.
 Red indicates Iron and radiates to the South .
 Gray indicates Lead and radiates West.

(2) Telluric currents, v. above.

We speak several times in this work of telluric rays and currents (vp 29). How to design them? Wouldn't they be like induced currents created by a whole atmosphere, positive (the atmosphere) like the soft iron bar of the coil... or perhaps, are they like in telephony, the currents parasitic or “ return by land ” ?

Doesn't atmospheric and static electricity, against which we increasingly seek to protect ourselves in electrical installations, make a particular contribution to them ? We are simply lifting here a corner of the veil which hides these mysteries from us ; it is up to science, in turn, to unveil them completely!

Neutrality or non-polarity of the wave amplifying device

- What ! you seem to hesitate. Is your device not working? I forgot, in fact, to tell you that not every device is satisfactory. You have to have the right one in hand.

I have one. Look. It is made of neutral material, without any polarity.

This rule is as important as the color rule for perfect detection.

And you will understand it. Wave detection is totally based on the phenomenon of resonance.

Good resonators are bodies that are good conductors and bad resonators bodies that are bad conductors (bad conductors: glass, rubber, wood, ivory, whalebone, synthetic resins, coal, wool, ebonite , galalith, bakelite).

In the presence of a body identical to them, the bodies that are good conductors begin to vibrate in resonance with the body that resembles them and this resonance, in conformity with the body identical to themselves and not with the body that the dowser is looking for. , creates a formidable parasite in prospecting and falsifies all indications. Thus a silver pendulum will vibrate in accordance with the silver , if there is silver nearby and not on the water sought by the dowser. The dowser's psyche can sometimes modify this resonance , but not always effectively.

The only way to eliminate this parasite and this source of parasites is to take sticks and pendulums made with neutral materials, that is to say bad conductors and without polarity, that is to say without proper resonance.

For having ignored this rule of dowsing, how deceived by dowzers in good faith!

Color-detect rods and pendulums do not have this drawback, because their manufacture is based particularly on the neutrality and non-polarity of the materials used.

Call of waves, direct or indirect walk or direction of walk (i)

- Retrace your steps: I forgot to tell you the direction of travel (2) that the dowser must adopt to better capture the hidden bodies.

(1) For the direction of travel take into account what we said above about the color. There are variations among dowzers.

(2) Radiation in general goes in the opposite direction to the rotation of the earth. We seize them, going in the opposite of the movement of bodies — negative movement and positive movement.

This is also the case for the satellites and the cyclonic and anticyclonic currents in the two hemispheres.

The Sun, Mars, Mercury, Venus, the Earth are positive +•
Jupiter, the Moon are negative —.

Saturn is bi-magnetic. This electrical state must be due to their mineralogical constitution, as well as to their color.

(See Correnson).

Sun = gold and radium

Mercury = cinnabar

Venus = copper

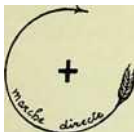

Moon = Silver

Earth = Barrium

Saturn = Lead

Indeed, it is recognized by certain dowzers, very scientific these, among others H. Mager, that the planes of influence of the bodies: solar plane, azimuth of the body, etc..., are not seized or do not reveal themselves. only in a special running direction for the dowser; that is to say that the dowser must move in relation to the body he is looking for,

+

rotating around it, clockwise (*direct* or *positive direction*) or counter-clockwise (*indirect* or *negative direction*).

And it is only by adopting the appropriate course that the wave of the hidden body clings, otherwise it does not cling — mystery of the waves! which we will perhaps explain one day.

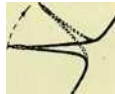

This walking can take place for the operator by actually moving his whole body or simply by walking his pendulum over the body in one direction or the other.

Wave response. Positive or negative reaction of the body

- Your pendulum or your wand passed on the body or around the body, like the hello of the telephone, constituted a call of waves. The called body responds... and its response is immediately translated by an attraction or repulsion of the pendulum or the rod, that is to say a rotation imparted to the

pendulum or stick in a well-determined direction like the previous direction of travel, direct or indirect, positive or negative.

Often this *reaction* or *response of the body* is a reverse movement of the initial march of the pendulum. Compare the data in the following table ■

TABLE OF WALKING DIRECTIONS AND THE CORRESPONDING REACTIONS: (i) + = clockwise direction for the pendulum, lowered from the rod.
— = counter-clockwise for the pendulum, raised from the rod.

(1) Certains sourciers ne trouvent qu'un sens de marche *vg.* direct, sauf pour le gaz, (M. Jacquemin, Toul). Les corps dont la réaction pendulaire, au lieu d'être contraire au sens de marche l'amplifie, tel le charbon, peuvent être supposés non inertes ou radio-actifs, à un degré quelconque, par le fait d'une combustion lente ou d'une désintégration.

Electro-positive or diamagnetic bodies have the sign
+.

Electronegative or paramagnetic bodies have the sign
-.

The fundamental radius of the positives is in the North, that of the negatives is in the South. For what ?

We can indeed consider the earth as a true magnetic compass which attracts bodies towards such and such a meridian, according to their polarity, or repels them.

The gap that differentiates them along the N.-S. constitutes their azimuth angle (fundamental radius).

When there is attraction, gyration is the sign. Repulsion results in oscillation. Coulomb had said it: like-named electricities repel each other—and those of opposite names attract each other. Here we have the proof.

The organs also follow this law of polarity , repulsion and attraction. Some are positive and others negative. The reason is that in our organs there are millions and millions of planetary systems in agitation (the cells) each dominated by contrary forces, centrifugal , centripetal, positive and negative.

The living cell just like the raw and inorganic matter remains the seat of a continuous vibratory movement.

Under the effect of this cellular agitation, living beings in turn emit electromagnetic radiation . It has been said that they were of the order of infrared. They are the ones captured by the medical thesis (again Correnson).

Wave direction: vertical and horizontal waves

From what we have just studied, it is easy for us to observe that the waves do not all follow the same direction, nor are they all carried along in the same movement. More than that, apart from their different azimuthal planes, they follow curves, some with a vertical axis, others with a horizontal axis.

Horizontal waves usually stop at 0.20 cm.

Vertical waves occur over the entire surface of bodies and can rise very high. They have the North pole + at the bottom, and the South pole at the top. Thus in the vertical metallic masses which conduct the waves like the lightning rod - it is the negative pole at the top which attracts the positive fluid of the atmosphere.

Wave length

Not only do waves have a particular curve and direction, but they also have a specific metric length.

M. Turenne has formulated the law: "there is, he says, on the magnetic field of waves (just like on the suspensory thread of the pendulum) a fundamental length and harmonic lengths."

A few wavelengths

Mr. Lesourd and several other dowzers gave wavelengths. They differ significantly from each other.

To what do we attribute these discrepancies? Probably due to reversed operator polarities. — Otherwise it is inexplicable that for MM. Mellin and Correnson violet radiates in the North with a wavelength of 0.41 while for M. Turenne violet radiates in the South with a wavelength of 0.80.

We will find these divergences in medical thesis. Obviously it is at first sight disconcerting... We strongly wish a device which universalizes the data and simplifies them. This device, we believe we have found it: it is the “*super detect*”.

This device not only amplifies the waves, regulates their direction of travel, but by slowing down their frequency makes them easily measurable in centimeters. Their field of activity does not exceed 0.60 cm. (either on the positive pole side or on the negative pole side) and, even after the 10th cm, we are persuaded that the perceived resonances are only harmonics of the bodies.

Finally, let us note that electrically supported radiation is stopped by glass, cardboard, paper, silk, gutta percha, porcelain, all insulating bodies. We personally work on porcelain cups ourselves.

Magnetically-supported spokes are canceled by iron. Porcelain is a perfect insulator for dowsing waves (Correnson).

The shape of the bodies

- You are surprised, my dear friend, that by this strange and mysterious phenomenon, called " wave call" and " wave response " the dowser seems to enter into a deep intimacy with the bodies he does not see, which he does not hear but which he feels vibrate at the end of his pendulum and his wand.

Here is even better and allow me to tell you that you are not at the end of your surprises ... The dowser with his rods and his pendulums searches inside the bodies, better than with his eyes which perceive only the surfaces.

Here, check carefully... I told you that here, under my feet, there is water, a current. This current was revealed to me by my rod and my green pendulum which suddenly stopped, turned on this point; to the right and to the left of the current I had inverted rotations which indicated to me the right bank and the left bank. Now that I have emerged from the vertical of the water, consider the inclination of my pendulum and my rod: mark on the ground all the sinuosities that my pendulum and my rod make in search of the current. What did you get?

- A line of 20 meters, all bumpy.

— Such is the form assumed by the current of water through the synclines and anticlines of the subsoils. It would be the same with a hidden object. The projection on the ground would follow its underground form . This is how the wand and the pendulum even manage to give us even the configuration of basements and the shape of hidden objects.

— It's really weird and amazing.

—Perfectly .

Serial numbers or determined number of turns of rods or pendulums

— Let's stop for a moment and now please tell me if your wand has been spun and how many times?

— Four times.

— Friend, mine has turned six times.

Don't be surprised. We do not have the same power of reception. Our stations are not of the same power.

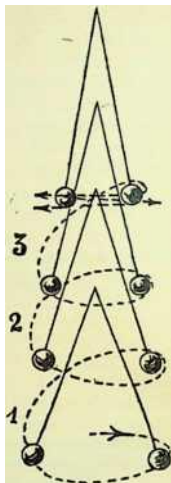

This is indeed a phenomenon recognized by all dowzers, that, according to the bodies captured, the human reflex imparts to the rod and to the pendulum a certain number of determined turns, which is not the same for all. It is a mechanical impulse imprinted by the recorded wave, with a muscular reflex which is not of the same power, an intensity which is with everyone but which translates as steam on the piston and of the piston on the connecting rod.

and on the wheels of a locomotive with a uniformity proportionate to the body of each... The diameter of the piston intervenes to establish the power with the pressure of the vapor, the speed etc., in the same way in dowsing the power of the dowser.

These are the sinusoids of the bodies noted by Brother Padey, very different from the sinusoids noted by Mager, Mermet.

This rule explains both the numbers of turns and the differences.

Serial figures reveal themselves wherever the body makes its influence felt (i). Girations and oscillations ment or by a shake of the fingers which brings back the number of series to one each time, provided that one counts the shakes. so a new element information about body radiation.

He

plays especially when the other indices of the bodies are not significant enough.

On the same object, the pendulum can give several series until exhaustion of all the elements which enter into its composition. Each serial number then corresponds to one of these components. Thus on charcoal, there are 5 serial numbers, those of embers (+ 13), hydrochloric acid (+ 8), sodium chloride (+ 7), phenol (+ 10) and of indole (+ 7).

The serial number is invariable for the same body and the same operator, with determined polarity (Correnson).

(1) On the same object, the pendulum can give several series, until exhaustion of all the elements which enter into its composition. Each serial number then corresponds to one of these elements.

For men, animals and birds there are 5 serial numbers.

The first number of series indicates the species: thus for the pigeon it is 84. (30 series = 30 turns).

The second serial number goes from 1 to 3 (it is the constitution).

The third indicates health (vigor) ranges from 7 to 15: *normal-*, from 16= diseases 16 also indicates sterility.

For fertilization of oviparous, from 16 = clear egg.

The fourth series indicates vitalism — at 570 is death.

Common numbers are 80 to 180 — at 200 it's good to start worrying.

The fifth series is nervous, cerebral.

1 indicates minus habens — 2 and 3 = normal states.

4 = brain overwork — and 5 imbalance.

Between 9 and 10 is death.

From 100 counting can be done by tens and multiples, 10, 20, 30, etc.

Some dowzers awaken the serial number of a co-ips by printing on their pendulum a number of turns corresponding to the serial number they are looking for. As soon as the sought-after body is thus awakened, it emits its serial number, which the dowser perceives very distinctly on the pendulum. This is the body's exact response.

Serial digits are always prime numbers. The multiples of these numbers express either the harmonics, or a bad adjustment, or alloys. Hence the confusion that reigns among the authors.

Positive or negative polarity (1)

— So your wand has turned as well as mine, but how? In which direction, forwards or backwards?

— Forward, towards space, upwards.

— Very well, it is the *negative movement*; the opposite, that is to say the rod turning towards you, therefore backwards, while descending, it would be the *positive movement*, (see the drawing p. 32J).

Now take your pendulum.

- He turns.

- In which way ?

— Clockwise.

(1) Here is the polarity of the colors according to Gorceix:

4- Yellow, orange, red.

— White, purple, blue and green.

"Very well, it's still the *positive sense*." *The opposite, that is to say in the opposite direction to the needles of a watch, it would be the negative direction or even the negative -polarity .*

It should be known in fact that the waves have a special polarity, which translates first on our muscles then on our pendulums and our rods by a particular movement, forwards or backwards for the rods, in the direction of clockwise. a clock or in the opposite direction for pendulums.

This is called positive or negative polarity.

This polarity is still detected in front of the two poles of a horseshoe magnet.

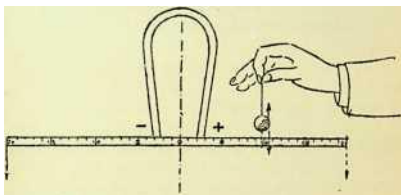

If care is taken, opposite these 2 poles, to place an object of metal or other material, the pendulum tuned to it and then moved vertically between the two poles of the magnet first, or per pendicularly, along a ruler located on both sides of the magnet, the pendulum will oscillate towards one pole, in preference to the other, will rotate in a gyratory direction, from right to left or from left to right, depending on the polarity of the object. This - particular direction of rotation is the polarity, positive or negative (1).

Magnets generally have two lines of force N.-S. and E.-O.

(1) For some dowzers, the raising of the wand corresponds to the positive gyration of the pendulum as well as to the polarity (*North*) of the blue needle of the compass — the lowering indicates the opposite... such as Mr. Father Wehrlé.

The polarity is still revealed in the stars and it is explained by a movement contrary *to* their axis of rotation. For example, the sun, which is positive +, has the moon and Jupiter negative - rotating around it; other satellites also rotate in the same direction: Earth, Mars, Uranus, Neptune, Venus are positive J-,

So it is with atoms. The electrons (negative —) rotate in the opposite direction to the protons (J-positive) in the molecule.

It is the radiation generated by these movements that the rods and the pendulums perceive.

These inverted movements, far from creating disharmony in the molecule, on the contrary, harmonize it, according to Coulomb's law: bodies of contrary electricity attract each other and those of similar electricity repel each other.

This is how opposite colors and metals go together: black with white; the Red

with blue; silver with iron; gold with nickel; and again the male with the female; the man with the woman.

Polarity is therefore explained by the movements of protons (+) and electrons (-) between them. Sometimes the protons dominate... the gyration will be mostly positive; if the electrons prevail or are the only acting ones, the gyration will be negative.

For Mr. Correnson are *-positive* : silver, aluminum , copper, iron, gold, calcium (marble), water, carbon (wood, coal), cavity (floor or cellar).

Are *negative* : tin, iodine, phosphorus (bone, alluminium), lead, sulphur, nickel.

Adjustment of the pendulum in length and weight

— Please always keep the pendulum in your hand. Note however that you can work equally well with the pendulum as well as with the wand, nevertheless I admit that the wand triggers faster and more clearly and that it allows you to work in difficult weather, both in wind storms and in foggy weather. But the pendulum better describes the outline of the things identified. In the laboratory, nothing can replace or equal it.

Your look betrays concern. You notice that the suspensory thread of your pendulum is

longer than mine. Don't be surprised. Here is the reason:

The wave recorded by the human body, - communicated to the muscular reflexes, not only corresponds to a color and to a determined number of turns but also to a length which is specific to it, which is not the same for everyone and which is measure along the pendulum.

It is therefore not indifferent, as the first Abbé Ferrand revealed, to regulate his pendulum correctly in length and weight.

We do it first on the witness of the body we are looking for. The marked point is well held by the finger and if the prospecting must be long and tiring, the point is meticulously determined by a knot along the thread.

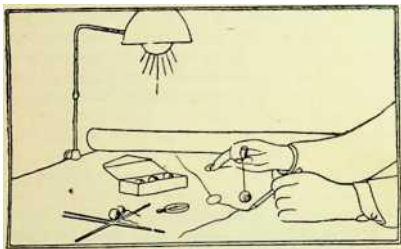

The adjustment can still be done, by means of the color. (Colored pendulums.) The color is sometimes - incorporated into the pendular mass (see *color detect*, *Marie-Bernard*, on sale at M. Lambert, Maison de la Dowsing, rue Saint-Roch, Paris), or inserted, thanks to im token {*MBL Pendulum*} — The colored token then merges with the pendulum and communicates its property and meaning to it.

The adjustment is finally made on the suspensory wire. At a length of wire determined by finger, the pendulum swings. That's the deal. We stop at the maximum amplitude of the pendulum.

Witnesses and colors therefore reinforce the syntonization.

All along the suspensory thread, there are several

adjustment zones... that of the fundamental and that of the harmonics... The zone closest to the pendulum is that of the fundamental. Of all, she is the best. Therefore many dowzers prefer to work on it — vg. Father Mermet. The other octaves fall along the wire at sometimes improbable lengths. Also we do not recommend them

Don't don't. It is the harmonics that they represent.

Let's get used to working with a very short wire and a light pendulum.

On the rulers, we will find for the measurement of the waves the same differences, do not be surprised. But to all the lengths and all the resonances of the harmonics, let us prefer those of the fundamental.

The question of the weight of the pendulum still comes into play in the mechanism of the adjustment, the lighter the weight, the greater the length of the wire.

Thread length and weight, are corresponding in the setting of the pendulum; serial numbers, too. — When the pendulum is well adjusted, the serial number stands out quite naturally, so that one can say that the real serial number is that corresponding to the real adjustment of the pendulum.

This setting still varies from person to person. It is up to everyone to build their own scale (i).

(i) Some dowsers set their pendulum and wand on the compass — the blue needle (North) and the other needle (South) give them positive or negative polarity.

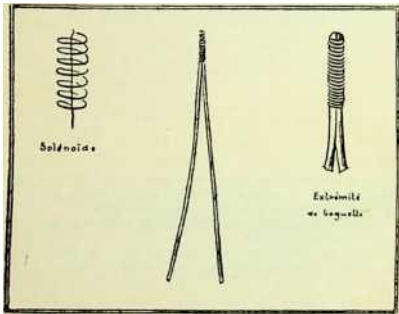

Others set their devices on the poles of a magnet or a flashlight.

You can also set your pendulum, from afar, outside the body to be prospected, as well as from a distance. Then the pendulum, held in the right hand, the operator, prospecting the horizon with the left hand, will wait for the release which will take place as soon as the left finger in antenna is in the extension of the object to be sought. The movement of the pendulum will indicate the presence of the object, the length of the wire, its distance; the direction of the antenna arm..., its exact direction in space. All that remains is to start moving in the direction of the antenna arm. The pendulum will then swing towards the coveted object. It will turn as soon as it reaches the vertical of this body, that is to say in its presence.

Choke coil stick

— This done, let us double our control by the use of the rod, and it is not in vain that the two strands of the rod are bound in a determined number of windings.

This determined number of turns is the proper adjustment of the stick. We have found that this number of windings plays a role in the

detection of bodies and we believe that this detecting power of the solenoid windings comes from the resistance and the self-induction which they introduce into the rod.

Is there a better, more favorable number of windings? We believe it. It is up to each dowser to examine this point in relation to his personal fluidic power.

Mental orientation. — Psyche (1)

— We are at the solemn moment. Please don't get distracted. It is essential that you fix your thoughts on the coveted object to detect all its riches.

This is the time to bring your psyche into action, to exercise your mental orientation. It takes place especially for the research of flows, depths and distances.

There is an extraordinary resonance and agreement - between the very strong will to find something and the mechanism of the pendulum and the wand, so much so that one could affirm that at the call of the will, the wand and the pendulum respond.

(i) The author who first seems to have insisted the most on the value of the psyche in dowsing is certainly IM. Christopher. After him this idea made its way and IMM. Lakhovsky, Voillaume, etc., gave him certain scientific Ibascos. It is amazing how this faculty develops through exercise. A good dowser never leaves his pendulum. A thousand opportunities will be offered to him during the day, to use his art: quality and suitability of food, search for an object, etc.

This progressive training at all times will develop the gift more than we can say.

This agreement between the psyche of the dowser and the synchronic and concordant movements of the wand and the pendulum is disturbing, and the explanation is still difficult to find. Perhaps we could say that, as in the hello of the telephone, the person at the end of the line responds, thus to the mental call of the spirit, through the imponderable medium of the ether as in TSF, the wave called responds, transmitted directly to the brain through our nerve threads which immediately impress our motor nerves and the response results in a number of determined oscillations and gyrations which contain the whole message. So, without being able to affirm anything positively, everything happens here as on the telegraph or on the telephone or at a radio listening post. The Morse code, the sound vibration are replaced by mechanical movements that you have to know this is, I believe, the principal art of the dowser.

This explanation is no doubt worth what it is worth. However, it seems to agree with the facts, which are surely indisputable.

Let's take an example: In the presence of a stream of water, the dowser mentally poses this very clear question: where is the water? With the left hand, he walks his index finger like an antenna around him, immediately the pendulum responds or the rod, in a determined number of revolutions or oscillations ; and it will be the same for the flow, the depth, etc...

Many dowsers have thus obtained perfectly exact answers. Is it simple coin-

cidencce? or real reflex responding exactly to an inner image, to a wave of depth, flow, distance, truly attached to our being and that our psyche reveals and details as with the will and the look we minutely detail the smallest nuances these of an image — or with exercised will and hearing, we detail all the notes and nuances of a piece of music?

We are just asking the question. It is up to the scholars to answer (i).

However, we can remember, as Maurice Pharec so rightly said, that “ in a dowsing experience everything is connected; the wave, through the intermediary of the look, of the touch and of the *thought* is communicated to the organism which reacts in a determined way. This reaction takes on different aspects, depending on how one has disciplined one's nervous and intuitive reflexes .

And as the great physicist Marconi added in his turn : “ the human brain is an instrument infinitely more sensitive than all the devices invented by man”.

(i) Man has psychic faculties (Intermediate between the five senses and reason) superior to the most perfected instruments (let us call them: 6th sense). Nothing can totally replace them, neither telescopes nor amplifiers of all kinds... Aren't they the ones that should be developed above all? Dowsing can greatly contribute to this.

