

Radiesthesia and Medicine

Khalil Messiha MB, ChB, MS, PhD

Dawoud Khalil Messiha, an Egyptian architect and dowser with an active interest in the history of Egypt and the effect of geometrical forms and figures on living systems, has produced the following report on some of the work in medical radiesthesia by his late father, Dr Khalil Messiha (1924-1998). Dr Messiha was a man of many talents having degrees in Fine Arts, Medicine, History of Medicine and Egyptology. He taught Anatomy to artists in The Faculty of Fine Arts, Cinema Institute, Arts in The Coptic Era in The Institute of Coptic Studies, was Director of the Museum of Medicine, Sakakini Palace, Daher, Cairo. As a physician he practised

medicine in his private clinic for over 30 years. He was an active member and lecturer in many scientific societies.

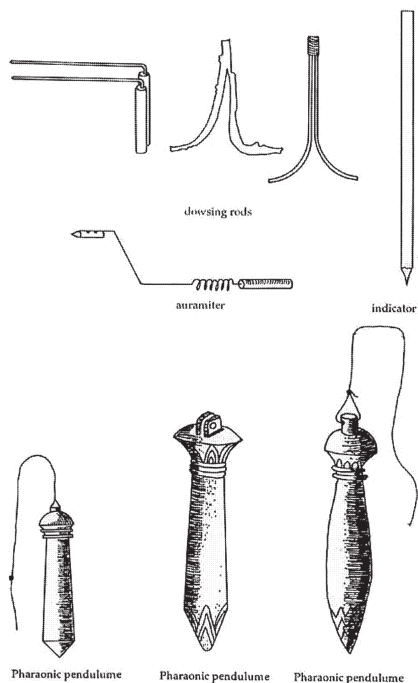

Radiesthesia has been regarded for centuries by many as a divinatory art needing certain psychic abilities, and by others as a secret science of the ancient temples, later of monasteries, and practised by closed societies. Both views are correct. Radiesthesia has survived the ages as a secret science of the Jesuit priests, and it was the missionaries' main tool in the search for unknown herbal remedies, besides being an important tool for discovery of underground water sources. The French Jesuit priest, Abbé Mermet, was famous for the discovery of underground water sources in France and Switzerland. Most of the water sources around Paris and Vienna were discovered in the 18th century by famous practitioners of radiesthesia.

Radiesthesia is a Latin term meaning '*sensitivity to radiation*'. Search for underground water, mineral detection and lost objects are well known to practitioners of radiesthesia and dowsing. They usually use dowsing rods and pendulums for their search work. Radiesthesia can also be a helpful tool in modern science and can encompass diverse fields. In what follows, some examples of these applications are discussed, particularly the use in medicine.

Dr Khalil Messiha practised dowsing and radiesthesia in medicine for more than 35 years. He used to investigate his patients by the traditional way as a physician, diagnosing the disease and giving a suitable remedy. In some cases the disease could have been cured by more than one remedy, although one of them would be the most effective. The physician could not

determine the most effective remedy unless the patient had used it for a few days, and sometimes more. (This usually happened in allergy cases, arthritis as well as other conditions). Diseases such as some kinds of severe diarrhoea needed laboratory analysis to find a suitable remedy and while the patient waited for laboratory results he had to use chemical remedies to stop the diarrhoea although not to cure it. Radiesthesia gives help to the physician in such cases by helping to choose the most effective remedy for each patient. Dr Khalil Messiha used to dowse remedies for his patients, not only to find the most effective remedy among several suitable remedies, but also to avoid side-effects. Sometimes the patient had severe pain or had an unknown disease and came to his physician (general practitioner) to identify his/her illness and find whether the help of a specialist was required. In some cases, several kinds of medical analysis had to be done to identify the problem and select the specialist to follow the case. These analyses could take a few days, sometimes more, and in a few cases doctors failed to detect the real cause of illness. The patient might have to take medication to cure the symptoms of the disease but not deal with its real cause.

Medical radiesthesia, when practised by doctors and physicians, can help define, in a short time, the starting point for medical analysis. This would

Some dowsing implements

save time and reduce suffering of patients. It can give help to doctors to quickly and safely investigate the abdomen of patients. Radiesthesia can help detect the real cause of illness even if the cause was in the energy body, chakras or vital systems. Such investigation might be necessary for people who live very far away from hospitals and laboratories, such as sailors and passengers in ships, or expeditions in deserts and forests, even slums and poor countries. In ancient Egypt, physicians, who were also priests in temples, used to practise medical radiesthesia to diagnose and cure their patients. Before being a medical priest in ancient Egypt a knowledge of medicine, healing, astrology, astronomy, herbs and dowsing was required. Dr Messiha, who was also an Egyptologist,

used 'ancient Egyptian Medical radiesthesia' and had remarkably good results in his work. He was able to analyze even the confusing chronic cases which persist for years without being accurately diagnosed. In addition he also found suitable systems to cure cases that had poor results with traditional medication for years. His way of diagnosis and treatment succeeded in curing 'chronic fatigue syndrome' which many people all over the world suffer from without knowing the exact cause or cure. As a dowser, Dr Khalil realized that some patients suffered illness for years without a good reaction to treatment. He dowsed their homes and found that their illness was a result of living in places affected by harmful earth radiation or bad harmonic colours. Such cases were treated first by re-arranging bedroom furniture, reorienting the sleeping direction and using Pharaonic tools to remove bad harmonic colours or geopathogenic zones.

Medical radiesthesia also gives help in anticipating the chances of suffering from future illness. This could be done in many ways. One way would be to study and analyze energy field systems of human beings so as to detect any deviation from normal in them. Another way is to analyze the genome of human beings and have the map of one's health in the future. The latter approach is what modern science is trying to develop with the help of complicated and special laboratories and instruments. Now, with the help of charts for anatomy of the human body, human energy fields, subtle bodies of man and by using dowsing tools such as pendulums, dowsing rods and radionic apparatus, simple laboratories will be adequate.

These are just some examples of the wide scope of work in medical dowsing and radiesthesia. Here, it is worth mentioning that dowsing and analysis of diseases have to be done by experienced dowsers. Beginner dowsers may get hurt or suffer symptoms of diseases if they ignore basic precautions in their work, such as adequate protection.
