

ITRAD INSTITUTE – BRAZIL

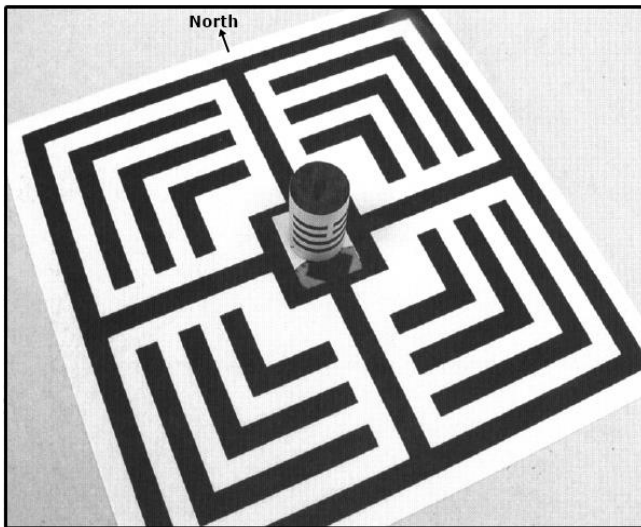

AMIENS TABLE

The square Amiens Table is a broadcaster (“wave emitter of form”) and, as such, it can be used to make ‘long and smooth’ broadcastings. Its size above the others graphs gives it a high degree of stability in relation to environmental inharmonious energies. If you need a little more power, for example, place on a pyramidal accumulator.

- Placed under a pyramid, it can be used as an accumulator, in the same way as the decagon (pyramid oriented to the North).
- Used as a support for ‘remote’ broadcastings, follow the scheme: orient the graph to the North, place in the center the witness (person, animal, plant, property, etc.), on the witness place the reagent (medicine, symbol, stone, etc.). Periodically, dowse the appropriate broadcasting time and the effectiveness.

Graphic published in a book by Jean Paul Honecker and recovered by the late Brazilian dowser António Rodrigues.

Dimension of the chart: 15 x 15 cm

Print out and orient the chart to the North. If you have a virtual cone pendulum or a universal pendulum, place it on the center of the graph and you will find that there is no negative green emission. Although they are right angles (90 degrees)!