SOME POSSIBLE ERRORS

— Friend, you are a little tired. Let's sit on the bench in the garden and listen to the good advice of an old dowser. I would so much like to assure you of success in your research.

First, avoid all causes of error. They are more numerous than is commonly supposed . Didn't the great Pastor say to his pupils? “ You can never take enough precautions ”.

Here are some of these sources of errors:

1° *Fatigue.*

Never work with a weary mind, or a tired body, your potential then very diminished, your " batteries " somehow flat, you would not have any suitable reception.

2° *The f>recif>itation.*

Hurrying, rushing, you would remind me of a young abbot, fitter and demon

radio operator especially, who was responsible for supervising the hearing of a radio in a room, turned his capacitor so often, walked us without giving us time to breathe through all the radios in the world, we were so tired that he drew this reproach from one of the listeners : " Monsieur l'abbé, you tire yourself and you tire us ." Needless to say that all the auditions presented by this young Eliacin were detestable.

3° *The preconceived idea.*

It is always necessary to work the brain empty, the will only strongly tended towards the research of the waves. Nothing falsifies true prospecting like the preconceived idea or the already inculcated prejudice that one will find this or that in the field of study.

4. *The parasitic influence of the crowd.*

No parasite is as dangerous for dowsing as the crowd, the general public. It empties in the twinkling of an eye all the receptive power of the waves in the dowser and this for several reasons . It paralyzes his psyche, which is no longer tense solely on the object to be sought, but on the impressions of the crowd, of the public erected as a jury. The dowser should not be more distracted from his work than the officer of the watch or the pilot on his ship, the artillery officer at his piece or the astronomer on duty, in front of his telescope, at

the lookout for a star. I know very well that the receiving antenna and the TSF set do not get excited in front of the general public, but here there is mechanics; in dowsing prospecting, there is above all psychism and attention.

5° *Other parasites (i).*

Bad weather, wind, fog, rain.

The drops of water in the atmosphere seem to form a prism and deflect the rays.

The wind moves the magnetic fields of the waves.

The best conditions for safe operation are high noon, calm and sunny weather.

6° *Afterglows.*

Any body that has spent so little time in one place creates a shelter or a source of radiation

(i) We cannot warn serious dowsers enough against the too easy tendency for some to want, on all occasions, under cover of dowsing, to claim to seek and find the most improbable things . The newspapers, on the lookout for all sensational facts, quickly made a point of highlighting these failures and gossiping about the real dowsers who themselves, thoughtful and cautious, can not help it.

That the true amateurs of sourcery beware of these charlatanesque intoxications and continue their research, far from the public, in the laboratory, in small more scientific committees these. They will then see, sheltered from the excitement of the crowd, that there is a long way to go from the cup to the lips and that true science is built not by leaps and bounds but by very slow steps and stages.

•which lasts or can last for some time, even in the absence of the body. This is another source of errors. The afterglow is like the shadow of the body... but here the real body is absent... only its shadow remains.

It is corrected, I believe, by a very simple means. Examine the afterglow from the front and with your back to it. If the rods and pendulums move from the front and from the back, there is no afterglow but the presence of the body. Afterglow waves do not pass through the human body.

The afterglow can be neutralized by resting the object on a neutral and insulating support: porcelain plate — black paper.

7° Ambition and prejudices of the crowd.

This will be our last warning.

Who does not see the multiple forms that dowsing can take? She can take an interest in everything if really everything is outwardly vibration and movement and the human body, a magnificent and universal agent of receptivity.

But this is precisely the main pitfall.

To be able to possess an object is not to possess it... To be able to capture all waves is not to record them all by the very fact. Many capture conditions are needed, in addition to the instrument... and above all certainty.

Now, the crowd is ambitious and devoured by the thirst for lucre. It can only lead us astray if we listen too easily to its insatiable suggestions.

TOWARDS A GREATER SIMPLIFICATION OF RADIESTHESIA

Wave amplifiers

We have seen, under the action of the solar rays, of the magnetic meridian, the dowsing waves are amplified.

Here are new sources of amplification: magnets, cosmic forces, super-detect.

i° *The magnets.*

Magnets, as we know, exert a mechanical action on certain bodies vg: iron; and this action is exercised even through a vacuum, it diminishes with the temperature, it is extinguished by fire.

The portion of space where this action takes place is called the magnetic field. In France, its intensity is 0.46 gauss.

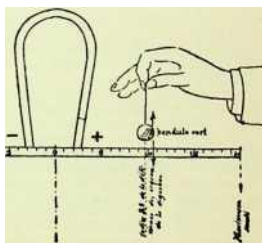

Under this magnetic action, magnetic lines are deployed which form curves, filling the entire magnetization field.

These lines of force vary according to the bodies. Some have 7, others 11, etc... It's sometimes a huge multi-octave keyboard.

These lines surround the body and seem to give it an induced magnetization, which disappears when the magnetized body is removed.

Man also has magnetism and this is not destroyed by death. He remains in his ashes and the objects that belonged to him.

The magnetized body can by contact artificially communicate its magnetization to others,

Magnets and rulers

it is *artificial magnetism*, because of this magnetization by influence: iron, cobalt, nickel are said for this to be paramagnetic bodies, steel as well as the needle of a compass retain this property for a long time, iron Mild, on the contrary, only retains it during the induction time.

The pendulum discovers the lines of force of the magnets, follows them and measures them.

Moreover, these lines of force have a polarity, positive on the North Pole side — negative on the South Pole side.

To these strengths let us add others.

2° The cosmic forces.

It is the set of multiple waves which, in our atmosphere, emanate from the stratosphere and further afield, and act on bodies: such as heat, light, etc., the earth, under their influence, appears like an amplified magnet, with two distinct poles, placed at the center of these attractions and repulsions.

3° Electro-magnets, the “super-detect”.

This is another source of amplification. The electromagnetic fluid, powered by batteries or a regular current, diffuses its action on objects

placed in its radiation and amplifies their radiation. The purpose of this amplification is to make these vibrations more perceptible, and in di

reducing their frequency, increasing their length ..., this can henceforth be measured by a metric ruler.(i)

This is the reason for our a *super-detect* device* (on sale at M. Lambert, Maison de la dowsing, 16, rue Saint-Roch, Paris.) (2)

(1) **Meteorology.** — In finishing the very interesting work of Captain M. Chrétien on meteorology... we have noticed throughout the volume that the laws of pendulums are as well those of the winds, of the high and low pressures, the ones and the others are expressed in one hemisphere or in the other by oscillations of currents or positive or negative gyrations, in all similar to pendular movements. This harmony of the movements in the sidereal world as well as in our atmosphere shows the perfect harmony which presides over the revolution of the bodies... and it is a satisfaction for the dowser to know his pendulum and his rod in agreement with all the Creation in motion.

(Read Henri Chrétien, *Captain Aviator*. Weather forecasting methods.)

(2) There are phenomena that can no longer be denied because they have been experimentally verified a hundred times. — They are : telepathy or communication of prints remotely. — *metagnomics* or the revelation of the contents (written thought and purpose) of a sealed letter . — psychometrics _ or the indication of the successive displacements of an object. — clairvoyance or the revelation of objects at a distance. — telekinesis or moving objects without any contact with them . — the *levitation* or lifting and displacement of these objects in the vertical. — the *ectoplasm* or emission of fluids, in very variable forms — even of ghosts, of human bodies.

In general, these phenomena only occur in semi-darkness or under red light.

RADIESTHETIC WAVES

Rulers and discs

i° *Ruler.*

It was not enough for the dowzers to discover the dowsing waves, several tried to measure them. This measurement, after polarity, serial numbers, etc., has become a characteristic of the wave.

The honor of this discovery belongs, I believe, to M. Turenne. Many others have followed him down this path.

The ruler used for this measurement was originally the tape measure, then the metal meter, with graduations in units, decimals and centesimals.

How to operate?

The object to be studied, placed at the beginning, that is to say at the zero of the ruler, the pendulum is moved over it, soon the pendulum begins to move, it moves again, then stops and bars crossed. This stopping of the pendulum is done on a graduation of the ruler. Look, write it down. This is the wavelength of the object, this length

can go for Mr. Turenne up to 10 meters and more. With us it does not go beyond 0.50.

The "*super-detection*" by amplifying the radiation of these waves allowed me without difficulty and within a very small radius to stagger them. The pendulum on the super-detect follows with mathematical precision the curve of these radiations, their nodes, their antinodes... The curve is generally complete from the first 0.25 centimeters... So that the other measurements seem rather detect the harmonics of this wave than the fundamental.

Thus one could explain the so numerous divergences of the dowzers, enumerating the wavelengths. We get lost in the cumbersome maze of their measurements...

With *super-detection* and by limiting ourselves to the study of the fundamental of the waves, perhaps one day we will be able to definitively eliminate the divergences of the dowzers, on this capital point of dowsing.

The relation also of these fundamental lengths with the colors would further aid in the simplification.

2° Discs. (*See end of book.*)

The disc, after the ruler, marks a great progress in the study of dowsing waves.

The honor of its discovery belongs, I believe, to MM. Turenne and Terestchenko.

Both noticed that if instead of working along a ribbon or an unfolded ruler

— an object (metal, organ powder, etc.) was placed in the center of a closed disc. Immediately there is an emission of waves which leaves the object towards a well-determined direction along the edges of the disc and the graduations that can be observed there seem to be staggered at regular intervals, as previously on the slider... Discs and sliders behave in the same way... (i) Colors, metals, organs, diseases, remedies, all objects therefore correspond to very precise orientations and graduations on the edges of a disc and these orientations are ultimately only the fundamental rays of bodies, as we know it. have repeatedly observed. From where immediately the idea came to us to - constitute as many discs as there could be radiesthetic researches to operate. It was enough for that to search on a disc

(i) For Mr. Brochenin...

Black= normal glandular system

Purple = anemia

Green = Liver

White = Lungs

Yellow = blood

Red = heart

Red and blue = nervous system

Red and white = bronchi

Indigo = intestine

Purple = Kidneys

Blue = brain

Orange = uterus

Green and indigo = stomach

Black and yellow = spleen

Black and green = gallbladder

Yellow and white = tuberculosis

Compare with the table below p. 178

appropriate and to fix there exactly the fundamental radius of the bodies to be studied.

Let us take for example the disc of precious stones , perfumes, etc... Provided with all these objects on a well oriented disc, it will suffice to place in the center one after the other the objects to be examined, the pendulum will oscillate towards a specific direction. Write it down... and when all the precious stones, perfumes, etc., have been thus studied, the disc will be made and it will be enough to use it to operate as on a phono disc. But here the mind or the psychism fixed on the object to be sought will play the role of the needle and will come to awaken the recorded wave, hitherto dormant, of the fundamental ray of the body sought.

And again at this simple mental call the pendulum will swing in the direction of the desired fundamental radius. Experience it yourself, you will be edified. If several oscillations of the pendulum appear it is that the studied body is an alloy and the pendulum then gives you the various elements which enter into its composition.

Starting from this experience, we made as many discs as we could on the sciences related to dowsing and the results obtained were the confirmation of this hypothesis.

Here is the list of some of these discs which will be on sale at the Maison de la Dowsing.

Disk of life and death (to discern the living from the dead).

Differential disk of animal and man (to thus discern the specific radiations of an animal or a human being).

Homeopathic disc.

Anatomic disc.

Disk of Diseases.

Disk of perfumes.

Disc of precious stones.

Disk of heredity and cosmic influences.

Disk of man and woman — of the sexes.

Sympathetic therapy record.

Iridology disk.

Acupuncture disc.

Railway Track Disc (to detect imperfections in railway tracks, the cause of so many accidents).

Remedies Disc.

Color disc, etc.

Disk of wines, fabrics, etc., etc.

Spectacle disc (to recognize the deficiencies of myopes and the nature of the glasses they need, the number of their diopters).

Disc of vegetable garden, orchard, barnyard, fertilizer, seed, hunting, fishing.

From the point of view of the army, record of major maneuvers, of battles.

Record of sea cruises.

Disc of astronomy, meteorology.

Disk of searches for planes, missing persons , etc...

The graduation of our discs is a metric measurement that goes from zero to 100. We

we preferred it to 360, which is more complicated.

We have only adopted this one for the search for the missing at sea. The nautical charts bearing latitude and longitude in this unit of measurement.

A perfect disc must solve all the problems relating to the object which one studies and contain all the elements of study which relate to it . It must moreover contain all the fundamental rays of the bodies which one seeks. Obviously it is a valuable document that can be multiplied at will to answer all the problems of thought and human knowledge.

Let us add the disc of the automobile, the locomotive , the plane, the housing, the carpentry, the road, the steamer, the inland waterways, the beehive, the water supply, the electricity. tricity, etc., etc.

Let one try this method and one will ser . quickly convinced of its value and its simplification (1).

(t) Bergson said: Statistical proof means nothing, and one perfect, indisputable experiment is enough. »

Closing (1)

By ending this first part, purely theoretical, of the movements of the rod and the pendulum, the reader will be grateful to us that in a rapid overview we give him an attempt at a scientific demonstration of the dowsing sense.

Do you therefore represent the human body as a TSF device? Don't doctors tell us that the eyeball is a real photographic device, a recorder of light waves? Why not attribute to the whole body what one admits for some senses?

The apparatus thus recognized, the dowser by his will and his psyche is in position of reception: antenna or frame, his nervous nets are stretched for the capture of the waves. Such is his psy-

(i) We believe that everyone can be a dowser, just as everyone can be a musician or a designer. It is the essence of the gift. Everyone has to cultivate it.

The method is enclosed in these pages.

The devices are: the color detect, the Bernard-Latour pendulum and the super-detect, on sale at the Maison de la Dowsing, 16, rue Saint-Roch, in Paris.

We capture the fluidic potential of a person on his hand or with the left index finger aiming at the solar plexus, or quite simply by resting his left hand on the shoulder of the person to be examined. The number of revolutions recorded by the rod or the pendulum is the fluid rate of the person and the direction of movement of the devices, the index of its polarity, positive or negative as we have indicated elsewhere.

chisme and the real or simply imagined native witnesses that it possesses make the selection.

The body acts as a capacitor.

Hétérodyne it will grant to the second phase its sensory to the wave that it wants to capture. The triggering takes place, the interference, the beats will arise, the muscular sensation, the amplified sensation.

All of this plays out in us, stirs within us to create a middle frequency, a stable balance which will then be translated for each of us into series numbers, determined, in such a color, in such an azimuth, etc. ..

The phenomena of intensity will vary according to the heating of the lamps, the winding..., translate: the vitalism, the dowsing potential of each one.

Parasitic fields may be created, disturbances due to bordering influences, confusing the path of the waves.

Amplifications too, proportional to the value of rods and pendulums, to the good physical and psychic disposition of the dowser.

Once the post is in good condition, the dowser also being in good shape, we are going to see the receptions of all kinds that he can obtain.

But this subject will be the subject of Part II .

From the previous theory it appears that the waves emitted by all material or living beings strike in a way all day long at the door of our home - and more urgently, at certain hours of full sun.

For many humans, the door remains closed.

For some, that is to say the privileged , the door is constantly opened by a well-determined psychic orientation, then the messages are revealed, coming from the ground, from space , from everywhere. If all the conditions are fulfilled: atmospheric, psychic, scientific and conscious, the reception is total, the message complete.

This is what we must aim for (i).

(i) However, we believe it is appropriate to remind dowsers again that they will never take enough care to separate themselves clearly and to free themselves completely from all the pendular forms which are similar to witchcraft, whatever it may be.

I have just re-read a series of articles entitled “ under the mask of wizards ”, by Marcel Sauvage. We see to what extent charlatanism, in all times, has decked itself out in the mantle of science to deceive and seduce humanity. Let us not speak of the coarse forms of magic as it presents itself in the great and small sabbaths, in the gatherings of bohemians at fixed times. Alas! for the renovators and peddlers of witchcraft and charlatanism, the pendulum and the rod would have no difficulty in becoming — not instruments of science — but objects of lucre and deceit. The incredible list of healers - ignorant of everything - but supposedly clairvoyant and extra-lucid is significant . That the dowsing does not try to rub shoulders with this abyss, as some would tend to advise it. It would be his death. On the contrary, apart from all the resounding and noisy competitions, under the control of real scholars, it strives, with its appropriate methods, to obtain an increasingly convincing percentage of successes. Then its honor will be recognized, its usefulness acquired. She'll do well in the science group.

(i) This summary table contains all of our previous observations. We are far from believing it to be perfect and complete. We would be grateful to the dowzers, after thorough and controlled study, to tell us what they think of it. In this art or science, for the quarter of an hour, we all advance, as pioneers. May our efforts converge. Help us.

SECOND PART

THE SOURCER. - HIS WORK.

— While waiting for you this morning, Friend, I have taken care to classify my research in order to better reveal my work to you. Please sit down and talk.

FIRST CHAPTER

LABORATORY WORK

— You see on my table a whole range of metals, ores. Thanks to my pendulums and my colored rods, I can affirm to have discovered something which resembles the atomic and molecular constitution of bodies, their crystal-

ization, to their special coloring, graduated, in the manner of the spectrum.

To get an idea, remember your notions of physics and chemistry.

NOTIONS OF PHYSICS AND CHEMISTRY

I. — MATTER AND ITS PROPERTIES.

Matter is an aggregate *of atoms*. The atom itself is an aggregate *of eons and electrons*.

Even indivisible, the atom is composed of even smaller elements. Imagine a solar system with planets and stars and you will approach reality. Aeons are fixed in number. Electrons in variable number. Hydrogen, for example, has only one electron, carbon has 6, chlorine 17, uranium, the richest, has 92 (1).

An aggregate of atoms is the *molecule*.

The molecules are more or less close together. Their interstices more or less continuous. This elasticity in the continuity of the molecules has created the different states of matter: solid, liquid or gaseous. We could even add a fourth state: *radiant*.

(1) See Mendeleff table. p. 164 Mendeleff classified the bodies with respect to the hydrogen atom and according to their number of free electrons.

There are forces that bind molecules together, this is *cohesion, attraction*. There are others which separate them, *heat, electricity*, etc.

Composition, decomposition, extension, radiation or movement, is all the work of inert or living matter.

In addition to these properties, there is the *molecular weight* which corresponds to the actual number of molecules contained in a liter of air or gas. The *atomic weight* is its number of electrons.

Density is the intervals or distances between particles

These particles are far from being at rest. They must be considered as little elastic balls, hitting each other and bouncing; it is their movement or radiation. This - molecular and atomic agitation has been rendered perceptible thanks to the microscope.

II — CRYSTALLIZATION.

It is also recognized that the molecules sura joust or combine with each other according to geometric figures which can be summed up in five: square, cube, hexagon, rhombohedron, pyramid.

Thus sulphide lead (galena) crystallizes in cubes, tin and titanium in square-based prisms.

III. — COLORING.

Bodies manifest themselves to us according to a range of colors quite similar to the scale of the spectrum.

Thus cobalt is pink, nickel green (in solution).

It is all these intrinsic qualities of the bodies that the so-called dowser rediscovers with his rods and his colored pendulums.

Let's talk about the *modus operandi*, we will see its marvelousness.

IV. — RADIESTHESIC RESEARCH OF ATOMIC WEIGHTS, CRYSTALLIZATION FIGURES AND COLOUR .

On a body, the pendulum and the rod turn, at the special azimuth of the body a determined number of revolutions. This serial number or digits corresponds - equivalently to the atomic weight of the body. 2 turns for water, 6 for carbon, etc.... (i)

Moreover, at the four principal meridians and at the four intermediate meridians, the pendulum has an oscillation which runs up to an extreme limit point . Mark this boundary. Join these points. We obtain a geometric figure similar to that of crystallization: a rhombus for cobalt, a square-based pyramid for nickel...

(i) This experiment needs to be controlled and verified by all dowzers in order to be generalized. We report here only our personal experiences and those of a few friends.

As for the coloring, it is detected using a pendulum or a colored rod. Only the sticks and pendulums of the color corresponding to the coloring of the body are impressed. Or again, having on his table the rosette of the colors of H. Mager, the bodies are not detected, that is to say, they act on the pendulum or the rod, only placed on the color of the rosette which gives them agrees.

All of these findings may not be in perfect agreement with all modern scientific data. However, would the chemist have nothing to gain by the use of rods and colored pendulums in research and qualitative and quantitative analyzes of bodies (i)? (*See table opposite*).

(i) The most diverse theories have come to light, touching the inner constitution of matter and its atomic motion.

The question, we see, is complicated enough for us not to ask dowsing to decide it.

One fact, however, concerning coloring. In the presence of certain microbes, it has been given to us, in the laboratory, to see the violet pendulum swinging and not on others. Verification made by the doctors present, it was recognized that the microbes on which the violet pendulum was moving were the microbes which take the Gram, and the others, those which do not take it. This concordance between Dr. Gram's violet staining procedure and the pendular indication is, to say the least, curious. Likewise on nearly 600 mother tinctures or plants... the pendulum gave positive gyrations on some and negative gyrations on others. The technicians present recognized that the plants with negative gyration were all drainers, and the others tonics, and the coloring of the pendant indicated the organ to which the draining or the tonic medication referred .

CHAPTER II

FIELD PROSPECTING

Basement study. - The rocks

— From the laboratory, let's go to the garden and experiment . First, an observation. The dowser does not concern himself with objects that fall directly under his senses, in particular those of sight and touch, such as superficial and apparent waters. He especially endeavors to study the mysteries of the basement, such as the rocks and the various stratifications of the geological layers.

Here, a few more reminders of geological science - will be useful.

NOTIONS OF GEOLOGY

I. — THE TERRESTRIAL UNDERGROUND, (i)

The radius of the Earth is 6.371 kilometers.

The solidified part is 60 to 80 kilometers thick.

(1) We are surprised at the mocking disdain and the sufficiency often affected by the detractors of dowsing, in the face of the still very obscure points of this science which basically only dates from a few years (I mean under the title of research scientist).

This solidified layer is unevenly cooled, so here and there, like islands, floats the incandescent material. From this uneven cooling are born, on the surface, the hollows, the bumps, the tears, the faults, the folds of ground.

This earth's crust or crust comes from a pasty, unevenly cooled magma over which molten materials have still flowed in subsequent outpourings, (i) This is all the earth's subsoil which can be recognized by the nature of the stratifications, their origin and form.

II. — CLASSIFICATION ACCORDING TO THE NATURE OF THE SUBSOIL.

Nature :

The subsoil includes several kinds of rocks:

a) *Eruptive rocks.* After the solidification or cooling of the earth, they were the first rejection of the central core in

(i) (Continued)

This need to want to unravel this complicated web of waves right away seems childish, if not ridiculous. True scholars have never acted like this.

I reread to convince myself of this and I advise our enemies to do the same the work of Pierre Termier entitled: *The great enigmas of the Earth*, Flammarion edition.

The author speaks of geology and he exclaims:

"Geology... that such a story is difficult to reconstruct, that it becomes more and more uncertain, imprecise and incomplete as one goes back up the scale of time, it is obvious... You all know that Geology is a particularly enigmatic science. No doubt there is no science that is not enigmatic.

fusion, volcanic product whose primary and essential element is *silica* (Si).

These are mainly *granites, porphyries, basalts, lavas, pumice stones*.

b) *Crystallohillian rocks*. They are still eruptive or igneous rocks, but of less resistance, having already been damaged by water, frost, cold.

Their essential element is still silica, but they are often found mixed with oxides: aluminium, potassium, calcium, iron, magnesium.

They are called *felspar, quartz, mica*.

c) *Sedimentary rocks: Aqueous or*

(Following)

All are *gardens of enigmas*, one walks there in the shadow of mysteries and each flower that one picks there is a new mystery. I even said, and I gladly repeat that science is made to give man a sense of mystery... that it evokes enigmas, rather than explains; that it is, first and foremost, a herald of the infinite.

Finally, after a dizzying walk through the world of spaces and life, the illustrious scholar concludes:

"From this walk, through time, we come back very humble, having touched no shore, having seen nothing but waves following waves. From where descends this river which does not dry up, whose speed is invariable, whose course no swimmer has ever been able to ascend? And where is he going? when will it stop flowing?..."

It is up to everyone to meditate on these pages. After this reading, only one attitude will suit the admirers of Pierre Termicr: leave the despisers of dowsing, indulge in their childish contests and their illusory percentages to stick only, like the clairvoyant Master, to seek the part of truth which emerges from the mystery of the waves, satisfied only "by the penumbra, as he said, sown

fossiliferous. Silica still holds a large place. They are :

Or *aggregates of siliceous rocks* : *flint, pudding millstones, molasses, sandstone, sands.*

Or *soft: clayey rocks* : *kaolin, slate, ochre, lime-based rocks* : *limestone, chalk, travertine, gypsum, plaster, marl, dolomite.*

Or *earths recrystallized* by the fusion of the lavas or the central heat. These are the *marbles, quartz and schists* (i).

III. — CLASSIFICATION ACCORDING TO ORIGIN.

Origin.

The subsoil, according to its origin, admits another classification and the rocks are then classified according to their formation.

of sparks where we see them moving. This is wisdom and clairvoyance. The rest is childishness and idle chatter.

(i) *Gneiss* is rotten granite (also called *gorrhe*).

Sandstone, an agglomerate of sand mixed with alumina, iron, lime, etc... (44 to 99 silica).

Puddingstones are large-sized sandstones.

Loess, these are glacial clays, swollen with water, they become impermeable.

Residual clays, these are impermeable rocky marls .

CLAYS AND GRANITES

It was given to me, following a failure, in a search for water, on clayey ground, to study, more attentively the clays and the granites, I had in hand their almost complete collection.

Originally, *eruptive rocks*, dominated by *gneiss* and *granite*.

Then the *primary lands* where the *Carboniferous* dominates.

Tertiary land is the age of *sandstone*.

The *secondary terrains* dominated by the *Jurassic Cretaceous*.

The *Quaternary lands* with the glacial period, it is the age of *sands* and *gravels*. So man is witness to the flow of *lava*, the eruption of volcanoes, the stratification of *basalts*. The developed vegetation, then rotted by the waters, gives *peat* and *coal mines* (i).

Clays (continued)

Polarity and running direction on clay. The pendulum always turns positive (-r) and the direction of travel must be indirect or negative (-)

Colors. — The clay ranges from orange-red to yellow-green.

Orientation. — Its orientation is South, S.-W., S.-E., East. (i) Some authors have classified rocks according to their origin, their chemical composition and their texture.

A) *Primitive rocks* — Archean terrain.

They are crystallophyllian rocks—that is to say, quartz, feldspar, mica — micachist or foliated granite.

B) *Eruptive rocks* coming from the interior of the earth, through cracks: these are the primary, secondary, tertiary and quaternary terrains.

They are crystalline (nothing but crystals).

They are mixed (crystals in an amorphous paste).

They are amorphous or vitreous.

Both can be neutral, acidic or basic.

C) *rocks*.

These are either detrital or chemical—or organic.

IV. — CLASSIFICATION ACCORDING TO TRAINING .

Training:

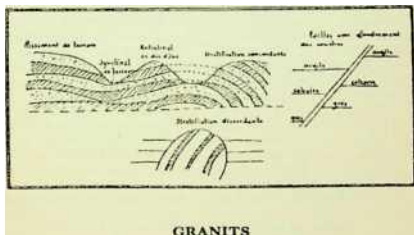

One would be strangely mistaken if one imagined the uniform basement. Usually there is no regularity. It is full of accidents.

These accidents are:

First of the *collapses* of the terrestrial layer: caves, cavities or underground lakes.

Then *faults* or cracks through the rocks, that is to say partial subsidence .

Then *creases*. These folds of different shapes and various stratifications

Polarity and running direction.

are positive 4-: Tanhélin (France) — New Sweden (Green) —
Black Sweden — Balméco (France), Kergomar (France),
Labrador Blue Norway.

have been called *synclines*, *anticlines*,
conformable or *discordant strata*.

Rocks according to their degree of impermeability (impermeability and capillarity go

White clay (Dreux)....	Plastic 27 to 30	waterproof.
.....c	19 to 23	—
lay Kaolin clay (St-Yrix)...	17 to 22	—
White	chalkig at 20	—
.....	13	—
Coarse	limestone	5 —

Granites (Continued)

Negative are — : Feuille morte (France) — Co -
 rail red (France) — Green Labrador Balmoral Finland —
 Gris Chippal (France).

The *direction of travel* is generally negative — except for
 Tanhelin, New Suede and Black Suede.

Colors. — The granites follow the whole range of colors
 from *Blue* (Tanhélin, Green New Sweden) through
 Yellow (Feuille morte — Balmoral — Kergomar,
Green (Balméco) Orange (coral red) Red (Sweden) juice -
 than black (Labrador Norway).

Orientations. — According to the color we will have:

Tanhelin (Blue — NE) Dead	Chippal (Black — West)
Leaf (Yellow — SE) Coral Red	Balmeco (Green — East)
(Orange — SW) Sweden (Red	Kergomar (Yellow — SE)
— South) Labrador (Black —	Labrador (Yellow — S. E)
West) Balmoral (Yellow — SE	

(1) **Capillarity.** — The power of capillarity or humidity
 is distributed as follows:

Compact clays and marls	1.50
clayey sands	0.60
Sands	0.30

Clay, the most impermeable rock, is also the most capillary.
 Then there are the *clayey marls*.

Melaceous friable gneiss	3	waterproof
Hard limestone	3	—
Blackish schist	2.85	—
Gypsum	2.20	—
Jurassic limestone	1.98	—
Gypsum	1.50	—
Grindstone flint	1.12	—
Coarse-grain	0.37	~
granite Quartz sandstone	0.66	—
Basalt (Guéret)	0.55	—
Slate schist	0.19	—
Meudon sandstone (Silycraie).	0.12	—
Quartz in vein (marble)...	0.08	—
Black eurite	0.07	—
Amphibological granite....	0.06	—

Capillarity (Continued)

Then finally the *clay shales*.

Slates, emerites, chalk, etc...

In clays it is important to distinguish between porous or permeable clays which allow water to pass through; they contain a lot of sand; and impermeable clays that retain water. The former are mainly alluvial clays. They are found in the Embrun region, on the banks of the Durance.

All clay contains 15 to 20% of its weight in water.

Clay is hydrated alumina silicate (usually white, opaque, unctuous). Greenish, it is iron protoxide silicate. Reddish, it is a hydrated iron protoxide.

Porcelain is made of pure clay or kaolin.

Marble is limestone; *alabaster* too.

The *diamond* is pure carbon; *pure* aluminum corundum.

Silica is the essential element of rock, silicic acid (opaque and colored), combined with mica, phosphate, gives granite, quartz. Mixed with lime gives marl. Mixed with alumina gives clay.

TABLE OF ROCKS EI

Body. Nature and composition	Azimuth	Color
SILICA (i) - Si. Anhydrous. Quartz, agathc, onix, amethyst, SiO_2. Hydrate. Opal, 2-12% water, meerschaum SiOH serpentine Blend. Chalcedony, jasper, flint. Less pure. 72 to 77% SiO_2 porphyry, schist, gneiss, mica. 75 to 90%. Feldspar and glacial sands, alluvium, sandstone. 43 to 57%. Basalts, lavas, eruptive rocks. 94%. Quartz. traces: clay, kaolin. Double hydrated alumina silicate $\text{H}_4 \text{Al}_2 \text{S}_4 \text{O}_{12}$ (Clay, kaolin). ALUMINA — Al_2O_3. Precious stones, corundum, gems (insoluble and infusible). CHLORIDE - Cl. Rock salt or sodium chloride. NaCl. SULPHATE - S. Gypsum or plaster (hydrated calcium sulphate) $\text{CaSO}_4 \cdot \text{H}_2\text{O}$ Alumina sands K_2SO_4 Alum. of potash.	West West West	Red Orange-Red Orange-Red

(i) Silica and alumina are the basis of the distinction that exists between the precious stones of the East or the West. Some are pure silica; the others, pure alumina.

» AND THEIR INDICATIONS

Body. Nature and composition	Azimuth	Color
CARBONATE. CaCO_3 . Chalk, marbles, limestones. Marls (mixed with clays)	BORN.	Blue

French granites. — Tanhelin, Dead Leaf, Coral Red, Chippal Gray, Balmeco, Kergomas. etc

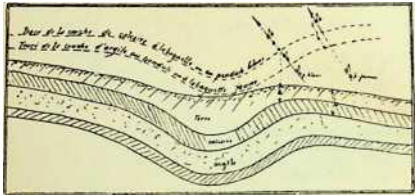

Foreign granites. ■ — New Green (Sweden), Dark Green Labrador (Norway), Balmoral (Finland), Blue Labrador (Norway), etc.

RADIESTHESIC RESEARCH OF ROCKS

(Configuration of layers, Veins, Depth, Quantity, Quality).

The skilful dowser with his rod and his witnesses must find the basements, their nature and their configuration.

For that, it is enough for him, stick or pendulum of the appropriate color, pendulum regulated in length, witness in hand, to cross-check on ground the azimuths or rays of influence, in regular march (direct or indirect).

i° *Configuration*. The rod having turned, the pendulum having oscillated, follow the exact indications of the rod and the pendulum. First stake out the *configuration of the layers* on the ground : *synclinal* and *anticline*, *concordant* or *discordant stratum* .

2° The *-depth*. To determine it, cut the detected layer perpendicularly, go in front of you,

stop when the rod or the pendulum stops.

This is the depth line. Put a stake.

Measure the distance from this stake to the previous line of

nment of the layer. This is the real depth .

3° Quantity.

All along the circumscribed layer , count the beats of the rod

, the oscillations of the pendulum , as many beats, as many oscillations , as many tons or quint aux, at your pleasure, mental.

4° Quality. Facing the sun, with the warning light or warning lights in hand, wait for the pendulum to trigger . The nature of the layer will be identical to the witness, the triggering of which will take place without shift in the solar plane and as exactly as possible,

CHAPTER III

FIELD PROSPECTING

Basement study. - Water

Just as in the human body the surgeon's scalpel can follow an abundant and marvelous channeling of the blood flow, through the meanders of muscles, nerves, the most varied tissues... thus, in the midst of the tangle geological layers so tormented at times, the dowser follows, thanks to the common thread of his colored pendulums and rods, the ramifications of the subterranean currents, in particular those of water, so beneficial to humanity.

Here again the usefulness of some hydrological notions .

NOTIONS OF HYDROLOGY

To be a good dowser one must be a good hydrologist .
Let's not forget that.

And first of all, no need to pick up currents

harmful. It is therefore essential to know how to recognize good water, in other words, drinking water.

I. — COMPOSITION OF WATERS.

1. Pure and potable waters.

Pure waters:

<u>Chlorine.....</u>	. 0.040	0.015 (pure)
<u>Sulfuric acid.....</u>	. 0.005	0.002
<u>Organic materials....</u>	. 0.002	0.001
<u>Volatile products</u>	. 0.040	0.015
Degree hydroti(x). 15a2og ^{ie8}	5 to 15 g	^{icB} soap water
Degree after ebul. 5 to 2g ^{ts}	2 to 4 g	^{tB} soap water

Chlorinated waters (city wells, near seas).

Potassium chloride .
 — sodium .
 — of barium.
 — calcium .

Ammonia hydrochloride.

Brominated waters.

as chlorides.

In addition :

Potassium bromide.

- sodium.
- of magnesium.

(1) This is the quantity of soap water needed to emulsify the water.

Iodidated waters:

As chlorides, sodium iodide.

Salt waters.

as chlorides.

Above all: sodium chloride.

Nitrogenous water (rainwater, city wells).

Nitric acid (oxidation of nitrogenous materials).

Ammonia nitrate.

— of potash.

— of lime.

Siliceous waters (crystalline soils).

Salicylic acid hydrate.

Silicate of soda.

— lime.

Sulphurous waters (in Cretaceous soils, marl, gypsum, pyrite, shales, coal).

Free hydrogen sulfide.

Calcium sulphide.

Sulphite of soda.

sodium hyposulphite.

Ammonia sulphate.

Sulphates of soda, baryta, lime, magnesia.

— alumina, iron.

Carbonated or carbonated waters (mineral waters).

Carbonic acid.

Hydrogen carbide.

Carbonates or bicarbonates of soda, baryta,
magnesia, lime, iron.
Ammonia carbonate.

Radioactive waters.

By radium release (emanation from uranium).
Argon, neon, krypton, helium (derived from radium).
Selenium, fluorine, arsenic, boron, lithium, rubidium,
cesium, strontium, zinc, glucinum, copper (they are recognized
by spectral analysis).

2. Polluted and undrinkable water

Suspicious waters.

Chlorine0.050
Sulfuric acid0.030
Organic matter .. 0.003
Volatiles0.070
Degree hydr30 drops, soap water.
Degree after boiling.... 11 to 18 g*»', soap water.

Bad waters.

Chlorine0.100
Sulfuric acid0.050
Organic materials . 0.004
Volatile products0.100
Degree hydr100 drops, soap water
Degree after boiling.... 20 drops, soap water.

Phosphorous waters.

(Polluted city waters, large agglomerations , near cemeteries, cesspools, stables , manure, unhealthy establishments.)

Phosphate soda, lime, alumina, iron, ammonia-magnesium.

3. Purification

It is done by the sandy layers of several meters, then the organic matters and the pathogenic waste are deposited. Or through peat, lignite, limestone; the waters lose their ferruginous elements, the alumina, but there is an increase in carbonic acid, in sulphuric acid.

4. Mineralization:

Through rock salt: release of hydrochloric acid.

Through carbonate rocks: release of carbonic acid.

II. — HYDROTIMETRIC DEGREE OF WATERS. (Sparkling water or not).

(The most foamy waters, by excess of sulphate, carbonate, chloride.)

Sodium sulfate1.46 1

— of lime.... 1.40 > Sulphurous waters.

— magnesia.. 1.25)

Sodium chloride...	1.20) Chlorinated waters,
— of calcium..	1.14 \ sodium.
Calcium carbonate	j Carbonated waters.
Carbonic acid...	

(Least foamy waters, by excess of magnesia, limestone.)

Magnesia 0.41 Magnesian waters.

Lime 0.57 Calcareous waters.

III. — THERMALITY.

Some dowsers discover it mentally
by calling it out of mental desire: 10° ? 20° ?, etc.

57	$^{\circ}$
Chaudessagnes	88°
Vichy Dome	61°
plumbers	7^{10}
Cauterets	60°
Neris	$5^{2^{\circ}}$
Hamam Meskroute (Algeria)	95°
45	$^{\circ}$
Victyy, Large Grid	41° S
Vichy, Hospital	33°
Vichy, Lucas	28°
Vichy, Celestins	15°

IV. — THE WATER INFILTRATION PROCESS.

In the basements the waters are current or stationary.
They form sheets or

streams, they run invisible or emerge from the ground.

a) Theory of Abbé Paramelle.

1. In every valley or glen, defile, gorge and bend in the ground there is an apparent or hidden stream, one or the other running over an impermeable layer, visible or hidden, superficial or deep. The watercourse is hidden, because it is covered with a permeable earth which could not leave it appearing on the surface of the ground.

2. Next to the rivers there are groundwater, contained by rocks, the interstices of rocks, alluvium, sand or gravel, aquifers which supply ordinary wells. Added to their imbibition flow is the absorption of water infiltration from rivers and rain.

3. The level of these waters depends on the thickness of the sandy layer that they cross and the impermeability of the land that supports them, the dams encountered along the way, accidents in the terrain (boulders, caves, holes, sinkholes).

4. The quantity of water is proportional to the rain, the vegetation and the nature of the terrain.

5. Groundwater has a speed proportional to the nature of the terrain, the slope of the subsoil, the obstacles

In relation to the land, we have established to appreciate } here the decreasing scale as speed of running waters.

Roche dure	3	Gravel	0.60
Layered rocks...	1.80	Sands	0.30
Soft shales	1.50	Oily clays	0.15
broken stones	0.90	Clay soils	0.08

b) Theory of P. Termier (from Lacroix to Henri, p. 85) *

For P. Termier, the subsoil is traversed over enormous distances by major rivers and rivers, which come from the melting of distant snows or glaciers and burst suddenly, thanks to an underground fault - sometimes it is an irruption of water from the seas through volcanic fissures — this water is desalinated by the sands before gushing out.

Most often these veins do not go straight. Some have extremely winding courses ; go up the basements

in lakes: there, the lakes of water having their radiant projection on the ground, can give the illusion of several currents.

Alongside these deep waters, there are those of runoff, at a shallow depth, fed by the seasonal flow of the rains.

Groundwater does not have the same velocities as surface water.

c) General theory. Artesian waters and springs.

The waters sometimes level with the ground. They are called *sources*.

They are called *wells* if the outcrop is artificial.

Sometimes the waters thus discovered spring up at the height of the point of departure. These are *artesian waters*.

Usually this rise of water is not at the total height of the starting point, because of the resistances or unevenness of the leveling.

In fact, the secondary and tertiary lands are admirably suited to give water.

Crystalline terrains are unfavorable to the search for artesian waters, as are very disturbed sedimentary terrains.

Artesian waters can only occur in regularly stratified terrains, with outcropping permeable deposits .

V. — RADIESTHESIC RESEARCH OF WATERS.

A. — General search for waters: on plateau.

After having determined with the pendulum the impermeable layer of the plateau, its syncline or anticline movement, the form of its stratification: concordant or discordant, the faults, the scree, the different aquifer levels, we can:

Dig anywhere where water has been detected, if the impermeable layer is uniform.

Dig furthest downstream where the slope is

the smoothest and the deepest syncline, if the impermeable layer is rugged and sloping.

B. — Research on the slopes.

Groundwater is more abundant on the slopes than on the plateaus because of the contribution of tributary waters.

Consequently :

Preferably dig where the slope is the gentlest, furthest from the top of the hill, in the deepest syncline.

Avoid catchment areas at the foot of rapid slopes, fear of scree and water precipitation.

When on certain slopes the syncline outcrops, drilling is easy; sometimes it has to be cleared because the earth covers it superficially and the vegetation invades it. But this vegetation is like the wheat of Ste-Barbe, it only grows because there is water below. Go get water from the gallery.

C. — Research in the valleys.

Valleys or thalwegs are often made up of scree, a tangle of rocks , land, at the confluence of several springs, at the edge of several slopes.

First of all, make the departure of all that is brought materials or old sedimentary.

Ordinarily, the valleys being the bed of several - torrents and the meeting line of several undulations, the waters there are abundant.

The main thing is to know how to discover their lodging.

Three cases:

The strata of the slopes are the same as those of the valley, the valley is then the spillway and the basin of the adjacent waters. To dig, as on a plateau, at the lowest place, at the deepest syncline.

The strata of the slopes are in opposite directions, some synclines ending in the valley, the other anticlines, at the start of the valley. Look for water only on the slope where the strata slope towards the valley.

The strata of the two slopes slope towards the valley, but the impermeable basement of the valley slopes perpendicular to them and not parallel. The currents being established along the slopes, digging along the banks.

Beware, however, that the underground thalweg, rain does not always have the same superficial thalweg cori.

The dowsing graph, like that of the waters, must therefore

Always dig at a point a little lower than where the valleys meet, that is to say preferably at the estuary of the underground rivers, at the intersection of the valleys in the thalweg.

As for artesian waters, reach the lowest point, the bottom of the impermeable basin.

These duly made geological precisions, pendulums - and sticks will be of invaluable help to us.

ANTONIO AUNÔS
sou[^]sglp[^] D o
be prior-

D. — More particular radlesthesis method .

We will leave aside all the empirical , geological, hydrometric, acoustic, hydrographic, gravitational, electric, magnetic , radio-magnetic, radio-physical processes employed by one and the other, physicists, hydrologists.

We will confine ourselves only to mentioning our dowsing method.

Cotton soaked in water, pendulum or green wand in hand for ordinary waters (purple wand for pure waters, blue for polluted waters), go on the ground in search of azimuths. These found, move towards the current of water. Search its depth. It will be found as before.

At the depth line put a stake.

At the vertical of the water another stake.

Measure the distances between the two stakes, we have the depth. On the current, to the right and to the left, the gyrations of the pendulum and the rod, in opposite directions, indicate the banks.

The number of beats or the oscillations indicate the flows, liters-minutes - if the dowser, by mental call, wishes this indication.

Heading upriver, the wand rises. Downstream, it remains indifferent whether or not it descends. One can thus follow the stream indefinitely.

The pendulum swings up and down. But downstream it pulls more.

For the potability of water, change the rod, take the rod or the pendulum of the appropriate color. (Some dowzers discover it by simple mental call 10°? 20°? also for the depths? upstream? downstream?)

Or again, with the control tube in hand of the waters that you want to control, position yourself facing the sun, if the rod triggers facing the sun, there is identity of the waters, if on the contrary it triggers with a shift to the right or on the left, there is only similarity (i).

(i) **Landmark of Waters.** For some dowzers the places where lightning strikes are aquifers.

Some other dowzers are content to specify on a sheet of paper two well-determined points: tree, house, etc., a wall, its orientation, to specify the distances - then on a scale fixed by them at 1/100 "for example, they will tell you exactly in relation to these known points where a current passes through your property and at what depth.

Note also that if we go in the opposite direction to the course of the sun, that is to say, from West to East (*negative direction*), the rod is lowered, when we have reached the solar plane; on the contrary, it straightens up when going in the other (*positive*) *direction of travel*, that is to say from East to West.

Here, again take into account the personal polarity of the dowser.

Noir (eaux gazeuses, acide carbonique) blanc (radioactivité) jaune (soufre fer). — Des courants d'eau émanent également des lignes de force ou images magnétiques. On en compte habituellement 7, quelquefois 30, la seule utile est la fondamentale ou courant lui-même.

CHAPTER IV

FIELD SCR PROSPECTING

Basement study. — Ores and metals

Water is beneficial. Happy are we to be able to capture it, thanks to dowsing, united with hydrology! But will this science stop at this research alone, the privilege of the vulgar dowser ? No.

Dowsing reveals other veins to us: minerals such as coal, sulphur, etc...; metals, such as gold, silver, copper, etc.

First, let's recall some elementary notions of chemistry.

SOME NOTIONS OF CHEMISTRY

I. — SIMPLE BODIES.

Simple bodies (chemical species that cannot be broken down into simpler elements when subjected to different

actions, including heat, electricity, light) are divided into two groups:

a) **Metals.** — These are bodies which give at least one basic oxide by combining with oxygen. Metals are electro-positive, conduct heat and electricity well. But in this conduction heat and electricity, they have degrees which are established in the following way boasts (i):

Gold	1000	Iron	374
Silver....	973	Zinc	363
Copper	898	Tin	303
Platinum....	381	Lead	179

i) **Metalloids** " These bodies don't - never form a basic oxide by combining with oxygen. They are electronegative, conduct heat and electricity poorly.

These are for example: oxygen, nitrogen, carbon, selenium, iodine, silicon, phosphorus, bromine.

II. — COMPOUND BODY.

Their number is considerable, so they are classified into groups, the bodies of the same group having the same *chemical function*.

(1) Other bodies are well below:

Marble	231
Porcelain	12
Clay	11

(Wood, coal, wool, rubber, ebonite, varnish are not good conductors.)

Acids. — Their characteristics are: vinegary flavor, red reaction of Sunflower blue, hydrogen content replaceable by a metal, by combining with the bases give a salt and water.

&) The basics. — Their characteristics are: special flavor (soap), blue reaction of reddened Sunflower, by combining with acids give salt and water.

c) **Salts.** — Variable flavor, never sour. Most often without reaction on the Nesol Tour.

rf) Oxides. — Combination of a simple body with oxygen. They are divided into *anhydrides*, *basic oxides* and *neutral oxides*. *From a chemical composition* point of view :

Acids are: either composed of a metal loid and hydrogen; their termination is *hydrous* (eg hydrochloric acid), or composed of oxygen, hydrogen and a simple body; their name ends in *ique* or *them* (eg sulfuric acid).

Bases contain metal, oxygen and hydrogen; they are called *hydrates*.

Salts. — Those composed of a metal and a metalloid have a name ending in *ure* (eg chloride). Those composed of a metalloid, oxygen and a metal have a name ending in *aie* or *ite*.

For oxygenated compounds, we use to designate them prefixes and endings.

sounds that mark the most or the least oxy gene:
ique - them, hyper - hypo.

III. — ALLOYS.

It is a combination of two metals: bronze = copper + tin, an alloy that includes mercury is called amalgam, gold amalgam = gold + mercury.

A BIT OF MINERALOGY

I. — DEPOSITS.

Ores and metals are in the earth, sometimes in their native and pure state, most often mixed, arranged in sedimentary layers, in deposits. Thus lignites, peats, coal are in strata like other terrains. Others are *ilons* or lenticular masses, clusters. They are in the cracks, the breaks, thrown there by the waters.

In these veins or layers, there is less homogeneity than in the other layers or deposits. Often the ore changes in quality or nature according to the thicknesses and the levels since it is less oxidized. Basically, the gite is generally better.

The thickness of a layer is called *power*.

The upper part of the vein is called *roof*.

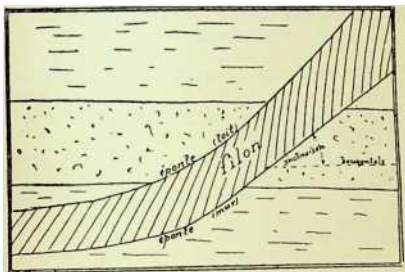

The *wall* is the lower part.

The wall is the limit on the side of the sterile rocks .

The power depends on the distance between the walls and the thickness.

The *direction* is determined by the inclination or angle made by the vein direction with the horizontal.

Sometimes a vein yields at different heights galena (sulphide of lead), sphalerite (sulphide of zinc) and pyrites of iron.

IL — SOME DEPOSITS:

Iron: The most abundant deposit in nature. In oxide form, iron carbonate mixed with other metals. The most important basin: Lorraine.

Aluminum: It is Bauxite and Leucite which is an alumina silicate. In Languedoc, in Provence, in Italy.

Lead: The United States are the most producing countries. Often associated with sulfur (galena or lead sulphide), zinc (blende or zinc sulphide), camone (cala mine or lead carbonate).

Zinc: This is the blende.

Copper: These are copper sulfide pyrites. In Germany, at Rio-Tinto, in France in Lyonnais (Sain-Bel).

Mercury: It is cinnabar or mercury sulphide. Italy, Spain.

Platinum: In the Urals (Russia).

Gold: Often associated with silver, palladium, rhodium, mercury. It is still found in nuggets in alluvium, or in puddingstones, auriferous quartz, gold tellurium.

Important centers: Europe, Asia, Transvaal , California.

Silver: Many compounds of silver: sulphide, iodide, nitrates, carbonates.

Magnesium, Radium: In mineral waters .

The main thing is not to know them but to find them in the basement (i).

(i) We do not recommend, even at the risk of astonishing ^a benevolent public, searches in the room and even less outside, for hidden objects: gold, various metals. Apart from the momentary stay of these objects in the hands, a corner of the room, in the open field, was too short to create a shelter.

III. — RADIESTHESIC RESEARCH OF MINERALS AND METALS

Ores and metals behave like water. They form a mirror to the solar radiations and reflect them on the ground where they can be discovered with the help of the rod and the pendulum.

The pendulum or rod in hand, with the appropriate neck, adjusted to the witness of the body that one is looking for, on the plane as well as on the ground, the initial movement of the pendulum having deviated, or the rod having straightened, one is certainly in front of the deposit.

Above the bearing the pendulum or the rod give continuous gyrations — on the boundary lines of the bearing, the pendulum and the rod follow the shape of the bearing and in their oscillations delimit the curve .

Let us follow this sinuous line, let us mark it well, we have the whole extent of the deposit, in general amplified as the shadow amplifies the body.

Here and there there may be ramifications, let us follow them and specify them.

radiation, the very presence of the public creates an enormous parasitic field, more powerful and more disturbing because of the exiguity of the field of maneuver and the highly aroused curiosity of the assistants, so much so that 99 times out of a hundred the dowser inexperienced goes before a big <failure>.

One can also adopt the method **of the** solar and azimuth planes, then act as previously for the waters.

Witness, pendulum or wand in hand of the appropriate neck, cross-check the azimuths of the bodies or the different planes of influence. Then follow the swing of the pendulum, the direction of the rod. Count your beats carefully.

Circumscribe the ends of the vein.

The seam well circumscribed, to find its depth go from the vertical of the seam perpendicularly to the point where the rod will stand up, the pendulum will bar or cross.

The number of beats translates the deposit in grams, in kilos, in quintals, in tons, according to the mental interrogation of the dowser.

The distance from the depth line to the bearing reflects the depth. The width of this line will indicate the height or thickness of the deposit. (*See table opposite.*)

In the search for metals — the metals being covered with different papers, one seizes their radiation either with the left finger in antenna, or the pendulum directly regulated on the object.

We can still look in a silver coin of 10 francs its alloy: silver, copper, aluminum; in a 2-franc piece: copper and aluminium; in wood: carbon; in marble: calcium; in ivory, bones, teeth: phosphorus.

IV. — MORE SPECIFIC SEARCH FOR OIL

Nothing is harder to find than oil. The experience of numerous boreholes, undertaken without success, despite all the efforts of specialist geophysicists, proves this to us.

Where do the difficulties arise? In general, the simultaneous presence in petroleum subsoils of three elements, almost always inseparable : salt water, gas or methane, heavy oil. We leave aside the other derivatives of these bodies

Their location in the subsoil is generally this: in the deep basin or syncline, lies the salt water; the heavy oil floats and resides in the capillary grain of the clay from which it will come out under pressure, thanks to the probe; .quite, at the summit, in the anticline, the gas.

The difficulty is therefore to direct the drilling not on the gas pocket or in the salt water, but only on the heavy oil which, under the pressure of the gases, will then rise to the surface, without stopping.

The dowsing, by circumscribing well the zones of presence of these three elements can help singularly in their research.

Now, to interest more particularly in these studies, let us say a word about the nature of petroleum, its origins as well as the deposits of the precious liquid.

Petroleum is a free hydrocarbon, of different colors, black, brown, white.

Natural hydrocarbons are of two kinds: soluble (asphalts) and insoluble (bituminous shale).

Different hypotheses have been put forward on the formation of oils:

The inorganic hypothesis: that of deposits in formation, through metallic masses, on granite. This hypothesis has in no way been confirmed by experience.

The organic hypothesis: according to this opinion, originally a deposit of marine algae or *sapropel* was formed on sedimentary soils — then the distillation of animal fat took place by fermentation, thanks to bacteria, the whole thing underwent the effect of intensive washings, first with salt water, then with fresh water — sheltered from oxygen under sealed clay ceilings, oil was formed. It invaded the clay bedrock, while the algae and bacteria fell to the bottom.

Sometimes oil oxidizes, then it becomes asphalt. A few clues reveal it on the outside : the fiery fountains (in Dauphiné), the damp, marshy ground, the iridescence of the waters on the surface in rounded spots. Not to be confused with naphtha and iron oxide. This is divided into plates and films.

CHAPTER V

FIELD PROSPECTING

Basement search. — Caves and Caverns.

(Caving)

It goes without saying that in the midst of climatic disturbances and upheavals of the subsoil by volcanic eruptions and land subsidence, more or less considerable cavities have been formed. Our basement is all strewn with them: there the caveman withdrew. A science called speleology has devoted itself to its research . Dowsing can also help.

Let us first recall a few basic notions:

SOME CONCEPTS OF SPELEOLOGY

Speleology is the science which studies caves , caverns, sometimes dry, sometimes filled with water.

Their existence is sometimes due to the settling of permeable parts and also to water erosion;

in fact, underground watercourses hollow out the basements, corrode, undermine, disintegrate. Only the solid parts (rocks) remain. Natural wells.

In the caves, there are several things to consider.

1) *The direction.*

Clearly mark the north-south line, taking into account the magnetic declination or difference between true north and magnetic north, (i)

2) *Length and width.* (2)

3) *Slope and depth.*~

4) *Excavations.*

RADIESTHESIC RESEARCH OF CAVITIES

Red pendulum or stick of the same color in hand, empty and corked vial as a witness, cross-check on the surface of the ground all the azimuth planes of influence, specify the location of the cavity, its depth, its dimensions; on it the pendulum has four oscillations towards different meridians.

(1) Due to the non-coincidence of the North Pole with the boreal magnetic pole (See Yearbook of the Bureau des Longitudes).

(2) Some of these caves or underground cavities have a worldwide reputation. *Fontaine de Vaucluse* with a flow rate of **4 m to 150 m** — **simple** funnel-shaped water supply opening, depth of the funnel 10 to 12 **m**; total depth of the basin 30 meters below the water level. A river takes its source: the Sorgue. *Cave of Padirac*. *Cave of Saint-Marcel* and *Cave of Locks*.

1° oscillation towards the object. It indicates the depth in relation to the surface of the ground.

2° oscillation EO This is the length. Number of oscillations = length.

3° oscillation NS This is the width. Number of oscillations = width.

4th swing. This is the interior height of the cavity itself.

If the pendulum swings, the object is *round*.

If he breaks down the dimensions into three — *triangle*.

In four equal oscillations = *square*.

In four unequal oscillations = *rectangle*.

Etc...

The depth is always given by intersecting the azimuth plane perpendicular to the direction of the hidden cavity in the subsoil (i).

We can still proceed as for water, with the help of the solar plane. Towards the sun we seek the angle of 45° , the rod or the pendulum then gives the indication of the vacuum. The distance which separates it from the cavity itself equals the minimum depth.

(1) Messrs. Armand Viré and Bidreman have specialized in this research. — Read: "How to become a dowser". We will see there that the use of the rod and the pendulum, in time of war, made it possible to discover retreats-shelters, very helpful to our soldiers, shells, etc...

Perhaps we will even be able, on a map, to discover the location of enemy troops, artillery equipment, etc. Dowsing therefore offers our General Staff useful indications for military operations and c This is probably the reason why he was appreciated in military schools, in France **and abroad**.

The maximum depth corresponds to the kicks. On the vacuum itself we obtain mentally or naturally by oscillations, or specific gyrations, succeeding one another, by series, and the depth, the width, the length, the height of the vaults, the objects which are there, the supporting pillars, in short all the details of the cave. The serial numbers and the colors as well as the different witnesses will still be able to add to the identification of these bodies and to the precision of the examination (i.)

(i) One uses for the research of the cavities either a hollow pendulum, or an empty vial, or an electric bulb, even worn out. The gyration is usually positive.

Some dowzers use the rabbit's or hare's foot (we don't know why).

For the search for the corpses, a piece of bone is enough - but we fear hasty identifications. For having neglected this point, a renowned dowser confused animal bones with the skeleton of Mother Alix le Clerc, in Nancy, and this confusion of bones threw discredit on her discovery which in several points was however remarkable.

For some dowzers (M. Brochenin among others) the serial number of the cavities is 6 and that of the bones 9.

CHAPTER VI

OF AGRICULTURE (i)

Improvements brought to this science by Dowsing.

Agriculture, we know, is the science that applies to the best exploitation of the farm, the barnyard, the land, the forests..., the choice and use of seeds, fertilizers. There is there a mine of researches and studies to which the dowsing can bring a precious help.

I. — ARABLE LAND.

By their composition, they are calcareous, siliceous , clayey, humus. Their variable dosages, or the predominance of one of these elements can make them silico-calcareous, silico-clayey or even argilo-calcareous, etc.

(i) Many authors have exercised their dowsing art in agriculture. In our opinion, we can cite the best: Mellin, Lacroix à l'Henry, Larvaron, Dr Chavanon, etc.

They all start from the principle that: the plant, like all other living or inanimate beings, radiates... Its radiance depends on its vegetative life and the laws that preside over its **fertilization** , germination, flowering and fruiting.

This integral development of the plant is subject to

Now, in these mixtures, the predominance of one of these elements will be very quickly determined by the pendulum and the rod; with the exact determination and proportion of each of these elements .

It suffices to know by Probst's law (see the pendulum balance of Gorceix and Brard) that for equal weights of identical substances the pendulum marks the neutral point or the point of equilibrium of these forces in the middle of their distance. If this medium is displaced it can be re-established by adding in favor of the substance inferior in weight what it lacks — in the twinkling of an eye the pendulum on this line of influence which connects two identical bodies will reveal the quantity which is missing . , and the quantity necessary to repair this inequality.

All the bodies entering into the composition of an earth can thus be detected, in quality and in quantity, thanks to the pendulum. Their amendment is also seen as dowsing.

atmospheric conditions, environmental requirements, terrain, polarity,

The dowsing by the pendulum or the rod has its say on the question,

If, in this study, methods and opinions vary, the fact of dowsing research in agriculture remains and the successes are indisputable,

Mr. Trcyve, landscape horticulturist, in Yzeure (*We have seen it with our own eyes*) has put together a real horticultural research plan on the work table: on this table, at the pendulum — without knowing the plant he has in his hand — he can tell the nature of this seed, its preferred ground for hatching, its climate, the month, the week, the day of its best sowing and the conditions exactly favorable to its growth,

II. — SEEDS.

Dowsing can identify them, indicate exactly their degree of productive value, the land that best suits them, even add the precise date of their sowing, the orientation that is most favorable to them, the origin, the climate , their habitat.

This is an opportunity to remind ourselves of everything we have said about the value of disks, and the need to immediately create one or more of them: the disk of arable land, seeds (quality, productivity, elements plant regenerators, date of sowing, orientation).

At the same time as the vitalism or the deficiency of the plants, the pendulum on the appropriate disc will also be able to specify the causes of these deficiencies or this vitalism, the remedy.

Our agriculture discs are in preparation (i).

(i) Our farming disk or disks all achieve this goal.

A deep dowsing study on agriculture involves the solution of the following problems:

Geographical and topographical location of the farm: latitude, longitude, plain, mountain, climate, geological subsoil , breed of animals bred.

Residential and farm buildings: house, stable, barn, dairy, cellar, pigsty, shed, lighting, drinking water supply, water drainage, valves and sewage.

Land: nature, quality, distribution of crops, rotation , various cereals, legumes, fields, natural and artificial meadows, pastures, mountains, wood, vegetable and fruit gardens.

Livestock: oxen, horses, dairy cows, breeding bulls, pigs, goats, barnyard animals.

Dead livestock: instruments of cultivation... harvest...

III. - FERTILIZERS.

Let's not forget that everything radiates, in agreement or in disagreement with other bodies. It is this resonance specific to fertilizers, it is this resonance of agreement or disagreement with such and such a terrain and this plant that must also be grasped by the pendulum. Here again the fertilizer disc will help us.

The agreement or similarity of pendulum movements will indicate total propriety; the disagreement will mark the dissimilarity.

IV. - THE BARNYARD.

From the plant and the fertilizer, let's move on to the animal: animal with feathers or fur, here is the barnyard. Bird, mammal..., in short, let's study the farm.

Here a special record must be established and contain the following pieces of information:

Animal; vitalism. Male and female. Laying. The reproduction. Organs.

Animal-disease: organs-microbes.

Animal-remedies: Fodder, climate, meat, air, drink, housing: stables.

The examination done here on disk can be repeated on a ruler. Here is an experiment which we were given the opportunity to bring to a successful conclusion, thanks to a very famous doctor in Paris who, in his spare time, was interested in breeding.

Many chickens on the farm were sick with white diarrhea.

Of the remedies tried, none had been effective until then.

I am consulted.

On a ruler, with my *super-detect device*, healthy chicken feathers gave a radiation of 0.12 cm. ; sick chicken feathers gave a radiation of 0.08 cm. ; the disease control gives a radiation of 0.08 cm. ; a first remedy proved ineffective, giving a radiation of 0.01 cm. ; a second equally ineffective remedy gives a radiation of 0.075 mm; a vaccine which on the ruler had given a radiation of 0.12 cm. was applied. All the chickens were healed.

The "*super-detect*" had revealed the concordance of the vaccine and the health.

Ruler and disc can therefore open an excellent way to the good behavior and hygiene of stables and poultry yards.

At the moment in producing centers, we are pursuing numerous researches of this order. The future will tell if we succeeded.

Here again it is necessary to build up a record.

V. — THE STABLE, (1) THE STABLE, THE PI - GEONNIER.

What is true of the barnyard can also be said of the barn, the stable, the dovecote.

(1) The horse also deserves to have its disc...

Whether it's a draft horse or a racehorse — basic qualities, redhibitory and hidden defects — food, etc., all that too comes under the rod and the pendulum...

The fashion is no longer for the short horse but for the long horse , since the carousel gave way to outdoor riding .

disk or a ruler of the fundamental azimuths of cattle, (i) of pigeons (2) establish the wavelength health, disease, remedies.

The pendulum will oscillate or gyrate on the points to incriminate, to cure, on the diseases, the remedies.

The horse (continued)

Appreciate the horse's solid spine, the robustness of its joints, the length of its loins, the flared rib cage, the muscular shoulders, the powerful thighs, the hidden kneecaps, the straight and supple hocks, the solid feet . .

The pendulum can give its indication on all these points **and** help the connoisseur to be less mistaken.

In the stud farm, dowsing therefore has a say.

(1) Here are some useful indications for agriculture.

(taken from Lacroix to Henri and from Mellin).

Some Animal Series Figures

Dog	34	Turtle	50	Fox	15
Cat	38	Ladybug..	20	Pig	40
Rat	52	Rabbit	35	Guinea pig ..	8
Hen	59	Hare	44	Pigeon	84
Sparrow	42	Sheep....	25		
Hedgehog	36	Cow	18		

(2) *Pigeon racing.* — (Lacroix to Henri.)

Feed. — Corn kernels (not cracked), jar peas, hemp seeds, wheat, buckwheat, red millet, rice, lentils.

Diseases. — Weakness = Thuja 30 c. or carbo vegetalis 30 c.

and Diarrhea = Bryonia 30 c. and chamomile 30 c. Heart remedies = Cratoegus, 100 c.

Diphtheria => Pertussin 30 c. — Sulfur 30 C « —“

Hyosciamus 30 c. — Diphterotoxin 3 to 4 drops.

Pigeon fallen from the nest => amica.

Apiary. — Learn to detect the Queen's radiation (before spawning) — after spawning her serial number is 12 — her wavelength 0.68.

Its food will be the flower at wavelength 0.68.

Chicken. — The “bacillum pullorum” has the length wave 0.62.

The Faculties in the Animal (Serial Figures—Benoît Padey)

<i>Instinct</i>		<i>Memory</i>		<i>Flair</i>	
Monkey	100	Elephant...	100	Leo	100
Elephant...	50	Dog	100	Wolf	87
Leo	45	Horse	65	Fox	85
Fox	40	Cat	51	Badger...	52
Bear	39	Fox	42	Hare	44
Horse	32	Wolf	35	Bear	13
Dog	30	Leo	32		
Pig	25	Donkey	24		
Donkey	24	Goat	16		
Goat	20	Monkey	10		
Cat	10	Pig	12		
Beef	9	bird	2		
Sheep	5				
Hen	3	<i>Note.</i> — The figures are placed here in descending order of sensory and perceptible value.			
Rabbit	2				
Bird	1				

Note: Instinct is studied towards the right temple

Memory is studied above the forehead — vertically The
flair starts from the tip of the nose forward.

VI. —THE GARDEN, THE ORCHARD, THE FOREST.

The disc is oriented here like the other discs .

It includes the *vitalism* of the plant, its disease. *The order of &s deficiencies:* (soft root, bark, sap, trunk, stem, leaf, flower, fruit).

Disease.

The cures. — Earth, climate, water, sun, cold, heat, habitat.

Use. — Remedies, drinks, ornament, food, external use, internal use.

Note. — The control to be used is any part of the plant, of the animal, photo-images.

VII. — THE LIVESTOCK, FISHING, FISH, FOREST, HUNTING, GAME.

Let's get out of the farm and explore its surroundings; we thus reach the lakes, the ponds, the forest.

Here the pendulum can give us precious indications, concerning fishing, hunting.

Constitute then the disc of the pond, the lake, the fish which are there, also constitute the disc of the forest and the game.

On these disks determine the exact orientation North-South-East-West, make it agree with the orientation of the lake, the forest to be examined.

On the edges of the disc determine with fish scales, with hair or feathers of game the azimuth or the fundamental radius of each other — a graduation all around the disc up to one hundred will fix you on the number game and fish. — On the weight... its qualities (food, agility, brood, young) — on the vegetation which attracts them — on the lodging simply - (remanence) or presence. — On the permanent or occasional habitat, on the distance.

This experience was a perfect success for me at Lac de l'Abbaye (Jura). The assistants were amazed because the fishing directed according to my indications gave at once nine tenches of two pounds each , at the place which the pendulum had determined as the favorite corner of the tenches. The pendulum also indicated the different depths of the lake, which was acknowledged to be correct by the owner.

VIII. — SEX, (i)

Let's not cry for immediate success: failure can come after the finest triumphs. I recently announced the arrival of a nice little Thérèse (2) and it was a little Jacques who was born... and yet seven previous successes had given me the illusion that on this point he was impossible to have errors. It is true that in the latter case I was deprived of my "super detect " device and was working haphazardly, on a borrowing table, a photo touched by several people.

Anyway here is the method for the eggs. Place the eggs one after the other on different plates, porcelain in general is insulating, change the plate each time to avoid the phenomenon of persistence.

On the egg the pendulum gives four oscillations

(1) Age Table -

Age - Gender	BO'LY	LAMBERT	MERSEMAN	C* BASTIDE
(Child. . Hom-1 (Adolesc. mc (Hom.fact Women..... Male..... feminine daughter	3 write-offs 2 cancellations	9, 14 21 20 2 oscill. 4- 12 1 turn — 6	30 20 deceased : oscillate.. alive. 4-21 4- 10	Series of life 8 t Series of m. 8 1. Hom. (25) 3 lit of 8 rounds Female 4-21: 10 or 1 5 ballin.

(2) *The sexes.* — Research always very difficult... because in animals the sex does not appear immediately after birth and there are fairly frequent anomalies in them: coupling of males — pairing of females.

rule . — The rod and the pendulum give more turns on the male than on the female.

Avoid impregnation, by studying the sex of the eggs — change support — shake your wand, wash your hands,

different meridians, the first oscillation indicates the value of the shell, the second (more oblique) that of the inner skin, the third perpendicular to the first indicates the albumin, the fourth the egg yolk, the pendulum ends its series in one gyration, to the right (female), to the left (male).

On clear eggs, the pendulum has no definite terminal gyration

For the sex of a child, the subject of examination is the photo of the mother. On the ruler, place the photo at the zero of the tape, move the pendulum: the pendulum swings in the space between 0.10 and 0.20 cm., it is the mother wave, between zero and 0.03 is the wave of the child. If the pendular movement ends in positive ovration

This **Undead**

		MERMET	PAUL BROWN 1
y ₁₀ FORTOUL	MILLER		
omnia: oscil. ernirne: gir. lœrt : Abs .	Male : 3 Female: 2	male => 30 female = 20	hangs. dare. : male hangs, gire : female male (egg) 11 female (egg) 10

put a new piece of paper between the examination paper and the table.

For the child. — After having exhausted the series of the mother, exhaust the same series of the child.

This failure reminded me of the reality of never acting haphazardly, to please . The pleasure here becomes a disappointment and a source of error.

CHAPTER VII

SOME OTHER

MORE SPECIAL RESEARCH

I. — SEARCH FOR TREASURES.

It has become a mania to consult dowzers for the search for treasures. Father Mermet admits having carried out a certain number of them, I believe, almost all without result.

Personally, I found a gold bracelet lost in a castle; found gold objects hidden under a plate; one of my students found eight gold coins in his field. This is all that dowsing has allowed me to obtain so far. The other experiments which have been completely successful have so far been purely by chance, as far as I know.

However, we do not know why gold would escape the investigations of dowsing. Gold has a fundamental radius like all other bodies (S.-West), its harmonics are perhaps more numerous. Don't stop at harmonics ... go as far as fundamental radiation. She is at the center of the radiance. There lies the metal.

II. — SEARCH FOR THE MISSING.

It also comes under dowsing. It is indisputable that the missing have been found, thanks to the pendulum.

The failures are also innumerable.

But failures should not discourage true seekers. How then to proceed? — Take a map of the presumed region where the missing person is thought to be found, before tuning the pendulum to a witness: photo, hair and linen of the person sought. On the map the pendulum will swing immediately towards the points where the radiation of the disappeared can be found. Stake out the route thus followed by the pendulum. At the terminus of the radiation is the person, then we will have some chance of finding him. I have three convincing cases of such discoveries to my credit. Sadly, that's very little! but my daily work does not give me the opportunity to do more.

III. — SEARCH FOR CRIMINALS.

Nothing is as delicate as this work because the imagination can lead the dowser to false suppositions, consequently to criminal charges, to errors prejudicial to the good reputation of people.

Moreover, on this subject, I had the opportunity to - listen to a very well-documented lecture by Doctor Locard, President of the laboratory of judicial research.

This crime investigation specialist

Nelles told us that in Lyons, the famous Jacques Aymar, in the 17th century, had succeeded in all the research of this order, which had been entrusted to him by the Public Prosecutor's Office at the time. In Paris, on the contrary, they had all failed. Mystery ! As for little Marescot, everyone knows that three answers out of seven hundred were given half satisfactory.

At the end of the conference, the famous Doctor confessed however that a difficult and recent dowsing research had given him full satisfaction .

Same difficulty for the research of the authors of anonymous letters. The percentage of successes is not very high.

Here then again the field remains largely or green to the research of dowzers. Maybe a disk based on the fingerprints and the various exhibits would work better.

IV. — SEARCH FOR LIFE AND DEATH. — DISTINCTION OF MAN AND ANIMAL.

Discerning if someone is still alive, in a region far from us or if he is dead, can deserve the attention of a dowser. To pose the problem is not to solve it and the failures of the pendulum amateurs on photos

have since left me skeptical about the certain possibility of this kind of research.

So I put together a record of life and death. On this disc the radiations of the dead will frankly line up in the death zone, that of the living, in another box.

So far I have only had my personal experiences to convince me of this absolute discrimination. I would like this method to become universal.

This is the case with the disc: *Men-animals. Women and men. Male and female.*

I met in these researches the most pitiful failures at my place and at other dowsing friends... so much so that it is difficult to believe in the success of these researches, purely pendular.

However, we immediately put together a record and it gave us satisfaction. It remains to universalize its use.

V. — GRAPHOLOGY AND COSMIC WAVES

Here we reach the extreme limits of dowsing, some would even say witchcraft. Obviously the ground is no longer as firm and scientific controls are lacking. It would no doubt be rash to launch the ray thesis, already so tottering, on such perilous paths. We would not have done it, if here and there attempts had not been tried with success; if more and more investigations of this

order, even very scientific lectures on the influence of cosmic rays had not been given in scholarly spheres.

Science, guided on this path, will soon be able to tell us what to think about it.

Here, at least, is what one can attempt with the prudent reserve dictated by the concern to remain always in the truth.

Graphology. (Consult the book of Ma dame Loeffer-Delachaux).

Graphology studies 8 signs in writing to discover some special notes relating to individuals, their character, their temperament, certain external habits, etc.

These 8 signs are: speed, degree of pressure of the hand, shape of the letters, size, direction, continuity, order, downstrokes.

Speed, the pendulum denotes it, depending on whether the movement of the pendulum on a writing is fast or slow, heavy or light.

It has been claimed that fast handwriting denotes intelligence—heaviness, dull-brainedness. — Thousands of checks alone can give us certainty in this respect.

The pressure of the hand, denotes a light, supported or heavy writing, the pendulum on the finger will make feel this lightness or this weight. Light handwriting is a sign of weak constitution — thick handwriting denotes congestive states. — However, avoid making a decision before thorough, numerous and conclusive checks.

Form. — The features are firm, strong, or barely touched. The pendulum then gives simple or complicated serial numbers, a fundamental or many harmonics.

Firm features indicate bold, strong natures, others, pusillanimous, weak or confused natures. Always stick to the same rules of elementary caution that we have advised.

Dimensions and order. — Until now, graphology has only approached physical life, now its role is more complicated and less certain: it is the search for intimate characteristics, the higher faculties themselves, the individual.

The so-called revelation begins with the chapter on the dimensions and arrangement of the letters. Sometimes the writing is small, narrow, real fly paw, other times it will be wide.

Here the pendulum will barely swing or take a large amplitude in its swing. Let us remember that small handwriting is a sign of a temperament or a spirit that is not very expansive, sad, homebody, focused on itself, while large handwriting will denote a cheerful, generous, expansive character with great vital exuberance. .

However, let's not put our hand in the fire to affirm that it is always so.

Direction. — A writing can lean to the right, horizontally or left. The pendulum indeed will turn towards one direction or towards the other, its direction will be positive or negative, let us know that here we can have an index of will. To the right,

the resolution is energetic, thoughtful; towards the - horizontal, it is indecisive, uncertain; to the left , it has all the signs of excess, of harshness.

Continuity. — The letters are linked or disjoined, the temperament is calm, the artistic sense; the very lively imagination in the first case; in the second case we expect disorder, agitation, trouble and confusion. In a word, to our eyes by the continuity of the letters the imagination of the subject is revealed. The pendulum without a jerk reveals the former, the agitated pendulum reveals the latter.

Thus the invisible soul is translated, no doubt very imperfectly in our eyes, by visible manifestations: gesture, song, voice, why don't we add the imprint of the hand or writing?

Jambs of the letters, (*-full, loose, dashes, circles, semi-circles*), here again will reveal the emotions of the soul, the pendulum will adopt perfect or incorrect forms. Writing is perhaps a bit of the graphic of the soul.

Cosmic waves.

At the present time it does seem, by the studies sketched out in this direction, that apart from heredity, temperament, we are subject to the influence of other environments , other waves called cosmic waves.

These radiations, for many, no longer seem to be in doubt.

Specify how and to what extent these

radiations reach us, here is still a point of dowsing to be fixed. We tried it in the disk of cosmic radiation, of their influence.

The universalized experience of this essay will tell us exactly whether we have succeeded (i).

(i) *Cosmic waves.* — They come from the sun and the stars; the moon and the planets also send them to us. They are electromagnetic. They create heat and light.

They are due to a wave phenomenon, or to an emission of particles, scientists do not agree on this point.

Prince Louis de Broglie favors the wave theory.

M. Lakhovsky admits an intermediate opinion: undulatory for interstellar spaces — undulatory and corpuscular in our atmosphere.

Telluric waves — We have already said a word about it. 42. To explain them one can imagine the earth as an enormous electric battery or better still an immense electric factory... throwing into the atmosphere like an antenna its wires charged with negative electricity. When these negative wires meet the atmosphere charged with positive ions, a spark breaks out. It's lightning.

One can conceive of all bodies buried in the earth as emitting α , β , γ radiations. The existence of these radiations no longer seems to be in any doubt at the present time. These rays escape and point at a constant angle called the "fundamental ray."

(See JF Ravat. — *Truths and illusions of Radies thesis*).

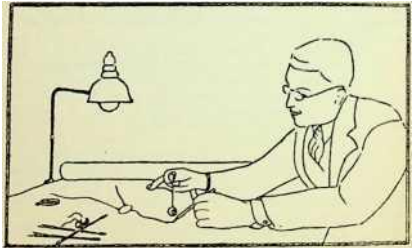

CHAPTER VIII

PROSPECTING ON PLANS (Teleradiesthesia)

— You followed me and this general dowsing study captivates you and yet!... All these researches are nothing, compared to another marvelous work which, in this case, in the experimental waves, seems to operate like a small revolution.

Let's go back, if you don't mind, to the laboratory and give me your kind attention. I want to talk to you about off-plan prospecting.

Good dowsers not only prospect on the ground, they also prospect on plans, on maps, on photographs, etc.

However implausible it may seem, it is a fact, and the fact can be explained; it is no more implausible than the TSF or remote sound recording, than television or the recording of distant images.

I. — ESSAY OF SCIENTIFIC DEMONSTRATION

TSF, as well as television, have shown us that any perception of waves can take place even at a distance provided that we have an antenna nearby to record this wave, a galena set to detect it, a tri-grid lamp to amplify it, an earphone to hear it if it is wireless, or two oscillating discs breaking up the image at the starting point and recomposing it at the point of arrival in television.

But can we not affirm that the dowser has these devices for his dowsing perceptions, wherever he is, the distance from the emitting object does not matter, since the recorded waves are (at least) as fast than the light waves which have a speed of 300,000 kilometers per second? In one second these waves have circled the Earth several times.

The receiving antenna here is the human body; he is at the same time receiver, transformer and detector through his entire circulatory, nervous and muscular system . The pendulum then acts as an amplifier .

The reception recorded and translated by the pendulum , it will therefore suffice to fix it on any

sheet of white paper, to draw a graph of it as on a sheet of paper, one draws a sketch of a distant vision or, on a phono disc one records an audition, or, on a telegraph tape one notes in Morse alphabet the receptions of this order.

Will it be said that sketches, phonograph records, telegraph tapes are fanciful data? No way. And yet they reveal to us very distant emissions. The device, in the circumstances, brought everything closer, despite the distance. Thus the human body for the dowser. It is the device for bringing the waves closer and receiving them from a distance.

The pendulum or the rod are only its amplifiers and revealers. It will be enough only to interpret the movements well.

Such, it seems, is the plausible explanation for the remote reception and fixation of dowsing and distant waves on paper, in perfect concordance and objectivity with the real plan.

Basically, prospecting on a plan is only the notation of distant waves on paper, on a scale of reception concordant with the plan or the reality of which the plan is only the reproduction.

II. — OBJECTIONS AND REPLIES.

1st Objection. We will say: The plan is, in fact, only a simple sheet of paper. How can it emit and record waves, especially distant ones? How on simple plan a dowser will be able to discover something other than what

see his eyes? And its notation, what objectivity can e¹
^ have? What real scope? Map prospecting is quite simply a work of the imagination, an arbitrary fantasy .

Answer: Not at all. Listen, observe.

The antenna, too, is, in fact, only copper wire. However, it is admitted that it gives way to waves. The human body, too, although at very great distances, records light, caloric, sound waves and many other waves that current science, such as radiography, has not yet been able to define well. All these waves, the hand of the musician, the draftsman, the painter, by the pen, the pencil, the brush, can fix them on simple paper, give the exact notation, draw the curve, the line with a precision which sometimes is almost the equivalent of reality. What relationship, however, is there really - between the artist's sketch and objective reality? The one that the interested sense has established with accuracy and that the hand has only expressed and translated.

Thus in esi-it dowsing perceptions. They seem to be of this order. The plan, after the dowser's notation, is like the graph given by an artist. It responds to reality, insofar as it translates exactly the perception of our hidden senses.

This is why any plan is not enough... To properly ensure the perception of the distant wave, and to translate it exactly by putting us in its trajectory, certain conditions are necessary as follows:

i° The plan must be as far as possible an exact reproduction of the land.

2° It will also be on a suitable scale, i/1000 for example so that the pendular deviations are not too great. Consider that at a scale of 1/10,000 a difference of 1 mm. creates a variation of 10 meters.

3° The plane must be well oriented, taking into account the difference in declination between the magnetic meridian and the geographical meridian (difference of 15° on average for France).

4° It is necessary as much as possible that it mentions the accidents of ground, the differences of altitude and the superficial streams.

Once these conditions have been met, the dowser will work on plans as well as on the ground. He will have the ground to prospect at the end of his nose. He will behave in front of his plan like the artilleryman in front of his piece or like the navigator in front of the map where he took stock. It will be in the path of the wave.

2nd Objection . We will also say: on the plan, from the place where one is working to the ground where one is prospecting, there is a multitude of intermediate planes , watercourses, mining deposits, etc.

How is the dowser sure to register and note exactly and only the terrain he has in view, that one and that one alone that the plan reveals to him?

Answer: At my listening post, which is the TSF device, or at my viewing post, which is the bellinograph, I have the possibility of recording all

the Hertzian waves circulating in space; as well as all distant visions. There are, however, many intermediate hearings and visions — however, the TSF device, like the bellinograph, will only pick up and emit the wave desired and chosen thanks to the device which is both a synthesizer and a selective one. Tuner, it vibrates at the legal wave. Selectively, it eliminates the other waves to reveal only one — this syntonization is obtained in the TSF apparatus by adjusting the rheostat and the galena — on the bellinograph by the oscillating recording discs — thus in the dowsing his body vibrates in syntonization of the wave, his psyche makes the selection.

The detailed and perfect plan therefore serves to fix the psyche, to determine the mental orientation, to close off in some way the internal recording apparatus to all waves that do not emanate from the station that one wants to capture and on which one is listening. granted, thanks to the plan.

By not wanting to submit to all these meticulous rules, stated here, many dowzers have been lamentably mistaken and their numerous "failures " have figured in impartial accounts. It's too bad.

III. — RADIESTHESIC METHOD OF RESEARCH ON PLAN.

Armed then with his pendulum and his witnesses, he will walk his instruments on the plan, will cross-check the azimuths.

First he will determine on a map the subsoils, their constitution, their depth, their synclines , anticlines, concordant and discordant stratification, faults and caverns.

The basement well identified, it will remain to seek water always by the same process as above. It will be easy to indicate the drilling to be done on the plateau , slope, in the valley, the flow rates, the depths , the potability.

If necessary, he can even determine the ore deposits and veins.

What the dowser would do on a large scale on the ground, he will do in miniature on the plan and the graduations of the scale will give him the exact objective distances.

Experience has, moreover, proven many times that the notation of the dowser on a well-made plan, corresponded to objective reality like the plan itself and that the sense of the dowser adapts itself with unequaled flexibility to the situation . scale of this same plane, just as the sense of sight and hearing adapt to prismatic binoculars for vision and headphones for hearing (i).

(i) The prowess of certain teleradiesthesist dowsers is no longer in doubt. They find from a distance and on maps the number of vehicles passing on a road. They count the automobiles which, at a certain place on the road, travel at full speed, they discover lost objects, direct a hunt, a fishery... We have already read it... etc., etc.

CONCLUSION

Now that we have touched on all the problems likely to interest dowsing, we are going to approach another study: medical dowsing. We don't treat her like a doctor...we aren't and we don't want to substitute ourselves for him in any way.

Besides, the medical dowser should never forget that one does not improvise as a doctor. To practice this art requires very extensive knowledge, a very rare flair and prudence, legitimately acquired diplomas, numerous and rigorous experiences. Moreover, life teaches us that, even with this baggage of security, we are not always safe from the most surprising and disappointing failures. "So what about clumsy people who imprudently interfere in this art?"

But it is always possible to know the result of the radiesthetic investigations already made on this ground by professionals of medicine and the pendulum - of the supplement brought by the pendulum and the rod to the precision of the diagnosis and the therapy.

To say what has been done in this direction, — what could still be done — basing ourselves solely on the assertions of pendulum doctors or dowsers, controlled by doctors, that is our goal.

TABLEAU DE MENDELÉEFF

THIRD PART

THE DOWSER AND MEDICAL RADIESTHESIA

The purpose of dowsing is the study of radiation .
Could she ignore medicine?

Several physicians, of unquestionable authority, did not believe him. They affirmed human radiation, the possibility of measuring it, of studying its harmony or dissonance, in relation to diseases, microbes, remedies.

It is the result of this scientific research that we are going to present in this third part . We will see there that dowsing — far from harming medicine — can make an extremely useful and favorable contribution to it, while

such as radiography, iridology, acupuncture , etc.

The rule to follow in this barely cleared way - protruded by the pioneers of dowsing is to advance there only with extreme caution. The medical dowser must always have in mind the principles of wisdom, enacted by the learned Doctor Régnault, Professor at the Naval School.

He writes in the *Cote d'Azur Medical*: " If we want to shed a little light on these very complex questions, we must proceed methodically and cautiously, accumulate facts, multiply experiences, before establishing a doctrine. Above all, we must avoid the exaggerations which make men of science hostile to such studies ...

And again: " The medical profession, already very crowded, sees itself invaded by pendulum and rod operators who, in a few minutes, without having done ten years of special studies, believe they can instantly establish a diagnosis and a treatment... Let's not talk about charlatans who want to use fashion. Stick to sincere people. They can have interesting reactions , they can also delude themselves and let themselves be carried away by the madwoman of the house..., in any case, they have to prove what they are saying. »

This judgment is not too severe. He eliminates the naive and charlatans from medical dowsing .

Here is another reflection — by Charles Richet, member of the institute and professor at the University of Paris — in his book *Notre Sixième sens*:

which is no less severe for the censors who left without and excessive, who systematically and *a priori deny* any scientific innovation.

“ When it comes to science, it is appropriate to be frankly revolutionary, provided that this revolution is based on the two unshakable foundations of all biological science: observation and experience. »

Observation, experience, rigorous checks, carried out by competent doctors and graduates , this is what this study will be made of.

I. — A GENERALLY ACCEPTED THEORY

The Graduated Wave Scale (i)

Throughout the world, waves of all lengths and all frequencies circulate almost endlessly .

Here is the graduated scale known to date:

(i) We will be pleased to know some definitions concerning wave theory . They are borrowed from the illustrated Grand Larousse :

Period : if any shock is produced at one point of an elastic medium, the equilibrium is broken in all the parts of this medium and this loss of equilibrium or vibration is transmitted step by step... at intervals of equal times... this interval is called *period*.

Speed. — But this shock starting from a point X is not instantaneous ... its propagation takes place in a time V which is called *velocity* (unit of time).

Wave length. — It is the unit of distance or path traveled during a period.

V, T are therefore the 3 measurements of the wave.

II. — A FACT: THE RADIESTHESIC WAVE

The human body is wonderfully equipped to capture some of these waves.

The eye captures light waves — the ear, sound waves — tactility, heat waves — smell, olfactory waves — taste, sapid waves.

Is this only where the capture of other waves stops? This can be doubted because a fact imposes itself on the attention of the observer and from this fact can be deduced certain plausible conclusions, which experience then demonstrates.

Here is that fact:

The human body, or at least certain human bodies, capture the Hertzian waves as well as an antenna and transmit these vibrations to the TSF apparatus sometimes with a disconcerting purity of sound.

Experience it yourself. Disconnect the input wire to the post, which communicates with the antenna. This wire, hold it by hand, thus suppressing communication with the antenna, then switch on your device and put on X post. You will have a hearing as pure as with the antenna. If you don't have an antenna, substitute the ground wire, you will get the same results. Hence the following conclusion: The human body, like an antenna, picks up the most distant Hertzian waves.

Let's continue... If now taking a pendulum you take care to tune it to your hand which

acts as an antenna — at a determined length of wire, the pendulum will swing... and if it is a piece of chestre gold that is recorded... the pendulum will swing at a rate marvelously suited to the piece , to so much so that your pendulum in its gyrations and oscillations will resemble a ballerina dancing to the rhythm of the piece of music played

What to conclude from this ? this indisputable fact... is that just as a TSF device by its resistances of all kinds makes the Hertzian wave decrease and makes it demote from the highest frequency to the lower level which is the sonority , thus the human body can also by itself operate a higher resistance and bring this decrease of the wave to the point of lowest frequency which is the mechanical oscillation and gyration (movements of the pendulum and the rod).

At least everything in the phenomenon that I have just cited to you seems to be explained in this way.

Let us go further and say, if, as many scientists seem to admit today, inert or living matter is only vibration, the vibrations being transmitted through space at a rate of speed and agitation that it seems premature to fix right now, I don't see why the human body would not capture them and why having captured them, as for the Hertzian wave captured previously, it does not break it down would not be a vibration of longer measurable wavelength such as mechanical oscillation and gyration would be. The hu reflex

impressed hand then behaves like the piston of the locomotive, actuated by the steam and setting in motion both the connecting rod and the wheel... X piston pressure equals X recti-linear movements of the connecting rod and X curvilinear movements of the wheel — thus what about the pendulum movement, it translates the degree of impression of the wave on the brain then on the human reflex.

This theory is worth what it is worth... but in reality it makes intelligible an indisputable phenomenon which certain people register and which it is pleasant for them to explain.

The theory explains the fact.

But the fact stands out.

III. INDISPUTABLE RADIESTHESIC FACT

RECOGNIZED BY SCIENCE (i)

To deny a fact *a priori* is not scientific. To control it, to make it indisputable, obvious, such is the task of science.

Does the dowsing fact exist?

Yes !

(i) Charles Richet has *Our Sixth Sense*".

® We are surrounded by vibrations, some of which shake slowly, and others do not shake normal sensibility.

a ...The luminous vibrations of the ether shake the retina. The mechanical vibrations of the air shake the terminations of the membrane of Corti, and give a sensation of noise; the olfactory cells and the taste cells are chemically shaken by olfactory or sapid substances, and the nerves of touch are shaken by the mechanical resistance of objects.

Who affirms it?

Great scholars... Their names are at the top of the best rated dowsing journals.

They are called: *Branly*, Member of the Institute.

D^T Meillère (deceased), former President of the Academy of Medicine of Paris.

Armand Viré, from the institute, Doctor of Science.

D'Arsonval, Member of the Institute.

D^T Foveau de Cour nielles, Winner of the Academy of Sciences and Medicine, Bachelor of Physical and Natural Sciences.

Abbé Bouly, Bachelor of Science.

Deslandres, Member of the Academy of Sciences.

Lakhovsky, Member of numerous scientific academies.

Darder Pericas, Professor of Geology at the National Institute of Taragona.

Chevalier de Vita, *D^I Régnault*, *D^T Lépine*, and how many others... almost all doctors, engineers, professors of faculties, etc.

Their dowsing works number more than forty. We give the bibliography at the end of this volume. Alone, they

" Now, normally, no other vibration reaches our organism, and yet there are an immense number of vibrations around us, the reality of which is absolutely certain (attraction, magnetic force, currents of high frequencies, Hertzian waves, rays ultra-violet, infrared, radium, ultra-sound, etc.) sometimes very strong - healthy vibrations, but which are not perceived by us, because there are no receptor organs.

" So we only have a small open window on the immense world "

This outline makes probable the fact of the radiesthetic wave.

constitute the best scientific apology of this art.

IV. — THE APPLICATION OF THIS FACT TO MEDICINE

How does this fact relate to medicine?

Here is. However high we go back in the medieval history of dowsing, there is no question of applying this art to medicine .

The first research of this order begins with Father Bouly. During the war and after the war, he had in the presence of doctors to detect certain microbial diseases. Armed with witnesses of these same microbes he made some interesting discoveries. It was then the turn of Father Mermet, of Brother Benoît Padey. To these known names of medical dowsers are added others: MM. Bovis, Christophe, etc.

So far it cannot be said that medical professionals have taken much interest in it. They watched the research from afar, they noticed a few inaccuracies, drowned in the midst of a thousand inaccuracies, and that as much for the diagnosis as for the therapy. Admittedly, the research was initially simplistic. Most of these medical dowsers were largely unaware of both the anatomy of the human body, and microbiology...and the process of disease and the value of therapy.

They were, compared to the medi dowsing

hold what were the simple dowsers of the past with regard to the current radio telluria for the search for waters, ores, metals, their ignorance and of geology and hydrology and mineralogy was total .

How can we be surprised then by so many errors and so many false interpretations! But just as engineers, scholars of all kinds have tackled the problem of geological dowsing, here a whole pleiad of doctors has risen, endeavoring today to solve the problem of medical dowsing .

V. — MEDICAL RADIESTHESIA AND ITS MULTIPLE WORKS

I. Doctor Savoire

Jacqueline Chantereine Method

The detector employed here is that of Professor - Mager. Around the patient, who is in the center, unrolls a colored rosette, the same as that of Mr. Mager.

At certain places of the rosette called planes, there are four of them, that is to say opposite certain colored sectors, the rod or the pendulum is agitated... the prospector doctor concludes... here corresponds skeletal fatigue (plan 1) remedies: carbonate of lime, eggshell — here , muscle fatigue (plan 2), remedies: iron oxide, light fatty substances — again: blood fatigue (plan 3) , remedies: iron, potassium phosphate,

fatty principles — finally there: brain fatigue (plan 4), remedies: phosphate, fatty principles... Beyond the four fields of manifestations there are others which, it seems, correspond.

The explanation of the phenomenon is this: The human body, just like the fossil ammonite (first known type of animal creation) is the center of a cellular movement, resulting from two forces: telluric and cosmic which can be add other forces, triggered in the human body by the chemical phenomena of digestion. The set of these ordered vibrations or radiations of the living is called the vibratory field of the body. It has its equivalence in the scale of colors — thus the telluric force radiates at the level of red — the cosmic force corresponds to violet radiation... Any body placed on its corresponding color creates a resonance and this resonance makes it vibrate the pendulum and the rod.

Such is the theory of colors, employed by the Doctor quoted here.

It is difficult to dispute it. Medically verified facts are the best proof of this.

II. — Doctor Leprince

1° In one of his first works (*Medicine or medical pendular examination*) — Dr. Leprince was content to summarize what was known about medical dowsing... he republished the theories in progress: that ^{of} Mr. Viscount Henry of France

on serial numbers, obtained with the patient's hand, etc., etc.

That of *the Abbé Mer puts*: oscillation = diseased organs — positive gyration = healthy organs; and positive gyration — very good remedy — negative gyration = bad remedy.

That of *Brother Padey* or the three zones of influence — the sinusoids of the body.

That of *Basset* — three states of bodies: vitality, sterility, death, manifested by the oscillations of the pendulum: vitality = 3 oscillations - sterility = 16 - death = 400 .

That of *M. Bovis* or pendular movements on the fingers of the hand. We will study it further.

2° In a second work: *Pendulums and Doctors, Dowzers and Malades*, the author progresses, he affirms certain dowsing laws. That is to say the solar plane — the azimuthal plane of the waves — the nature of the dowsing waves: long waves, short waves.

Here is the book: *Vertebrotherapy*.

Here the dowsing is all concentrated on the study of the vertebral column, source of all our evils... the good functioning or the bad functioning of our organs falling under it. The main thing is to keep it in good condition.

Chiropractors have long used this art. The dowsing can find there to explore a useful field of observations.

The patient facing west — the pendulum tuned to the patient's hand the prospector will explore

Organ Series Colors and Numbers)

We applied the serial colors and numbers we saw (Padey method eprince) not only to diseases but to all organs — Let's study them events in a summary table. (See above Brochenin p. 86.J,

		Orange (cloudy) Chocolate		YELLOW YELLOW White White, Yellow

>for example. If the person gets 35, he is therefore 15 points short. Deduct

with his left hand the patient's vertebral column and the pendulum will respond, its oscillations and gyrations will indicate the state of the vertebrae and at the same time that of the corresponding organs .

It is still Dr. Leprince who, with his theory of *chromo-diagnosis and the use* of the prismatic pendulum will reveal to us a whole corner, barely studied, of the use of colors in medical dowsing. (See table on pages 178 and 179/

Already, for the Chinese, red represented the heart; the white, the lungs; the black, the kidneys; green blue, 1st liver; the yolk, the spleen. Dr. ^{Leprince} will search this unsuspected mine and reveal many secrets to us.

Since then the theory of color in medical thesis has made progress and it seemed important to us to highlight, in a single table , both the divergent colorations of dowzers and their concordant interpretations. There is thus still there matter with controversy, because probably as in ordinary dowsing, the color has only one relative value, and its correspondence with such or such object depends and on the value of the dowser and the quality of color — absolute compared to color in general, it is variable depending on the disease.

M. Lesourd, in his “Method Radiesthesic ” took good care to tell us the whims of the pendular reactions, in the presence of a medicinal sample.

III. —Abbe Bouly

He uses a wand.

He always studies the disease, the patient being placed between the sun and the operator.

He holds in his hand the witnesses of microbes, diseases, remedies.

The serial number of the wand is identical to the evil, the microbe and the remedy.

The rod turns in the same direction for the good food.

It turns in the opposite direction for the harmful food.

Illness can be studied on the patient's hand, on his body.

Vertical or horizontal. That is to say, going up or down along the body. — At each vertical landing or at each horizontal plane the rod jerks.

In the horizontal study, the radiation is followed up to its point of origin, that is to say up to the diseased organ.

NOTE. — Doctor Naret and Father Baryl do the same on an anatomical chart. The pendulum goes straight towards the diseased organ and the medicine. (This one will sometimes appear simply on a catalog of pharmacy or herbalism),

We mention this last method without making it our own. We are too attached to the objectivity of research to get carried away with all the psychic and empirical forms of dowisers.

IV. — Abbé Mer puts

(He works on a pendulum)

He also studies radiation vertically or horizontally by going up or down along the body, the left hand as an antenna... the pendulum moves towards the diseased organ.

In the study on photo... it is the same... so the left hand is directed towards the photo which it covers in a certain way.

Not only does the pendulum move towards the - diseased organ, but it indicates a serial number, the serial number of the organ, of the microbe, of the remedy . The left hand more or less close to the skin indicates the depth of the evil, at the moment of the triggering of the pendulum.

The directions of rotation of the pendulum indicate the suitability, the harmfulness of the drug... the positive direction = good, the negative direction = bad. Beats or oscillations up to 10 indicate the severity of the disease.

V. — Brother Padey

He was a lover of the baguette like Abbé Bouly.

It admits around the body a crescent of radiations .

At the level of the organs emanate radiation.

Radiations parallel to each other are an indicator of health; dissymmetrical, disproportion

born, exceeding the circle of the crescent, overlapping one another, it is an indication of disease.

The patient, as for Father Bouly, must be placed between the sun and the operator.

Several areas are to be considered throughout the body:

On the right, first zone: from the head to the belt. It reveals the state of the left lung, heart and blood.

On the left, second zone: from head to toe: (right lung, nerves, mental state).

The sinusoid of the cure (or serial number) is identical to that of the disease.

The remedy can be a plant, an ore, a metal.

The length of the middle line, called the chest , indicates physical strength.

Brother Padey also *studied* animals, their instincts, qualities and defences.

Instinct is revealed at the right temple.

The memory above the forehead vertically.

The flair from the tip of the nose to the front.

The length of these radiations indicates the importance of the faculty. For instinct the monkey comes first (100), the bird last (i), the elephant (50).

For memory, on the contrary, the elephant and the dog have 100 — the monkey 10 — the bird 2.

Animal affection is taken from the bottom of the left hemisphere of the brain.

For flair, the lion wins with 100 — the fox and the wolf have 87.

The sense of orientation in animals starts from the mouth to the ears (Mme de Mersseman).

VI. — Christopher

Diagnosis and therapy

On the diseased organ the pendulum stops or rotates negatively.

The remedy is that which reverses this gyration.

good remedy the pendulum gire+ (positive), the rod is raised.

On the *bad* remedy the pendulum swings — (negative), the rod lowers.

On the indifferent remedy there is oscillation of the pendulum or immobility of the rod.

The external use of a drug is detected by a + (good) gyration in the hollow or the palm of the hand.

Medication dose... A distance is established between the patient (his urine, etc.) and the medication ... (appropriate dose). We cross the ray which connects them with the rod or the pendulum. If there is a suitable dose... the pendulum and the wand start. If the dose is not exact, there is a stop. Repeat until the true dose is obtained, and the gyration of the pendulum and the movement of the rod will take place.

One studies in the same way the suitable color... the metal... because there are beneficent and malefic colors and metals.

VII. —Lakhovsky

Circuit theory. — Illness is an organic and oscillatory imbalance. Restoring true balance is health.

This balance is reestablished by carrying insulated copper wires wound in determined turns. By creating an oscillatory circuit inverse to that of the microbe or of the disease, we cancel it and we thus make it possible to conduct a regenerating fluid into the diseased cells, or better, we create in ourselves salutary electric currents.

Lakhovsky's sterilizing cap has also achieved surprising success.

But this is not dowsing.

Here is the dowsing theory of this author: Bodies radiate — this radiation acts. Our body reacts in resonance with these radiations .

On an iron deposit, the iron molecules in our body begin to vibrate in resonance with the iron under our feet. But our body contains all the minerals that are found in nature: the 92 bodies of the Mendéléef table. It can therefore be in perpetual resonance with nature.

The shock of this resonance acts on the cellular oscillation of the whole organism. There is then produced in the body of the dowser an induced current of the same kind as in nature.

And it is this current which unconsciously translates - into the mechanical reflexes of his muscles,

these reflexes which have so little amplitude that they are invisible — but the reflexes give the pendulum impulses which, by repeating themselves, make it oscillate or gyrate. These sustained movements resemble those of the pendulum of a pendulum under the successive impulses of the spring.

VIII. — Miller

Mental dowsers

Many medical dowsers, to whom Lakhovsky is attached, enemies of fanciful and complicated methods, believing above all in the value of the mental apparatus, in the research of waves, have substituted for the methods described hitherto, a process of investigation, both simpler and more rational, that of mental orientation and the human psyche. Well-versed in clinical examination, they mentally ask their pendulum, through precise questions, the solution of the doubts that arise in their minds, and either for diagnosis or for treatment, the pendulum answers their questions exactly.

Their medical flair is thus directed towards the exact solution and the problem posed is quickly solved.

This preponderance given to the psyche in dowsing research is not illusory, it rests on the most scientific basis possible.

Let's listen again to Mr. Lakhovsky telling us:

By basing radicsthetic research on the functional value of the resonating brain, the medical dowser therefore puts himself in the best and surest conditions of medical receptivity.

This clearly shows the superiority of this method over all the others.

The works of Dr. Roux de Vichy and of M. Lakhovsky bring it into full light. We refer readers more eager to use it to these authors.

As for Mr. Meunier, the finger on the sick organ - (photo, urine, whatever) the pendulum swings — (negative) it's the disease.

The remedy reverses the gyration of the pendulum.

To count the number of negative gyrations on the organ is the degree of disease — to count the number of positive gyrations is health.

The remedy must exceed in number of gyrations the degree of the evil... and raise the number of health doubled of its up to x turns.

The dose, the time and the duration of the treatment are prompted mentally and indicated by the oscillations or gyrations of the pendulum. *Example : Mentally say: what dose? i gram? 2? 3? or first dilution? second?, etc...* The pendulum swings 1, 2, 3.

How many days ? 1, 20, 30? the pendulum indicates it.

In the morning, on an empty stomach, etc. the pendulum swings positively .

Toxicity of a plant. — In front of a plant,

Je pendulum gives its number of series and its number of toxicity... from 7 a plant is harmful... to make the experiment on mushrooms.

IX. — Mrs. Mersseman

It is difficult for us to follow this author in all the fields where she leads us: She often works on the patient's left hand held between the operator and the photo.

Missing person: Having found the location of the body with the pendulum, she divides this point into 4 meridians, she follows each of these meridians, she has the track and the distance by mental questions in meters, 100 meters, etc.

We assume that this author first oriented her map correctly with the geographical meridian , otherwise we no longer understand the accuracy of her data—unless we admit the pure functioning of the psyche—but here we fear the madwoman of the house. .

It admits male colors, female colors.

She looked for sex.

She searched for the dead, the living, etc., etc.

X. —Bosset

Human series. — When one studies man there are five serial numbers to be obtained.

Cash figures. - This is the first. Count from 1 to 30. There are 30 human species, hence 30 possible gyrations or oscillations.

figure , *constitution*. - It's the second, there are 12. Count from 1 to 12. These are the 4 fundamental temperaments: sanguine, bilious, nervous, lymphatic, the others are mixed.

Number of *health, vigor*, it is the third. It goes from 1 to 30, 1 to 15 = health, 16 to 30 = illness — 16, sterility, helplessness, 20 to 30 = helplessness.

figure . It is the fourth, it goes from 1 to 600 — from 10 count by series of 10, from 100 count by series of 100, — 50 = beautiful vitality, 570 death. Worry from 200.

Figure of *nerve and brain value*. It's the fifth. Count from 1 to 10 — 10 severe brain fatigue — 1 excellent, — 2 and 3 = average — 4 = overactivity — 5 = disorder.

NOTE. — The method of series is excellent for finding the author of anonymous letters.

XI. — ^{Dr.} Sparrow

Here is his theory: (read his method in Léon Joly).

According to this author — man is not only an electric battery with positive and negative poles , but he is a battery which possesses the quintessence of all known and unknown radio-electromagnetic wireless devices .

These waves are born and propagate about all the organic chemistry phenomena that occur in it.

Digestion. — This takes place only by very varied combinations, the circulation of nutritive elements, the contributions of exit and assimilation by exchange of endosmosis of the muscular movements as well of the viscera as of the voluntary muscles. It is these movements which generate friction, shocks and the production of radiant energy.

Traffic. — The same can be said of the circulation of the blood... vital spontaneous movement. The blood circulates with considerable speed. In 24 seconds he did the whole body circuit. This circulation is made up of speed, of friction on the walls of the vessels — all sources of energy.

Breathing. — Who does not know the mechanism of respiration, inspiration, expiration, regular play of the lungs drawing in or rejecting air, giving occasion to these chemical phenomena of blood oxygenation.

Muscular and nervous system. — Of how many contractions and dilations they are the occasion and the cause — even in the most immaterial functions: the phenomenon of thought, of dreams, of intense cerebral activity.

All of this, which is the phenomenon of life and action, generates friction and an activity that is not without dynamic and molecular repercussions, a source of energy and electricity.

The psyche and then the pendular reflex can detect these phenomena.

XII. — Father Paul Wherlé

seriousness of harm. It is obtained as in **the** Meunier method.

Nature of evil. The pendulum has turned negative on the patient. It turns negative on the microbial tube. So there is microbe identity.

The pendulum has swung positive... there is no germ.

The pendulum has swung — the germ exists but it's not virulent.

Mental work. — One can work without control microbes, without control organs, by mental appeal of the microbe, the organ, the remedy.

If the microbe is absent, the pendulum swings 4~ (positive = good), if present, it swings — (negative = bad). Thus for the healthy organ = + (positive) sick = — (negative).

External use = the pendulum girds identically and on the drug and on the palm and the back of the hand.

XIII. — Lesourd and Turenne

Until now, the pendulum study of physiological phenomena was limited to summary estimates of the degree of the disease and the value of the remedy, by gyratory or oscillatory manifestations, in one direction or the other.

The Lesourd and Turenne methods made medical dowsing take a giant leap forward, thanks to the study of the wavelength.

Here is a brief description of these methods:

Lesourd method

The waves, asserts Mr. Lesourd, develop like a magnetic field which comprises five planes.

Foreground: (0.20 cm. from the object), the plane is determined by an oscillation of the pendulum vertically on the line.

Second plane = 0.40 cm.

Third plane — at 0.60 cm.

Fourth plane = at 1.60 cm.

Fifth plan = at 8.00 cm.

These five plans are plans, so to speak, of *health*.

Here are sick plans 5, 13, ig, 25, 51, 55, 62, 68, 72, 75, 78.

From the very clear line of demarcation of these planes or from their displacement, flows the state of health or all the anomalies of a secret evil which gnaws at the sick person.

The examination of the magnetic field firstly has as witness or subject of study: *urine* (any other object having been used by the person could also be used: tears, sweat, blood, photograph, hair).

Health. — The five magnetic fields appear clearly.

Non-microbial disease. — The first three

magnetic fields remain, the other two are attenuated (160 and 800).

Microbial disease. — The first magnetic field (0.20) disappears... another has taken its place (from 0 to 0.20).

The other fields are reduced and moved.

The cure. — The remedy will be any product which has the same wavelength as the disease and which restores the magnetic fields of health.

Turenne method

It looks a lot like Lesourd's, but the characteristic magnetic planes of health and disease seem a bit off.

Turenne's magnetic fields are (from the disease point of view):

0.13	0.50	0.68
0.19	0.55	0.80
0.25	0.62	

To these disease lengths correspond microbial lengths and remedy lengths .

As the search for these lengths exceeding one meter is difficult and subject to error, a wavemeter is used which reduces the distances to be studied. The work is then done in reduction, on a harmonic of the body to be studied and the task is all the more simplified.

We refer to these authors for the details of their theories.

The reader will not fail to notice that he

there is no agreement between them for the classification either of colors, or of microbes, or of remedies.

This discrepancy is regrettable.

But perhaps it is explained either by the difference in the reference standard (tube of homeopathic radium , wavemeter), or by the nature and quality of the products used, or by the difference in the radiesthetic potential of the these two authors, or even by the form of their work... the note perceived by them being rather the harmonic than the fundamental, the field of variations then extends to infinity.

Whatever the divergences of these two authors, like formerly Mager, Christophe, Bouly, Padey, Mermet, they well deserved the dowsing.

XIV. — Other methods

Other methods have emerged. We cannot ignore them. They also throw their light on the problems of medical dowsing.

i° Vertebral method

This method only takes into account the vertebrae .

She studies them dowsing one after the other according to the current methods of pendulum diagnosis. Dr. Leprince has already told us what he thought of it: Here are additional details ·

The left index finger aimed along the spine or even the left hand walked along the spine. It goes from one worm to another.

The pendulum swings in a negative gyratory direction, it indicates evil.

The operator then interprets.

Here is a succinct table summarizing these observations : (*See page 198J*).

2° Method of the fingers of the hand (diagnosis typist).

At first glance, this search for waves by the fingers of the hand may seem strange to us. Doesn't it seem to be related to palmistry?

However if one takes care, as affirmed it many competent dowzers (in particular D^r Leprince) that the man releases fluids and that these fluids escape by the fingers of the hand; if we take into account a common phenomenon observed near a TSF set that the contact of the hand with the device reinforces the sound and can even emit it in the absence of an antenna, we will not be too surprised to see certain medical dowzers having specialized in this research.

Here again a summary table will speak more to the intelligence and the eyes than to verbose and diffuse developments.

We will better understand in this overview the dissimilarities and similarities of these researches.

The serial numbers of the organs

The first work to date mentioning this fact is signed by Brother Padey.

Brother Benoît Padey, in fact, seems to be the first to have revealed this strange phenomenon of illnesses agreeing with such and such a serial number .

Since then, other authors have come to add their indications to his, especially Father Mermet.

Here are classified the main diseases, microbes and their different serial numbers.

We also note, opposite, certain plants, gold, minciais or metals which give almost the same indications. This similarity is perhaps indicative of a therapeutic value - based on this concordance (x).

(i) Obviously, in all this treatise on medical dowsing , we wanted to remain within a purely dowsing framework : serial numbers, polarity, azimuth, color, etc..., but it is understood, as we We have already done for the other dowsing research : geology, hydrology, mineralogy, chemistry, that the medical dowser is in no way exempted from the thorough knowledge of the science to which his research refers , therefore here, from the knowledge of medicine .

We bless the circumstances which enabled us , in Lille, to follow very assiduously the medical courses of renowned professors and thus to acquire, in their contact, a minimum of medical data, essential to our research. To ignore this minimum is to compromise the dowsing.

En laboratoire
Recherche sur le « Super-detect »

XV. — Fr. Marie-Bernard

We believe we can say that medical dowsing is just like dowsing... each medical dowser has explored, in his own way, the field of waves, without the help of anyone else, like tourists. , lost in a forest and each following a very different track, sometimes finding themselves together at the edge of a clearing.

Really the field of medical dowsing, and we could already judge by the short outline that we gave of it, was beaten in all directions. Almost all the great avenues and main tracks have been followed.

In our opinion, all that remained was to coordinate all this research, to simplify it.

It was our task.

I ^{re} *Simplification.* — *The amplification of the waves by the "super-detect".*

n Find me, told me a famous radiologist, Professor of Faculty, sympathetic however to the dowsing, a device which, in my hands refractory to the pendular movements, gives me the same results as you obtain. »

Refractory hands! for months these words came back to me like fixed ideas... Are there really refractory hands? cut-out type temperaments, compared to the dowsing waves or rather are it not the dowsing waves which arrive too

weak to certain subjects, to impress them. We knew this at the beginning of the TSF when only galena sets worked and the Hertzian wave was perceived with difficulty through the earphones.

We avoided this thinness of the hertzian waves by the amplifiers... bigrid lamps, trigrids... batteries of these same lamps... the loudspeaker... and the hertzian order became from then on easily and very clearly. perceptible.

Let's do that, I said to myself, let's amplify the dowsing wave and everyone will perceive it. It's done. — The super-detect realizes this improvement . It amplifies the dowsing wave. An adjustment with coils and rheostats makes it possible to adapt this amplification to the degree of sensitivity of each one, on the ruler of the super-detect... everyone is a waterfinder.

Hence the first simplification of our method.

Our assertions can now be checked —our diagnoses and therapeutics discussed and examined. The 6th ^{sense} is no longer a sense unique to dowsers. It can become the prerogative of all.

(i) In the course of this work, we have multiplied the synthetic tables at the risk of astonishing the readers by the divergences of the authors. That the medical dowsers do not stop at that. That in turn, using more sophisticated means and more selected products, they draw up synthetic, less discordant pictures. Dowsing and medical science will only have to gain from it.

No doubt it will be necessary to find a unique device and method. Color detect. — MBL pendulum — Marie-Bernard discs — super detect — can be a powerful help.

super detect

IIth *Simplification.* — *The perfect orientation of the psyche, without the possibility of error.*

Most of the errors that we found in even good dowsers came from a misguided, poorly educated psyche.

The dowsing sense, just like our other senses, undergoes a deformation at the origin by the fact of its lack of use. We have read in psychology that the child, at birth, believed all objects to be glued to his retina - the exact appreciation of distances, of measurements only came with time and education.

So it is with the psyche, with the thesical meaning in raddomancy.

And what means of quickly, scientifically and surely educating one 's psyche? We think we've found it...it's *disk usage*.

The disc, in dowsing as in radiophony , must contain in its lines, all the melody that one wants to hear or discover. For this it is important that it be well composed, in conformity with nature, with science, contain all the fundamental radii of the bodies or azimuths that

we want to search — that is, all the elements of the search.

In medicine, therefore, all records relating to this science will be composed: anatomy — microbiology — allopathy — homeopathy — herbalism , etc.

Anatomy disc. — On this disc will be imprinted all the exact fundamental azimuths or radii of the organs. We have, to compose it, taken, as study witnesses... the dust of organs, from known laboratories: Byla, Lumière, Lesourd, we could take others, prepared by the best laboratories in the world.

Microbial discs. — One proceeds for microbes as for organ dust.

A magnetic deviation takes place on the disc according to the virulence of the microbe. — Write it down exactly .

Disk diseases. — The witness here will be either blood or saliva of tubercular, typhoid, syphilitic, etc.

The azimuthal radiation is always found to be the same, either for microbial fatigues or for organic fatigues.

Remedies disc. — *Homeopathy.* — Use homeopathic medicines at different dilutions.

We will fix on the disc, first all the polychrests, then the secondary, complementary drugs—the incompatible ones.

Remedies disc. — *Allopathy and herbalism.* — Each plant has its radiance, each species

Also, it will not take long to notice that out of 800 specialties studied, only three hundred give an exact radiation. The others belong to harmless drugs: mica panis and aqua simplex.

(1) To complete the notions of dactylo-diagnosis (p. 196) here are the indications of Colonel Bourbonloun.

pressure, temperature examination disk . — This disc, better perhaps than the devices used in pharmacies, will tell you exactly what concerns these different points, which are however essential to the diagnosis and on which the interrogations imposed on seriously ill patients and their answers leave so much uncertainty.

To take our investigations further, we have even composed perfume discs, precious stones, iridology, acupuncture, sympathicotherapy discs, etc. (*See note p. 211/*

These various discs in preparation will be delivered to the medical public in the form of a cover.

The medical psyche thus well educated, the dowsing wave amplified, the main elements of our research simplified, a final simplification was still necessary.

IIIrd *Simplification*. — *Selection by color* . — We have always thought it and many dowzers have thought it with us and even before us — color is inherent in waves. Each dowsing wave can take its place on the color scale.

Color can therefore become a precious standard for dowsing research... but alas! when one studies the authors one does not take long to realize that the medical dowzers are far from agreeing on the site of the colors. Some place the red frankly

in the North (Turenne) the others in the South (Mellin, Mager) and so on.

It was therefore a question of being fixed on this first point. We obtained the universal color code by E. Seguy — 48 plates — 720 colors, edited by Lechevalier, and then sure of our color witnesses we fixed their exact location on the magnetic disk. Our examination has led us to the same conclusions as those of H. Mager and Mellin. It is therefore their record that we have adopted.

Once this standard disc was composed, we adopted it for all our other discs and from now on we have adapted the color to all our research .

The bond of sympathy between all the radiations is there . The organs radiate in this or that color — the diseases also and the remedies . To find the color of an organ... is already almost to be fixed both on its remedy and on its disease.

Based on these data, we have compiled a medical file — here it is:

Any witness can be used (hair, blood, urine, photo, etc.).

Dowsing medical sheet

I. Etiology. (Remote or future causes).

Temperament — Heredity — Cos mic influences

— Alkalinity — Acidity.

Mentality — Psychism — Faculties.

II. Diagnostic. (Various symptoms: general, functional, physical).

Chromodiagnosis. — The Color — Tired Organs — Intoxication — Poison — Microbes.

Special research: Iridology — Acupuncture — Vertebrotherapy — Dowsing sympathetic therapy.

III. Prognosis. (Duration and severity of harm).

Gravity. — Wavelength — Voltage — Temperature.

Duration. — Healing — Life or Death.

IV. Therapeutic or Treatment. (Symptomatic , specific).

Allopathy. — Painkillers — Specific — Dosage — Incompatibility.

Homeopathy. — Aggravation or improvement — Mentality — Polychrestes — Complementaries — Antidotes — Incompatibles — Dilution — Dosage — Duration.

Herbalism. — Simples — Herbal teas, alcohols — * Perfumes.

Regimes — *Seaside resorts.* — Climatic — Mineral waters.

Conclusion

We ended with the presentation of our method this somewhat long chapter of medical dowsing.

In all this, the reader will notice that we have not done the work of a doctor but only the work of a dowser.

The doctor, guided by our research, is in no way exempted from practicing his art... before as after the dowsing examination, he remains free to adopt or reject these conclusions. The dowser, just like the radiographer, only provided him with a new element for his useful investigations... (i)

(i) Several times in this book we have alluded to iridology, acupuncture, sympathicotherapy, etc. (p. 208).

Here are some brief ideas about these therapeutic methods.

1° *Iridology*. — It is a method of medical research based on the meticulous examination of the iris and the pupil of the eye. The iris being previously divided into several segments, one looks on these various segments for spots or deformations, indicators of organic deficiencies.

2° *Acupuncture*. — This is another method of medical examination, borrowed from Chinese doctors. It consists of. prick or cauterize on certain routes of the organs (called meridians) certain points, more particularly revealing organic disorders. Healings were obtained in this way.

3° *Sympathicotherapy*. — Many doctors have recognized that in the nasal or rectal mucosa all the relays of the great sympathetic are found in miniature. With the help of sticks, with a bulging end, touches are made in the cavities. They sometimes give salutary reactions.

To help each of these methods we have created discs relating to it.

Let non-doctor dowsers confine themselves to that. At first they will attract no disagreement, then they will do useful work, not by replacing medicine but by helping it.

Their examinations, always thus controlled in the clinic, will gain in precision and instead of a fierce struggle, without profit for either of these two arts, reconciliation will be made between these two sciences, created to help each other and not to tear each other apart (i).

(i) Vertebral method. — Let us remember that the vertebral column is composed from top to bottom of seven cervical vertebrae, twelve dorsal and five lumbar. The sacral and coccygeal vertebrae do not contain any medullary element,

The first cervical vertebra controls the optic nerves, the middle ear and the scalp.

The 2nd, part of the face and the posterior region of the neck.

The 3rd on the nose and cheeks.

The 4th to the external ear and to the mouth.

The 5th, in the lower jaw and on the sides of the neck.

The 6th, ^{to} the larynx and the shoulder.

The 7th on the upper arm.

The 1st dorsal, at the lower half of the arm.

The 2nd, in the heart.

The 3rd within.

The 4th to the liver.

The 5th is the center of repression of febrile states.

The 6th and the 7th are in connection with the stomach.

The 8th – and 9th, with pancreas and spleen.

The 10th and the 11th, with the kidney.

The 12th regulates the course of the lymphatic circulation.

The first lumbar vertebra influences the intestine.

The 2nd lumbar vertebra influences the ovary.

The 3rd is related to the thigh muscles.

The 4th and 5th influence the large intestine, the external genitalia and the thigh muscles.

Maurice PHAREC.

FOURTH PART

ACQUIRED FACTS

We thought that facts rather than theories could support our assertions. In the presence of theories, we argue. Faced with the facts, we bow down.

Undoubtedly, these facts do not extend to all the branches of dowsing... they do not settle all the problems, their universality is not established, consequently no rigorous conclusion is essential.

But they are varied... their successes, indisputable , the methods employed are always the same, and the results, almost invariable. That the method is universalized and that its happy results are amplified... the dowsing can therefore take on the appearance of science.

Even then, not all dowsing puzzles will be solved. Those that the

blind bias will do well then to meditate on these words of the illustrious Termier in "the great enigmas of the Earth..." We have quoted them throughout in a Note to our book. We summarize them here.

<t Science is full of enigmas, insoluble for the most part, but which are not obscure enough to be indifferent to us and which seduce us by the semi-darkness, strewn with sparks, where we see them moving. »

This penumbra, strewn with sparks, of scientific dowsing is enough for us, as it was enough for the Masters whose sure directives have always enlightened our research and illuminated our path. Now here are our controlled experiments.

Only the drillings (i) that we mention here have been carried out to our knowledge. Of these boreholes only one was a failure. We say it right away.

Drillings carried out on our indications

Failure

Drilling near Embrum.

Failure. — At 5 meters I announced water on clay. We found no trace...

Since then I have found by studying clay that

(r) We have done a lot of prospecting. The cost of drilling, the difficulties of current times, have prevented the owners from carrying out the research. For us, therefore, only the boreholes mentioned here count... Their success speaks volumes about the merits of the method used.

the clay always swelled with water and that the water detected on the clay, when there was only a little, was not fluent water...; I therefore now take the precaution of only confirming the presence of water on clay much lower... at the level of the rock or the impermeable layer, forming a basin where water can really accumulate, without fear of absorption. The clay is indeed disappointing to indicate the depth of the water...

I had the same surprise in Saint-Martin-de-Valamas with an owner... the water was not found on the clay but fortunately on the rock where I had placed it on the second floor.

Hence the need for the dowser not to rely on clay and to indicate the depths according to the aquifer level on rock.

Achievements

TARARE July

26 , 1937

- I, the undersigned Janin Jacques Lou'S, Auxiliary Head of the Banque de France, in Tarare, (Rhône), declare that I am entirely satisfied with the results of the water searches carried out on my property in Chalosset on the radiesthetic indications of the Reverend Father Marie-Bernard.

Wanting to find a source that would irrigate the meadows above the farm, I submitted a map of the land to explore. After studying at his residence, the Reverend Father informed me that there were, in the useful zone, three superimposed streams of water, of increasing flow, crossing a clay vein, wedged between two granite masses . The verification carried out in the field even by the eminent practitioner confirmed the work carried out on the plan.

From the first works, at a depth slightly lower than that announced, water was found in abundance.

enough not to search for the other currents. For two years, despite periods of drought, water has continued to gush. I nevertheless intend to dig further, certain to update the other sources with higher flow still indicated by the Reverend Father. But the water already so easily obtained satisfies my desires and I am happy to issue, with gratitude, the said certificate, #

J AN IN.

GAP. — Champsaur Valley.

December 27, 1934.

• Perhaps it will be interesting for you to know that I had a well digger come to collect the water at the place you had indicated to us (until then several boreholes had been drilled on other indications, without success, in the granite).

He was happy to find a nice tablecloth right away; all our gratitude is due to you united to our admiration for your science and your devotion. »

Miss GONFARD.
7, rue de Provence, Gap (H. Alpes)

Château de la Roche near MAZE (Maine-et-Loire).

February 20, 1935.

• I had the work you had told me carried out: deepening the well in the garden by 4 meters (it was 16 meters deep at the time) and digging a small gallery down to the real spring, which sprang end of the pike and now my well, which contained about 0 m. 80 of water depth at 10 m. 50 !

I am delighted with the result that I owe you and for which I would like to express my gratitude. •

Miss d'ANDIGNE.

A certificate given by the well digger accompanies this letter.

CELLES-LES-BAINS (Ardeche).

• I take this opportunity to thank you very much for the valuable information you have given us, both

on the location as on the quality of our springs (mineral waters). The one under construction, during your visit has just been dug up to 30 meters.

We installed a temporary motor-pump and noted an hourly flow rate of 1000/1100 litres. »

Charles WHITE.

MECHANICAL WEAVING October 30 , 1736

REMY VINCENT

QUINTENAS

(Ardeche)

" When in 1930 when I had almost finished drilling a well, you were kind enough to come and visit me and give me your opinion on this drilling, I was not expecting so much precision from your part: ignoran: that I was new conceptions of dowsing.

different pendulums, you told me to my great astonishment that of the three threads of water, one was soiled and made the whole thing unfit for consumption.

I never doubted your good faith, but nevertheless I assumed that your diagnosis could be wrong, the water seemed very clear to me.

When the work was finished, the well properly cleaned and washed, I waited a few days ; until the overflow began to give way to take a sample for analysis. This was done and fully confirmed your statements. See the wording below .

“Ammonia: presence. Nitrite: presence. Chloride: 112 milligrams per litre. Organic matter: 73 milligrams. Oxygen absorbed per liter in an alkaline medium. This water is therefore clearly bad from a chemical point of view. Bacteriological analysis will very probably confirm this result .

I am very happy to be able to congratulate you and ask you to accept the expression of all my respect. »

Mr. GRUNDLER
TPE engineer

To Monsieur Aggeron,
Director of the Fonderies de Foug

"I am currently studying on behalf of the municipality of Saint-Martin-de-Valamas (Ardèche) a drinking water supply project. This commune summoned a dowser, Father Marie-Bernard, who made important discoveries. In this case, it is a supply of 2,000 meters of interlocking cast iron pipes and cord of 70, 80 and 90 and 100 in diameter, etc. »

Signed: GRUNDLER.
Architect voyer, from St-Martin-de-Valamas.

SAINT-MARTIN-DE-VALAMAS - January 21, 1937

Reverend Father Marie-Bernard,

"I am pleased to inform you that I found water at the place indicated by you on my land in Saint-Martin-de-Valamas. Having had a borehole drilled after having dug the 6 m pit. About 50 deep, the last fitting of the pump was carried out on January 18, 1937 and gave complete satisfaction. Attached is a certificate as you requested.

Certificate

I, the undersigned Delavis Irénée tinsmith in St-Martin-de-Valamas (Ardèche) certify that having land entirely deprived of water, I have asked Father Marie-Bernard to kindly carry out an examination of this land on the plan. which I sent to him. His first experience was made on this plane, and then on the ground itself. This study took place around July 8, 1936. The Father specified that we had to dig at the place already indicated on the plan and that at 14 meters we would find abundant water . This indication was confirmed to me by a letter from the Father dated August 14, 1936. I had a dig at the endro : t

indicated a pit of 3 m. over 3 m. and about 6 m. 50 deep then, I continued the work by drilling 73 cm. of diameter. The drilling was pushed up to 18 m. 50 approximately from ground level: but from 14 m. 50 or so we found the water. I installed a pump delivering about 15 liters per minute. On several occasions I did push-ups for 30 minutes and the last for 1 hour. 30; the pump always gives the same quantity I must add that I did not push the experiment further but it seems conclusive to me; the height of water in the borehole being approximately 3 m. 80."

Made in St-Martin-de-Valamas, January 20, 1937.

DELAVIS Irenaeus.

CL MATHET

CHARLY (Rhône)

"I, the undersigned Claude-Lucien Mathet, owner in Charly (Rhône), certify that, on the indications of the Reverend Father Marie-Bernard, I dug a well on my property, this drilling gave the indicated flow from the depth of ten meters. I am therefore very satisfied with the research carried out by the Reverend Father Marie-Bernard. •

November 26, 1936 L.

MATHET.

ZINGUERIE-PLUMBING

BARBERET

TARARE

• I, the undersigned Antoine Barberet, entrepreneur in Tarare* certify that the Reverend Father Marie-Bernard, made at my request, first on an oriented sketch, then, on the spot, a survey for the search for water in my property in Bully (Rhône).

The Reverend Father Marie-Bernard had told me following this prospecting that after having drilled in the hard gorrh I would find a bank of wet sand around three meters fifty in depth and that by going deeper into the hard rock until eight meters fifty to nine meters approximately I would have a flow of approximately eighty liters per hour.

I had a well drilled at the place indicated in the garage by the company Léon Masson de Tarare. I noted the presence of the sand bank at the depth indicated and I found in the hard rock at eight meters fifty the water sought in quantity corresponding to that indicated.

I am delighted with this success and I can only praise the science of Reverend Father Marie-Bernard.

May he please find here the expression of my deepest gratitude.

»

Done and closed to assert what is right.

At Tarare, June twenty-ninth, nineteen hundred and thirty-seven.

BARBERET.

SAINT-FORGEUX (Rhône)

December 12, 1934

• I, the undersigned, Jean Faury, residing in Saint-Forgeux (Rhône), acknowledge having appealed, through the intermediary of Father Berrichon, parish priest of the said place, to Father Marie-Bernard, to prospect for the sources there. would have on my property. This one after having prospected on a plan to him provided by Mr. the Curé, came on the ground and found by the use of the rod and the pendulum a source which he declared to have to be found between 5 and 6 meters deep. At 5 meters the water appeared. I dug 10 meters and the flow is 300 liters in 24 hours in dry weather. »

In witness whereof, before Father D. Berrichon,

I sign: FAURY.

Claudine NOYEL, wife FAURY.

PARISH OF ST-FORGEUX
(Rhône)

• We, the undersigned interested owners and the parish priest of Saint-Forgeux (Rhône) recognize that the Reverend Father Marie-Bernard, indicated to us a very precise water point in the property of Mrs. Veuve Ravichon, located in the Château district, and that at the depth of eight meters indicated by the Reverend Father a well providing abundant and very healthy water was dug by Mr. Martinon de

Rozier-en-Donzy. For more than a year, even in the drought of 1933, water has never failed. »

In witness whereof, we sign this day of May 2, 1934,

Widow Antoine RAVICHON,

Marie Ravichon.

Anna RAVICHON,

PERRICHON. parish

priest of Saint-Forgeux.

ROBERT MONIER

Architect

RIOM-ES-MONT AGN ES

(Cantal)

On 10-9-35

“ Father, I apologize for not having written to you sooner,

We have searched the places indicated by you:

1. At the Chateau de la Jaleinc, at Riom-ès-Montagnes, at Saint-Etienne.

At La Jaleine we found water but as I told you we didn't go to the second uappe and the one we have is sufficiently abundant and very rich in organic matter, I hope to remedy this in making an appropriate filter, (this pollution had been reported).

In Riom on the hillside of the Gorce we actually found the granite and at the place you had indicated to me on the map I found a source. A trench which we prolong in gallery in the side of the mountain enabled us to bring to light another source located approximately 4 meters below the first which we did not disturb, I am sure that by persevering we will have a result.

In Saint-Etienne we are doing research in the gallery and from the latest news that I had, I believe that there was some hope. For which I send you my compliments.

I am sending you a statement of the plan of Anglards which I will ask you to explore as soon as possible and return to me, your information is very useful and very profitable to me, I thank you in advance. »

R. MONIER.

STAR (Drome)

September 18, 1936

"My valiant brothers dug by hand up to 7 meters - They are forced to give up because of the water that invades them from the bottom of the well.

(These were mineral waters).

< According to Mr. Henri Mager, our water is classified among the most highly radioactive mineral waters. Its radio activity is made of uranium and radium. It also contains carbon dioxide, sulphur, potash, soda. »

Accept the assurance of my sincere thanks.

Jeanne BARONNET.

CATTLE TRADE

NOTIN Father and Son

St-Clément-les-Places

(Rhone)

"I, the undersigned, Notin Claude, cattle dealer, in Saint-Clément-les-Places (Rhône).

his indications at five meters depth I had water at will to drink twenty oxen or cows during the years of great drought 1934 and 1935 ^{oh!} there was water almost nowhere. »

Done at Saint-Clément-les-Places, June 12, 1936.

NOTE.

CITY HALL

FROM ST-MARTIN-DE-VALAMAS

(Ardeche)

• I, the undersigned Mayor of Saint-Martin-de-Valamas, certify that, following prospecting research carried out on the territory of the Commune of Saint-Martin-de-Valamas, by the Reverend Father Marie-Bernard, the flow of an existing source , which was 25 liters per minute, was raised to 40 liters. »

Issued for whatever reason.

Done at Saint-Martin-de-Valamas, July 8, 1936⁶ -

The mayor,

Ars
Le puits Saint-François d'Assise

My Dear Father,

.....
 • The well was dug to 15 m. 50. Up to 15 meters, the drilling was easy and we found at this depth a source which gives us 300 liters per minute. The workers wanted to go lower, but they ran into some kind of cement on rock-hard coagulated pebbles and took three days to dig 50 centimeters. In addition to the block that had to be drilled, they were prevented by the water which gushed out abundantly and that the pump was insufficient to lift it.

"I thank you, Father, for the precision of your calculations, to the *credit of dowsing* and your charity which assures us of a quantity of water for our garden and, if necessary, for the Very pure water table.

In any case, *complete victory!* You told us: "You will have plenty of water at 15 meters and also at this depth, *rock...* everything *has been checked to the letter*, at the place indicated. »
 Please...

Bishop CONVERT, parish priest.

VOCANCE (Ardeche)

"Small reward for the find made thanks to your indications .
 Heartfelt thanks. »

A. LIVERSAIN.

CHAPPE (Allier), August 15, 1937

M.C. VARAGNAT

Architect-Surveyor

i6, avenue Jean-Jaures

TARARE (Rhône)

"When you made your visit to the estates at the end of October 1934, I asked ^{you to kindly explore} my fields of Champ Rousset and Champ Blandin, with a view

(1) Several other works are in progress, with full success. I am still waiting for the certificates of the happy beneficiaries !
 are of these surveys.

from the search for water. Pressed by the already late hour, you were unable to go as far as these remote tenements and you answered me that you would study off the plan. I confess that I was a little skeptical about the result, and despite the information you sent me a few days later, I did not start drilling.

During your trip on February 26, 1935, in very bad weather, you checked your prospecting on the spot on the plan. She was in every way accurate.

It remained to dig. 4 sts., 4 sts. 50 max wasn't much to find a good source. Up to 3 meters the storm was quite easy. At 3 m. 60 we paused, the water starting to bother us. But we wanted to go down to 4 m. 50. At 4.35 m we were rewarded, the blast brought us water in quantity, and this time spring water. We installed a strong pump and since then we have been easily filling tarpaulins in the two meadows for the watering of our cattle. This saves us the significant cost of labor which was necessary to bring them to the pond.

I read with great interest the book "Initiation à la Radies - thésie", by Father Marie-Bernard, and I am happy to note, after two and a half years (including several periods of drought), that his method has led us here to great success. I congratulate you and thank you.

Accept, Monsieur Varagnat, the assurance of our best feelings.

Signed: J. RÉGERAT
Château de Marçais

This personal success is one of the results of my long collaboration with Father Marie-Bernard and of the studies that I have pursued in this direction under his senior direction. May he find here the expression of my gratitude

Claudius Varagnat.

At the beginning of August, I took advantage of Father Marie-Bernard's visit to ask him his opinion on a water survey I had done in a cellar of my country house . After studying the plan, he confirmed to me the existence of a syncline towards an angle of the building and of water in greater quantity than I had hoped for myself.

I made undertake a drilling in this cellar near the angle by MM. G. Brunier and E. Perret.

At the depth I had indicated, water was found. The drilling was continued at the mine up to the second depth fixed by the R. Father. The water came at several points with a greater flow. A chisel hole was then drilled over a length of 2.50 in the direction of the angle and the iron pipe engaged in this hole brought water, in full drought, in interesting quantity .

The flow increasing, it is not yet possible for me to specify it. The water is under pressure and has reached a level of 1.20 below the well slab.

It is pleasant for me to see, once again, the value of Father Marie-Bernard's method. I thank him here very warmly for this result and I am grateful to him for having made me his collaborator.

C. VARAGNAT, architect.
TARARE (Rhône).

MEDICAL PROSPECTING

Dr JOSEPH LOISELET
5, rue Victor-Hugo
HYERES (Var)

The 19 February 1935

My Reverend Father,

• I would first like to thank you for the lengthy consultations given. I saw Dr. Marc Clément from Hyères who applies your new method and is very satisfied with it.

Greater precision.

If you can, please be kind enough to do the dowsing analysis of the attached photograph.

Everyone is delighted with the method which is making great progress in the minds of the sick. I believe it is called to render great services. ■

RPJ LOISLET.

former Professor of Medicine at the Faculty of
Lille and Beirut.

Dr. Charles Rousson

(St Luc Hospital, Lyon)

Very Dear Father Marie-Bernard,

"I would like to thank you again for the constant effort you have made towards me:

The successes are becoming more frequent and less difficult every day: the homeopathic method finds in dowsing a control and an increase in security, this is your work and be assured that when I speak of "my" method I am making a duty to recall the happy influence you had on me. »

Charles. ROUSON.

Note. — The medical examinations, mentioned here, were made on urine, photographs or hair, at the request of the doctors — (without the knowledge of the interested parties) and the medical form sent directly in a sealed envelope, to the Consulting Doctor, for the sole purpose of enlighten him, leaving him all the responsibility for diagnosis and therapy. — To do otherwise is to expose oneself to miscalculations and to step outside the framework of legality, dowsing and often common sense, according to the adage: to each his own profession.

Conclusion

The study of the dowsing one sees it, supposes a meticulous and long-term work. It is done in the silence of the laboratory and not in the public square (as the juries organizing skillfully awarded competitions would like to surprise simpletons and make them fall into their traps).

On the dowsing ground, barely cleared, one can only advance with caution, repeating the same experience a hundred times, checking the failures, to discover their causes.

After all, what does immediate success matter, provided that science one day benefits from our discoveries. In all the other fields: optics, acoustics, electricity, wireless, we only proceeded slowly, and, so to speak, at a snail's pace. Why force the ray thesis now to hurry and have its say on all things. In serious cenacles **and in** good faith, it makes its way. It does not register more failures than other studies, however graduates and so-called acquired... Very often the percentages of success which are its own, equal the percentages of others. What to wish him

moreover ? if not that it progresses... It will progress, if each dowser knows how to keep out of the charlatanism and the exhilaration of the amazing and, neglecting the nasty and jealous critics, when they are not interested, traces its furrow , undeterred.

	Table of rocks according to their degree of impermeability	104
	Other dowsing table	106 and 107
	Radiesthesis research of rocks (configuration , layers, depth, quantity, quality)	108
CHAPTER III. — PROSPECTING ON THE GROUND, STUDY OF THE UNDERGROUND. WATERS		
	Notions of hydrology	no
	I. Composition of waters	no
	a) Pure and drinkable waters (pure waters, chlorides, bromines, iodures, salts, nitrogenous , siliceous, sulphurous, carburized or carbonated, radioactive)	
	suspicious, bad water, phosphorus water	113
	c) Purification	114
	d) Mineralization	114
	II Water hydrotimetric degree	114
	a) Foamiest Waters	114
	b) Least foamy waters	*15
III.	Thermality	115
IV.	The process of water infiltration	115
	a) Father Paramelle's theory	116
	b) Theory of P. Termier	
	c) General theory. Artesian waters and springs.	117
V.	The radiesthesis research of the waters	117
	A) A few more principles of hydrology.	
	a) On-set research	117
	b) Slope research	118
	c) Research in the valleys	118
	B) radiesthesis method itself. 1 20	
	Table: Water — dowsing synthesis	122
CHAPTER IV. — PROSPECTING ON THE GROUND, STUDY OF THE UNDERGROUND. MINERALS. METALS		
	Some notions of chemistry	123

I.	Simple bodies	
II.	Compound bodies.....	
III.	Alloys.....	
A bit of mineralogy.....		
I.	Deposits	
II.	Some deposits (iron, aluminum, lead, gold, silver, etc.	
III.	Radiesthesis research of ores and metals	
	<i>Radiesthesis table of ores and metals. .</i>	
IV.	More specific search for oils	

CHAPTER V. — PROSPECTING ON THE GROUND, STUDY OF
THE UNDERGROUND CAVES AND UNDERGROUND CAVERNS. .

Some notions of speleology.....	
I.	Management.....
II.	Length and Width.....
III.	Slope and depth
IV.	Excavation.....
Radiesthesis search of cavities	

CHAPTER VI. — FARMING. — PERFECTIONS BY
RADIESTHESIS

I.	Arable land	II
	Seeds	
III.	Fertilizers.....	
IV.	The barnyard	
V.	The barn, the stable, the dovecote	
VI.	The vegetable garden, the orchard, the forest	
VII.	The fishpond, the fishing, the fish, the forest, the hunting, game	
VIII.	sex	
	<i>Table of age, sex, dead, alive</i>	146 and

CHAPTER VII — OF SOME OTHER MORE SPECIAL
RESEARCHES.....

I.	Search for treasures	II
	Search for the missing.....	
III.	Search for criminals	
IV.	Search for life or death — Distinction between man and animal	
	Graphology and cosmic waves	

	Page"
Speed, hand pressure, shape, dimensions and order.....	
Direction, continuity, descent of letters	153
CHAPTER VIII. — SURVEY ON PLANS	
(<i>teleradiesthesia</i>)	156
I. Scientific demonstration essay	157
II. Objections and Responses	158
III. Dowsing method of research on ifor plans.....	
Closing	163
<i>T a ble by Mendelcef</i>	164

THIRD PART

THE DOWSER AND MEDICAL RADIESTHESIA

The dowser and medical dowsing.....	165
I. A generally accepted theory	167
<i>The graduated scale of waves</i>	168
II. A fact: the dowsing wave	170
III. The indisputable dowsing fact, recognized by science	172
IV. The application of this fact to medicine	174
V. Medical dowsing and its many works. 175	
Doctor Knowledge. Method Jacqueline Chantereinc	175
Doctor Leprince. — Chromo diagnosis	176
<i>Table of colors and series numbers for organs</i>	178 and 179
Father Bouly	181
Father Mermet	182
brother padey	182
Christopher	184
Lakhovsky	185
sucker	186
Mrs Mersseman	188
bump t	188
Dr Sparrow	189
Father Paul Wherlé	191
Lesourd and Turenne.....	191

Other methods	194
<i>Typing-diagnosis table</i>	196 and 197
<i>Vertebral Table</i>	198
<i>Table of disease series figures (Metal therapy ...</i>	200 and 201
RP Marie Bernard, <i>Test of simplified method</i>	203
The super-detect — The discs — the colors....	203
Medical form (Etiology, symptoms, prognosis.	
Diagnosis and symptomatic and specific therapy)	209
Conclusion	2 £ 1

FOURTH PART

ACQUIRED FACTS

<i>Acquired facts</i>	213
Failures	z 14 Successes
.....	215 Drillings. —
Discrimination between mineral water and polluted water	215
Medical surveys	225 Conclusion
.....	227
Table of Contents	229
Bibliography	235
Some dowsing discs	out of text

BIBLIOGRAPHY

- RadiotelJurists and dowsers. — Proceedings of the first International Congress. — Avignon 1926.
- Hector Mclin. — Domestic and agricultural dowsing.
- Gabriel Lesourd (pharmacist). — Radiesthetic method of researching diseases.
— Pharmacy and dowsing.
- Merle Louis. — Dowsing and prehistory.
- René Lacroix at the Henri. — Theoretical and practical manual of dowsing.
- Dr. Abel Martin (veterinarian). — Dowsing diagnosis and veterinary medicine.
— Life. Be. Write-offs
- Martin-Laval (A.) (Engineer). — The radiance of matter .
- Monnet (abbot). - How I operate.
— The revealing pendulum.
- Mersseman. — The magic pendulum.
- Ortholieb Georges. — The great riddle of dowsers.
- Pali Alex. — Groundwater research.
- Father Suc. — In Search of Natural Truth by Wand and Pendulum.
- Turenne. (Engineer). "From the hazel wand to the prospector's detectors. (3 vol.)
— The light, the colors.
— Water, zoology, botany.
— Laws of similars: induction, waves of diseases, remedies.
— "Electro-magnetic" waves in front of rods and pendulums.
" The minerals... the harmful waves.
- Viré Armand (Doctor of Science). — How to become a dowser.
- Voillaume (Engineer). — Essay on human radiation.
- Wehrle (abbot). — The School of the Dowser.
- Ferrand (abbot). — Adjustment of the pendulum in length and weight.

- Dr. Alfred Roux (Doctor). — Truths about medical radiesthesia diagnosis .
- A. Renault. — The pendulum for all.
- Henri Chrétien (aviator captain). — Cancer, its cause.
 — Weather forecasting methods.
- Maurice Wagnier. — Dowsing, its evolution from 1750 to 1937-
- Auschcr ES — The art of discovering sources and capturing them
- . Bourdoux (abbot). — Practical notions of dowsing. Bovis. —
 Radiation from all bodies.
- Brard and Gorceix (Engineers). — The precision pendulum
 balance.
- Gorceix (Polytechnician). — Letters from a neophyte
- Jeannet Jean. — The mineralogist dowser on plans and maps.
- Brown Paul. — The bazaar magnet.
- Capron André. - Dowsing.
- Christopher. " You will be a waterfinder. Apology of the dowser.
- Correnson J. (Lieutenant-Colonel). — Elementary treatise on
 physical dowsing.
- Dart (Engineer). — The wave... free energy.
- Frammcry. — The " S " radiations of dowsers.
- H. of France (Viscount). — The modern dowser.
 — Memories of a dowser.
- Lakhowsky. — Nature and its wonders.
 — The Earth and us.
 — Eternity, life, death.
- Larvaron. — Radiotellury applied to the search for water.
 — Radio-telluria, its applications.
- Leprince (Dr) (doctor). — Medical dowsing.
 — To heal and stay young.
 — The captivating mystery of waves (chromodiagnosis)
 — The new horizons of medicine.
 — Diagnosis by colors: treatment by metals.
 — Human vitality and the medicine of tomorrow.
 — Human radiation.
 — The dowsing apprentice.
 — Dowsers and the sick. — Pendulums and Physicians.
 — Vertebrotherapy.
 — Treatise on reflexotherapy.
 — Method of Assuero.

Loeffler Delachaux. — Dowsing graphology.
 Mager Henri (Professor). — New
 prospecting methods.
 — Physical radio — A new science.
 — The dowsers and their processes.
 — Subterranean hydrology.
 — The dowsing rod and the forces of nature.
 — Miscellaneous pamphlets.
 Jubaru (S.J.). " What are we to think of dowsers?"
 Camilla Eynard. " They accuse me of being cured."
 Léon Joly (Member of the institute). — Radiotelluria and
 Radiethesis
 in the face of science.
 Charles Richet (Professor). — The sixth sense.
 Padey (Benoit). — The Secrets of the Wand.
 — Abbreviated treatise.
 — The doctor of the poor, of the settler, missionary.
 Abbot Lambert. — The mystery of the dowser.
 Landesque (Engineer). — Hydrology and Hydroscopy.
 Bosset (Professor). — Essay on the theory of the pendulum.
 Jacqueline Chantereine and Dr. Savoie. — Waves and
 radiation
 human.
 Articles from the Journal of Studies.
 Various journals.
 Dr. A. Lacour (Doctor). - The pendulum.
 Gay and Fortoul.
 Daniel de Roltz. — Unknown treasures.
 Saint-Yves Cassac.
 Dr Aveline (Doctor). — Harmful waves
 Branly (Edouard). — Wireless telegraphy.
 Borel. — Radiesthetic phenomena and their
 rational use.
 Brown. — Sex before the pendulum.
 Colomer (F.). — Prospecting, research and study of
 mining deposits.
 Bulletin of the friends of dowsing.
 The dowser's chronicle. — Review of H. de France.
 Remote prospecting. — Review of Christophe.
 Medical dowsing. — Dr. ^{V.} Barry, Lyons.
 RP Marie-Bernard. — Introduction to dowsing
 — Conquering the airwaves.
 Pothier J. — The vagaries of pigeon racing and the responses of

ANTONIO AUNO
 ABOGADO

Renaut and Vandveschelden. — Our pigeons and radiant waves.
 Renault (D^r). — The method of Abrams. Human reflexes.
 Terestchenko. — Method for dowsing food and drink.
 Vallemont (Abbot of). — Occult Physics 1693.

Other Books Consulted

Father Moreux. — Build your position yourself.
 — Mechanical.
 — Physics.
 André Coeuroy. — Overview of the radio.
 Ernest Coustet. — How to install telephony at home .
 Dr Henry Bouquet. - Surgery.
 Dr Vaucaire. - The human body.
 Eugene Weiss. - The mecanic.
 Viger — The atmosphere.

 Layraoux. — From rbdomancy to radies thesis.
 Ch.Rod . Pollack. — The vital healing fluid.

HOUSE OF RADIESTHESIA

16, Rue Saint-Roch — Paris (1st)

(Does not have a branch)

RC Seine n° 612.505 Telephone: Opéra 29-60

MANY EXCLUSIVITIES

EDITION OF BOOKS

MANUFACTURING OF EQUIPMENT

THE ONLY SPECIALIZED WORLDWIDE

Founded by

Alfred LAMBERT, Owner Director

Permanent exhibition and sale of everything that appears as
books, rods, clocks, witnesses, compasses, magnets and
dowsing devices.

DOCUMENTATION CENTER

TEACHING, RESEARCH, NEWS

Radiesthesis aptitude examination by specialists

**Cash purchase of Books, Manuscripts,
Documents (old or modern) relating
to this Science**

GROUP LESSONS AND PRIVATE LESSONS
by experienced teachers

OTHER WORKS BY THE AUTHOR

A MODEL TERTIARY: MR. PAUL BRÉZUN. (exhaust).

SIMPLE THERESIAN NOTES. (exhaust).

THE NEW MESSAGE OR SAINTE-THERESE OF THE CHILD JESUS
— **Her childhood life** — **Her Marian life** 10th thousand — work of 464 pages — illustrated — with mass-office and prayers of the Saint — analytical table.

UP! THE SKY ! in the footsteps of Saint Thérèse of the Child Jesus. — 124-page album — Color illustrations — for children — 10th thousand.

The most beautiful of the Saints! SAINT-FRANCIS OF ASSISI, the Friend of Children. — Album of 80 pages — large in 8° numerous color illustrations 5th thousand.

AMPUIS — Outline of religious and local history. — Numerous illustrations. Preface by Bishop Lavallée (out of print).

INITIATION TO RADIESTHESIA, (out of print).

ILLUSTRATED PLATE ON THE CAPUCINS. (16 pages).

“SAINT FRANCIS OF ASSISI, Our Father”. — New life of St. Francis about 200 pages - all illustrated very well documented on the TO - Souvenir de Mission et de Retraites-. Very reduced price.

In the Conquest of the Waves. — **VADE-MECUM OF THE MEDICAL RADIES THESIS.** (House of Dowsing).
